## Author Query Form

Journal code: CRUS

Transmittal No.: CRUS4004

Dear Author,

During the preparation of your manuscript for typesetting, some questions have arisen. They are listed below. Please check your proof carefully and mark all corrections at the appropriate place in the proof (e.g., by using on-screen annotation in the PDF file) or compile them in a separate list. Note: if you opt to annotate the file with software other than Adobe Reader then please also highlight the appropriate place in the PDF file.

Any queries or remarks that have arisen during the processing of your manuscript are listed below and highlighted by flags in the proof.

Location in article	Query / Remark: <b>Click on the Q link</b> to find the query's location in text Please insert your reply or correction at the corresponding line in the proof

5      FIRST RECORD OF *EPIGRAPSUS POLITUS* HELLER, 1862 FROM  
6      RÉUNION ISLAND (DECAPODA, BRACHYURA, GECARCINIDAE)

7                          BY  
8

9                          NICOLAS HUET<sup>1</sup>) and JOSEPH POUPIN<sup>2,3</sup>)

10                         <sup>1</sup>) 11 rue Saladin, F-97480 Saint-Joseph, La Réunion, France

11                         <sup>2</sup>) École Navale, BCRM de Brest, CC 600, Lanvéoc, F-29240 Brest, France

12  
13      The gecarcinids of the genus *Epigrapsus* are terrestrial crabs of the tropical  
14 Indo-West Pacific, with only two species currently accepted (Ng et al., 2008;  
15 Naruse et al., 2018; Sasaki, 2019): *Epigrapsus politus* Heller, 1862, type locality  
16 Tahiti, and *Epigrapsus notatus* (Heller, 1865), type locality Nicobar Islands. These  
17 crabs are the smallest gecarcinids, carapace width (CW) being usually no more  
18 than 2-3 cm. They occupy a narrow coastal band, a few metres above the supratidal  
19 level. Although being probably common in the Indo-West Pacific, they are rarely  
20 reported because of a lack of interest in these crabs as human food, and their  
21 discreet way of life, remaining hidden under stones or vegetation during daytime.  
22 Here, we report for the first time the presence of *E. politus* on Réunion Island, a  
23 significant geographic range extension of this species in the Western Indian Ocean  
24 (WIO).  
25

26      *Epigrapsus* crabs have been searched in Réunion Island during two dedicated  
27 land investigations at the stations mapped on fig. 1. A first investigation was  
28 made by the second author (JP) in March-April 2008 on the southwestern coast,  
29 between Saint Gilles-Les-Bains and Saint Joseph (fig. 1, circles; details of stations  
30 in Poupin, 2009: 116, Annexe 1, stations 1, 2, 6, 7, 10, 14, 16). A second  
31 investigation was made in November 2019 on the same coast by the first author  
32 (NH) between Saint-Leu and Saint-Philippe (fig. 1, squares) with 8 stations  
33 visited (from north to south): (1) Pointe au Sel, (2) Terre Sainte, (3) Grand Bois,  
34 (4) Grande Anse, (5) Manapany-Les-Bains, (6) Pointe Cayenne to (7) Piton Babet,  
35 and (8) Pointe Marine Vincendo. *Epigrapsus* crabs were found only during the  
36 second investigation and only at Manapany-Les-Bains (fig. 1, black square, 5).  
37 A dozen crabs were seen in that place during three successive visits. Two

Fig. 1. Places prospected for *Epigrapsus* crabs around La Réunion in 2008 (white circles, unnumbered) and 2019 (squares, 1 to 8). *Epigrapsus politus* Heller, 1862 was found only at Manapany-Les-Bains (black square, 5).

specimens were collected for morphological observations: 1 male  $13.7 \times 16.2$  mm (carapace length  $\times$  CW) (fig. 2), and 1 female  $15.3 \times 18.7$  mm. After observations and macro photographs, they have been deposited and registered in the collection of the Muséum national d'Histoire naturelle, Paris (MNHN-IU-2013-7280).

