HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

A Study of the Superposition of a Hybrid PV/CPV Utility-Scale Power Plant

Objectives & Issues

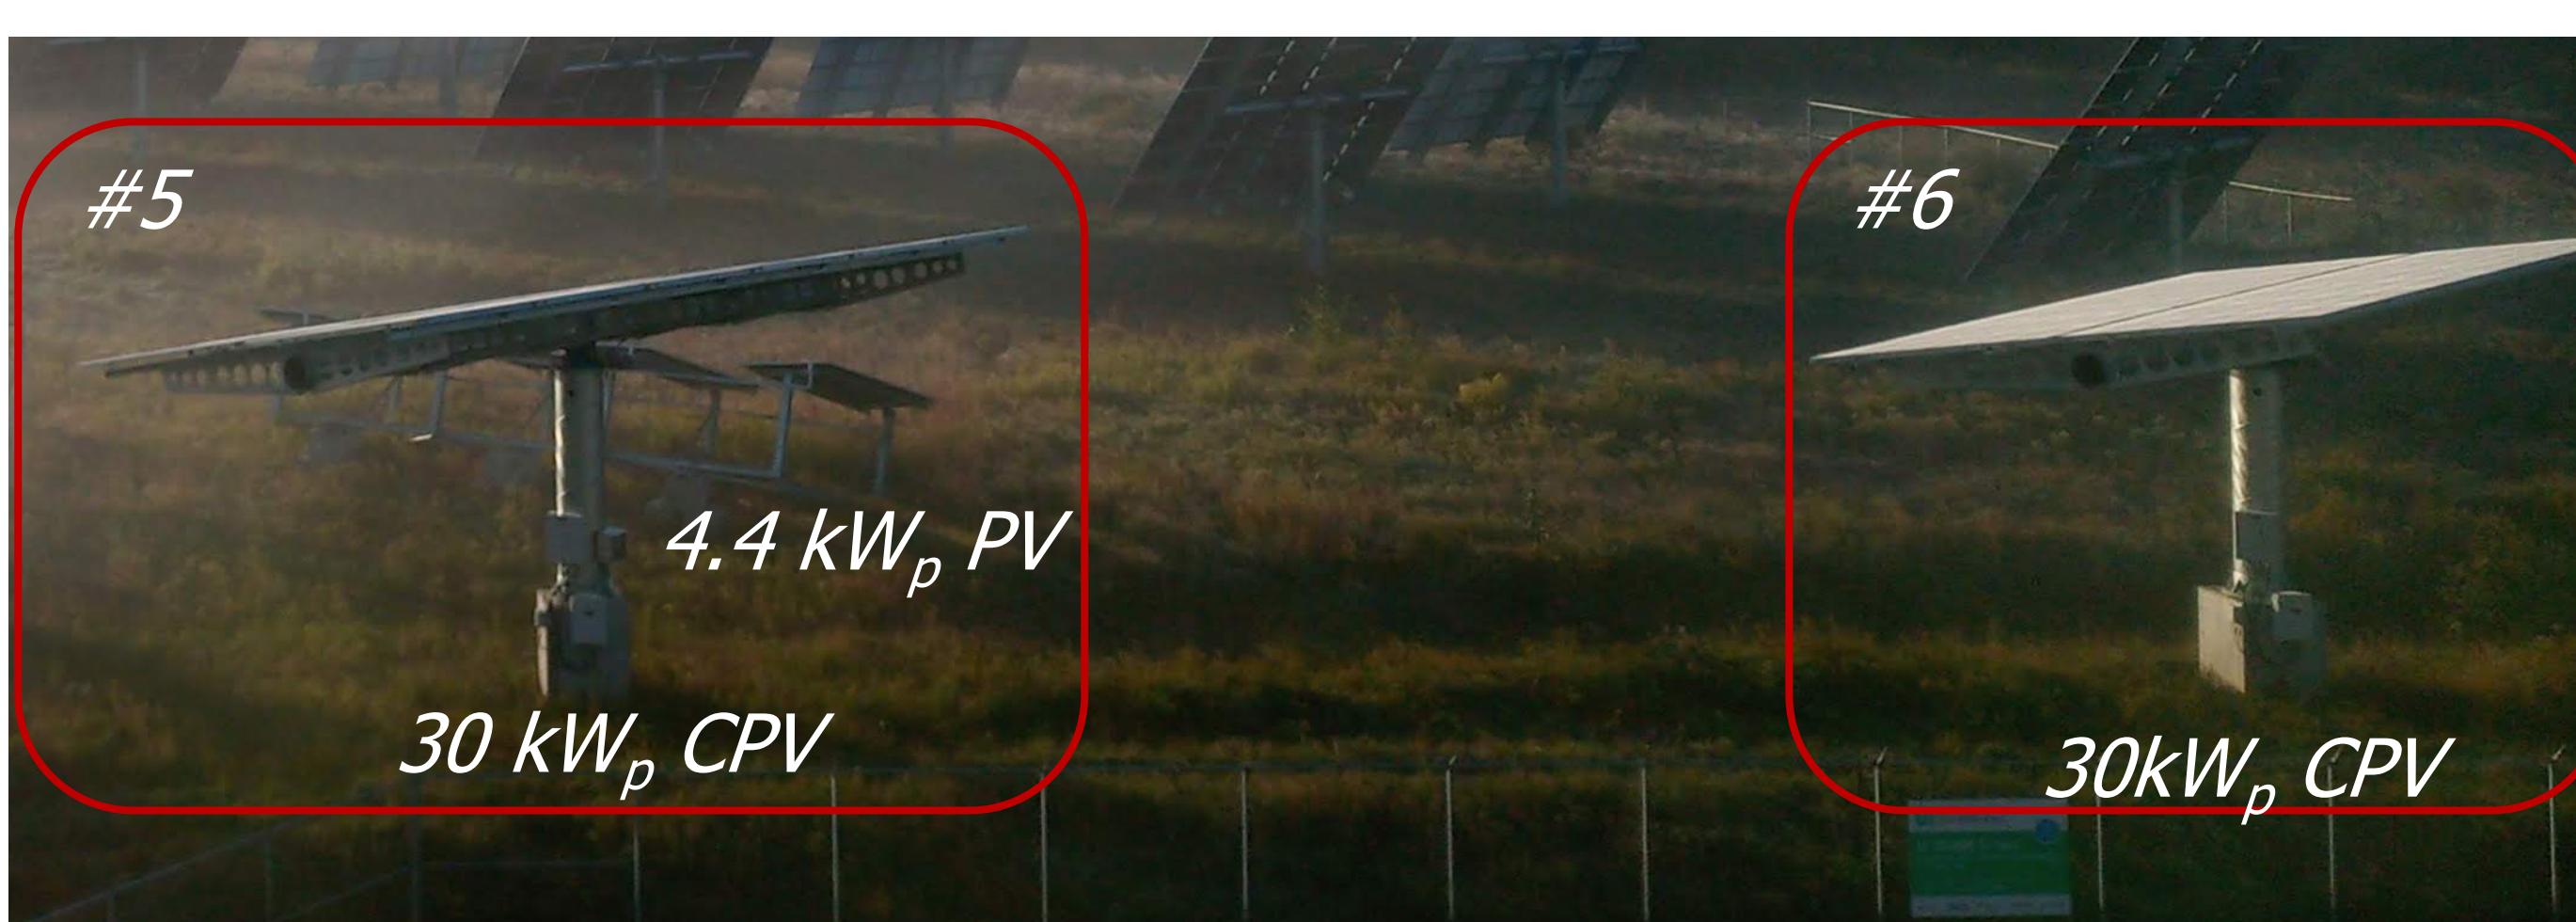

- Cloud passages suppress CPV energy production.
 - Inverters enter standby mode when input voltage <200V
 - It takes about 1min to start inverters
- What is the impact of inverter start-up time on CPV systems energy production?
- Can we reduce this impact by hybridizing CPV systems with flat panel PV?

