# AN INVERSE PROBLEM FOR A PARABOLIC SYSTEM IN AN UNBOUNDED GUIDE 

LAURE CARDOULIS*

#### Abstract

In this article we consider a two-by-two parabolic system defined on an unbounded guide with coefficients depending both on the space variable and on the time variable. The main aim of this paper is to obtain a stability result for the coefficients depending on the space variable. Using Carleman inequalities adapted for the guide, we obtain Hölder estimates of these coefficients in any finite portion of the guide with boundary measurements, given two sets of initial conditions.

## 1. Introduction

Let $\omega$ be a bounded connex domain in $\mathbb{R}^{n-1}, n \geq 2$ with $C^{2}$ boundary. Denote $\Omega=\mathbb{R} \times \omega$ and $Q=\Omega \times(0, T), \Sigma=\partial \Omega \times(0, T)$. We consider the following problem

$$
\left\{\begin{array}{l}
\partial_{t} u=\Delta u+\alpha \phi_{1} u+\beta \phi_{2} w+g_{1} \text { in } Q  \tag{1.1}\\
\partial_{t} w=\Delta w+\gamma \phi_{3} u+\delta \phi_{4} w+g_{2} \text { in } Q \\
u(., 0)=a_{1}, w(., 0)=a_{2} \text { in } \Omega \\
u=a_{3}, w=a_{4} \text { in } \Sigma
\end{array}\right.
$$

where $\alpha, \beta, \gamma, \delta$ are bounded coefficients defined on $\Omega$ such that

$$
\alpha, \beta, \gamma, \delta \in \Lambda_{1}\left(M_{0}\right)=\left\{f \in L^{\infty}(\Omega),\|f\|_{L^{\infty}(\Omega)} \leq M_{0}\right\} \text { for some } M_{0}>0,
$$

and $\phi_{1}, \phi_{2}, \phi_{3}, \phi_{4}$ are bounded coefficients defined on $[0, T]$ such that for $i=1, \cdots, 4$

$$
\phi_{i} \in \Lambda_{2}\left(M_{0}\right)=\left\{f \in C^{1}([0, T]), f\left(\frac{T}{2}\right) \neq 0 \text { and }\|f\|_{C^{1}([0, T])} \leq M_{0}\right\}
$$

The main problem is to estimate the coefficients $(\alpha, \beta, \gamma, \delta)$ from boundary observations of $(u, w)$. We will consider two sets of Cauchy and Dirichlet conditions $A$ and $B$ and denote

$$
\begin{gather*}
G=\left(g_{1}, g_{2}\right), A=\left(a_{1}, a_{2}, a_{3}, a_{4}\right), B=\left(b_{1}, b_{2}, b_{3}, b_{4}\right), \rho=\left(\alpha, \beta, \gamma, \delta, \phi_{1}, \phi_{2}, \phi_{3}, \phi_{4}\right), \\
\tilde{\rho_{1}}=\left(\widetilde{\alpha}, \widetilde{\beta}, \widetilde{\gamma}, \widetilde{\delta}, \phi_{1}, \phi_{2}, \phi_{3}, \phi_{4}\right), \tilde{\rho_{2}}=\left(\alpha, \widetilde{\beta}, \widetilde{\gamma}, \widetilde{\delta}, \tilde{\phi_{1}}, \phi_{2}, \phi_{3}, \phi_{4}\right), \tilde{\rho_{3}}=\left(\alpha, \tilde{\beta}, \tilde{\gamma}, \tilde{\delta}, \phi_{1}, \phi_{2}, \phi_{3}, \phi_{4}\right) . \tag{1.2}
\end{gather*}
$$

Let two positive reals $l, L$ be such that $l<L$. Denote

$$
\Omega_{L}=(-L, L) \times \omega \text { and } \Omega_{l}=(-l, l) \times \omega .
$$

The first result of this paper gives a Hölder stability result (3.4) for the coefficients $\alpha, \beta, \gamma, \delta$ and is the following (see Theorem 3.1)

$$
\begin{gathered}
\|\alpha-\tilde{\alpha}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\beta-\tilde{\beta}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\gamma-\tilde{\gamma}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\delta-\tilde{\delta}\|_{L^{2}\left(\Omega_{l}\right)}^{2} \\
\leq K\left(\int_{\gamma_{L} \times(0, T)} \sum_{k=0}^{1}\left(\left|\partial_{\nu}\left(\partial_{t}^{k}\left(u_{A}-\tilde{u}_{A}\right)\right)\right|^{2}+\left|\partial_{\nu}\left(\partial_{t}^{k}\left(w_{A}-\tilde{w}_{A}\right)\right)\right|^{2}\right) d \sigma d t\right.
\end{gathered}
$$

[^0]$$
\left.\left.+\int_{\gamma_{L} \times(0, T)} \sum_{k=0}^{1}\left(\left|\partial_{\nu}\left(\partial_{t}^{k}\left(u_{B}-\tilde{u}_{B}\right)\right)\right|^{2}+\left|\partial_{\nu}\left(\partial_{t}^{k}\left(w_{B}-\tilde{w}_{B}\right)\right)\right|^{2}\right) d \sigma d t\right)\right)^{\kappa}
$$
where $K$ is a positive constant, $\kappa \in(0,1), \gamma_{L}$ is a part of the boundary (see (2.2)), and assuming that the hypothesis (3.3) is satisfied. We consider in the above result $V_{A}=\left(u_{A}, w_{A}\right)$ (resp. $\left.\tilde{V}_{A}=\left(\widetilde{u}_{A}, \widetilde{w}_{A}\right)\right)$ a solution of (1.1) associated with the coefficients $(\rho, G, A)$ (resp. $\left.\left(\tilde{\rho_{1}}, G, A\right)\right)$ and $V_{B}=\left(u_{B}, w_{B}\right)\left(\right.$ resp. $\left.\tilde{V}_{B}=\left(\widetilde{u}_{B}, \widetilde{w}_{B}\right)\right)$ a solution of (1.1) associated with the coefficients $(\rho, G, B)$ (resp. $\left.\left(\tilde{\rho}_{1}, G, B\right)\right)$ where $A$ is a set of Cauchy and Dirichlet conditions and $B$ is a suitable change of initial and boundary conditions. The above result is an improvement of results obtained in [5] with different and less restrictive hypotheses but with two choices of Cauchy and Dirichlet conditions $A$ and $B$. In abbreviated form we will call $A$ and $B$ the two sets of initial conditions. It is an improvement because on one hand the hypotheses, though quite differents, are easier to satisfy than in [5] and on the other hand there are no observation terms of the solutions $(u, w)$ at a fixed time on the right-hand side of the estimate, such as $\left\|\left(u_{A}-\tilde{u}_{A}\right)\left(., \frac{T}{2}\right)\right\|_{H^{2}\left(\Omega_{L}\right)}^{2}$ (see [5]). The idea of choosing two different sets of initial conditions can be found in [2] for a hyperbolic equation in a bounded domain (see also [6] for a hyperbolic system).
A consequence of the above result is given in Theorem 3.2 where the measurements are given for only one component (for example $u$ ) and is the following (see (3.6))
\[

$$
\begin{aligned}
& \|\alpha-\tilde{\alpha}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\beta-\tilde{\beta}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\gamma-\tilde{\gamma}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\delta-\tilde{\delta}\|_{L^{2}\left(\Omega_{l}\right)}^{2} \\
\leq & K\left(\left\|u_{A}-\tilde{u}_{A}\right\|_{H^{2}\left([0, T], H^{2}\left(\omega^{\prime} \cap \Omega_{L}\right)\right)}^{2}+\left\|u_{A}-\tilde{u}_{A}\right\|_{H^{1}\left([0, T], H^{4}\left(\omega^{\prime} \cap \Omega_{L}\right)\right)}^{2}\right. \\
& +\left\|u_{B}-\tilde{u}_{B}\right\|_{H^{2}\left([0, T], H^{2}\left(\omega^{\prime} \cap \Omega_{L}\right)\right)}^{2}+\left\|u_{B}-\tilde{u}_{B}\right\|_{H^{1}\left([0, T], H^{4}\left(\omega^{\prime} \cap \Omega_{L}\right)\right)}^{2} \\
+ & \left.\left.\int_{\gamma_{L} \times(0, T)} \sum_{k=0}^{1}\left(\left|\partial_{\nu}\left(\partial_{t}^{k}\left(u_{A}-\tilde{u}_{A}\right)\right)\right|^{2}+\left|\partial_{\nu}\left(\partial_{t}^{k}\left(u_{B}-\tilde{u}_{B}\right)\right)\right|^{2}\right) d \sigma d t\right)\right)^{\kappa}
\end{aligned}
$$
\]

where $K>0, \kappa \in(0,1)$ and $\omega^{\prime}$ is a neighborhood of $\gamma_{L}, \omega^{\prime}$ being a subdomain of $\Omega$ such that $\gamma_{L} \subset \partial \omega^{\prime}$, and assuming that $\alpha=\tilde{\alpha}$ and $\beta=\tilde{\beta}$ in $\omega^{\prime}$. We can relax the hypothesis that the coefficients $\alpha$ and $\beta$ are supposed known in $\omega^{\prime}$ when these coefficients are in $H^{2}(\Omega)$ and we obtain a similar result with the $L^{2}$-norms replaced by the $H^{2}$-norms for the coefficients $\alpha$ and $\beta$ on the left-hand side of the above estimate and additional terms such as $\left\|\left(u_{A}-\tilde{u}_{A}\right)\left(., \frac{T}{2}\right)\right\|_{H^{4}\left(\Omega_{L}\right)}^{2}$ on the right-hand side of this estimate (see (3.7)).
The third result gives a Hölder result (3.10) for the coefficients $\phi_{1}, \beta, \gamma, \delta$ (assuming also that $\left.\phi_{i} \in C^{2}([0, T])\right)$ and is the following (see Theorem 3.3)

$$
\begin{gathered}
\sum_{i=0}^{2}\left\|\partial_{t}^{i}\left(\phi_{1}-\tilde{\phi}_{1}\right)\right\|_{L^{2}((0, T))}^{2}+\left\|\beta-\tilde{\beta}_{l}^{2}\right\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\gamma-\tilde{\gamma}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\delta-\tilde{\delta}\|_{L^{2}\left(\Omega_{l}\right)}^{2} \\
\leq K\left(\sum_{k=0}^{1}\left(\left\|\partial_{t}^{k}\left(u_{A}-\tilde{u}_{A}\right)\left(\cdot, \frac{T}{2}\right)\right\|_{H^{2}\left(\Omega_{L}\right)}^{2}+\left\|\partial_{t}^{k}\left(u_{B}-\tilde{u}_{B}\right)\left(\cdot, \frac{T}{2}\right)\right\|_{H^{2}\left(\Omega_{L}\right)}^{2}\right)\right. \\
\left.+\left\|\partial_{t}^{2}\left(u_{A}-\tilde{u}_{A}\right)\left(\cdot, \frac{T}{2}\right)\right\|_{L^{2}\left(\Omega_{L}\right)}^{2}+\left\|\partial_{t}^{2}\left(u_{B}-\tilde{u}_{B}\right)\left(\cdot, \frac{T}{2}\right)\right\|_{L^{2}\left(\Omega_{L}\right)}^{2}\right)+\left\|\left(w_{A}-\tilde{w}_{A}\right)\left(\cdot, \frac{T}{2}\right)\right\|_{H^{2}\left(\Omega_{L}\right)}^{2} \\
+\left\|\left(w_{B}-\tilde{w}_{B}\right)\left(\cdot, \frac{T}{2}\right)\right\|_{H^{2}\left(\Omega_{L}\right)}^{2}+\int_{\gamma_{L} \times(0, T)} \sum_{k=0}^{2}\left(\left|\partial_{\nu}\left(\partial_{t}^{k}\left(u_{A}-\tilde{u}_{A}\right)\right)\right|^{2}+\left|\partial_{\nu}\left(\partial_{t}^{k}\left(w_{A}-\tilde{w}_{A}\right)\right)\right|^{2}\right) d \sigma d t \\
\left.\left.+\int_{\gamma_{L} \times(0, T)} \sum_{k=0}^{2}\left(\left|\partial_{\nu}\left(\partial_{t}^{k}\left(u_{B}-\tilde{u}_{B}\right)\right)\right|^{2}+\left|\partial_{\nu}\left(\partial_{t}^{k}\left(w_{B}-\tilde{w}_{B}\right)\right)\right|^{2}\right) d \sigma d t\right)\right)^{\kappa}
\end{gathered}
$$

where $K$ is still a positive constant, $\kappa \in(0,1)$, and $\tilde{\phi}_{1}$ belongs to a set of admissible coefficients (namely $\Lambda_{3}\left(M_{3}\right)$, see (3.8)). In the above case we denote $V_{A}=\left(u_{A}, w_{A}\right)\left(\right.$ resp. $\left.\tilde{V}_{A}=\left(\widetilde{u}_{A}, \widetilde{w}_{A}\right)\right)$ a solution of (1.1) associated with $(\rho, G, A)$ (resp. $\left(\tilde{\rho_{2}}, G, A\right)$ ) and $V_{B}=\left(u_{B}, w_{B}\right)$ (resp. $\tilde{V}_{B}=$ $\left.\left(\widetilde{u}_{B}, \widetilde{w}_{B}\right)\right)$ a solution of (1.1) associated with $(\rho, G, B)$ (resp. $\left(\tilde{\rho_{2}}, G, B\right)$ ). So this third result gives a determination of one coefficient depending on the time variable. Be careful that the meanings of $\tilde{V}_{A}$ and $\tilde{V}_{B}$ are not the same in Theorems 3.1 and 3.2 on one hand and Theorem 3.3 on the other hand.
Finally the fourth theorem gives a Hölder result (3.11) for the following reaction-diffusion system

$$
\left\{\begin{array}{l}
\partial_{t} u=\Delta u+\alpha \phi_{1} u+\beta \phi_{2} w+\Theta_{1} \cdot \nabla u+\Theta_{2} \cdot \nabla w+g_{1} \text { in } Q  \tag{1.3}\\
\partial_{t} w=\Delta w+\gamma \phi_{3} u+\delta \phi_{4} w+\Theta_{3} \cdot \nabla u+\Theta_{4} \cdot \nabla w+g_{2} \text { in } Q \\
u(., 0)=a_{1}, w(., 0)=a_{2} \text { in } \Omega \\
u=a_{3}, w=a_{4} \text { in } \Sigma,
\end{array}\right.
$$

where all the coefficients $\alpha, \beta, \gamma, \delta, \phi_{1}, \phi_{2}, \phi_{3}, \phi_{4}, \Theta_{1}, \Theta_{2}, \Theta_{3}, \Theta_{4}$ are bounded. We present here a result for the four coefficients $\beta, \gamma, \delta, \Theta_{1}$ (and assuming that $\Theta_{1}$ has the form $\Theta_{1}=\nabla \xi_{1}$ ). So denote now

$$
\begin{equation*}
\Theta=\left(\Theta_{1}, \cdots, \Theta_{4}\right), \quad \tilde{\Theta}=\left(\tilde{\Theta}_{1}, \Theta_{2}, \Theta_{3}, \Theta_{4}\right) \tag{1.4}
\end{equation*}
$$

