## 9    Quantification by UPLC-MS/MS

Methylisothiazolinone

Chloromethylisothiazolinone

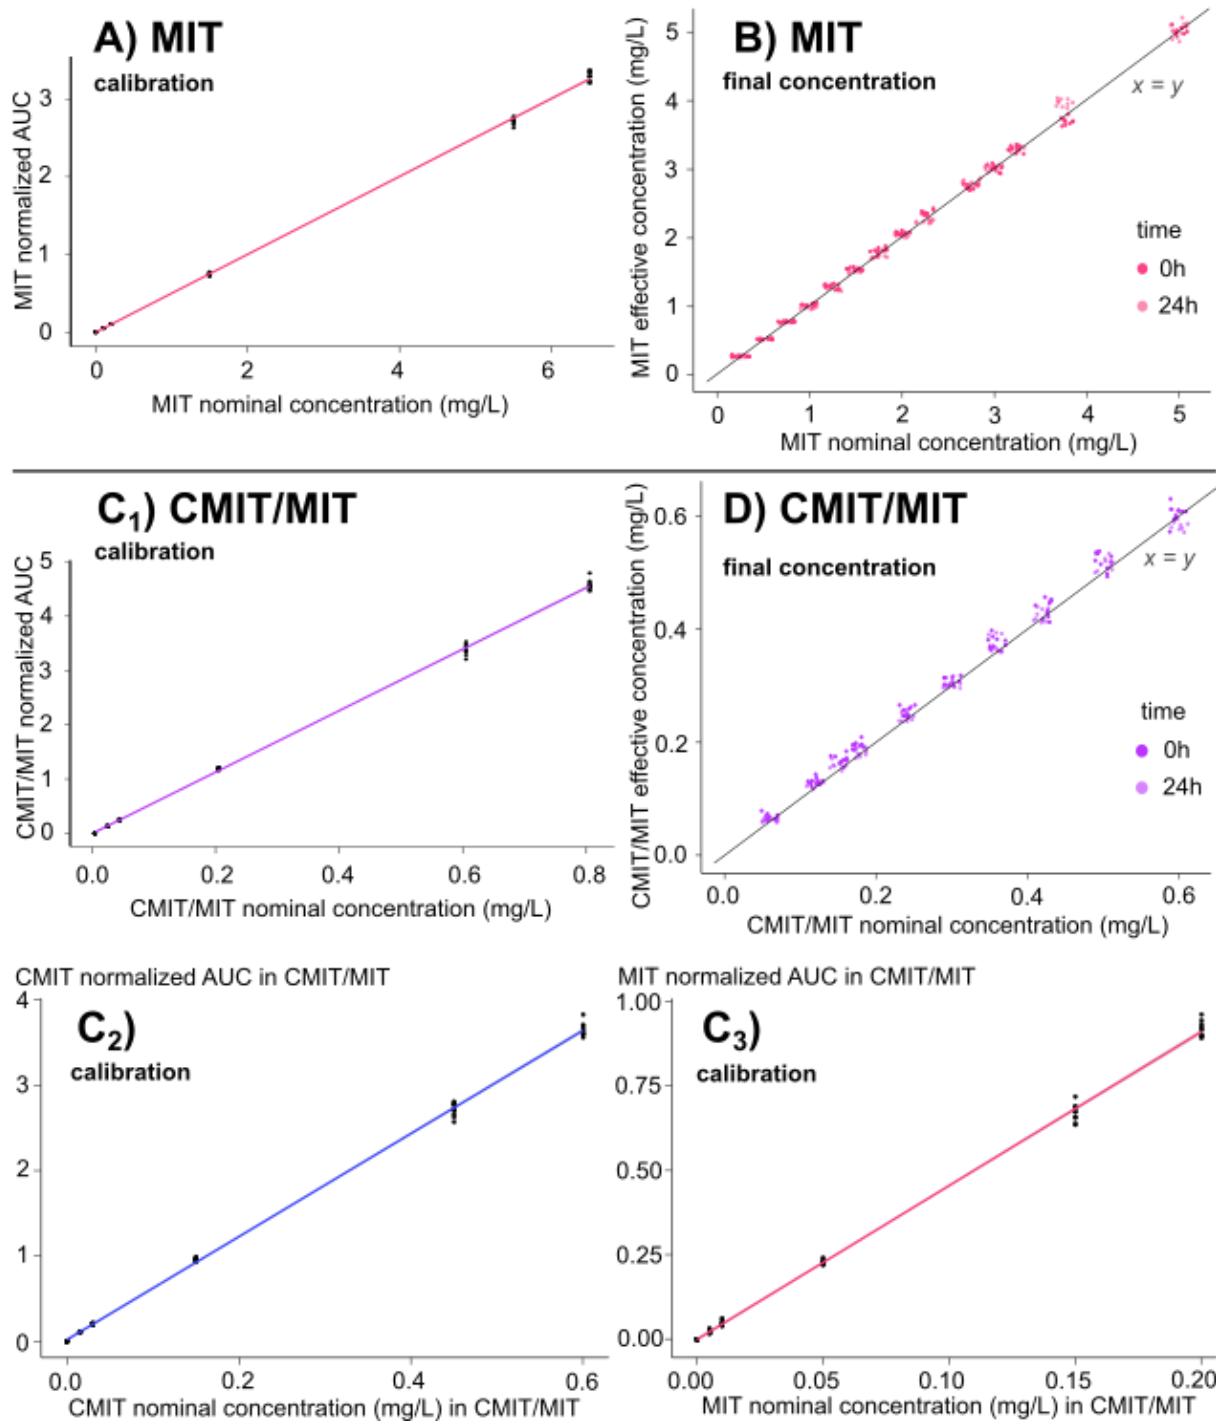

10  
11    **Figure S1.** Formulas of 2-méthylisothiazol-3(2H)-one (CAS n°2682-20-4) and 5-Chloro-2-methyl-1,2-  
12    thiazol-3(2H)-one (CAS n°26172-55-4)

13  
14    Calibration curves were obtained from standards at the following concentrations: (1) 0.02, 0.04, 0.2,  
15    0.6 and 0.8 mg/L and 0.2 mg/L of the internal standard solution for the mixture of CMIT and MIT and  
16    at (2) 0.1, 0.2, 1.5, 5.5 and 6.5 mg/L and 1.5 mg/L of the internal standard solution for the MIT alone.  
17    The concentrations reported for the mixture are the cumulated concentrations of both CMIT and MIT  
18    (3:1 ratio). Each solution and blanks were injected ten times.

19  
20    Using quantification transitions, CMIT and MIT areas were normalized by the I.S. area for each  
21    injection (calibration and bioassay samples). Calibration curves (Figure 1) were generated with R  
22    (version 4.0.0) as linear regression with generalized least squares to correct for heteroscedasticity of  
23    residuals.

24    **Table S2.** Mass transitions and retention times for the target compounds in UPLC-MS/MS. I.S.,  
25    internal standard.

| Compound      | Precursor ion<br>( <i>m/z</i> ) | Product ion ( <i>m/z</i> ) | Collision energy<br>(eV) | Retention time<br>(min) |
|---------------|---------------------------------|----------------------------|--------------------------|-------------------------|
| MIT           | 116.0170                        | 100.9935                   | 28                       | 0.3 – 0.4               |
| CMIT          | 149.9790                        | 134.9546                   | 28                       | 1.1 – 1.2               |
| MIT-D3 (I.S.) | 119.0360                        | 100.9935                   | 28                       | 0.3 – 0.4               |