Approach

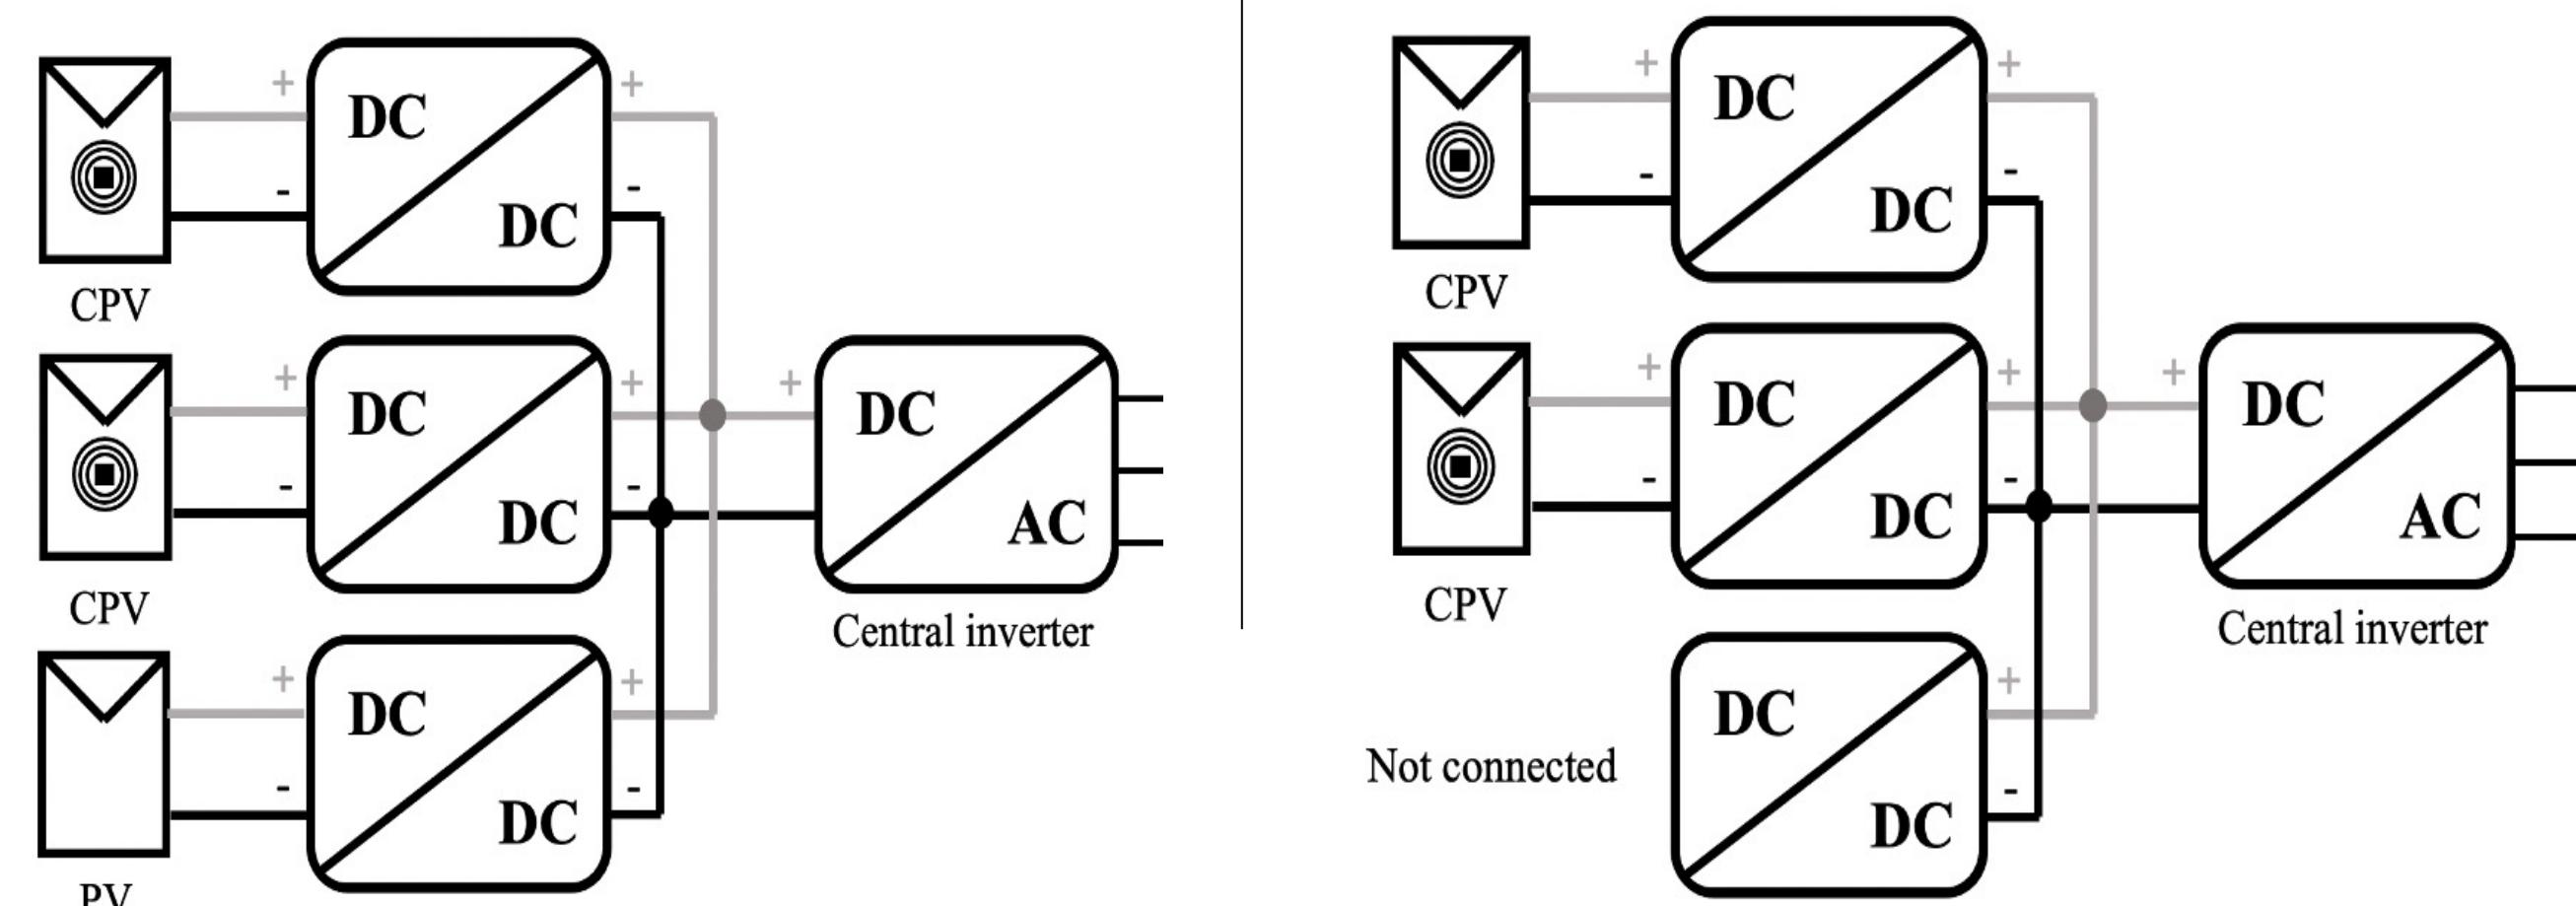

Data from U. Sherbrooke CPV park (8 trackers – 240kW)