We get the following result

$$
\begin{aligned}
& \|\beta-\tilde{\beta}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\gamma-\tilde{\gamma}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\delta-\tilde{\delta}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\left\|\Theta_{1}-\tilde{\Theta}_{1}\right\|_{\left(L^{2}\left(\Omega_{l}\right)\right)^{n}} \\
& \quad \leq K\left(\left\|\left(u_{A}-\tilde{u}_{A}\right)\left(., \frac{T}{2}\right)\right\|_{H^{3}\left(\Omega_{L}\right)}^{2}+\left\|\left(u_{B}-\tilde{u}_{B}\right)\left(., \frac{T}{2}\right)\right\|_{H^{3}\left(\Omega_{L}\right)}^{2}\right. \\
& +\int_{\gamma_{L} \times(0, T)} \sum_{k=0}^{1}\left(\left|\partial_{\nu}\left(\partial_{t}^{k}\left(u_{A}-\tilde{u}_{A}\right)\right)\right|^{2}+\left|\partial_{\nu}\left(\partial_{t}^{k}\left(w_{A}-\tilde{w}_{A}\right)\right)\right|^{2}\right) d \sigma d t \\
& \left.\left.+\int_{\gamma_{L} \times(0, T)} \sum_{k=0}^{1}\left(\left|\partial_{\nu}\left(\partial_{t}^{k}\left(u_{B}-\tilde{u}_{B}\right)\right)\right|^{2}+\left|\partial_{\nu}\left(\partial_{t}^{k}\left(w_{B}-\tilde{w}_{B}\right)\right)\right|^{2}\right) d \sigma d t\right)\right)^{\kappa}
\end{aligned}
$$

where $K$ is a positive constant, $\kappa \in(0,1)$. This time we denote $V_{A}=\left(u_{A}, w_{A}\right)$ (resp. $\tilde{V}_{A}=$ $\left.\left(\widetilde{u}_{A}, \widetilde{w}_{A}\right)\right)$ a solution of (1.3) associated with $(\rho, G, A, \Theta)\left(\right.$ resp. $\left.\left(\tilde{\rho_{3}}, G, A, \tilde{\Theta}\right)\right)$ and $V_{B}=\left(u_{B}, w_{B}\right)$ $\left(\right.$ resp. $\left.\tilde{V}_{B}=\left(\widetilde{u}_{B}, \widetilde{w}_{B}\right)\right)$ a solution of (1.3) associated with $(\rho, G, B, \Theta)\left(\right.$ resp. $\left.\left(\tilde{\rho_{3}}, G, B, \tilde{\Theta}\right)\right)$.
Note that all our results imply uniqueness results. Up to our knowledge, there are few results concerning the simultaneous identification of more than one coefficient in each equation (see for examples $[1,2,5,6,9,10]$ ) and note that in these papers the coefficients only depend on the space variable. Also notice that there are very few results where the measurements are given with only one component. Here the first and fourth theorems (Theorems 3.1 and 3.4) extend some results obtained in [5, Theorem 3.2] but with hypotheses (see (3.2) and (3.3)) less restrictive than in [5]. The second result (Theorem 3.2) gives a result for four coefficients depending on the space variable and with measurements of only one component. The third theorem (Theorem 3.3) also gives a result for four coefficients but one of each depending on the time variable. Furthermore, usually the papers investigate the case of bounded domains and give results with observations on a subdomain of the domain (see for example $[1,2,10]$ ). Here we present results with observations on a part of the boundary (see Theorems 3.1, 3.3, 3.4). Besides, because of our unbounded domain and our choice of weight functions (2.3), we will use cut-off functions in time and in the direction $x_{1}$ (see for example [12] where cut-off functions are removed but in a bounded domain). Finally, usually the results have observations terms with data of the solution at a fixed time (such as $\left\|\left(u_{A}-\tilde{u}_{A}\right)\left(., \frac{T}{2}\right)\right\|_{H^{2}\left(\Omega_{L}\right)}^{2}$, see for example $[5,7,8]$ ). We have been able to remove them in Theorems 3.1, 3.2i) thanks to the properties of the weight functions. So the theorems presented here give stability results for
four coefficients for a system defined on an unbounded domain, with boundary measurements in Theorems 3.1, 3.3 and 3.4, measurements for only one component in Theorem 3.2, with a time variable coefficient in Theorem 3.3. These results extend previous results for one equation [7, 8] or for a system [5] defined on an unbounded guide. Last we recall that the method of Carleman estimates used for solving inverse problems has been initiated by [3].
This Paper is organized as folows: in Section 2, we recall the weight functions adapted for our unbounded domain and the Carleman estimate (2.6) as well as the crucial inequality (2.4) for our Hölder estimates. Then in Section 3 we state and prove our results.

## 2. Carleman estimate

Denote $Q_{L}=\Omega_{L} \times(0, T)=(-L, L) \times \omega \times(0, T), x=\left(x_{1}, \cdots, x_{n}\right) \in \mathbb{R}^{n}, x^{\prime}=\left(x_{2}, \cdots, x_{n}\right)$ and define the operator

$$
A_{0} u=\partial_{t} u-\Delta u
$$

Let $l>0$, following [7] we are going to carry out special weight functions allowing us to avoid observations on the cross section of the wave guide in our inverse problem. For this we consider some positive real $L>l$ and we choose $\hat{a}=\left(a_{1}, a^{\prime}\right) \in \mathbb{R}^{n} \backslash \Omega$ such that if $\hat{d}(x)=\left|x^{\prime}-a^{\prime}\right|^{2}-x_{1}^{2}$ for $x \in \Omega_{L}$, then

$$
\begin{equation*}
\hat{d}>0 \text { in } \Omega_{L}, \quad|\nabla \hat{d}|>0 \text { in } \overline{\Omega_{L}} \tag{2.1}
\end{equation*}
$$

Moreover we define

$$
\begin{equation*}
\Gamma_{L}=\left\{x \in \partial \Omega_{L},<x-\hat{a}, \nu(x)>\geq 0\right\} \text { and } \gamma_{L}=\Gamma_{L} \cap \partial \Omega \tag{2.2}
\end{equation*}
$$

Here $<.$, . $>$ denotes the usual scalar product in $\mathbb{R}^{n}$ and $\nu(x)$ is the outwards unit normal vector to $\partial \Omega_{L}$ at $x$. Notice that $\gamma_{L}$ does not contain any cross section of the guide. From [14]-[15] we consider weight functions as follows: for $t \in(0, T)$, if $M_{1}>\sup _{0<t<T}(t-T / 2)^{2}=(T / 2)^{2}$,

$$
\begin{equation*}
\psi(x, t)=\hat{d}(x)-\left(t-\frac{T}{2}\right)^{2}+M_{1} \text { and } \phi(x, t)=e^{\lambda \psi(x, t)} \tag{2.3}
\end{equation*}
$$

The constant $\lambda>0$ will be set in Proposition 2.2 and is usually used as a large parameter in Carleman inequalities. Since we will not use it, we will consider $\lambda$ fixed in the article. We recall from [7] and [8] the following result.
Proposition 2.1. There exist $T>0, L>l, \hat{a} \in \mathbb{R}^{n} \backslash \Omega_{L}$ and $\epsilon>0$ such that (2.1) holds and, setting

$$
O_{L, \epsilon}=\left(\Omega_{L} \times((0,2 \epsilon) \cup(T-2 \epsilon, T))\right) \cup(((-L,-L+2 \epsilon) \cup(L-2 \epsilon, L)) \times \omega \times(0, T)),
$$

we have

$$
\begin{equation*}
d_{1}<d_{0}<d_{2} \tag{2.4}
\end{equation*}
$$

where

$$
d_{0}=\inf _{\Omega_{l}} \phi(\cdot, \theta), \quad d_{1}=\sup _{O_{L, \epsilon}} \phi, \quad d_{2}=\sup _{\Omega_{L}} \phi(\cdot, \theta) \text { and } \theta=\frac{T}{2}
$$

From now on and from simplicity we denote $\theta=\frac{T}{2}$ throughout the paper. These two above estimates (2.4) will be fruitful in Section 3 to solve our inverse problem. In the sequel $C$ will be a generic positive constant. When needed, we will specify its dependency with respect to the different parameters. We will use the following notations: Let $\alpha=\left(\alpha_{1}, \cdots, \alpha_{n}\right)$ be a multi-index with $\alpha_{i} \in \mathbb{N} \cup\{0\}$. We set $\partial_{x}^{\alpha}=\partial_{1}^{\alpha_{1}} \cdots \partial_{n}^{\alpha_{n}},|\alpha|=\alpha_{1}+\cdots+\alpha_{n}$ and define

$$
H^{2,1}\left(Q_{L}\right)=\left\{u \in L^{2}\left(Q_{L}\right), \partial_{x}^{\alpha} \partial_{t}^{\alpha_{n+1}} u \in L^{2}\left(Q_{L}\right),|\alpha|+2 \alpha_{n+1} \leq 2\right\}
$$

endowed with its norm

$$
\|u\|_{H^{2,1}\left(Q_{L}\right)}^{2}=\sum_{|\alpha|+2 \alpha_{n+1} \leq 2}\left\|\partial_{x}^{\alpha} \partial_{t}^{\alpha_{n+1}} u\right\|_{L^{2}\left(Q_{L}\right)}^{2}
$$

We recall now a global Carleman-type estimate proved in [7, Proposition 4.2] or in [8, Proposition 3], based on a classical Carleman estimate (see Yamamoto [14, Theorem 7.3]). The key difference with the classical Carleman inequality in [14, Theorem 7.3] is to remove, on the cross-sections of $\Omega_{L}$, the boundary condition and the observation. For that we need cut-off functions in time. On the other hand, to manage our infinite wave guide we also need to consider cut-off functions in space but only in the infinite direction $x_{1}$. These cut-off functions will induce additive terms coming from the commutator between the evolution operator and these cut-off functions. Let $\chi, \eta$ be $C^{\infty}$ cut-off functions such that $\chi, \nabla \chi, \Delta \chi \in \Lambda_{1}\left(M_{0}\right), 0 \leq \chi \leq 1,0 \leq \eta \leq 1$,

$$
\begin{gather*}
\chi(x)=0 \text { if } x \in((-\infty,-L+\epsilon) \cup(L-\epsilon,+\infty)) \times \omega), \\
\chi(x)=1 \text { if } x \in(-L+2 \epsilon, L-2 \epsilon) \times \omega, \\
\eta(t)=0 \text { if } t \in(0, \epsilon) \cup(T-\epsilon, T), \eta(t)=1 \text { if } t \in \times(2 \epsilon, T-2 \epsilon) . \tag{2.5}
\end{gather*}
$$

with $\epsilon$ defined in Proposition 2.1.
Proposition 2.2. [7, Proposition 4.2] There exist a value of $\lambda>0$ and positive constants $s_{0}$ and $C=C\left(\lambda, s_{0}\right)$ such that

$$
\begin{gather*}
I(u)=\int_{Q_{L}}\left(\frac{1}{s \phi}\left(\left|\partial_{t} u\right|^{2}+|\Delta u|^{2}\right)+s \phi|\nabla u|^{2}+s^{3} \phi^{3}|u|^{2}\right) e^{2 s \phi} d x d t \\
\leq C\left\|e^{s \phi} A_{0} u\right\|_{L^{2}\left(Q_{L}\right)}^{2}+C s^{3} e^{2 s d_{1}}\|u\|_{H^{2,1}\left(Q_{L}\right)}^{2}+C s \int_{\gamma_{L} \times(0, T)}\left|\partial_{\nu} u\right|^{2} e^{2 s \phi} d \sigma d t \tag{2.6}
\end{gather*}
$$

for all $s>s_{0}$ and all $u \in H^{2,1}\left(Q_{L}\right)$ satisfying $u(., 0)=u(., T)=0$ in $\Omega_{L}, u=0$ on $\left(\partial \Omega \cap \partial \Omega_{L}\right) \times$ $(0, T)$. We denote $\partial_{\nu} u=\nu \cdot \nabla u$ and recall that $A_{0} u=\partial_{t} u-\Delta u$.

Since the method of Carleman estimates requires several time differentiations, we assume in the following that $u, w$ (solution of (1.1) or (1.3)) belong to $\mathcal{H}=H^{2}\left([0, T], H^{2}(\Omega)\right) \cap W^{2, \infty}(\Omega \times$ $(0, T))$ for Theorems 3.1, $\mathcal{H}=H^{3}\left([0, T], H^{4}(\Omega)\right) \cap W^{4, \infty}(\Omega \times(0, T))$ for Theorem 3.2, $\mathcal{H}=$ $H^{3}\left([0, T], H^{2}(\Omega)\right) \cap W^{3, \infty}(\Omega \times(0, T))$ for Theorem 3.3, $\mathcal{H}=H^{2}\left([0, T], H^{3}(\Omega)\right) \cap W^{3, \infty}(\Omega \times(0, T))$ for Theorem 3.4, satisfying the a-priori bound

$$
\|u\|_{\mathcal{H}}<M_{2} \text { and }\|w\|_{\mathcal{H}}<M_{2} \text { for given } M_{2}>0
$$

From now on, we use the notation $f(\theta)=f(., \theta)$ for any function $f$ defined on $Q$.

## 3. Inverse problem

3.1. Preliminary lemmas. From [11, Lemma 4.2], we derive the following result, also used in [7] or [5, Lemma 3.1].

Lemma 3.1. There exist positive constants $s_{1}$ and $C$ such that

$$
\int_{\Omega_{L}} e^{2 s \phi(\theta)}(f(\theta))^{2} d x \leq C s \int_{Q_{L}} e^{2 s \phi} f^{2} d x d t+\frac{C}{s} \int_{Q_{L}} e^{2 s \phi}\left(\partial_{t} f\right)^{2} d x d t
$$

for all $s \geq s_{1}$ and $f \in H^{1}\left(0, T ; L^{2}\left(\Omega_{L}\right)\right)$.
For the sake of completeness, we recall its proof.

Proof. Consider $\eta$ defined by (2.5) and any $w \in H^{1}\left(0, T ; L^{2}\left(\Omega_{L}\right)\right)$. Since $\eta(\theta)=1$ and $\eta(0)=0$, we have

$$
\begin{aligned}
& \int_{\Omega_{L}} w(x, \theta)^{2} d x=\int_{\Omega_{L}}(\eta(\theta) w(x, \theta))^{2} d x=\int_{\Omega_{L}} \int_{0}^{\theta} \partial_{t}\left(\eta^{2}(t)|w(x, t)|^{2}\right) d t d x \\
= & 2 \int_{0}^{\theta} \int_{\Omega_{L}} \eta^{2}(t) w(x, t) \partial_{t} w(x, t) d x d t+2 \int_{0}^{\theta} \int_{\Omega_{L}} \eta(t) \partial_{t} \eta(t)|w(x, t)|^{2} d x d t
\end{aligned}
$$

As $0 \leq \eta \leq 1$, using Young's inequality, it comes that for any $s>0$,

$$
\begin{equation*}
\int_{\Omega_{L}} w(x, \theta)^{2} d x \leq C s \int_{Q_{L}}|w|^{2} d x d t+\frac{C}{s} \int_{Q_{L}}\left|\partial_{t} w\right|^{2} d x d t \tag{3.1}
\end{equation*}
$$

Then we can conclude replacing $w$ by $e^{s \phi} f$ in (3.1).
The following lemma will be only used for Theorem 3.4. It is a classical lemma for a first order partial differential operator but which necessites a strong positivity condition (3.2). This condition is nevertheless weaker than the one used in [8] or [5] (which was $|\nabla \hat{d} \cdot \nabla \tilde{u}(\theta)| \geq R>0$ in $\Omega_{L}$ ). So we follow an idea developed in [13] for Lamé system in bounded domains, also used for example in [8] or in [5]. The lemma below will be used in the proof of Theorem 3.4 with $\left(v_{1}, \cdots, v_{4}\right)=\left(\tilde{w}_{B}(\theta), \tilde{u}_{A}(\theta), \tilde{w}_{A}(\theta), \tilde{u}_{B}(\theta)\right)$. Recall that $\hat{d}$ is defined by (2.1).

Lemma 3.2. Assume that the following assumption

$$
\begin{equation*}
\left|v_{1} \nabla \hat{d} \cdot \nabla v_{2}-v_{3} \nabla \hat{d} \cdot \nabla v_{4}\right| \geq R \text { in } \Omega_{L} \text { for some } R>0 \tag{3.2}
\end{equation*}
$$

holds. Consider the first order partial differential operator $\operatorname{Pf}=v_{1} \nabla f \cdot \nabla v_{2}-v_{3} \nabla f \cdot \nabla v_{4}$. Then there exist positive constants $s_{1}^{\prime}>0$ and $C>0$ such that for all $s \geq s_{1}^{\prime}$,

$$
s^{2} \int_{\Omega_{L}} e^{2 s \phi(\theta)} f^{2} d x \leq C \int_{\Omega_{L}} e^{2 s \phi(\theta)}|P f|^{2} d x
$$

for all $f \in H_{0}^{1}\left(\Omega_{L}\right)$.
Proof. The proof follows [8] or [5]. Let $f \in H_{0}^{1}\left(\Omega_{L}\right)$. Denote $w=e^{s \phi(\theta)} f$ and $Q w=e^{s \phi(\theta)} P\left(e^{-s \phi(\theta)} w\right)$. So we get $Q w=P w-s \lambda \phi(\theta) w(P \hat{d})$. Therefore we have

$$
\int_{\Omega_{L}}|Q w|^{2} d x \geq s^{2} \lambda^{2} \int_{\Omega_{L}}(\phi(\theta))^{2} w^{2}(P \hat{d})^{2} d x-2 s \lambda \int_{\Omega_{L}} \phi(\theta)(P w) w(P \hat{d}) d x
$$

So

$$
\int_{\Omega_{L}}|Q w|^{2} d x \geq s^{2} \lambda^{2} \int_{\Omega_{L}}(\phi(\theta))^{2} w^{2}(P \hat{d})^{2} d x-s \lambda \int_{\Omega_{L}} \phi(\theta)\left(P w^{2}\right)(P \hat{d}) d x
$$

Thus integrating by parts

$$
\int_{\Omega_{L}}|Q w|^{2} d x \geq s^{2} \lambda^{2} \int_{\Omega_{L}}(\phi(\theta))^{2} w^{2}(P \hat{d})^{2} d x+s \lambda \int_{\Omega_{L}} w^{2} \nabla \cdot\left(\phi(\theta)(P \hat{d})\left(v_{1} \nabla v_{2}-v_{3} \nabla v_{4}\right)\right) d x .
$$

And we can conclude for $s$ sufficiently large.