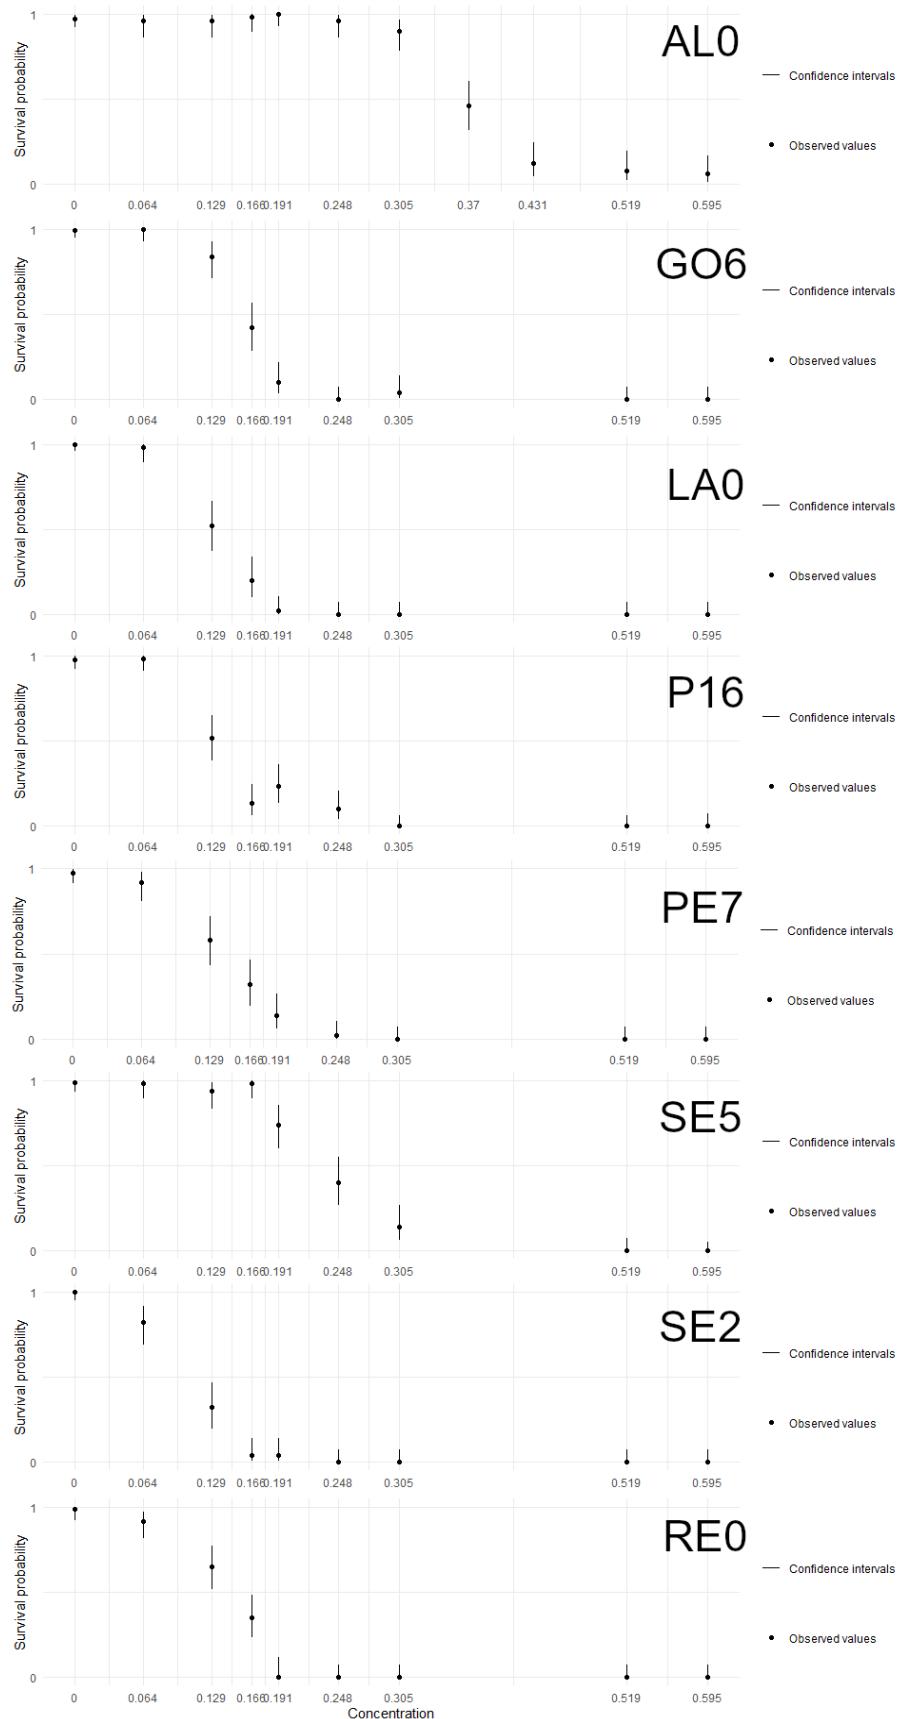

**Figure S2.** Measures of isothiazolinones concentration in water contaminated with MIT (A and B) or CMIT/MIT (C<sub>1-2-3</sub> and D), with 10 technical replicates. In calibration curves (A and C), the areas under the curve (AUC) are normalized by the internal standard area. For CMIT/MIT samples, calibration curves show CMIT (C<sub>2</sub>, adjusted R<sup>2</sup> = 0.999, p-value < 0.001) and MIT (C<sub>3</sub>, adjusted R<sup>2</sup> = 0.998, p-value < 0.001) AUC separately, and the mixture CMIT/MIT (C<sub>1</sub>, adjusted R<sup>2</sup> = 0.999, p-value < 0.001) as derived from the single molecules' AUC. Based on calibration curves, the bioassay samples' effective concentrations are plotted against nominal concentrations for MIT samples (B) and CMIT/MIT samples (D), showing strong linear relationship in both cases (MIT: R<sup>2</sup> = 0.998, p-value < 0.001; CMIT/MIT: R<sup>2</sup> = 0.995, p-value < 0.001). Effective concentrations in samples are displayed at 0 and 24h after contamination and are reported in supplemental material (table S3).