Most favorable condition for PV / CPV hybridization

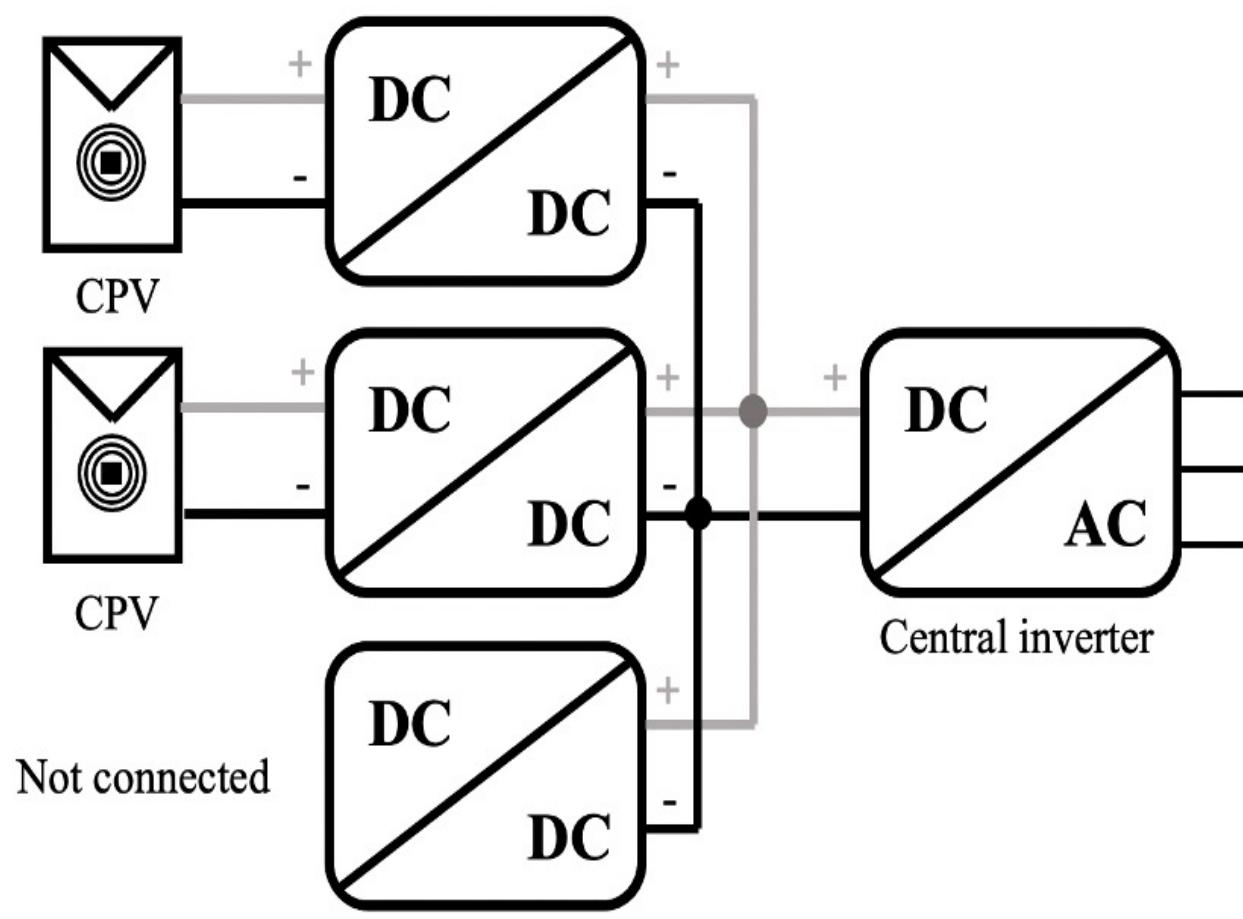

→ Days with intense DNI drops but a non-zero GNI