### 3.2. Statements of results.

3.2.1. First result. Consider $V_{A}=\left(u_{A}, w_{A}\right)\left(\right.$ resp. $\left.\tilde{V}_{A}=\left(\tilde{u}_{A}, \tilde{w}_{A}\right)\right)$ a strong solution of (1.1) associated with $(\rho, G, A)$ defined by (1.2) (resp. $\left.\left(\tilde{\rho_{1}}, G, A\right)\right)$ where $A$ is a set of initial and boundary conditions. Consider also $V_{B}=\left(u_{B}, w_{B}\right)$ (resp. $\left.\tilde{V}_{B}=\left(\tilde{u}_{B}, \tilde{w}_{B}\right)\right)$ a strong solution of (1.1) associated with $(\rho, G, B)$ (resp. $\left.\left(\tilde{\rho}_{1}, G, B\right)\right)$ and where $B$ is another set of initial and boundary conditions. Assume that all the coefficients $\alpha, \beta, \gamma, \delta, \tilde{\alpha}, \tilde{\beta}, \tilde{\gamma}, \tilde{\delta}$, belong to $\Lambda_{1}\left(M_{0}\right)$ and all the coefficients $\phi_{i}$ to $\Lambda_{2}\left(M_{0}\right)($ for $i=1, \cdots, 4)$.
Our main result is the following
Theorem 3.1. Let $l>0$. Let $T>0, L>l$ and $\hat{a} \in \mathbb{R}^{n} \backslash \Omega$ satisfying the conditions of Proposition 2.1. Assume that

$$
\begin{equation*}
\left|\tilde{u}_{A}(\cdot, \theta) \tilde{w}_{B}(\cdot, \theta)-\tilde{u}_{B}(\cdot, \theta) \tilde{w}_{A}(\cdot, \theta)\right| \geq R \text { in } \Omega_{L} \text { for some } R>0 . \tag{3.3}
\end{equation*}
$$

Then there exists a sufficiently small number $\tau_{0}>0$ such that if $\tau \in\left(0, \tau_{0}\right)$,

$$
\begin{aligned}
& \sum_{k=0}^{1} \int_{\gamma_{L} \times(0, T)}\left(\left|\partial_{\nu}\left(\partial_{t}^{k}\left(u_{A}-\tilde{u}_{A}\right)\right)\right|^{2}+\left|\partial_{\nu}\left(\partial_{t}^{k}\left(w_{A}-\tilde{w}_{A}\right)\right)\right|^{2}\right. \\
& \left.+\left|\partial_{\nu}\left(\partial_{t}^{k}\left(u_{B}-\tilde{u}_{B}\right)\right)\right|^{2}+\left|\partial_{\nu}\left(\partial_{t}^{k}\left(w_{B}-\tilde{w}_{B}\right)\right)\right|^{2}\right) d \sigma d t \leq \tau
\end{aligned}
$$

then the following Hölder stability estimate holds

$$
\begin{equation*}
\|\alpha-\tilde{\alpha}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\beta-\tilde{\beta}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\gamma-\tilde{\gamma}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\delta-\tilde{\delta}\|_{L^{2}\left(\Omega_{l}\right)}^{2} \leq K \tau^{\kappa} \text { for all } \tau \in\left(0, \tau_{0}\right) \tag{3.4}
\end{equation*}
$$

Here, $K>0$ and $\kappa \in(0,1)$ are two constants depending on $R, L, l, M_{0}, M_{1}, M_{2}, T$ and $\hat{a}$.
3.2.2. Second result. As a consequence of Theorem 3.1, we can give a stability result with measurements of only one component. Theorem 3.2i) gives an estimate of the four coefficients $\alpha, \beta, \gamma, \delta \in$ $L^{2}(\Omega)$ when $\alpha=\tilde{\alpha}$ and $\beta=\tilde{\beta}$ in a neighborhood $\omega^{\prime}$ of the boundary of interest $\gamma_{L}$. That means that these two coefficients $\alpha$ and $\beta$ are supposed known in $\omega^{\prime}$. We relax this last hypothesis in Theorem 3.2ii) where an estimate of these four coefficients is given for $\alpha, \beta \in H^{2}(\Omega)$. Consider $V_{A}=\left(u_{A}, w_{A}\right)$ (resp. $\left.\tilde{V}_{A}=\left(\tilde{u}_{A}, \tilde{w}_{A}\right)\right)$ a strong solution of (1.1) associated with $(\rho, G, A)$ defined by (1.2) (resp. $\left.\left(\tilde{\rho}_{1}, G, A\right)\right)$. Consider also $V_{B}=\left(u_{B}, w_{B}\right)\left(\right.$ resp. $\left.\tilde{V}_{B}=\left(\tilde{u}_{B}, \tilde{w}_{B}\right)\right)$ a strong solution of (1.1) associated with $(\rho, G, B)$ (resp. $\left.\left(\tilde{\rho_{1}}, G, B\right)\right)$. Assume that all the coefficients $\alpha, \beta, \gamma, \delta, \tilde{\alpha}, \tilde{\beta}, \tilde{\gamma}, \tilde{\delta}$, belong to $\Lambda_{1}\left(M_{0}\right)$ and all the coefficients $\phi_{i}$ to $\Lambda_{2}\left(M_{0}\right)$ (for $\left.i=1, \cdots, 4\right)$. For Theorem 3.2ii) we also suppose that $\alpha, \beta, \tilde{\alpha}, \tilde{\beta} \in \Lambda^{\prime}\left(M_{0}\right)=\left\{f \in H^{2}(\Omega),\|f\|_{H^{2}(\Omega)} \| \leq M_{0}\right\}$ and $\phi_{i} \in C^{2}([0, T])$.

Theorem 3.2. Let $l>0$. Let $T>0, L>l$ and $\hat{a} \in \mathbb{R}^{n} \backslash \Omega$ satisfying the conditions of Proposition 2.1. Let $\omega^{\prime}$ be a neighborhood of $\gamma_{L}, \omega^{\prime} \subset \Omega_{L+\epsilon}$ such that $\gamma_{L} \subset \partial \omega^{\prime}$, $\partial \omega^{\prime}$ being $C^{2}$. Assume that the hypothesis(3.3) holds and that we also have

$$
\begin{equation*}
\left|\beta \phi_{2}\right| \geq R>0 \text { in } Q_{L} \tag{3.5}
\end{equation*}
$$

i): We suppose that $\alpha=\tilde{\alpha}$ and $\beta=\tilde{\beta}$ in $\omega^{\prime}$.

Then there exists a sufficiently small number $\tau_{0}>0$ such that if $\tau \in\left(0, \tau_{0}\right)$,

$$
\begin{gathered}
\left\|u_{A}-\tilde{u}_{A}\right\|_{H^{2}\left([0, T], H^{2}\left(\omega^{\prime} \cap \Omega_{L}\right)\right)}^{2}+\left\|u_{A}-\tilde{u}_{A}\right\|_{H^{1}\left([0, T], H^{4}\left(\omega^{\prime} \cap \Omega_{L}\right)\right)}^{2} \\
+\left\|u_{B}-\tilde{u}_{B}\right\|_{H^{2}\left([0, T], H^{2}\left(\omega^{\prime} \cap \Omega_{L}\right)\right)}^{2}+\left\|u_{B}-\tilde{u}_{B}\right\|_{H^{1}\left([0, T], H^{4}\left(\omega^{\prime} \cap \Omega_{L}\right)\right)}^{2} \\
+\int_{\gamma_{L} \times(0, T)} \sum_{k=0}^{1}\left(\left|\partial_{\nu}\left(\partial_{t}^{k}\left(u_{A}-\tilde{u}_{A}\right)\right)\right|^{2}+\left|\partial_{\nu}\left(\partial_{t}^{k}\left(u_{B}-\tilde{u}_{B}\right)\right)\right|^{2}\right) d \sigma d t \leq \tau
\end{gathered}
$$

then the following Hölder stability estimate holds

$$
\begin{equation*}
\|\alpha-\tilde{\alpha}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\beta-\tilde{\beta}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\gamma-\tilde{\gamma}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\delta-\tilde{\delta}\|_{L^{2}\left(\Omega_{l}\right)}^{2} \leq K \tau^{\kappa} \text { for all } \tau \in\left(0, \tau_{0}\right) . \tag{3.6}
\end{equation*}
$$

ii): We suppose that $\alpha, \beta, \tilde{\alpha}, \tilde{\beta} \in H^{2}(\Omega)$.

Then there exists a sufficiently small number $\tau_{0}>0$ such that if $\tau \in\left(0, \tau_{0}\right)$,

$$
\left\|\left(u_{A}-\tilde{u}_{A}\right)(\cdot, \theta)\right\|_{H^{4}\left(\Omega_{L}\right)}^{2}+\left\|\left(u_{B}-\tilde{u}_{B}\right)(\cdot, \theta)\right\|_{H^{4}\left(\Omega_{L}\right)}^{2}+\left\|u_{A}-\tilde{u}_{A}\right\|_{H^{3}\left([0, T], H^{2}\left(\omega^{\prime} \cap \Omega_{L}\right)\right)}^{2}
$$

$$
+\left\|u_{A}-\tilde{u}_{A}\right\|_{H^{2}\left([0, T], H^{4}\left(\omega^{\prime} \cap \Omega_{L}\right)\right)}^{2}+\left\|u_{B}-\tilde{u}_{B}\right\|_{H^{3}\left([0, T], H^{2}\left(\omega^{\prime} \cap \Omega_{L}\right)\right)}^{2}+\left\|u_{B}-\tilde{u}_{B}\right\|_{H^{2}\left([0, T], H^{4}\left(\omega^{\prime} \cap \Omega_{L}\right)\right)}^{2}
$$

$$
+\int_{\gamma_{L} \times(0, T)} \sum_{k=0}^{2}\left(\left|\partial_{\nu}\left(\partial_{t}^{k}\left(u_{A}-\tilde{u}_{A}\right)\right)\right|^{2}+\left|\partial_{\nu}\left(\partial_{t}^{k}\left(u_{B}-\tilde{u}_{B}\right)\right)\right|^{2}\right) d \sigma d t \leq \tau
$$

then the following Hölder stability estimate holds

$$
\begin{equation*}
\|\alpha-\tilde{\alpha}\|_{H^{2}\left(\Omega_{l}\right)}^{2}+\|\beta-\tilde{\beta}\|_{H^{2}\left(\Omega_{l}\right)}^{2}+\|\gamma-\tilde{\gamma}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\delta-\tilde{\delta}\|_{L^{2}\left(\Omega_{l}\right)}^{2} \leq K \tau^{\kappa} \text { for all } \tau \in\left(0, \tau_{0}\right) \tag{3.7}
\end{equation*}
$$

Here, $K>0$ and $\kappa \in(0,1)$ are two constants depending on $R, L, l, M_{0}, M_{1}, M_{2}, T,\left\|g_{0}\right\|_{\left(C^{1}\left(\omega^{\prime}\right)\right)^{n}}$ and $\hat{a}$.
3.2.3. Third result. Now we present a result for the four coefficients $\left(\phi_{1}, \beta, \gamma, \delta\right)$. We consider here $V_{A}=\left(u_{A}, w_{A}\right)\left(\right.$ resp. $\left.\tilde{V}_{A}=\left(\tilde{u}_{A}, \tilde{w}_{A}\right)\right)$ a strong solution of (1.1) associated with $(\rho, G, A)$ defined by $(1.2)\left(\right.$ resp. $\left.\left(\tilde{\rho_{2}}, G, A\right)\right)$. Consider also $V_{B}=\left(u_{B}, w_{B}\right)\left(\right.$ resp. $\left.\tilde{V}_{B}=\left(\tilde{u}_{B}, \tilde{w}_{B}\right)\right)$ a strong solution of (1.1) associated with $(\rho, G, B)$ (resp. ( $\left.\tilde{\rho_{2}}, G, B\right)$ ). Assume that all the coefficients $\alpha, \beta, \gamma, \delta, \tilde{\beta}, \tilde{\gamma}, \tilde{\delta}$, belong to $\Lambda_{1}\left(M_{0}\right)$ and all the coefficients $\phi_{i}, \tilde{\phi}_{1}$ to $\Lambda_{2}\left(M_{0}\right)$ (for $\left.i=1, \cdots, 4\right)$. Let the set of admissible coefficients

$$
\begin{equation*}
\Lambda_{3}\left(M_{3}\right)=\left\{f \in C^{2}([0, T]),\left|\partial_{t}^{2}\left(f-\phi_{1}\right)(t)\right| \leq M_{3}\left|\left(f-\phi_{1}\right)(\theta)\right| \text { for all } t \in[0, T]\right\} \tag{3.8}
\end{equation*}
$$

with $M_{3}$ a positive constant.
Our result is the following.
Theorem 3.3. Let $l>0$. Let $T>0, L>l$ and $\hat{a} \in \mathbb{R}^{n} \backslash \Omega$ satisfying the conditions of Proposition 2.1. We suppose that $\tilde{\phi}_{1} \in \Lambda_{3}\left(M_{3}\right)$. Assume that Assumption (3.3) holds and that

$$
\begin{equation*}
|\alpha| \geq R>0 \text { in } \Omega_{L} \tag{3.9}
\end{equation*}
$$

Then there exists a sufficiently small number $\tau_{0}>0$ such that if $\tau \in\left(0, \tau_{0}\right)$,

$$
\begin{aligned}
& \sum_{k=0}^{1}\left(\left\|\partial_{t}^{k}\left(u_{A}-\tilde{u}_{A}\right)(\cdot, \theta)\right\|_{H^{2}\left(\Omega_{L}\right)}^{2}+\left\|\partial_{t}^{k}\left(u_{B}-\tilde{u}_{B}\right)(\cdot, \theta)\right\|_{H^{2}\left(\Omega_{L}\right)}^{2}\right)+\left\|\partial_{t}^{2}\left(u_{A}-\tilde{u}_{A}\right)(\cdot, \theta)\right\|_{L^{2}\left(\Omega_{L}\right)}^{2} \\
& \quad+\left\|\partial_{t}^{2}\left(u_{B}-\tilde{u}_{B}\right)(\cdot, \theta)\right\|_{L^{2}\left(\Omega_{L}\right)}^{2}+\left\|\left(w_{A}-\tilde{w}_{A}\right)(\cdot, \theta)\right\|_{H^{2}\left(\Omega_{L}\right)}^{2}+\left\|\left(w_{B}-\tilde{w}_{B}\right)(\cdot, \theta)\right\|_{H^{2}\left(\Omega_{L}\right)}^{2} \\
& \quad+\int_{\gamma_{L} \times(0, T)} \sum_{k=0}^{2}\left(\left|\partial_{\nu}\left(\partial_{t}^{k}\left(u_{A}-\tilde{u}_{A}\right)\right)\right|^{2}+\left|\partial_{\nu}\left(\partial_{t}^{k}\left(w_{A}-\tilde{w}_{A}\right)\right)\right|^{2}\right) d \sigma d t \leq \tau
\end{aligned}
$$

then the following Hölder stability estimate holds
$\|\beta-\tilde{\beta}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\gamma-\tilde{\gamma}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\delta-\tilde{\delta}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\sum_{i=0}^{2}\left\|\partial_{t}^{i}\left(\phi_{1}-\tilde{\phi}_{1}\right)\right\|_{L^{2}(0, T)}^{2} \leq K \tau^{\kappa}$ for all $\tau \in\left(0, \tau_{0}\right)$.
Here, $K>0$ and $\kappa \in(0,1)$ are two constants depending on $R, L, l, M_{0}, M_{1}, M_{2}, M_{3}, T, \hat{a}$.
Remark 1. - Notice that the hypothesis $\tilde{\phi}_{1} \in \Lambda_{3}\left(M_{3}\right)$ is satisfied when $\tilde{\phi}_{1} \in C^{2}([0, T])$ is such that $\phi_{1}(\theta) \neq \tilde{\phi}_{1}(\theta)$ and $\frac{\sup _{t \in[0, T]}\left|\partial_{t}\left(\phi_{1}-\tilde{\phi}_{1}\right)(t)\right|}{\left|\phi_{1}(\theta)-\tilde{\phi}_{1}(\theta)\right|} \leq M_{3}$. Moreover note also that if $\tilde{\phi}_{1} \in C^{2}([0, T])$ is such that $\phi_{1}(\theta) \neq \tilde{\phi}_{1}(\theta)$, then if we denote $f_{1}=\phi_{1}-\tilde{\phi}_{1}$, we have $f_{1}(\theta) \neq 0$. Therefore $t \mapsto\left|\frac{f_{1}(t)}{f_{1}(\theta)}\right|$ is bounded on $[0, T]$ so there exists a positive constant $C_{0}$ such that for all $t \in[0, T]$, $\left|f_{1}(t)\right| \leq C_{0}\left|f_{1}(\theta)\right|$. Similarly there exists a positive constant $C_{1}$ such that $\left|\partial_{t} f_{1}(t)\right| \leq C_{1}\left|f_{1}(\theta)\right|$
and there exists a positive constant $C_{2}$ such that $\left|\partial_{t}^{2} f_{1}(t)\right| \leq C_{2}\left|f_{1}(\theta)\right|$.
Note also that if $\tilde{\phi_{1}} \in \Lambda_{3}\left(M_{3}\right)$ and $\tilde{\phi}_{1}(\theta)=\phi_{1}(\theta)$, then $\partial_{t}^{2}\left(\overline{\phi_{1}}-\phi_{1}\right)=0$ in $[0, T]$. Therefore $\tilde{\phi}_{1}$ has the form $\tilde{\phi}_{1}(t)=\phi_{1}(t)+k(t-\theta)$ with $k$ any real.

