HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

PAPER • OPEN ACCESS

Electron dissociative attachment to ArH⁺, HD⁺, N₂⁺ and CO₂

The advertisement features a yellow header with the PRIME logo and text "PACIFIC RIM MEETING ON ELECTROCHEMICAL AND SOLID STATE SCIENCE". Below it, "HONOLULU, HI" and "Oct 6-11, 2024" are displayed. A brown banner at the bottom left encourages "Abstract submission deadline: April 12, 2024" and "Learn more and submit!". To the right, a green section titled "Joint Meeting of" lists "The Electrochemical Society", "The Electrochemical Society of Japan", and "Korea Electrochemical Society". A photograph shows a woman presenting a poster at a conference booth.

Synopsis We will present our recent results in the study of electron-induced reactivity of ionized and neutral molecules. The Configuration Interaction method and the Multichannel Quantum Defect Theory have been employed in order to obtain cross sections for collisions of electrons with ArH⁺, HD⁺, N₂ and CO₂.

Using the Multichannel Quantum Defect Theory (MQDT) [1-6], we computed the cross sections and the rate coefficients for the dissociative recombination (DR) (1.1) and the related competitive processes - vibrational excitation or deexcitation (VE or VdE) (1.2) ($v_f^+ > v_i^+$ or $v_f^+ < v_i^+$) and dissociative excitation (DE) (1.3):

AB standing for ArH[7], HD and N₂[6]. Here v_i^+ and v_f^+ stand for the initial and final vibrational quantum number of the target ion.

These processes occur in the interstellar media, in (re)entry, fusion edge and laboratory plasmas.

The configuration interaction method [8] has been alternatively used for exploring the dissociative electron attachement (1.4) and dissociative excitation (1.5) of CO₂ whose removal is crucial for depollution:

The study of the reactional dynamics relies on the calculation of the relevant potential energy curves and of the corresponding mutual interactions. In these calculations one bond of the target (OC-O) has been stretched only, in order to obtain CO in its electronic ground state.

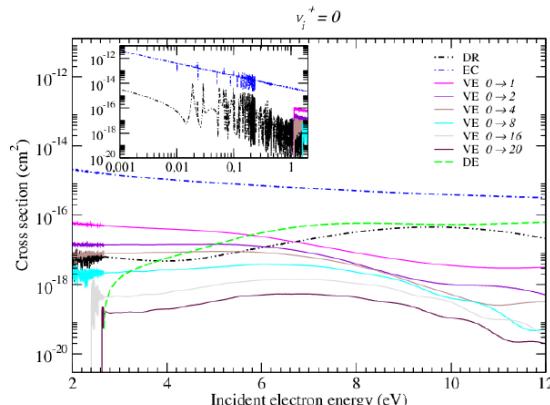

Figure 1. Reactive collisions of HD⁺ in its ground vibrational state with electrons.