Hybrid inverter

Full-CPV inverter

Results

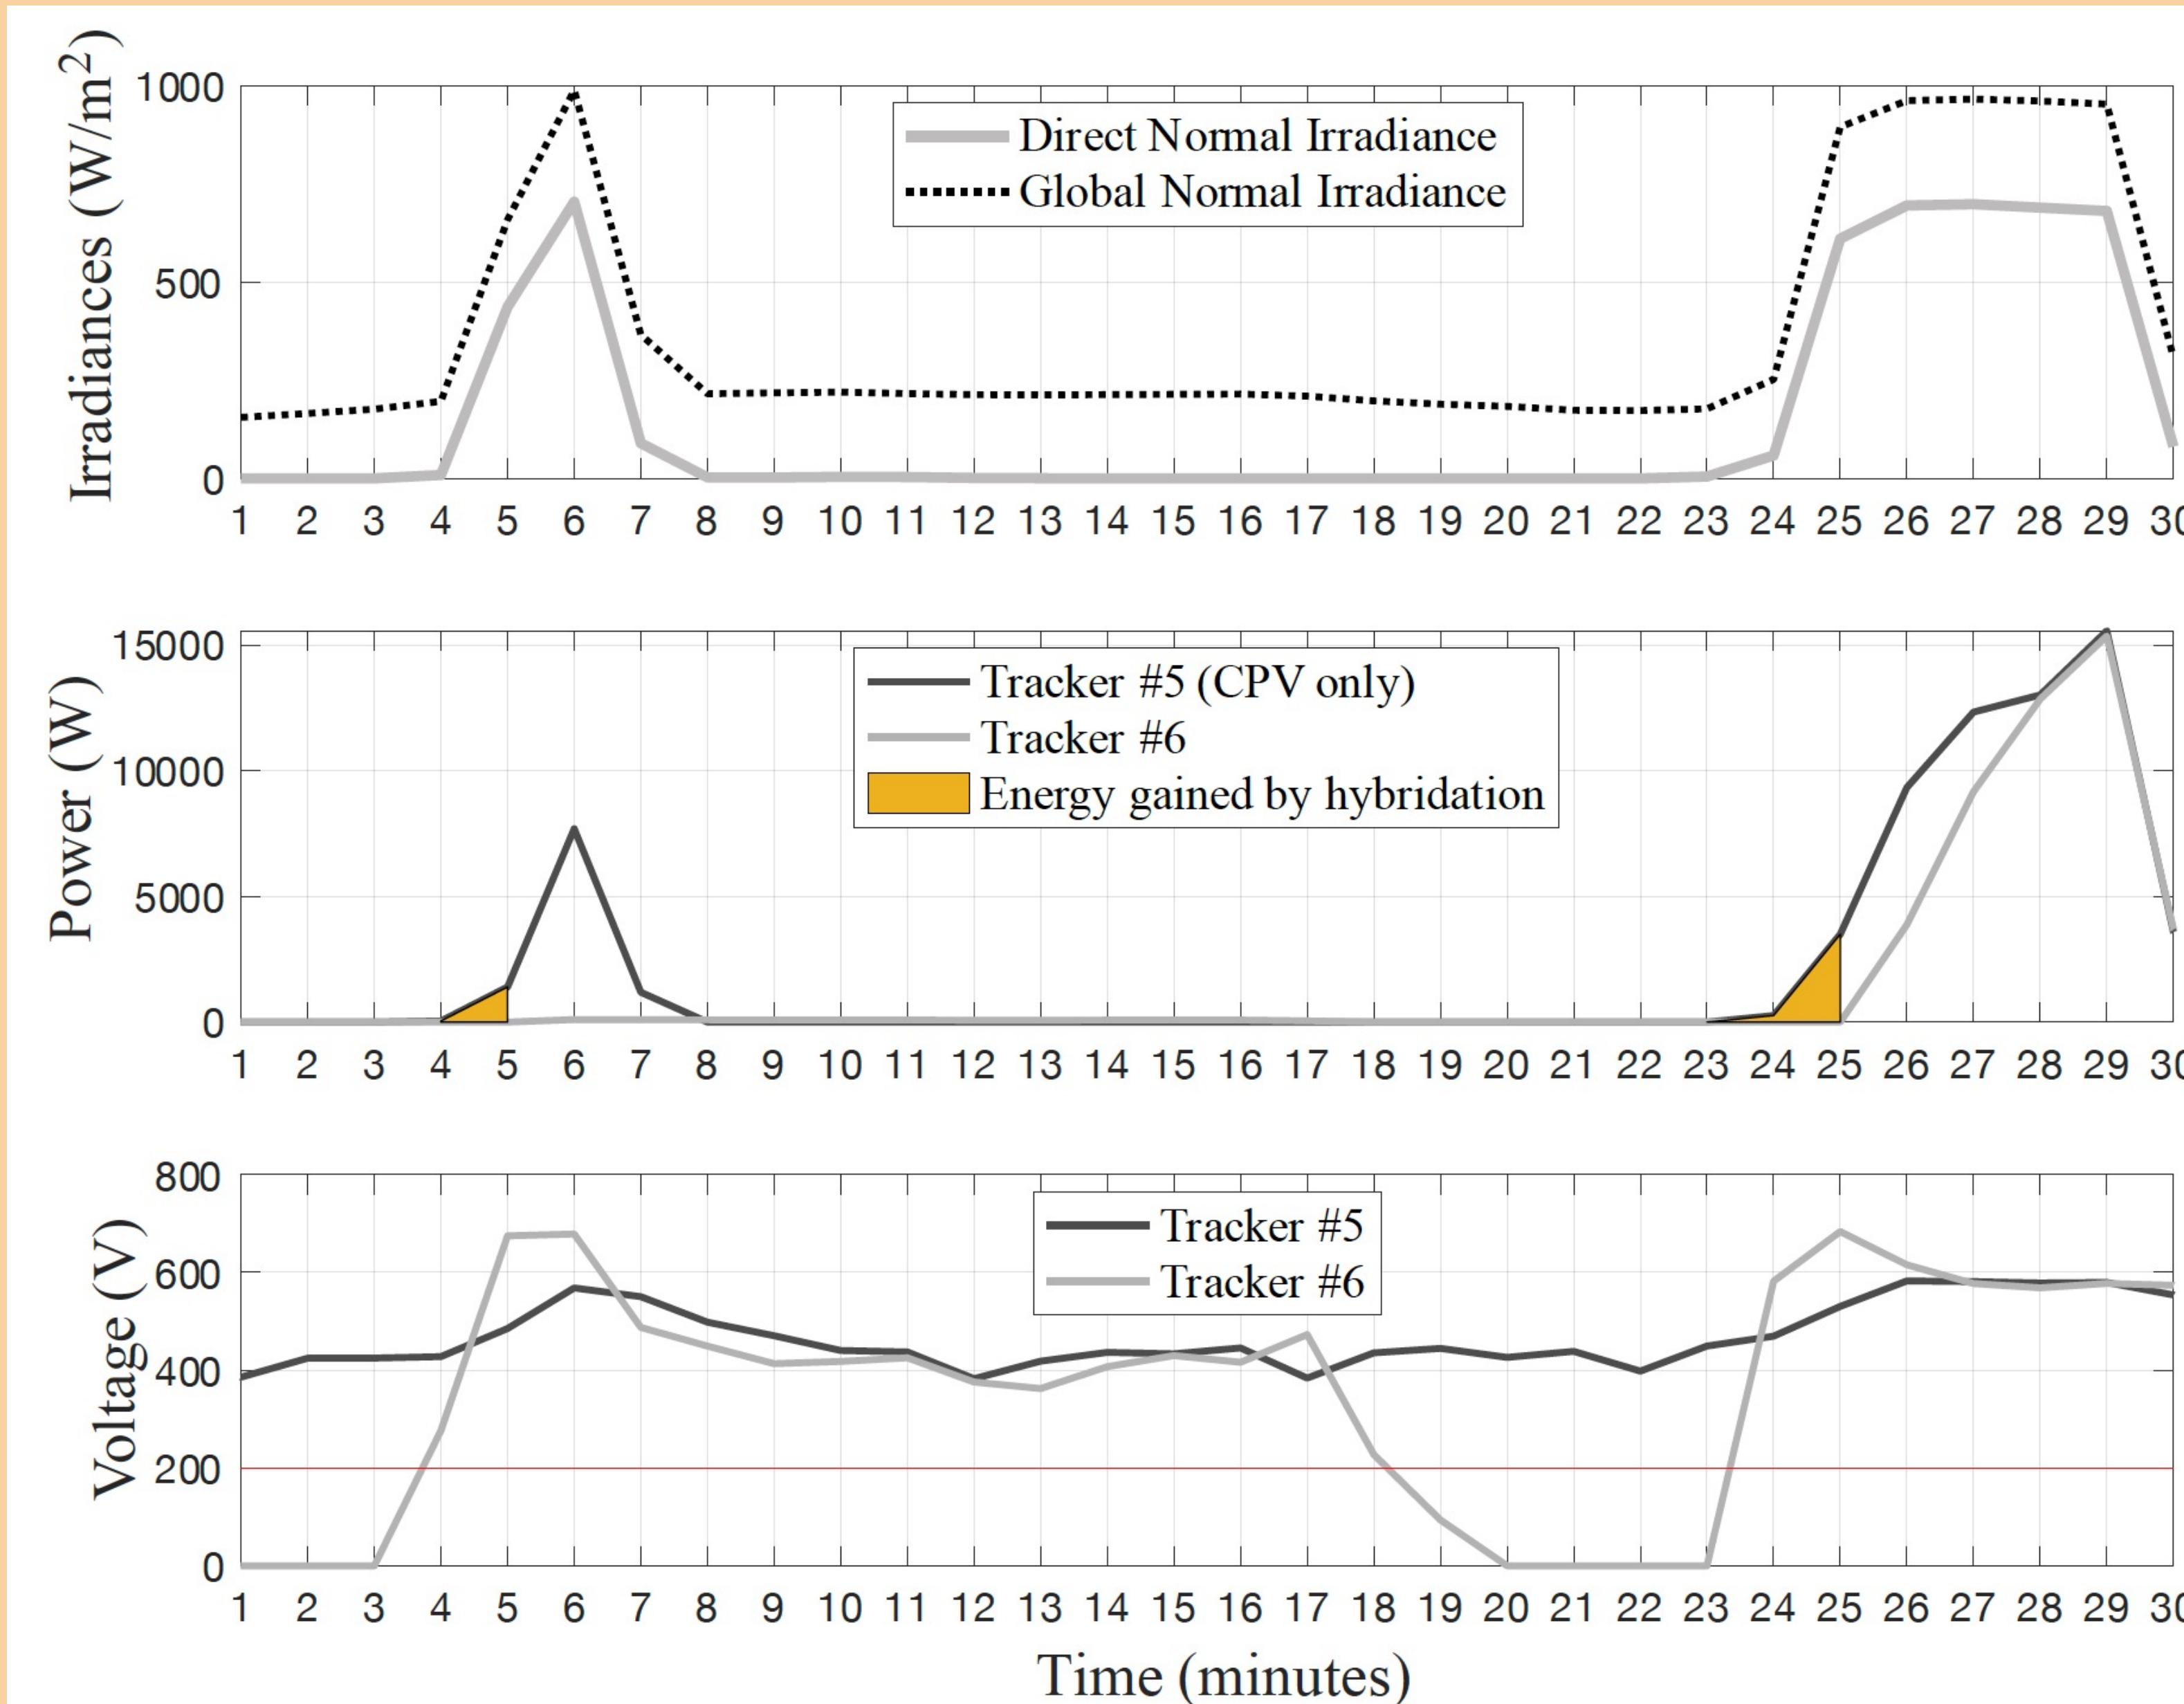

Fig.1 GNI and DNI (top), power of trackers #5 and #6 (middle) and voltage across one input of the corresponding inverters (bottom), the red line corresponds to the trigger voltage of the inverter