- Moreover if the function $\phi_{1}$ is more regular, for example if $\phi_{1} \in C^{p}([0, T])$ with $p \geq 2$, then Theorem 3.3 is still valid with a more generalized admissible set of coefficients $\Lambda_{3}^{\prime}\left(M_{3}\right)=\{f \in$ $C^{p}([0, T]),\left|\partial_{t}^{p}\left(f-\phi_{1}\right)(t)\right| \leq M_{3}\left|\left(f-\phi_{1}\right)(\theta)\right|$ for all $\left.t \in[0, T]\right\}$. But in this case, because of our method, the observations terms at the fixed time $\theta$ on the right-hand side of the estimate (3.10) would demand more regularity.
- On the contrary, we can relax some of the observations terms on $u\left(u_{A}\right.$ and $\left.\tilde{u}_{A}\right)$ at $\theta$ on the righthand side of $(3.10)$ and only have $\|(u-\tilde{u})(\cdot, \theta)\|_{H^{2}\left(\Omega_{L}\right)}^{2}$ but for a more restrictive admissible set of coefficients $\Lambda_{3}^{\prime \prime}\left(M_{3}\right)=\left\{f \in C^{2}([0, T]),\left|\partial_{t}^{i}\left(f-\phi_{1}\right)(t)\right| \leq M_{3}\left|\left(f-\phi_{1}\right)(\theta)\right|\right.$ for all $i=0,1,2$ and $t \in$ $[0, T]\}$.
3.2.4. Fourth result. Finally, we consider the system (1.3). Consider $V_{A}=\left(u_{A}, w_{A}\right)$ (resp. $\tilde{V}_{A}=$ $\left.\left(\tilde{u}_{A}, \tilde{w}_{A}\right)\right)$ a strong solution of (1.3) associated with $(\rho, G, A, \Theta)$ defined by (1.2) and (1.4) (resp. $\left.\left(\tilde{\rho_{3}}, G, A, \tilde{\Theta}\right)\right)$. Consider also $V_{B}=\left(u_{B}, w_{B}\right)\left(\right.$ resp. $\left.\quad \tilde{V}_{B}=\left(\tilde{u}_{B}, \tilde{w}_{B}\right)\right)$ a strong solution of (1.3) associated with $(\rho, G, B, \Theta)\left(\operatorname{resp} .\left(\tilde{\rho_{3}}, G, B, \tilde{\Theta}\right)\right)$. Assume that all the coefficients $\alpha, \beta, \gamma, \delta, \tilde{\beta}, \tilde{\gamma}, \tilde{\delta}$, belong to $\Lambda_{1}\left(M_{0}\right)$ and all the coefficients $\phi_{i}$ to $\Lambda_{2}\left(M_{0}\right)$ (for $i=1, \cdots, 4$ ). Moreover we suppose that $\Theta_{i}, \tilde{\Theta}_{1}$ belong to $\left(\Lambda_{1}\left(M_{0}\right)\right)^{n} \cap\left(L^{2}(\Omega)\right)^{n}$ (for $\left.i=1, \cdots, 4\right)$ and there exist functions $\xi_{1}, \tilde{\xi}_{1}$ such that

$$
\Theta_{1}=\nabla \xi_{1}, \tilde{\Theta_{1}}=\nabla \tilde{\xi}_{1} \text { in } \Omega
$$

Theorem 3.4. Let $l>0$. Let $T>0, L>l$ and $\hat{a} \in \mathbb{R}^{n} \backslash \Omega$ satisfying the conditions of Proposition 2.1. Assume that Assumptions (3.2) and (3.3) are satisfied with $\left(v_{1}, \cdots, v_{4}\right)=$ $\left(\tilde{w}_{B}(\cdot, \theta), \tilde{u}_{A}(\cdot, \theta), \tilde{w}_{A}(\cdot, \theta), \tilde{u}_{B}(\cdot, \theta)\right)$.
If $\xi_{1}=\tilde{\xi}_{1}$ and $\Theta_{1}=\tilde{\Theta}_{1}$ on $\partial \Omega \cap \partial \Omega_{L}$, then there exists a sufficiently small number $\tau_{0}>0$ such that if $\tau \in\left(0, \tau_{0}\right)$,

$$
\begin{gathered}
\sum_{k=0}^{1} \int_{\gamma_{L} \times(0, T)}\left(\left|\partial_{\nu}\left(\partial_{t}^{k}\left(u_{A}-\tilde{u}_{A}\right)\right)\right|^{2}+\left|\partial_{\nu}\left(\partial_{t}^{k}\left(w_{A}-\tilde{w}_{A}\right)\right)\right|^{2}+\left|\partial_{\nu}\left(\partial_{t}^{k}\left(u_{B}-\tilde{u}_{B}\right)\right)\right|^{2}\right. \\
\left.+\left|\partial_{\nu}\left(\partial_{t}^{k}\left(w_{B}-\tilde{w}_{B}\right)\right)\right|^{2}\right) d \sigma d t+\left\|\left(u_{A}-\tilde{u}_{A}\right)(\cdot, \theta)\right\|_{H^{3}\left(\Omega_{L}\right)}^{2}+\left\|\left(u_{B}-\tilde{u}_{B}\right)(\cdot, \theta)\right\|_{H^{3}\left(\Omega_{L}\right)}^{2} \leq \tau
\end{gathered}
$$

then the following Hölder stability estimate holds

$$
\begin{equation*}
\|\beta-\tilde{\beta}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\gamma-\tilde{\gamma}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\delta-\tilde{\delta}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\left\|\Theta_{1}-\tilde{\Theta_{1}}\right\|_{\left(L^{2}\left(\Omega_{l}\right)\right)^{n}} \leq K \tau^{\kappa} \tag{3.11}
\end{equation*}
$$

for all $\tau \in\left(0, \tau_{0}\right)$.
Here, $K>0$ and $\kappa \in(0,1)$ are two constants depending on $R, L, l, M_{0}, M_{1}, M_{2}, T$ and $\hat{a}$.

### 3.3. Proofs of theorems.

3.3.1. Proof of Theorem 3.1. Let $V_{A}=\left(u_{A}, w_{A}\right)$ (resp. $\left.\tilde{V}_{A}=\left(\widetilde{u}_{A}, \widetilde{w}_{A}\right)\right)$ be a solution of (1.1) associated with $(\rho, G, A)$ (resp. $\left.\left(\tilde{\rho}_{1}, G, A\right)\right)$ and $V_{B}=\left(u_{B}, w_{B}\right)$ (resp. $\tilde{V}_{B}=\left(\widetilde{u}_{B}, \widetilde{w}_{B}\right)$ ) be a solution of (1.1) associated with $(\rho, G, B)$ (resp. $\left.\left(\tilde{\rho}_{1}, G, B\right)\right)$. We decompose the proof in several steps.

- First step:

Denote $V=(u, w)=V_{A}, \tilde{V}=(\tilde{u}, \tilde{w})=\tilde{V}_{A}$ and

$$
\begin{equation*}
U=u-\tilde{u}, W=w-\tilde{w}, a=\alpha-\tilde{\alpha} \cdot b=\beta-\tilde{\beta}, c=\gamma-\tilde{\gamma}, d=\delta-\tilde{\delta} \tag{3.12}
\end{equation*}
$$

Then $(U, W)$ satisfy the following system

$$
\left\{\begin{array}{l}
\partial_{t} U=\Delta U+\alpha \phi_{1} U+\beta \phi_{2} W+a \phi_{1} \tilde{u}+b \phi_{2} \tilde{w} \text { in } Q  \tag{3.13}\\
\partial_{t} W=\Delta W+\gamma \phi_{3} U+\delta \phi_{4} W+c \phi_{3} \tilde{u}+d \phi_{4} \tilde{w} \text { in } Q \\
U=W=0 \text { on } \Sigma .
\end{array}\right.
$$

Define

$$
\begin{equation*}
y_{0}=\eta \chi U, z_{0}=\eta \chi W, y_{1}=\partial_{t} y_{0}, z_{1}=\partial_{t} z_{0} \tag{3.14}
\end{equation*}
$$

We deduce that $\left(y_{i}, z_{i}\right)$ for $i=0,1$ satisfy the following systems

$$
\left\{\begin{array}{l}
\partial_{t} y_{0}=\Delta y_{0}+\alpha \phi_{1} y_{0}+\beta \phi_{2} z_{0}+a \eta \chi \phi_{1} \tilde{u}+b \eta \chi \phi_{2} \tilde{w}+R_{1} \text { in } Q_{L}  \tag{3.15}\\
\partial_{t} z_{0}=\Delta z_{0}+\gamma \phi_{3} y_{0}+\delta \phi_{4} z_{0}+c \eta \chi \phi_{3} \tilde{u}+d \eta \chi \phi_{4} \tilde{w}+R_{2} \text { in } Q_{L} \\
y_{0}=z_{0}=0 \text { on } \partial \Omega_{L} \times(0, T)
\end{array}\right.
$$

with

$$
R_{1}=-(\Delta \chi) \eta U-2 \eta \nabla \chi \cdot \nabla U+\chi \partial_{t} \eta U, R_{2}=-(\Delta \chi) \eta W-2 \eta \nabla \chi \cdot \nabla W+\chi \partial_{t} \eta W
$$

We have

$$
\left\{\begin{array}{l}
\partial_{t} y_{1}=\Delta y_{1}+\alpha \phi_{1} y_{1}+\beta \phi_{2} z_{1}+R_{3} \text { in } Q_{L}  \tag{3.16}\\
\partial_{t} z_{1}=\Delta z_{1}+\gamma \phi_{3} y_{1}+\delta \phi_{4} z_{1}+R_{4} \text { in } Q_{L} \\
y_{1}=z_{1}=0 \text { on } \partial \Omega_{L} \times(0, T)
\end{array}\right.
$$

with

$$
\begin{aligned}
R_{3} & =a \chi \partial_{t}\left(\eta \phi_{1} \tilde{u}\right)+b \chi \partial_{t}\left(\eta \phi_{2} \tilde{w}\right)+\partial_{t} R_{1}+\alpha y_{0} \partial_{t} \phi_{1}+\beta z_{0} \partial_{t} \phi_{2} \\
R_{4} & =c \chi \partial_{t}\left(\eta \phi_{3} \tilde{u}\right)+d \chi \partial_{t}\left(\eta \phi_{4} \tilde{w}\right)+\partial_{t} R_{2}+\gamma y_{0} \partial_{t} \phi_{3}+\delta z_{0} \partial_{t} \phi_{4}
\end{aligned}
$$

- Second step: we estimate $\sum_{i=0}^{1}\left(I\left(y_{i}\right)+I\left(z_{i}\right)\right)$ by the Carleman inequalities (2.6).

Note that all the terms in $A_{0} y_{i}$ or $A_{0} z_{i}$ with derivatives of $\chi$ or $\eta$ will be bounded above by $C e^{2 s d_{1}}$ with $C$ a positive constant (see Proposition 2.1 for the definitions of $d_{1}$ and $d_{2}$ ). Moreover all the terms such as $\int_{Q_{L}} e^{2 s \phi} y_{i}^{2} d x d t$ on the right-and side of the estimates (2.6) will be absorbed by $I\left(y_{i}\right)$ for $s$ sufficiently large. So we have for $s$ sufficiently large,

$$
\begin{aligned}
\sum_{i=0}^{1}\left(I\left(y_{i}\right)+\right. & \left.I\left(z_{i}\right)\right) \leq C \int_{Q_{L}} e^{2 s \phi}\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2} d x d t+C s^{3} e^{2 s d_{1}} \\
& +C s \int_{\gamma_{L} \times(0, T)} e^{2 s \phi} \sum_{i=0}^{1}\left(\left|\partial_{\nu} y_{i}\right|^{2}+\left|\partial_{\nu} z_{i}\right|^{2}\right) d \sigma d t
\end{aligned}
$$

Since $e^{2 s \phi} \leq e^{2 s \phi(\theta)} \leq e^{2 s d_{2}}$ we get

$$
\begin{equation*}
\sum_{i=0}^{1}\left(I\left(y_{i}\right)+I\left(z_{i}\right)\right) \leq C \int_{Q_{L}} e^{2 s \phi}\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2} d x d t+C s^{3} e^{2 s d_{1}}+C s e^{2 s d_{2}} F_{0}\left(\gamma_{L}\right) \tag{3.17}
\end{equation*}
$$

with $F_{0}\left(\gamma_{L}\right)=\int_{\gamma_{L} \times(0, T)} \sum_{i=0}^{1}\left(\left|\partial_{\nu} y_{i}\right|^{2}+\left|\partial_{\nu} z_{i}\right|^{2}\right) d \sigma d t$.

- Third step: now we estimate $\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left|\partial_{t}^{i} f(\theta)\right|^{2} d x$ and $\int_{\Omega_{L}} e^{2 s \phi(\theta)}|\Delta f(\theta)|^{2} d x$ for $f=y_{0}$ or $f=z_{0}$ and $i=0,1$. By Lemma 3.1, we have (since $\phi \geq 1$ and $\frac{1}{\phi} \geq \frac{1}{d_{2}}$ )

$$
\begin{gathered}
\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left|y_{0}(\theta)\right|^{2} d x \leq C s \int_{Q_{L}} e^{2 s \phi} y_{0}^{2} d x d t+\frac{C}{s} \int_{Q_{L}} e^{2 s \phi} y_{1}^{2} d x d t \leq \frac{C}{s^{2}}\left(I\left(y_{0}\right)+I\left(y_{1}\right)\right) \\
\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left|\partial_{t} y_{0}(\theta)\right|^{2} d x \leq C s \int_{Q_{L}} e^{2 s \phi} y_{1}^{2} d x d t+\frac{C}{s} \int_{Q_{L}} e^{2 s \phi}\left|\partial_{t} y_{1}\right|^{2} d x d t \leq C I\left(y_{1}\right), \\
\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left|\Delta y_{0}(\theta)\right|^{2} d x \leq C s \int_{Q_{L}} e^{2 s \phi}\left|\Delta y_{0}\right|^{2} d x d t+\frac{C}{s} \int_{Q_{L}} e^{2 s \phi}\left|\Delta y_{1}\right|^{2} d x d t \leq C s^{2}\left(I\left(y_{0}\right)+I\left(y_{1}\right)\right)
\end{gathered}
$$

Notice that the three above inequalities are satisfied replacing $\left(y_{0}, y_{1}, y_{2}\right)$ by $\left(z_{0}, z_{1}, z_{2}\right)$. Therefore

$$
\begin{gathered}
\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(\left|y_{0}(\theta)\right|^{2}+\left|\partial_{t} y_{0}(\theta)\right|^{2}+\left|\Delta y_{0}(\theta)\right|^{2}+\left|z_{0}(\theta)\right|^{2}+\left|\partial_{t} z_{0}(\theta)\right|^{2}+\left|\Delta z_{0}(\theta)\right|^{2}\right) d x \\
\leq C s^{2} \sum_{i=0}^{1}\left(I\left(y_{i}\right)+I\left(z_{i}\right)\right)
\end{gathered}
$$

So using (3.17) we deduce that

$$
\begin{gather*}
\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(\left|y_{0}(\theta)\right|^{2}+\left|\partial_{t} y_{0}(\theta)\right|^{2}+\left|\Delta y_{0}(\theta)\right|^{2}+\left|z_{0}(\theta)\right|^{2}+\left|\partial_{t} z_{0}(\theta)\right|^{2}+\left|\Delta z_{0}(\theta)\right|^{2}\right) d x \\
\quad \leq C s^{2} \int_{Q_{L}} e^{2 s \phi}\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2} d x d t+C s^{5} e^{2 s d_{1}}+C s^{3} e^{2 s d_{2}} F_{0}\left(\gamma_{L}\right) \tag{3.18}
\end{gather*}
$$

At last in this step, denote

$$
\begin{equation*}
R=\left(R_{1}, R_{2}, R_{3}, R_{4}\right) \tag{3.19}
\end{equation*}
$$

- Fourth step: here we estimate $\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2} d x$.