The crabs were identified as *E. politus*, based on morphological characters presented in Ng et al. (1988, table 1) and in the key to Japanese Gecarcinidae in Ng et al. (2000), including: (a) carapace poorly convex with posterolateral margins converging towards posterior carapace (fig. 2a, b); (b) single low epibranchial notch (fig. 3b); (c) ambulatory legs stout without setae on meri, carpi, propodi (fig. 2a); (d) small size, larger specimen being  $15.3 \times 18.7$  mm while the largest *E. notatus* can reach  $29.6 \times 36.4$  mm (Ng et al., 1988). The specimens examined also match well with high definition macro photographs examined for several specimens of *E. politus* collected by JP at Moorea, French Polynesia (10/x/2008) and deposited in the Florida Museum of Natural History, Gainesville, FL (FLMNH, UF15715-718).

*Epigrapsus politus* resembles, and has been sometimes confused with, *Cyclograpsus integer* H. Milne Edwards, 1837, also collected at Manapany-Les-Bains by the first author (NH). The latter is distinguished by: (a) a smaller size (CW

## NOTES AND NEWS

3

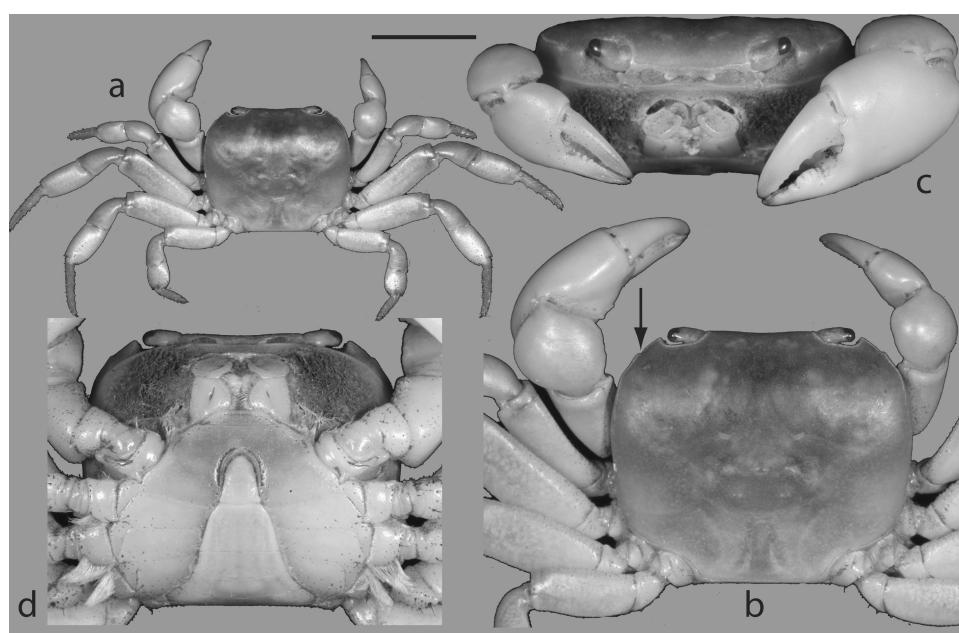

Fig. 2. Habitus of *Epigrapsus politus* Heller, 1862, male  $13.7 \times 16.2$  mm (MNHN-IU-2013-7280):  
a, whole animal, dorsal view; b, carapace dorsal view with indication of low epibranchial notch  
(arrow); c, cephalothorax, frontal view; d, ventral view with aspect of male abdomen. Scale bar: a,  
10 mm; b, c, d, 5 mm.

Fig. 3. *Epigrapsus politus* Heller, 1862 biotope at Réunion Is. (Manapany-Les-Bains). The crab was  
observed exclusively inside the dotted oval line, about 5 m away from the highest sea level, in a place  
with pebbles covered with creeping vine Convolvulaceae, *Ipomoea pes-caprae* (L.) R. Br., 1818, and  
grass.

about 1 cm versus about 2 cm for *E. politus*); (b) an oblique setose ridge on the meri and ischia of the third maxillipeds; (c) no teeth on the anterolateral margin of the carapace; (d) red eyes (but this character is sometimes also observed in *E. politus*); and (e) posterior margins of carapace subparallel to slightly diverging backward. It also lives closer to the sea in the intertidal zone and it moves much faster than *E. politus*, being more difficult to catch in the field (JP personal field notes in French Polynesia).