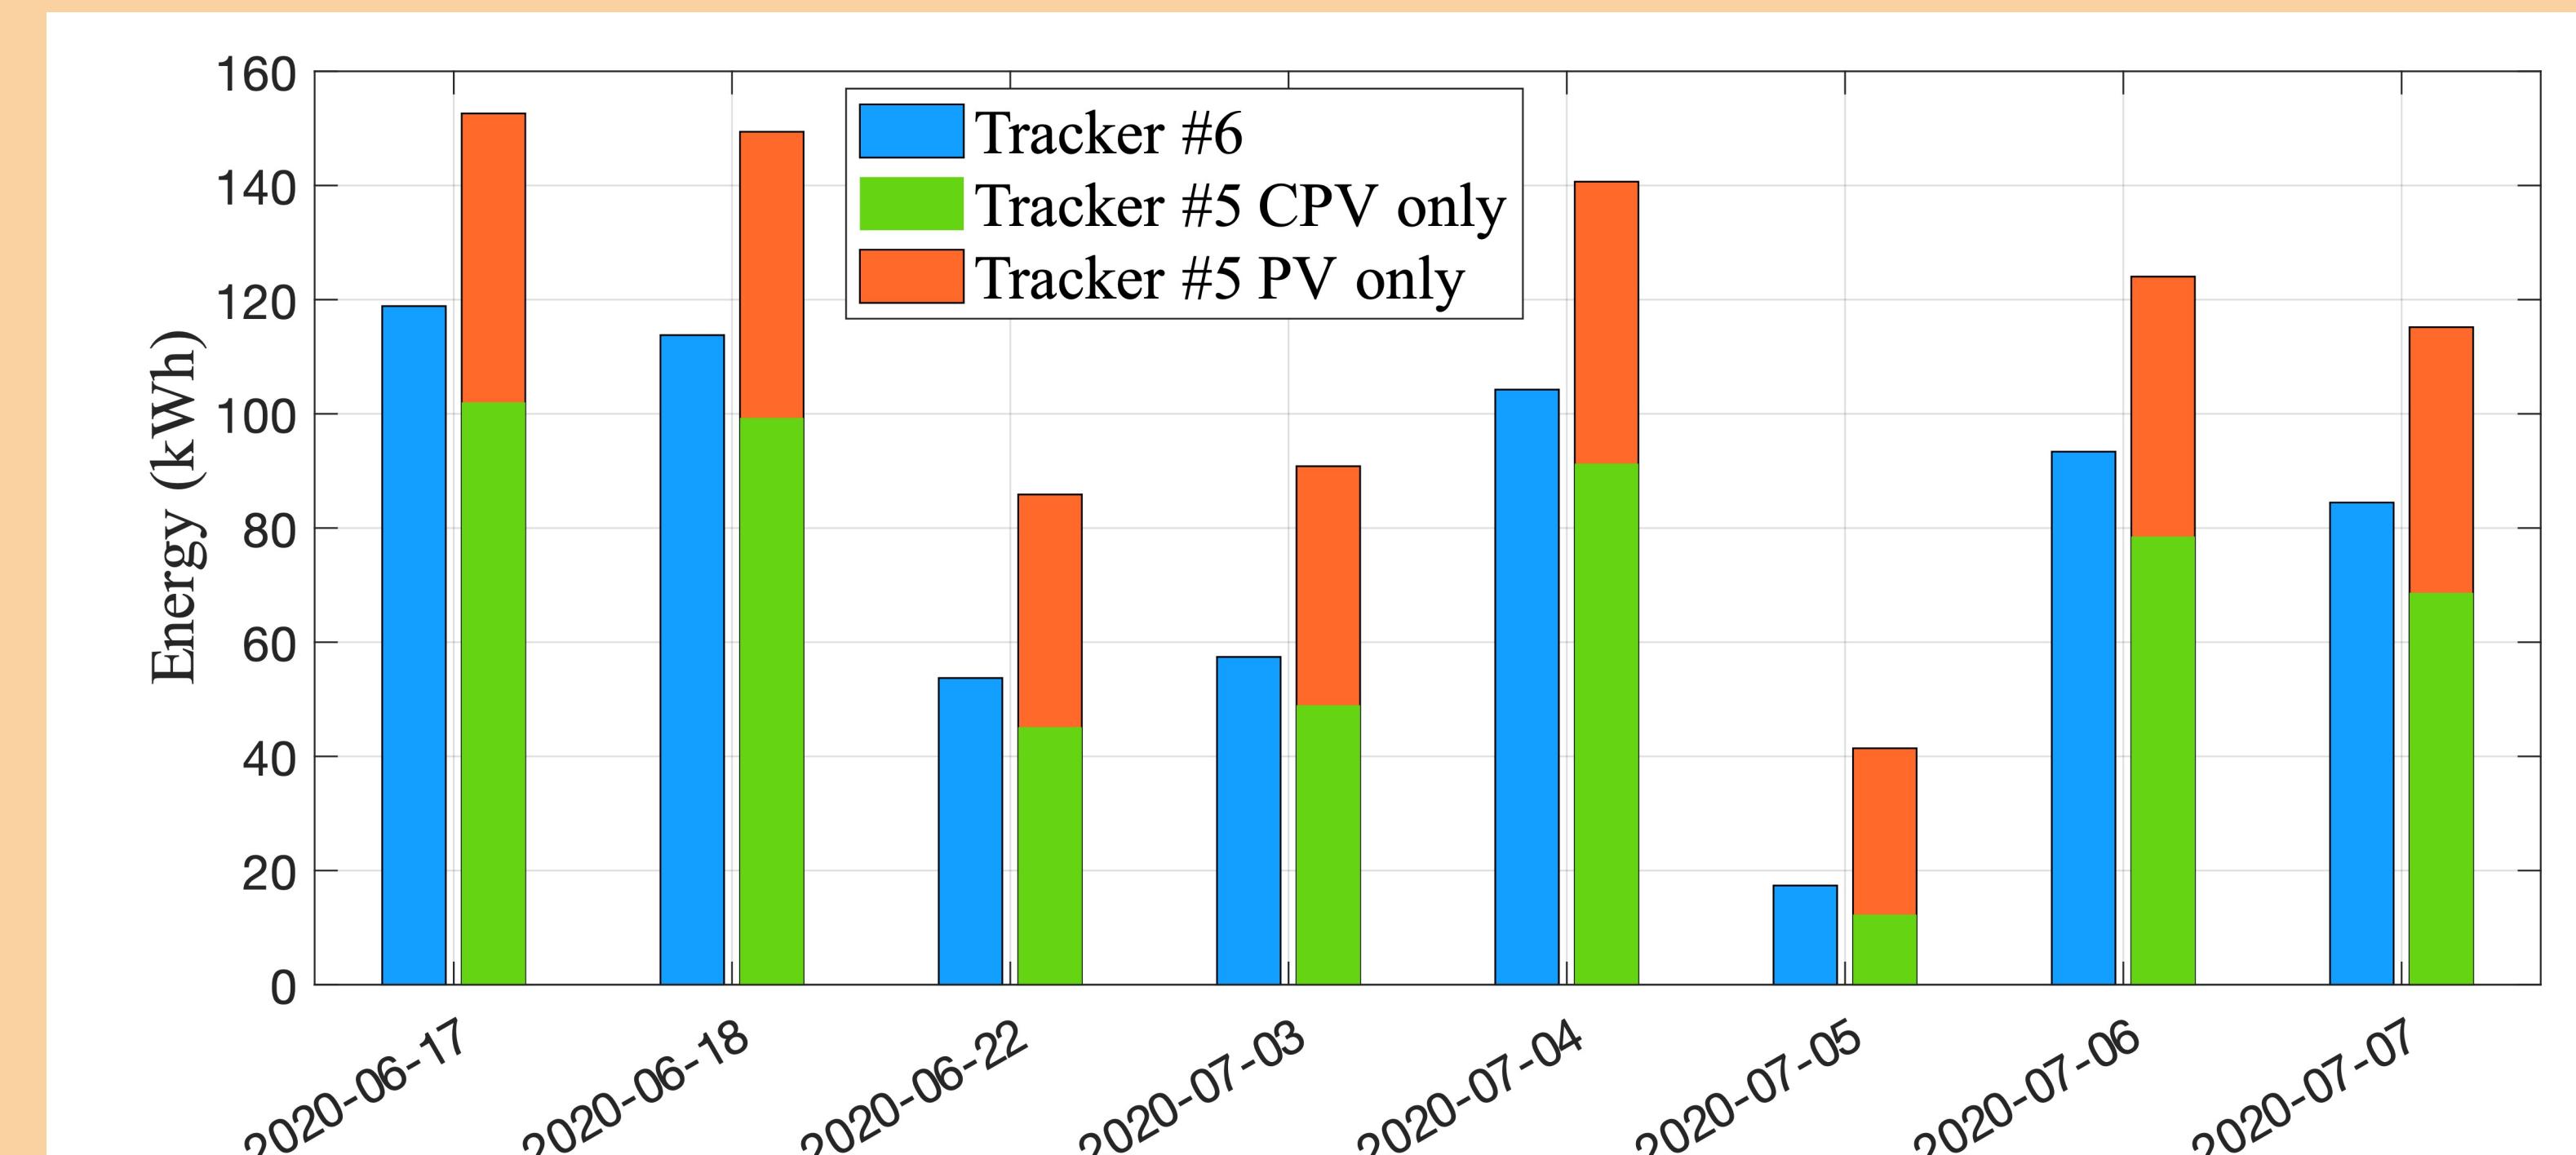

Fig.2 Energy yielded by trackers #5 and #6 during 8 days with intense DNI drops

Full-CPV inverter → voltage drops to 0V twice

Hybrid inverter → PV panels maintain >200V all day long

→ Gain of energy (yellow region in fig. 1)

Over a 8-day period: gain of hybridization is below tracker to tracker uncertainty

→ No significant improvement of energy production

Conclusion

- Hybridizing PV and CPV avoids latency due to inverter start-up time
 - but
 - Energy gain is below tracker to tracker
- Little economic interest of hybridizing PV/CPV

Work is in progress to generalize this to other regions