We choose now the two sets of conditions $A$ and $B$ and consider $V_{A}, \tilde{V}_{A}, V_{B}$ and $\tilde{V}_{B}$. From now on, each function $f$ defined in the precedent steps is denoted either $f_{A}$ or $f_{B}$ when it is related either by the conditions $A$ or $B$. Denote now $F_{0 A}\left(\gamma_{L}\right)=F_{0}\left(\gamma_{L}\right)$ associated with $\left(V_{A}, \tilde{V}_{A}\right)$, and $F_{0 B}\left(\gamma_{L}\right)=F_{0}\left(\gamma_{L}\right)$ associated with $\left(V_{B}, \tilde{V}_{B}\right)$ (see (3.17) in the second step):
$F_{0 A}\left(\gamma_{L}\right)=\int_{\gamma_{L} \times(0, T)} \sum_{i=0}^{1}\left(\left|\partial_{\nu} y_{i A}\right|^{2}+\left|\partial_{\nu} z_{i A}\right|^{2}\right) d \sigma d t, F_{0 B}\left(\gamma_{L}\right)=\int_{\gamma_{L} \times(0, T)} \sum_{i=0}^{1}\left(\left|\partial_{\nu} y_{i B}\right|^{2}+\left|\partial_{\nu} z_{i B}\right|^{2}\right) d \sigma d t$.
Let $R_{A}$ be defined by (3.19) for $\left(V_{A}, \tilde{V}_{A}\right)$ (resp. $R_{B}$ for $\left.\left(V_{B}, \tilde{V}_{B}\right)\right)$. Multiplying the first equation of (3.15) written for $y_{0 A}$ by $\tilde{w}_{B}$ and the first equation of (3.15) written for $y_{0 B}$ by $\tilde{w}_{A}$ and subtracting, we eliminate the term in $b$ and we get

$$
\begin{gather*}
a \eta \chi \phi_{1}\left(\tilde{u}_{A} \tilde{w}_{B}-\tilde{u}_{B} \tilde{w}_{A}\right)=\tilde{w}_{B}\left(\partial_{t} y_{0 A}-\Delta y_{0 A}-\alpha \phi_{1} y_{0 A}-\beta \phi_{2} z_{0 A}-R_{1 A}\right) \\
-\tilde{w}_{A}\left(\partial_{t} y_{0 B}-\Delta y_{0 B}-\alpha \phi_{1} y_{0 B}-\beta \phi_{2} z_{0 B}-R_{1 B}\right) . \tag{3.20}
\end{gather*}
$$

By hypothesis (3.3), applying (3.20) for $t=\theta$, since $\eta=1$ in a neighborhood of $\theta$ we get

$$
\begin{gathered}
\int_{\Omega_{L}} e^{2 s \phi(\theta)} a^{2} \chi^{2}\left(\phi_{1}(\theta)\right)^{2} d x \leq C \int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(\left|\partial_{t} y_{0 A}(\theta)\right|^{2}+\left|\partial_{t} y_{0 B}(\theta)\right|^{2}+\left|\Delta y_{0 A}(\theta)\right|^{2}+\left|\Delta y_{0 B}(\theta)\right|^{2}\right. \\
\left.+\left|y_{0 A}(\theta)\right|^{2}+\left|z_{0 A}(\theta)\right|^{2}+\left|y_{0 B}(\theta)\right|^{2}+\left|z_{0 B}(\theta)\right|^{2}\right) d x+C e^{2 s d_{1}} .
\end{gathered}
$$

But $\phi_{1} \in \Lambda_{2}\left(M_{0}\right)$. So from (3.18) applied for $y_{0 A}, y_{0 B}, z_{0 A}, z_{0 B}$ we obtain

$$
\begin{equation*}
\int_{\Omega_{L}} e^{2 s \phi(\theta)} a^{2} \chi^{2} d x \leq C s^{2} \int_{Q_{L}} e^{2 s \phi}\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2} d x d t+C s^{5} e^{2 s d_{1}}+C s^{3} e^{2 s d_{2}} F_{1}\left(\gamma_{L}\right) \tag{3.21}
\end{equation*}
$$

with $F_{1}\left(\gamma_{L}\right)=F_{0 A}\left(\gamma_{L}\right)+F_{0 B}\left(\gamma_{L}\right)$. Similarly we can replace $a$ by $b$ on the left-hand side of (3.21), still using (3.15) for $y_{0 A}$ and $y_{0 B}$. Indeed

$$
\begin{gathered}
-b \eta \chi \phi_{2}\left(\tilde{u}_{A} \tilde{w}_{B}-\tilde{u}_{B} \tilde{w}_{A}\right)=\tilde{u}_{B}\left(\partial_{t} y_{0 A}-\Delta y_{0 A}-\alpha \phi_{1} y_{0 A}-\beta \phi_{2} z_{0 A}-R_{1 A}\right) \\
-\tilde{u}_{A}\left(\partial_{t} y_{0 B}-\Delta y_{0 B}-\alpha \phi_{1} y_{0 B}-\beta \phi_{2} z_{0 B}-R_{1 B}\right)
\end{gathered}
$$

So we have
$\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(a^{2}+b^{2}\right) \chi^{2} d x \leq C s^{2} \int_{Q_{L}} e^{2 s \phi}\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2} d x d t+C s^{5} e^{2 s d_{1}}+C s^{3} e^{2 s d_{2}} F_{1}\left(\gamma_{L}\right)$.

We do the same to obtain $c$ and $d$ using this time (3.15) for $z_{0 A}$ and $z_{0 B}$ and the hypothesis (3.3). Therefore
$\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(c^{2}+d^{2}\right) \chi^{2} d x \leq C s^{2} \int_{Q_{L}} e^{2 s \phi}\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2} d x d t+C s^{5} e^{2 s d_{1}}+C s^{3} e^{2 s d_{2}} F_{1}\left(\gamma_{L}\right)$.
Adding (3.22) and (3.23), we have
$\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2} d x d t \leq C s^{2} \int_{Q_{L}} e^{2 s \phi}\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2} d x d t+C s^{5} e^{2 s d_{1}}+C s^{3} e^{2 s d_{2}} F_{1}\left(\gamma_{L}\right)$.
Now we proceed as in $[2,11,12]$ in order to prove that $s^{2} \int_{Q_{L}} e^{2 s \phi}\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2} d x d t$ can be absorbed by the left-hand side of the above estimate for $s$ sufficiently large ( $s \geq s_{2}$ ). Indeed

$$
s^{2} \int_{Q_{L}} e^{2 s \phi}\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2} d x d t=\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2}\left(\int_{0}^{T} s^{2} e^{2 s(\phi-\phi(\theta))} d t\right) d x
$$

But $\phi-\phi(\theta)=-e^{\lambda\left(\hat{d}+M_{1}\right)}\left(1-e^{-\lambda(t-\theta)^{2}}\right)$ and there exists a positive constant $C$ such that $\phi-\phi(\theta) \leq-C\left(1-e^{-\lambda(t-\theta)^{2}}\right)$. Therefore $\int_{0}^{T} s^{2} e^{2 s(\phi-\phi(\theta))} d t \leq \int_{0}^{T} s^{2} e^{-2 s C\left(1-e^{-\lambda(t-\theta)^{2}}\right)} d t$ uniformly in $x$. Moreover by the Lebesgue convergence theorem, we have

$$
\int_{0}^{T} s^{2} e^{-2 s C\left(1-e^{-\lambda(t-\theta)^{2}}\right)} d t \rightarrow 0 \text { as } s \rightarrow \infty
$$

Thus for $s$ sufficiently large, we get

$$
\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2} d x \leq C s^{5} e^{2 s d_{1}}+C s^{3} e^{2 s d_{2}} F_{1}\left(\gamma_{L}\right)
$$

Since $e^{2 s d_{0}} \leq e^{2 s \phi(\theta)}$ in $\Omega_{l}$ and $\chi=1$ in $\Omega_{l}$, we deduce that
$e^{2 s d_{0}}\left(\|\alpha-\tilde{\alpha}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\beta-\tilde{\beta}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\gamma-\tilde{\gamma}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\delta-\tilde{\delta}\|_{L^{2}\left(\Omega_{l}\right)}^{2}\right) \leq C s^{3}\left(e^{2 s d_{2}} F_{1}\left(\gamma_{L}\right)+s^{2} e^{2 s d_{1}}\right)$
which can be rewritten
$\|\alpha-\tilde{\alpha}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\beta-\tilde{\beta}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\gamma-\tilde{\gamma}\|_{L^{2}\left(\Omega_{l}\right)}^{2}+\|\delta-\tilde{\delta}\|_{L^{2}\left(\Omega_{l}\right)}^{2} \leq C s^{3}\left(e^{2 s\left(d_{2}-d_{0}\right)} F_{1}\left(\gamma_{L}\right)+s^{2} e^{2 s\left(d_{1}-d_{0}\right)}\right)$.
As $d_{1}-d_{0}<0$ and $d_{2}-d_{0}>0$, we can optimize the above inequality with respect to $s$ (see for example $[5,7,8]$ ). Indeed, note that if $F_{1}\left(\gamma_{L}\right)=0$, since (3.24) holds for any $s \geq s_{2}$ and $d_{1}-d_{0}<0$ we get (3.4). Now if $F_{1}\left(\gamma_{L}\right) \neq 0$ is sufficiently small $\left(F_{1}\left(\gamma_{L}\right)<\frac{d_{0}-d_{1}}{d_{2}-d_{0}}\right)$, we optimize (3.24) with respect to $s$. Indeed denote

$$
f(s)=e^{2 s\left(d_{2}-d_{0}\right)} F_{1}\left(\gamma_{L}\right)+e^{2 s\left(d_{1}-d_{0}\right)} \text { and } g(s)=e^{2 s\left(d_{2}-d_{0}\right)} F_{1}\left(\gamma_{L}\right)+s^{2} e^{2 s\left(d_{1}-d_{0}\right)} .
$$

We have $f(s) \sim g(s)$ at infinity. Moreover the function $f$ has a minimum in

$$
s_{3}=\frac{1}{2\left(d_{2}-d_{1}\right)} \ln \left(\frac{d_{0}-d_{1}}{\left(d_{2}-d_{0}\right) F_{1}\left(\gamma_{L}\right)}\right) \text { and } f\left(s_{3}\right)=K^{\prime} F_{1}\left(\gamma_{L}\right)^{\kappa}
$$

with $\kappa=\frac{d_{0}-d_{1}}{d_{2}-d_{1}}$ and $K^{\prime}=\left(\frac{d_{0}-d_{1}}{d_{2}-d_{0}}\right)^{\frac{d_{2}-d_{0}}{d_{2}-d_{1}}}+\left(\frac{d_{0}-d_{1}}{d_{2}-d_{0}}\right)^{\frac{d_{1}-d_{0}}{d_{2}-d_{0}}}$. Finally the minimum $s_{3}$ is sufficiently large $\left(s_{3} \geq s_{2}\right)$ if the following condition $F_{1}\left(\gamma_{L}\right) \leq \tau_{0}$, with $\tau_{0}=\frac{d_{0}-d_{1}}{\left(d_{2}-d_{0}\right) e^{2 s_{2}\left(d_{2}-d_{1}\right)}}$, is satisfied. So we conclude for Theorem 3.1.
3.3.2. Proof of Theorem 3.2. We keep the notations of the proof of Theorem 3.1. In this theorem, we want to remove all the observation terms on $w$ obtained in Theorem 3.1 and express them in terms of $u$. So we look at the terms $\int_{\gamma_{L} \times(0, T)} e^{2 s \phi}\left|\partial_{\nu} z_{i}\right|^{2} d \sigma d t$ for $i=0,1$ appearing in step 2 of Theorem 3.1. Recall that $z_{i}=0$ outside $\Omega_{L-\epsilon}$ and $\gamma_{L} \subset \partial \omega^{\prime}$.
As in [4, Lemma 2] we choose $g_{0} \in C^{2}\left(\overline{\omega^{\prime}}, \mathbb{R}^{n}\right)$ such that $g_{0}=\nu$ on the $C^{2}$-boundary $\partial \omega^{\prime}$ where $\nu$ is the normal vector to $\partial \omega^{\prime}$. We have by integration by parts for any integer $i=0,1$,

$$
\begin{gathered}
\int_{\omega^{\prime} \times(0, T)} e^{2 s \phi} \Delta z_{i} g_{0} \cdot \nabla z_{i} d x d t=-\int_{\omega^{\prime} \times(0, T)} \nabla\left(e^{2 s \phi} g_{0} \cdot \nabla z_{i}\right) \cdot \nabla z_{i} d x d t \\
+\int_{\partial \omega^{\prime} \times(0, T)} e^{2 s \phi} g_{0} \cdot \nabla z_{i} \partial_{\nu} z_{i} d \sigma d t
\end{gathered}
$$

So

$$
\begin{gathered}
\int_{\omega^{\prime} \times(0, T)} e^{2 s \phi} \Delta z_{i} g_{0} \cdot \nabla z_{i} d x d t=-\int_{\omega^{\prime} \times(0, T)} \nabla\left(e^{2 s \phi} g_{0} \cdot \nabla z_{i}\right) \cdot \nabla z_{i} d x d t \\
+\int_{\partial \omega^{\prime} \times(0, T)} e^{2 s \phi}\left|\partial_{\nu} z_{i}\right|^{2} d \sigma d t
\end{gathered}
$$

and we get

$$
\begin{equation*}
\int_{\gamma_{L} \times(0, T)} e^{2 s \phi}\left|\partial_{\nu} z_{i}\right|^{2} d \sigma d t \leq C s \int_{\left(\omega^{\prime} \cap \Omega_{L}\right) \times(0, T)} e^{2 s \phi}\left(\left|\nabla z_{i}\right|^{2}+\left|\Delta z_{i}\right|^{2}\right) d x d t \tag{3.25}
\end{equation*}
$$

From the first equation in (3.15) we have

$$
\begin{equation*}
\beta \phi_{2} z_{0}=\partial_{t} y_{0}-\Delta y_{0}-\alpha \phi_{1} y_{0}-a \eta \chi \phi_{1} \tilde{u}-b \eta \chi \phi_{2} \tilde{w}-R_{1} \text { in } Q_{L} . \tag{3.26}
\end{equation*}
$$

By the same way, from (3.16) we have

$$
\begin{equation*}
\beta \phi_{2} z_{1}=\partial_{t} y_{1}-\Delta y_{1}-\alpha \phi_{1} y_{1}-R_{3} \text { in } Q_{L} . \tag{3.27}
\end{equation*}
$$

i) First assume that $a=b=0$ in $\omega^{\prime}$. From hypothesis (3.5), (3.25)-(3.27) we get

$$
\begin{gathered}
\sum_{i=0}^{1} \int_{\gamma_{L} \times(0, T)} e^{2 s \phi}\left|\partial_{\nu} z_{i}\right|^{2} d \sigma d t \leq C s \sum_{i=0}^{1} \int_{\left(\omega^{\prime} \cap \Omega_{L}\right) \times(0, T)} e^{2 s \phi}\left(\left|\nabla \partial_{t} y_{i}\right|^{2}+\left|\nabla\left(\Delta y_{i}\right)\right|^{2}+\left|\nabla y_{i}\right|^{2}+\left|y_{i}\right|^{2}\right. \\
\left.+\left|\Delta \partial_{t} y_{i}\right|^{2}+\left|\Delta\left(\Delta y_{i}\right)\right|^{2}+\left|\Delta y_{i}\right|^{2}\right) d x d t+C s e^{2 s d_{1}}
\end{gathered}
$$