At Manapany-Les-Bains, specimens of *Epigrapsus politus* were seen about 5 m far from the higher sea level on a very limited place, staying on a wet earthy ground under pebbles that were covered with creeping vine, Convolvulaceae (*Ipomoea pes-caprae* (L.) R. Br., 1818) and grass (fig. 3). The associated fauna includes unidentified insects (crickets and ants) and a gastropod of the family Ellobiidae (*Melampus* sp.), rarely found in Réunion and perhaps part of the crab's diet? Terrestrial decapods commonly associated to the same biotope in Réunion (Poupin, 2009) are *Coenobita rugosus* H. Milne Edwards, 1837, *Geograpsus crinipes* (Dana, 1851) and *G. grayi* (H. Milne Edwards, 1853). The crabs were seen only during daytime (around 5 p.m.) by fine weather and calm sea, and not during other visits made at night or with bad weather with rough sea and big swell. They are probably not recent settlers in Réunion, because already observed in 2016 at the same station but not identified at that time (NH, field notes). *Epigrapsus politus* seems, however, uncommon on the island and was not retrieved in any others places prospected in 2019, despite careful attention paid to its preferred biotope.

The taxonomic history and previous geographic records of *Epigrapsus* species are recapitulated herein, limited to contributions where specimens were examined and/or with photographs. A few unpublished records are also included for the first time for *E. politus* from G. Paulay and students' collections in the western and central Pacific (FLMNH, 2020). All these places of observations are mapped on fig. 4.

### Epigrapsus notatus (Heller, 1865)

*Grapsodes notatus* Heller, 1865: 58, pl. 5 fig. 2, Nicobar. — Miers, 1877: 136, Papua New Guinea  
(Duke of York Is.). — De Man, 1887: 160, Indonesia, Moluccas (Morotai Is.). — Alcock, 1900:  
442, Nicobar.

*Mystacocarcinus crenidens* Hilgendorf, 1888: 29, Bismarck Archipelago (New Ireland, Carteret  
'Harbour' =? Carteret Is.)

*Epigrapsus (Grapsodes) notatus* — Sendler, 1923: 27, fig. 2, pl. 5(20) photos 3, Papua New Guinea  
(Bertrand Is. = Tarawai Is.).

*Epigrapsus (Grapsodes) notatus punctatus* Sendler, 1923: 28, Papua New Guinea (Bertrand Is. =  
Tarawai Is.; Liebliche Is. = Arawa Is.).

*Epigrapsus (Grapsodes) wolfi* Sendler, 1923: 28, fig. 3, pl. 6(21) photos 4, Papua New Guinea  
(Lamassa).

*Epigrapsus villosus* Ng, 2002: 1220, figs. 1-3, Guam. — Ng et al., 2008, 215, fig. 160, Vanuatu.

*Epigrapsus* sp. 1 (n. sp., Ng) — Paulay et al., 2003: 494, Guam (type of *E. villosus*).