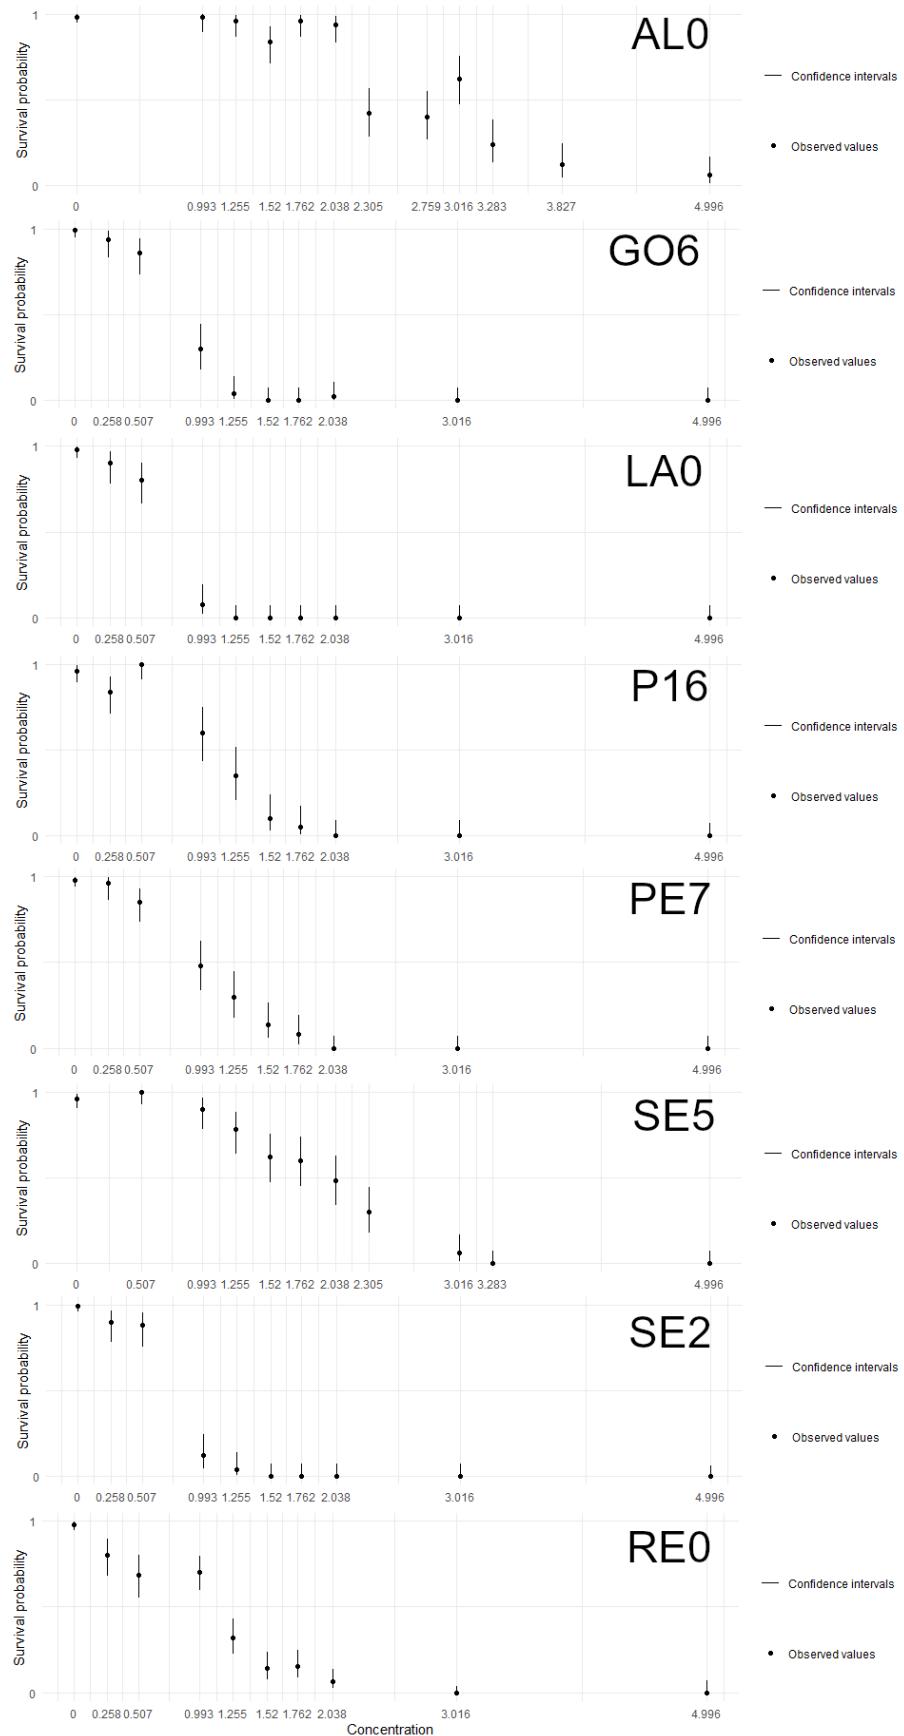

39 **Table S3.** CMIT and MIT concentrations measured with analysis by UPLC-MS/MS (mg/L) and  
 40 degradation over 24h. CMIT+MIT concentration was computed by adding CMIT and MIT measures in  
 41 mixture.

|                     | Nominal concentration (mg/L) | Effective median concentration in mg/L (SD) | Effective median concentration in mg/L (SD) at 0h | Effective median concentration in mg/L (SD) at 24h | Percentage decrease in concentration over 24h |
|---------------------|------------------------------|---|---|--|---|
| CMIT+MIT in mixture | 0.06                         | 0.064 (0.005)                               | 0.067 (0.005)                                     | 0.062 (0.002)                                      | 7.5 %   |
|                     | 0.12                         | 0.129 (0.006)                               | 0.131 (0.006)                                     | 0.126 (0.004)                                      | 3.8 %   |

79

80 Source: morse modelling vignette (<https://CRAN.R-project.org/package=morse>)

81 The number  $N_i$  of surviving organisms at time  $t$  follows a binomial distribution:

$$N_i \sim B(n_i^{init}, f(c_i))$$

82 With  $n_i^{init}$  as the initial number of organisms and  $c$  the contaminant level, and  $f$  the three parameters

83 log-logistic function:

$$f(c) = \frac{d}{1 + (\frac{c}{e})^b}$$

84 Where  $b$  relates to the effect intensity of the contaminant and so to the steepness of the slope in the  
85 dose-response curve,  $d$  is the survival rate in absence of contaminant, and  $e$  is the LC<sub>50</sub>

86

87 **Table S5.** Log-logistic models parameters estimates at 48h for the 8 clonal lineages, median and 95%  
88 credible interval. The parameters describe as follow:  $b$  relates to the effect intensity of the  
89 contaminant and so to the steepness of the slope in the dose-response curve,  $d$  is the survival rate in  
90 absence of contaminant, and  $e$  is the LC<sub>50</sub>.