So

$$
\sum_{i=0}^{1} \int_{\gamma_{L} \times(0, T)} e^{2 s \phi}\left|\partial_{\nu} z_{i}\right|^{2} d \sigma d t \leq C s e^{2 s d_{1}}+C s e^{2 s d_{2}} G_{0}\left(\omega^{\prime}\right)
$$

with $G_{0}\left(\omega^{\prime}\right)=\left\|y_{0}\right\|_{H^{1}\left(0, T, H^{4}\left(\omega^{\prime} \cap \Omega_{L}\right)\right)}^{2}+\left\|y_{0}\right\|_{H^{2}\left(0, T, H^{2}\left(\omega^{\prime} \cap \Omega_{L}\right)\right)}^{2}$.
Therefore (3.17) is still valid with $s F_{0}\left(\gamma_{L}\right)$ replaced by $s^{2} G_{1}\left(\gamma_{L}\right)=s^{2} \int_{\gamma_{L} \times(0, T)} \sum_{i=0}^{1}\left|\partial_{\nu} y_{i}\right|^{2} d \sigma d t+$ $s^{2} G_{0}\left(\omega^{\prime}\right)$. Thus we follow the proof of Theorem 3.1 substituting $F_{0}\left(\gamma_{L}\right)$ by $G_{1}\left(\gamma_{L}\right)$. The rest of the proof (steps 3 and 4) remains unchanged.
ii) Here we suppose that $\alpha, \beta, \tilde{\alpha}, \tilde{\beta} \in H^{2}(\Omega)$. We will need to differentiate $y_{0}$ and $z_{0}$ twice with respect to $t$ (in order to get (3.35)) and we have

$$
\left\{\begin{array}{l}
\partial_{t} y_{2}=\Delta y_{2}+\alpha \phi_{1} y_{2}+\beta \phi_{2} z_{2}+\partial_{t} R_{3}+\alpha \partial_{t} \phi_{1} y_{1}+\beta \partial_{t} \phi_{2} z_{1} \text { in } Q_{L},  \tag{3.28}\\
\partial_{t} z_{2}=\Delta z_{2}+\gamma \phi_{3} y_{2}+\delta \phi_{4} z_{2}+\partial_{t} R_{4}+\gamma \partial_{t} \phi_{3} y_{1}+\delta \partial_{t} \phi_{4} z_{1} \text { in } Q_{L}, \\
y_{2}=z_{2}=0 \text { on } \partial \Omega_{L} \times(0, T) .
\end{array}\right.
$$

Therefore

$$
\begin{equation*}
\beta \phi_{2} z_{2}=\partial_{t} y_{2}-\Delta y_{2}-\alpha \phi_{1} y_{2}-\partial_{t} R_{3}-\alpha \partial_{t} \phi_{1} y_{1}-\beta \partial_{t} \phi_{2} z_{1} \text { in } Q_{L} . \tag{3.29}
\end{equation*}
$$

Notice that we can take $\sum_{k=0}^{2} \int_{\gamma_{L} \times(0, T)}\left(\left|\partial_{\nu}\left(\partial_{t}^{k}\left(u_{A}-\tilde{u}_{A}\right)\right)\right|^{2}+\left|\partial_{\nu}\left(\partial_{t}^{k}\left(w_{A}-\tilde{w}_{A}\right)\right)\right|^{2}+\partial_{\nu}\left(\partial_{t}^{k}\left(u_{B}-\right.\right.\right.$ $\left.\left.\left.\tilde{u}_{B}\right)\right)\left.\right|^{2}+\left|\partial_{\nu}\left(\partial_{t}^{k}\left(w_{B}-\tilde{w}_{B}\right)\right)\right|^{2}\right) d \sigma d t$ as observation terms in (3.4). So we apply (3.25) for $i=0,1,2$. From (3.25)-(3.29) we get
$\sum_{i=0}^{2} \int_{\gamma_{L} \times(0, T)} e^{2 s \phi}\left|\partial_{\nu} z_{i}\right|^{2} d \sigma d t \leq C s \sum_{i=0}^{2} \int_{\left(\omega^{\prime} \cap \Omega_{L}\right) \times(0, T)} e^{2 s \phi}\left(\left|\nabla \partial_{t} y_{i}\right|^{2}+\left|\nabla\left(\Delta y_{i}\right)\right|^{2}+\left|\nabla y_{i}\right|^{2}+\left|y_{i}\right|^{2}\right.$
$\left.+\left|\Delta \partial_{t} y_{i}\right|^{2}+\left|\Delta\left(\Delta y_{i}\right)\right|^{2}+\left|\Delta y_{i}\right|^{2}+\left(a^{2}+b^{2}\right) \chi^{2}+|\nabla(a \chi)|^{2}+|\nabla(b \chi)|^{2}+|\Delta(a \chi)|^{2}+|\Delta(b \chi)|^{2}\right) d x d t+C s e^{2 s d_{1}}$.
So

$$
\begin{gathered}
\sum_{i=0}^{2} \int_{\gamma_{L} \times(0, T)} e^{2 s \phi}\left|\partial_{\nu} z_{i}\right|^{2} d \sigma d t \leq C s e^{2 s d_{2}} \tilde{G}_{0}\left(\omega^{\prime}\right)+C s e^{2 s d_{1}} \\
+C s \int_{Q_{L}} e^{2 s \phi}\left(\left(a^{2}+b^{2}\right) \chi^{2}+|\nabla(a \chi)|^{2}+|\nabla(b \chi)|^{2}+|\Delta(a \chi)|^{2}+|\Delta(b \chi)|^{2}\right) d x d t
\end{gathered}
$$

with $\tilde{G}_{0}\left(\omega^{\prime}\right)=\left\|y_{0}\right\|_{H^{2}\left(0, T, H^{4}\left(\omega^{\prime} \cap \Omega_{L}\right)\right)}^{2}+\left\|y_{0}\right\|_{H^{3}\left(0, T, H^{2}\left(\omega^{\prime} \cap \Omega_{L}\right)\right)}^{2}$.
Thus the estimate (3.17) becomes

$$
\begin{gather*}
\sum_{i=0}^{2}\left(I\left(y_{i}\right)+I\left(z_{i}\right)\right) \leq C s^{3} e^{2 s d_{1}}+C s^{2} e^{2 s d_{2}} \tilde{G}_{1}\left(\gamma_{L}\right) \\
+C s^{2} \int_{Q_{L}} e^{2 s \phi}\left(\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2}+|\nabla(a \chi)|^{2}+|\Delta(a \chi)|^{2}+|\nabla(b \chi)|^{2}+|\Delta(b \chi)|^{2}\right) d x d t \tag{3.30}
\end{gather*}
$$

with $\tilde{G}_{1}\left(\gamma_{L}\right)=\int_{\gamma_{L} \times(0, T)} \sum_{i=0}^{2}\left|\partial_{\nu} y_{i}\right|^{2} d \sigma d t+\tilde{G}_{0}\left(\omega^{\prime}\right)$.
As in the third step of Theorem 3.1 when we get (3.18), by Lemma 3.1 we have

$$
\begin{gathered}
\sum_{i=0}^{1} \int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(\left|y_{i}(\theta)\right|^{2}+\left|\nabla y_{i}(\theta)\right|^{2}+\left|\Delta y_{i}(\theta)\right|^{2}+\left|z_{i}(\theta)\right|^{2}+\left|\nabla z_{i}(\theta)\right|^{2}+\left|\Delta z_{i}(\theta)\right|^{2}\right) d x \\
\leq C s^{2} \sum_{i=0}^{2}\left(I\left(y_{i}\right)+I\left(z_{i}\right)\right)
\end{gathered}
$$

So from (3.30)

$$
\begin{gather*}
\sum_{i=0}^{1} \int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(\left|y_{i}(\theta)\right|^{2}+\left|\nabla y_{i}(\theta)\right|^{2}+\left|\Delta y_{i}(\theta)\right|^{2}+\left|z_{i}(\theta)\right|^{2}+\left|\nabla z_{i}(\theta)\right|^{2}+\left|\Delta z_{i}(\theta)\right|^{2}\right) d x \\
\leq C s^{4} \int_{Q_{L}} e^{2 s \phi}\left(\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2}+|\nabla(a \chi)|^{2}+|\Delta(a \chi)|^{2}+|\nabla(b \chi)|^{2}+|\Delta(b \chi)|^{2}\right) d x d t \\
+C s^{5} e^{2 s d_{1}}+C s^{4} e^{2 s d_{2}} \tilde{G}_{1}\left(\gamma_{L}\right) \tag{3.31}
\end{gather*}
$$

Now we estimate $\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2}+|\nabla(a \chi)|^{2}+|\Delta(a \chi)|^{2}+|\nabla(b \chi)|^{2}+|\Delta(b \chi)|^{2}\right) d x$ as in the fourth step of Theorem 3.1. We consider two sets of initial conditions $A$ and $B$ and the corresponding solutions $V_{A}, \tilde{V}_{A}, V_{B}, \tilde{V}_{B}$ of (1.1). As in (3.20)-(3.23) we get

$$
\begin{aligned}
& \int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2} d x \leq C \int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(\left|\partial_{t} y_{0 A}(\theta)\right|^{2}+\left|\partial_{t} y_{0 B}(\theta)\right|^{2}+\left|\Delta y_{0 A}(\theta)\right|^{2}\right. \\
&+\left|\Delta y_{0 B}(\theta)\right|^{2}+\left|y_{0 A}(\theta)\right|^{2}+\left|y_{0 B}(\theta)\right|^{2}+\left|\partial_{t} z_{0 A}(\theta)\right|^{2}+\left|\partial_{t} z_{0 B}(\theta)\right|^{2}+\left|\Delta z_{0 A}(\theta)\right|^{2} \\
&\left.+\left|\Delta z_{0 B}(\theta)\right|^{2}+\left|z_{0 A}(\theta)\right|^{2}+\left|z_{0 B}(\theta)\right|^{2}\right) d x+C e^{2 s d_{1}}
\end{aligned}
$$

So from (3.31) we obtain

$$
\begin{gather*}
\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2} d x \leq C s^{5} e^{2 s d_{1}}+C s^{4} e^{2 s d_{2}} G_{2}\left(\gamma_{L}\right) \\
\left.+C s^{4} \int_{Q_{L}} e^{2 s \phi}\left(\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2}+|\nabla(a \chi)|^{2}+|\Delta(a \chi)|^{2}+|\nabla(b \chi)|^{2}+|\Delta(b \chi)|^{2}\right)\right) d x d t \tag{3.32}
\end{gather*}
$$

with $G_{2}\left(\gamma_{L}\right)=\tilde{G}_{1 A}\left(\gamma_{L}\right)+\tilde{G}_{1 B}\left(\gamma_{L}\right)$.
We apply the same ideas for $\nabla(a \chi), \nabla(b \chi), \Delta(a \chi), \Delta(b \chi)$.
For any integer $1 \leq i \leq n$, taking the space derivative with respect to $x_{i}$ in (3.20), we obtain

$$
\begin{gather*}
\partial_{x_{i}}(a \chi) \eta \phi_{1}\left(\tilde{u}_{A} \tilde{w}_{B}-\tilde{u}_{B} \tilde{w}_{A}\right)+a \eta \chi \phi_{1} \partial_{x_{i}}\left(\tilde{u}_{A} \tilde{w}_{B}-\tilde{u}_{B} \tilde{w}_{A}\right) \\
\quad=\partial_{x_{i}}\left(\tilde{w}_{B}\left(\partial_{t} y_{0 A}-\Delta y_{0 A}-\alpha \phi_{1} y_{0 A}-\beta \phi_{2} z_{0 A}-R_{1 A}\right)\right) \\
-\partial_{x_{i}}\left(\tilde{w}_{A}\left(\partial_{t} y_{0 B}-\Delta y_{0 B}-\alpha \phi_{1} y_{0 B}-\beta \phi_{2} z_{0 B}-R_{1 B}\right) .\right. \tag{3.33}
\end{gather*}
$$

Therefore by hypothesis (3.3) we deduce that

$$
\begin{gathered}
\int_{\Omega_{L}} e^{2 s \phi(\theta)}|\nabla(a \chi)|^{2} d x \leq C \int_{\Omega_{L}} e^{2 s \phi(\theta)}(a \chi)^{2} d x+C e^{2 s d_{1}} \\
+\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(\left|\nabla \partial_{t} y_{0 A}(\theta)\right|^{2}+\left|\nabla \Delta y_{0 A}(\theta)\right|^{2}+\left|\nabla y_{0 A}(\theta)\right|^{2}+\left|\nabla z_{0 A}(\theta)\right|^{2}\right. \\
\left.+\left|\nabla \partial_{t} y_{0 B}(\theta)\right|^{2}+\left|\nabla \Delta y_{0 B}(\theta)\right|^{2}+\left|\nabla y_{0 B}(\theta)\right|^{2}+\left|\nabla z_{0 B}(\theta)\right|^{2}\right) d x .
\end{gathered}
$$

From (3.31)-(3.32) we get

$$
\begin{aligned}
& \int_{\Omega_{L}} e^{2 s \phi(\theta)}|\nabla(a \chi)|^{2} d x \leq C s^{5} e^{2 s d_{1}}+C s^{4} e^{2 s d_{2}} G_{2}\left(\gamma_{L}\right)+C e^{2 s d_{2}}\left(\left\|y_{0 A}(\theta)\right\|_{H^{3}\left(\Omega_{L}\right)}^{2}+\left\|y_{0 B}(\theta)\right\|_{H^{3}\left(\Omega_{L}\right)}^{2}\right) \\
& +C s^{4} \int_{Q_{L}} e^{2 s \phi}\left(\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2}+|\nabla(a \chi)|^{2}+|\Delta(a \chi)|^{2}+|\nabla(b \chi)|^{2}+|\Delta(b \chi)|^{2}\right) d x d t .
\end{aligned}
$$

Taking again the space derivative with respect to $x_{i}$ in (3.33) we obtain

$$
\begin{align*}
& \int_{\Omega_{L}} e^{2 s \phi(\theta)}|\Delta(a \chi)|^{2} d x \leq C s^{5} e^{2 s d_{1}}+C s^{4} e^{2 s d_{2}} G_{2}\left(\gamma_{L}\right)+C e^{2 s d_{2}}\left(\left\|y_{0 A}(\theta)\right\|_{H^{4}\left(\Omega_{L}\right)}+\left\|y_{0 B}(\theta)\right\|_{H^{4}\left(\Omega_{L}\right)}\right) \\
& +C s^{4} \int_{Q_{L}} e^{2 s \phi}\left(\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2}+|\nabla(a \chi)|^{2}+|\Delta(a \chi)|^{2}+|\nabla(b \chi)|^{2}+|\Delta(b \chi)|^{2}\right) d x d t . \tag{3.35}
\end{align*}
$$

Similarly for $b$, so from $(3.32),(3.34),(3.35)$ we have

$$
\begin{gathered}
\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2}+|\nabla(a \chi)|^{2}+|\Delta(a \chi)|^{2}+|\nabla(b \chi)|^{2}+|\Delta(b \chi)|^{2}\right) d x \\
\leq C s^{5} e^{2 s d_{1}}+C s^{4} e^{2 s d_{2}} G_{2}\left(\gamma_{L}\right)+C e^{2 s d_{2}}\left(\left\|y_{0 A}(\theta)\right\|_{H^{4}\left(\Omega_{L}\right)}+\left\|y_{0 B}(\theta)\right\|_{H^{4}\left(\Omega_{L}\right)}\right) \\
+C s^{4} \int_{Q_{L}} e^{2 s \phi}\left(\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2}+|\nabla(a \chi)|^{2}+|\Delta(a \chi)|^{2}+|\nabla(b \chi)|^{2}+|\Delta(b \chi)|^{2}\right) d x d t .
\end{gathered}
$$

As in the proof of Theorem 3.1 (see the fourth step) we can absorb the last term of the above estimate by the left-hand side so we deduce that for $s$ sufficiently large

$$
\begin{aligned}
& \qquad \int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(\left(a^{2}+b^{2}+c^{2}+d^{2}\right) \chi^{2}+|\nabla(a \chi)|^{2}+|\Delta(a \chi)|^{2}+|\nabla(b \chi)|^{2}+|\Delta(b \chi)|^{2}\right) d x \\
& \leq C s^{5} e^{2 s d_{1}}+C s^{4} e^{2 s d_{2}} G_{3}\left(\gamma_{L}\right) \\
& \text { with } G_{3}\left(\gamma_{L}\right)=G_{2}\left(\gamma_{L}\right)+\left\|y_{0 A}(\theta)\right\|_{H^{4}\left(\Omega_{L}\right)}+\left\|y_{0 B}(\theta)\right\|_{H^{4}\left(\Omega_{L}\right)} \text { and we conclude as for Theorem 3.1. }
\end{aligned}
$$

3.3.3. Proof of Theorem 3.3. Let $V_{A}=\left(u_{A}, w_{A}\right)$ (resp. $\left.\tilde{V}_{A}=\left(\widetilde{u}_{A}, \widetilde{w}_{A}\right)\right)$ be a solution of (1.1) associated with $(\rho, G, A)$ (resp. $\left.\left(\tilde{\rho_{2}}, G, A\right)\right)$ and $V_{B}=\left(u_{B}, w_{B}\right)$ (resp. $\left.\tilde{V}_{B}=\left(\widetilde{u}_{B}, \widetilde{w}_{B}\right)\right)$ be a solution of (1.1) associated with $(\rho, G, B)$ (resp. $\left(\tilde{\rho_{2}}, G, B\right)$ ). As for Theorems 3.1 and 3.2 we decompose the proof in several steps.