*Epigrapsus notatus* — Tesch, 1918: 134, Indonesia, 'Talaut' = Talaud Is. (Lirung). — Sakai, 1955:  
200, Japan (Hachijo Is.). — Türkay, 1973a: 105, figs. 1, 3, Nicobar (type of *E. notatus*), figs. 2, 4,  
5-6, Papua New Guinea (type of *E. wolfi*). — Türkay, 1974: 251, figs. 6, 9, 19, Nicobar, Indonesia  
(Talaud Is.), Papua New Guinea (Bertrand Is. = Tarawai Is., type of *E. punctatus*; Lamassa,  
New Ireland; St. Matthias = Mussau Is.; Liebliche Is. = Arawe Is.; Admiralty Is. = Manus Is.),  
Salomon (Steward Is.); Japan (Bonin Is. = Ogasawara Is.). — Sakai, 1976: 678, fig. 373, Japan  
(Hachijo Is.). — Türkay, 1977: 157, Carteret 'Harbour' =? Carteret Is., type of *Mystacocarcinus  
crenidens*). — Tavares, 1989: 36, Indonesia (western Sumatra), Papua New Guinea (Bismarck  
Archipelago). — Takeda, 1994: 218, colour photo 5, Ryukyu (Ishigaki Is.). — Ng et al., 1998:  
72, figs. 1-5, Taiwan (fig. 3, colour photo). — Ng et al., 2000: 379, Ryukyu (Ishigaki Is.), 380,  
Papua New Guinea (Nagada). — Lee, 2001: 141, Taiwan (colour photo). — Cuesta et al., 2002:  
1672, Taiwan (Hengchun, Hualien). — Ng, 2002: 1224, Guam. — Paulay et al., 2003: 494,  
Guam. — Liu & Jeng, 2005: 135, Taiwan (Hengchun). — De Grave et al., 2009: 109, fig. 7G,  
Taiwan (colour photo). — Shih, 2013: 108, Dongsha Is. (colour photos). — Hartnoll et al., 2017:  
933, Taiwan (Kenting). — Ng et al., 2017: 97 (comprehensive references for Taiwan). — Guinot  
et al., 2018: 551, Taiwan (Hsiang-Chiao-Wan). — Naruse et al., 2018: 210-212, tab. 1, Indonesia  
(west Java), Philippines (Cagayan, Palau Is.), Taiwan, Japan (Ryukyu), Guam (including type  
of *E. villosus*), Vanuatu. — Sasaki, 2019: 12683 (taxonomy and comprehensive references). —  
Toyota et al., 2019: 190-191, Ryukyu (Ishigaki Is.; colour figs.).

The new record of *Epigrapsus politus* in Réunion significantly extends its geographic range in the WIO, 2500 km away from Chagos Is. and 5500 km far

1 from Christmas Is (fig. 4). For the time being this is the only WIO place where  
2 the crab has been found. No other record has been retrieved despite a thorough  
3 search in previously published contributions (mentioning Gecarcinidae) for the  
4 following places: central and western India (Trivedi et al., 2018; without Andaman  
5 & Nicobar); Seychelles (Haig, 1984); Red Sea (Holthuis, 1977); Somalia (Vannini  
6 & Valmori, 1981); Mozambique and South Africa (Türkay, 1973b; Emmerson,  
7 2016); Comoros (Fourmanoir, 1954), Mayotte (Bouchard et al., 2013), Scattered  
8 Is. (Poupin et al., 2013a-b; Poupin, 2016; Poupin et al., 2018), and Madagascar  
9 (Türkay, 1974).

10 The discreet way of life of *Epigrapsus politus* suggests, however, that it has  
11 been potentially overlooked in other WIO places. It could probably be discovered  
12 in the future in neighbouring islands such as Mauritius, Rodrigues, Madagascar,  
13 Scattered Is., Mayotte, and Comoros, when its preferred biotope is more carefully  
14 investigated. In Mayotte, for example, Bouchard et al. (2013) have reported the  
15 sesarmid crab *Metasesarma obesum* (Dana, 1851), another discreet species that  
16 has been shown to co-occur with *E. politus* in Okinawa (Osawa & Fujita, 2005).  
17 This suggests that *E. politus* is perhaps also present in Mayotte.

#### ACKNOWLEDGEMENTS

21 G. Paulay, University of Florida, and his students, J. Starmer, C. McKeon  
22 and H.-C. Liu, are thanked for giving permission to use of their unpublished  
23 observations of *Epigrapsus politus* in several places of the western and central  
24 Pacific (Philippines, Palau, Micronesia, Line Islands, and Society Islands).