- First step: We keep the notations of (3.12)

$$
V=(u, w)=V_{A}, \tilde{V}=(\tilde{u}, \tilde{w})=\tilde{V}_{A}, U=u-\tilde{u}, W=w-\tilde{w}, b=\beta-\tilde{\beta}, c=\gamma-\tilde{\gamma}, d=\delta-\tilde{\delta}
$$

and now define

$$
f_{1}=\phi_{1}-\tilde{\phi_{1}}
$$

We still define (see (3.14)) (for $i=0,1,2$ )

$$
y_{0}=\eta \chi U, z_{0}=\eta \chi W, y_{i}=\partial_{t}^{i} y_{0}, z_{i}=\partial_{t}^{i} z_{0}
$$

The systems (3.13), (3.15), (3.16) become

$$
\left\{\begin{array}{l}
\partial_{t} U=\Delta U+\alpha \phi_{1} U+\beta \phi_{2} W+\alpha f_{1} \tilde{u}+b \phi_{2} \tilde{w} \text { in } Q \\
\partial_{t} W=\Delta W+\gamma \phi_{3} U+\delta \phi_{4} W+c \phi_{3} \tilde{u}+d \phi_{4} \tilde{w} \text { in } Q \\
U=W=0 \text { in } \Sigma
\end{array}\right.
$$

and $\left(y_{i}, z_{i}\right)$ for $i=0,1$ satisfy the following systems

$$
\left\{\begin{array}{l}
\partial_{t} y_{0}=\Delta y_{0}+\alpha \phi_{1} y_{0}+\beta \phi_{2} z_{0}+\alpha f_{1} \eta \chi \tilde{u}+b \phi_{2} \eta \chi \tilde{w}+S_{1} \text { in } Q_{L}  \tag{3.36}\\
\partial_{t} z_{0}=\Delta z_{0}+\gamma \phi_{3} y_{0}+\delta \phi_{4} z_{0}+c \phi_{3} \eta \chi \tilde{u}+d \phi_{4} \eta \chi \tilde{w}+S_{2} \text { in } Q_{L} \\
y_{0}=z_{0}=0 \text { on } \partial \Omega_{L} \times(0, T)
\end{array}\right.
$$

with

$$
S_{1}=R_{1}=-(\Delta \chi) \eta U-2 \eta \nabla \chi \cdot \nabla U+\chi \partial_{t} \eta U, S_{2}=R_{2}=-(\Delta \chi) \eta W-2 \eta \nabla \chi \cdot \nabla W+\chi \partial_{t} \eta W .
$$

We have

$$
\left\{\begin{array}{l}
\partial_{t} y_{1}=\Delta y_{1}+\alpha \phi_{1} y_{1}+\beta \phi_{2} z_{1}+S_{3} \text { in } Q_{L} \\
\partial_{t} z_{1}=\Delta z_{1}+\gamma \phi_{3} y_{1}+\delta \phi_{4} z_{1}+S_{4} \text { in } Q_{L} \\
y_{1}=z_{1}=0 \text { on } \partial \Omega_{L} \times(0, T)
\end{array}\right.
$$

with

$$
\begin{gathered}
S_{3}=\partial_{t}\left(\alpha f_{1} \eta \chi \tilde{u}+b \phi_{2} \eta \chi \tilde{w}\right)+\partial_{t} S_{1}+\alpha y_{0} \partial_{t} \phi_{1}+\beta z_{0} \partial_{t} \phi_{2}, \\
S_{4}=R_{4}=\partial_{t}\left(c \phi_{3} \eta \chi \tilde{u}+d \phi_{4} \eta \chi \tilde{w}\right)+\partial_{t} S_{2}+\gamma y_{0} \partial_{t} \phi_{3}+\delta z_{0} \partial_{t} \phi_{4} .
\end{gathered}
$$

We also have

$$
\left\{\begin{array}{l}
\partial_{t} y_{2}=\Delta y_{2}+\alpha \phi_{1} y_{2}+\beta \phi_{2} z_{2}+\partial_{t} S_{3}+\alpha \partial_{t} \phi_{1} y_{1}+\beta \partial_{t} \phi_{2} z_{1} \text { in } Q_{L} \\
\partial_{t} z_{2}=\Delta z_{2}+\gamma \phi_{3} y_{2}+\delta \phi_{4} z_{2}+\partial_{t} S_{4}+\gamma \partial_{t} \phi_{3} y_{1}+\delta \partial_{t} \phi_{4} z_{1} \text { in } Q_{L} \\
y_{2}=z_{2}=0 \text { on } \partial \Omega_{L} \times(0, T) .
\end{array}\right.
$$

- In the second step we estimate $\sum_{i=0}^{2}\left(I\left(y_{i}\right)+I\left(z_{i}\right)\right)$ as in Theorem 3.1 and we get

$$
\begin{gather*}
\sum_{i=0}^{2}\left(I\left(y_{i}\right)+I\left(z_{i}\right)\right) \leq C \int_{Q_{L}} e^{2 s \phi}\left(b^{2}+c^{2}+d^{2}\right) \chi^{2} d x d t+C \int_{Q_{L}} e^{2 s \phi} \chi^{2}\left(\sum_{i=0}^{2}\left(\partial_{t}^{i} f_{1}\right)^{2}\right) d x d t \\
+C s^{3} e^{2 s d_{1}}+C s e^{2 s d_{2}} \tilde{F}_{0}\left(\gamma_{L}\right) \tag{3.37}
\end{gather*}
$$

with $\tilde{F}_{0}\left(\gamma_{L}\right)=\int_{\gamma_{L} \times(0, T)} \sum_{i=0}^{2}\left(\left|\partial_{\nu} y_{i}\right|^{2}+\left|\partial_{\nu} z_{i}\right|^{2}\right) d \sigma d t$ (nearly same definition as before since (3.17)). Now following the proof of Theorem 3.1 we look at (3.18) in this context. First note that because of the fourth step of this proof, we can no longer use the estimates of the Laplacian terms in (3.18) and contrary to Theorems 3.1, 3.2, 3.4, we have to take care of the powers of $s$ on the right-hand sides of our estimates. In fact we could only look at the estimate of $\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left|\partial_{t} z_{0}(\theta)\right|^{2} d x$ but because of the remarks given just after the proof of this theorem, we will keep more terms. So
we will not estimate $\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left|\partial_{t} z_{0}(\theta)\right|^{2} d x$ as in Theorems 3.1, 3.2, 3.4 (see the third step of Theorem 3.1) and for that, we need to differentiate twice $y_{0}$ and $z_{0}$ with respect to $t$. Thus

$$
\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left|\partial_{t} z_{0}(\theta)\right|^{2} d x \leq C s \int_{Q_{L}} e^{2 s \phi}\left|z_{1}\right|^{2} d x d t+\frac{C}{s} \int_{Q_{L}} e^{2 s \phi}\left|z_{2}\right|^{2} \leq \frac{C}{s^{2}}\left(I\left(z_{1}\right)+I\left(z_{2}\right)\right)
$$

So we have (coming from Lemma 3.1 as in (3.18)) and by (3.37)

$$
\begin{gathered}
\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(\left.y_{0}(\theta)\right|^{2}+\left|\partial_{t} y_{0}(\theta)\right|^{2}+\left|z_{0}(\theta)\right|^{2}+\left|\partial_{t} z_{0}(\theta)\right|^{2}\right) d x \leq \frac{C}{s^{2}} \sum_{i=0}^{2}\left(I\left(y_{i}\right)+I\left(z_{i}\right)\right) \\
\leq \frac{C}{s^{2}} \int_{Q_{L}} e^{2 s \phi}\left(b^{2}+c^{2}+d^{2}\right) \chi^{2} d x d t+\frac{C}{s^{2}} \int_{Q_{L}} e^{2 s \phi} \chi^{2}\left(\sum_{i=0}^{2}\left(\partial_{t}^{i} f_{1}\right)^{2}\right) d x d t+C s e^{2 s d_{1}}+\frac{C}{s} e^{2 s d_{2}} \tilde{F}_{0}\left(\gamma_{L}\right) .
\end{gathered}
$$

Since $\phi \leq \phi(\theta)$ we get

$$
\begin{gather*}
\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(\left|y_{0}(\theta)\right|^{2}+\left|\partial_{t} y_{0}(\theta)\right|^{2}+\left|z_{0}(\theta)\right|^{2}+\left|\partial_{t} z_{0}(\theta)\right|^{2}\right) d x \leq \frac{C}{s^{2}} \int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(b^{2}+c^{2}+d^{2}\right) \chi^{2} d x \\
+\frac{C}{s^{2}} \int_{Q_{L}} e^{2 s \phi(\theta)} \chi^{2}\left(\sum_{i=0}^{2}\left(\partial_{t}^{i} f_{1}\right)^{2}\right) d x d t+C s e^{2 s d_{1}}+\frac{C}{s} e^{2 s d_{2}} \tilde{F}_{0}\left(\gamma_{L}\right) \tag{3.38}
\end{gather*}
$$

- Third step: here we estimate $\int_{\Omega_{L}} e^{2 s \phi(\theta)} \chi^{2}\left(b^{2}+c^{2}+d^{2}\right) d x$ as in Theorem 3.1 with two different sets of conditions $A$ and $B$. We recall that each function $f$ precendently defined is denoted either $f_{A}$ or $f_{B}$ when it is related either by the conditions $A$ or $B$.
For the coefficient $b$ we can write from the first equation of (3.36)

$$
\begin{gathered}
-b \eta \chi \phi_{2}\left(\tilde{u}_{A} \tilde{w}_{B}-\tilde{u}_{B} \tilde{w}_{A}\right)=\tilde{u}_{B}\left(\partial_{t} y_{0 A}-\Delta y_{0 A}-\alpha \phi_{1} y_{0 A}-\beta \phi_{2} z_{0 A}-\alpha f_{1} \eta \chi \tilde{u}_{A}-S_{1 A}\right) \\
-\tilde{u}_{A}\left(\partial_{t} y_{0 B}-\Delta y_{0 B}-\alpha \phi_{1} y_{0 B}-\beta \phi_{2} z_{0 B}-\alpha f_{1} \eta \chi \tilde{u}_{B}-S_{1 B}\right)
\end{gathered}
$$

Note that the terms in $f_{1}$ disappear in the above equality. For the coefficients $c$ and $d$ we use the second equation of (3.36) and proceed as in Theorem 3.1. Indeed, for example for $c$, we have

$$
\begin{gathered}
c \eta \chi \phi_{3}\left(\tilde{u}_{A} \tilde{w}_{B}-\tilde{u}_{B} \tilde{w}_{A}\right)=\tilde{w}_{B}\left(\partial_{t} z_{0 A}-\Delta z_{0 A}-\gamma \phi_{3} y_{0 A}-\delta \phi_{4} z_{0 A}-S_{2 A}\right) \\
-\tilde{w}_{A}\left(\partial_{t} z_{0 B}-\Delta z_{0 B}-\gamma \phi_{3} y_{0 B}-\delta \phi_{4} z_{0 B}-S_{2 B}\right) .
\end{gathered}
$$

Therefore by hypothesis (3.3) and (3.38) we obtain for $s$ sufficiently large

$$
\begin{equation*}
\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(b^{2}+c^{2}+d^{2}\right) \chi^{2} d x \leq \frac{C}{s^{2}} \int_{Q_{L}} e^{2 s \phi(\theta)} \chi^{2}\left(\sum_{i=0}^{2}\left(\partial_{t}^{i} f_{1}\right)^{2}\right) d x d t+C s e^{2 s d_{1}}+C e^{2 s d_{2}} F_{2}(\theta) \tag{3.39}
\end{equation*}
$$

with $F_{2}(\theta)=\tilde{F}_{0 A}\left(\gamma_{L}\right)+\tilde{F}_{0 B}\left(\gamma_{L}\right)+\left\|\Delta y_{0 A}(\theta)\right\|_{L^{2}\left(\Omega_{L}\right)}+\left\|\Delta y_{0 B}(\theta)\right\|_{L^{2}\left(\Omega_{L}\right)}+\left\|\Delta z_{0 A}(\theta)\right\|_{L^{2}\left(\Omega_{L}\right)}+$ $\left\|\Delta z_{0 B}(\theta)\right\|_{L^{2}\left(\Omega_{L}\right)}$.

- Fourth step: we estimate now $\int_{Q_{L}} e^{2 s \phi(\theta)} \chi^{2}\left(\sum_{i=0}^{2}\left(\partial_{t}^{i} f_{1}\right)^{2}\right) d x d t$. Here again we use the two different sets of coefficients $A$ and $B$. From (3.36) for $y_{0 A}$ and $y_{0 B}$, we get

$$
\begin{align*}
& \alpha \eta \chi f_{1}\left(\tilde{u}_{A} \tilde{w}_{B}-\tilde{u}_{B} \tilde{w}_{A}\right)=\tilde{w}_{B}\left(\partial_{t} y_{0 A}-\Delta y_{0 A}-\alpha \phi_{1} y_{0 A}-\beta \phi_{2} z_{0 A}-S_{1 A}\right) \\
&-\tilde{w}_{A}\left(\partial_{t} y_{0 B}-\Delta y_{0 B}-\alpha \phi_{1} y_{0 B}-\beta \phi_{2} z_{0 B}-S_{1 B}\right) \tag{3.40}
\end{align*}
$$

Applying (3.40) for $t=\theta$, by hypotheses (3.3) and (3.9), using again (3.38) we obtain

$$
\begin{align*}
& \int_{\Omega_{L}} e^{2 s \phi(\theta)} \chi^{2}\left(f_{1}(\theta)\right)^{2} d x \leq \frac{C}{s^{2}} \int_{Q_{L}} e^{2 s \phi(\theta)} \chi^{2}\left(\sum_{i=0}^{2}\left(\partial_{t}^{i} f_{1}\right)^{2}\right) d x d t \\
& +\frac{C}{s^{2}} \int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(b^{2}+c^{2}+d^{2}\right) \chi^{2} d x+C s e^{2 s d_{1}}+C e^{2 s d_{2}} F_{2}(\theta) . \tag{3.41}
\end{align*}
$$

Deriving now (3.40) with respect to $t$, we have

$$
\begin{gathered}
\left(\partial_{t} f_{1}\right) \alpha \eta\left(\tilde{u}_{A} \tilde{w}_{B}-\tilde{u}_{B} \tilde{w}_{A}\right)+f_{1} \partial_{t}\left(\alpha \eta \chi\left(\tilde{u}_{A} \tilde{w}_{B}-\tilde{u}_{B} \tilde{w}_{A}\right)\right)=\partial_{t}\left(\tilde{w}_{B}\left(\partial_{t} y_{0 A}-\Delta y_{0 A}-\alpha \phi_{1} y_{0 A}-\beta \phi_{2} z_{0 A}-S_{1 A}\right)\right. \\
\left.-\tilde{w}_{A}\left(\partial_{t} y_{0 B}-\Delta y_{0 B}-\alpha \phi_{1} y_{0 B}-\beta \phi_{2} z_{0 B}-S_{1 B}\right)\right)
\end{gathered}
$$

and evaluating this last equation at $t=\theta$, still by hypotheses (3.3) and (3.9), we get

$$
\begin{align*}
& \int_{\Omega_{L}} e^{2 s \phi(\theta)} \chi^{2}\left(\partial_{t} f_{1}(\theta)\right)^{2} d x \leq C \int_{\Omega_{L}} e^{2 s \phi(\theta)} \chi^{2}\left(f_{1}(\theta)\right)^{2} d x \\
+ & C \int_{\Omega_{L}} e^{2 s \phi(\theta)} \sum_{i=0}^{1}\left(\left|\partial_{t}^{i} z_{0 A}(\theta)\right|^{2}+\left|\partial_{t}^{i} z_{0 B}(\theta)\right|^{2}\right)+C e^{2 s d_{2}} F_{3}(\theta) \tag{3.42}
\end{align*}
$$

with
$F_{3}(\theta)=\sum_{k=0}^{2}\left(\left\|\partial_{t}^{k} y_{0 A}(\theta)\right\|_{L^{2}\left(\Omega_{L}\right)}^{2}+\left\|\partial_{t}^{k} y_{0 B}(\theta)\right\|_{L^{2}\left(\Omega_{L}\right)}^{2}\right)+\sum_{k=0}^{1}\left(\left\|\partial_{t}^{k} \Delta y_{0 A}(\theta)\right\|_{L^{2}\left(\Omega_{L}\right)}^{2}+\left\|\partial_{t}^{k} \Delta y_{0 B}(\theta)\right\|_{L^{2}\left(\Omega_{L}\right)}^{2}\right)$.
From (3.38), (3.41) and (3.42) we have

$$
\begin{gather*}
\int_{\Omega_{L}} e^{2 s \phi(\theta)} \chi^{2}\left(\left(f_{1}(\theta)\right)^{2}+\left(\partial_{t} f_{1}(\theta)\right)^{2}\right) d x \leq \frac{C}{s^{2}} \int_{Q_{L}} e^{2 s \phi(\theta)} \chi^{2}\left(\sum_{i=0}^{2}\left(\partial_{t}^{i} f_{1}\right)^{2}\right) d x d t \\
\quad+\frac{C}{s^{2}} \int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(b^{2}+c^{2}+d^{2}\right) \chi^{2} d x+C s e^{2 s d_{1}}+C e^{2 s d_{2}} F_{4}(\theta) \tag{3.43}
\end{gather*}
$$

with $F_{4}(\theta)=F_{2}(\theta)+F_{3}(\theta)$.
Moreover by Taylor's formula, we have

$$
f_{1}(t)=f_{1}(\theta)+\partial_{t} f_{1}(\theta)(t-\theta)+\partial_{t}^{2} f_{1}\left(c_{\theta}\right) \frac{(t-\theta)^{2}}{2} \text { and } \partial_{t} f_{1}(t)=\partial_{t} f_{1}(\theta)+\partial_{t}^{2} f_{1}\left(c_{\theta}^{\prime}\right)(t-\theta)
$$

with $c_{\theta}, c_{\theta}^{\prime} \in[0, T]$. Therefore, since $\tilde{\phi}_{1} \in \Lambda_{3}\left(M_{3}\right)$ the admissible set of coefficients, we get

$$
\left.\sum_{i=0}^{2}\left(\partial_{t}^{i} f_{1}\right)^{2} \leq C\left(f_{1}(\theta)\right)^{2}+\left(\partial_{t} f_{1}(\theta)\right)^{2}\right)
$$

so from (3.43) we deduce that for $s$ sufficiently large

$$
\begin{equation*}
\int_{Q_{L}} e^{2 s \phi(\theta)} \chi^{2}\left(\sum_{i=0}^{2}\left(\partial_{t}^{i} f_{1}\right)^{2}\right) d x d t \leq \frac{C}{s^{2}} \int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(b^{2}+c^{2}+d^{2}\right) \chi^{2} d x+C s e^{2 s d_{1}}+C e^{2 s d_{2}} F_{4}(\theta) \tag{3.44}
\end{equation*}
$$

- Fifth and last step: now addding (3.39) and (3.44) we obtain

$$
\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(b^{2}+c^{2}+d^{2}\right) \chi^{2} d x+\int_{Q_{L}} e^{2 s \phi(\theta)} \chi^{2}\left(\sum_{i=0}^{2}\left(\partial_{t}^{i} f_{1}\right)^{2}\right) d x d t \leq C s e^{2 s d_{1}}+C e^{2 s d_{2}} F_{4}(\theta)
$$

So

$$
\int_{\Omega_{l}} e^{2 s \phi(\theta)}\left(b^{2}+c^{2}+d^{2}\right) d x+\int_{\Omega_{l} \times(0, T)} e^{2 s \phi(\theta)}\left(\sum_{i=0}^{2}\left(\partial_{t}^{i} f_{1}\right)^{2}\right) d x d t \leq C s e^{2 s d_{1}}+C e^{2 s d_{2}} F_{4}(\theta)
$$

and we conclude as for Theorem 3.1 by optimizing the above inequality with respect to $s$.

Remark 2. - If the admissible set of coefficients is $\Lambda_{3}^{\prime}\left(M_{3}\right)$ (thus less restrictive than $\Lambda_{3}\left(M_{3}\right)$ ), then we would have to derive $p-1$ times (3.40) with respect to $t$ and that would demand more regularity for the observation terms on $u$.

- On the contrary if the admissible set of coefficients is $\Lambda_{3}^{\prime \prime}\left(M_{3}\right)$, so more restrictive than $\Lambda_{3}\left(M_{3}\right)$ (or if $\tilde{\phi}_{1} \in C^{2}([0, T])$ is such that $\tilde{\phi}_{1}(\theta) \neq \phi_{1}(\theta)$ and $\frac{\sup _{t \in[0, T]}\left|\partial_{t}^{i}\left(\phi_{1}-\tilde{\phi}_{1}\right)(t)\right|}{\left|\phi_{1}(\theta)-\tilde{\phi}_{1}(\theta)\right|} \leq M_{3}$ for $i=0,1,2$ ), then we can drop (3.42) and (3.43) in the above proof. Therefore the result remains valid without $F_{3}(\theta)$ and so $F_{4}(\theta)=F_{2}(\theta)$. Thus the observations terms on $u$ are only $\left\|\left(u_{A}-\tilde{u_{A}}\right)(\cdot, \theta)\right\|_{H^{2}\left(\Omega_{L}\right)}^{2}$ and $\left\|\left(u_{B}-\tilde{u_{B}}\right)(\cdot, \theta)\right\|_{H^{2}\left(\Omega_{L}\right)}^{2}$.
3.3.4. Proof of Theorem 3.4. Here again we follow the method described before. Let $V_{A}=\left(u_{A}, w_{A}\right)$ (resp. $\left.\tilde{V}_{A}=\left(\tilde{u}_{A}, \tilde{w}_{A}\right)\right)$ be a strong solution of (1.3) associated with $(\rho, G, A, \Theta)$ defined by (1.2) and (1.4) (resp. $\left.\left(\tilde{\rho}_{3}, G, A, \tilde{\Theta}\right)\right)$. Consider also $V_{B}=\left(u_{B}, w_{B}\right)$ (resp. $\left.\tilde{V}_{B}=\left(\tilde{u}_{B}, \tilde{w}_{B}\right)\right)$ a strong solution of (1.3) associated with $(\rho, G, B, \Theta)\left(\operatorname{resp} .\left(\tilde{\rho_{3}}, G, B, \tilde{\Theta}\right)\right)$.
- As before, in a first step we define

$$
V=(u, w)=V_{A}, \tilde{V}=(\tilde{u}, \tilde{w})=\tilde{V}_{A}, U=u-\tilde{u}, W=w-\tilde{w}, b=\beta-\tilde{\beta}, c=\gamma-\tilde{\gamma}, d=\delta-\tilde{\delta}
$$

and also

$$
H=\Theta_{1}-\tilde{\Theta_{1}}=\nabla h \text { with } h=\xi_{1}-\tilde{\xi}_{1} .
$$

Recall that for $i=0,1$,

$$
y_{0}=\eta \chi U, z_{0}=\eta \chi W, y_{1}=\partial_{i} y_{0}, z_{1}=\partial_{t} z_{0} .
$$

Then

$$
\left\{\begin{array}{l}
\partial_{t} y_{0}=\Delta y_{0}+\alpha \phi_{1} y_{0}+\beta \phi_{2} z_{0}+\Theta_{1} \cdot \nabla y_{0}+\Theta_{2} \cdot \nabla z_{0}+b \eta \chi \phi_{2} \tilde{w}+\eta \nabla(\chi h) \cdot \nabla \tilde{u}+T_{1} \text { in } Q_{L},  \tag{3.45}\\
\partial_{t} z_{0}=\Delta z_{0}+\gamma \phi_{3} y_{0}+\delta \phi_{4} z_{0}+\Theta_{3} \cdot \nabla y_{0}+\Theta_{4} \cdot \nabla z_{0}+c \eta \chi \phi_{3} \tilde{u}+d \eta \chi \phi_{4} \tilde{w}+T_{2} \text { in } Q_{L} \\
y_{0}=z_{0}=0 \text { on } \partial \Omega_{L} \times(0, T)
\end{array}\right.
$$

with

$$
\begin{aligned}
T_{1}= & \left(\partial_{t} \eta\right) \chi U-(\Delta \chi) \eta U-2 \nabla \chi \cdot \nabla(\eta U)-\eta U \Theta_{1} \cdot \nabla \chi-\eta W \Theta_{2} \cdot \nabla \chi-\eta h \nabla \tilde{u} \cdot \nabla \chi \\
& T_{2}=\left(\partial_{t} \eta\right) \chi W-(\Delta \chi) \eta W-2 \nabla \chi \cdot \nabla(\eta W)-\eta U \Theta_{3} \cdot \nabla \chi-\eta W \Theta_{4} \cdot \nabla \chi
\end{aligned}
$$

And

$$
\left\{\begin{array}{l}
\partial_{t} y_{1}=\Delta y_{1}+\alpha \phi_{1} y_{1}+\beta \phi_{2} z_{1}+\Theta_{1} \cdot \nabla y_{1}+\Theta_{2} \cdot \nabla z_{1}+b \eta \chi \partial_{t}\left(\phi_{2} \tilde{w}\right)+\eta \nabla(\chi h) \cdot \nabla \partial_{t} \tilde{u}+T_{3} \text { in } Q_{L}, \\
\partial_{t} z_{1}=\Delta z_{1}+\gamma \phi_{3} y_{1}+\delta \phi_{4} z_{1}+\Theta_{3} \cdot \nabla y_{1}+\Theta_{4} \cdot \nabla z_{1}+c \eta \chi \partial_{t}\left(\phi_{3} \tilde{u}\right)+d \eta \chi \partial_{t}\left(\phi_{4} \tilde{w}\right)+T_{4} \text { in } Q_{L}, \\
y_{1}=z_{1}=0 \text { on } \partial \Omega_{L} \times(0, T)
\end{array}\right.
$$

with

$$
\begin{gathered}
T_{3}=\alpha y_{0} \partial_{t} \phi_{1}+\beta z_{0} \partial_{t} \phi_{2}+\partial_{t} \eta\left(b \chi \phi_{2} \tilde{w}+\nabla(\chi h) \cdot \nabla \tilde{u}\right)+\partial_{t} T_{1} \\
T_{4}=\gamma y_{0} \partial_{t} \phi_{3}+\delta z_{0} \partial_{t} \phi_{4}+\partial_{t} \eta\left(c \chi \phi_{3} \tilde{u}+d \chi \phi_{4} \tilde{w}\right)+\partial_{t} T_{2} .
\end{gathered}
$$

Thus we obtain

$$
\begin{gathered}
\sum_{i=0}^{1}\left(I\left(y_{i}\right)+I\left(z_{i}\right)\right) \leq C \int_{Q_{L}} e^{2 s \phi}\left(\left(b^{2}+c^{2}+d^{2}\right) \chi^{2}+|\nabla(\chi h)|^{2}\right) d x d t+C s^{3} e^{2 s d_{1}} \\
+C s \sum_{i=0}^{1} \int_{\gamma_{L} \times(0, T)} e^{2 s \phi}\left(\left|\partial_{\nu} y_{i}\right|^{2}+\left|\partial_{\nu} z_{i}\right|^{2}\right) d \sigma d t
\end{gathered}
$$

We deduce that (see the third step of Theorem 3.1)
$\sum_{i=0}^{1} \int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(\left|y_{i}(\theta)\right|^{2}+\left|\nabla y_{i}(\theta)\right|^{2}+\left|z_{i}(\theta)\right|^{2}+\left|\nabla z_{i}(\theta)\right|^{2}\right) d x+\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(\left|\Delta y_{0}(\theta)\right|^{2}+\left|\Delta z_{0}(\theta)\right|^{2}\right) d x$

$$
\begin{gather*}
\leq C s^{2} \sum_{i=0}^{1}\left(I\left(y_{i}\right)+I\left(z_{i}\right)\right) \\
\leq C s^{2} \int_{Q_{L}} e^{2 s \phi}\left(\left(b^{2}+c^{2}+d^{2}\right) \chi^{2}+|\nabla(\chi h)|^{2}\right) d x d t+C s^{5} e^{2 s d_{1}}+C s^{3} e^{2 s d_{2}} F_{0}\left(\gamma_{L}\right) \tag{3.46}
\end{gather*}
$$

with $F_{0}\left(\gamma_{L}\right)$ defined by (3.17).

- In a second step we consider the solutions of (1.3) associated with two different sets of initial conditions $A$ and $B$ and we recall that each function $f$ precendently defined is denoted either $f_{A}$ or $f_{B}$ when it is related either by the conditions $A$ or $B$. As in the fourth step of Theorem 3.1 we have a similar estimate to (3.23) for the coefficients $c$ and $d$. Indeed, writing (3.45) for $z_{0 A}$ and $z_{0 B}$, by the hypothesis (3.3) and from (3.46) we have
$\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(c^{2}+d^{2}\right) \chi^{2} d x \leq C s^{2} \int_{Q_{L}} e^{2 s \phi}\left(\left(b^{2}+c^{2}+d^{2}\right) \chi^{2}+|\nabla(\chi h)|^{2}\right) d x d t+C s^{5} e^{2 s d_{1}}+C s^{3} e^{2 s d_{2}} F_{1}\left(\gamma_{L}\right)$
with $F_{1}\left(\gamma_{L}\right)$ defined by (3.21). Now we eliminate $b$ in (3.45) in order to estimate the coefficient $h$ and we evaluate at $t=\theta$. We use here the partial differential operator $P$ defined in Lemma 3.2.

$$
\begin{gathered}
P(\chi h)=\tilde{w}_{B}(\theta) \nabla(\chi h) \cdot \nabla \tilde{u}_{A}(\theta)-\tilde{w}_{A}(\theta) \nabla(\chi h) \cdot \nabla \tilde{u}_{B}(\theta) \\
P(\chi h)=\tilde{w}_{B}(\theta)\left[\partial_{t} y_{0 A}(\theta)-\Delta y_{0 A}(\theta)-\alpha \phi_{1} y_{0 A}(\theta)-\beta \phi_{2} z_{0 A}(\theta)-\Theta_{1} \cdot \nabla y_{0 A}(\theta)-\Theta_{2} \cdot \nabla z_{0 A}(\theta)-T_{1 A}(\theta)\right] \\
-\tilde{w}_{A}(\theta)\left[\partial_{t} y_{0 B}(\theta)-\Delta y_{0 B}(\theta)-\alpha \phi_{1} y_{0 B}(\theta)-\beta \phi_{2} z_{0 B}(\theta)-\Theta_{1} \cdot \nabla y_{0 B}(\theta)-\Theta_{2} \cdot \nabla z_{0 B}(\theta)-T_{1 B}(\theta)\right] .
\end{gathered}
$$

From Lemma 3.2 we have

$$
s^{2} \int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(\partial_{x_{i}}(h \chi)\right)^{2} d x \leq C \int_{\Omega_{L}} e^{2 s \phi(\theta)}\left|P\left(\partial_{x_{i}}(\chi h)\right)\right|^{2} d x
$$

So taking the space derivative with respect to $x_{i}$ (for $i=1, \cdots, n$ ) in (3.48), from (3.46) we get that

$$
\begin{gathered}
s^{2} \int_{\Omega_{L}} e^{2 s \phi(\theta)}|\nabla(\chi h)|^{2} d x \leq C \int_{\Omega_{L}} e^{2 s \phi(\theta)}|\nabla(\chi h)|^{2} d x+C s^{2} \int_{Q_{L}} e^{2 s \phi}\left(\left(b^{2}+c^{2}+d^{2}\right) \chi^{2}+|\nabla(\chi h)|^{2}\right) d x d t \\
+C e^{2 s d_{2}}\left(\left\|y_{0 A}(\theta)\right\|_{H^{3}\left(\Omega_{L}\right)}^{2}+\left\|y_{0 B}(\theta)\right\|_{H^{3}\left(\Omega_{L}\right)}^{2}\right)+C s^{5} e^{2 s d_{1}}+C s^{3} e^{2 s d_{2}} F_{1}\left(\gamma_{L}\right)
\end{gathered}
$$

and for $s$ sufficiently large,

$$
\begin{align*}
& s^{2} \int_{\Omega_{L}} e^{2 s \phi(\theta)}|\nabla(\chi h)|^{2} d x \leq C s^{2} \int_{Q_{L}} e^{2 s \phi}\left(\left(b^{2}+c^{2}+d^{2}\right) \chi^{2}+|\nabla(\chi h)|^{2}\right) d x d t \\
&+C s^{5} e^{2 s d_{1}}+C s^{3} e^{2 s d_{2}} F_{5}(\theta) \tag{3.49}
\end{align*}
$$

with $F_{5}(\theta)=F_{1}\left(\gamma_{L}\right)+\left\|y_{0 A}(\theta)\right\|_{H^{3}\left(\Omega_{L}\right)}^{2}+\left\|y_{0 B}(\theta)\right\|_{H^{3}\left(\Omega_{L}\right)}^{2}$. Now we look at the coefficient $b$. We also use (3.45) for $y_{0 A}$ and $y_{0 B}$

$$
\begin{gather*}
-b \eta \chi \phi_{2}\left(\tilde{u}_{A} \tilde{w}_{B}-\tilde{u}_{B} \tilde{w}_{A}\right)=\tilde{u}_{B}\left(\partial_{t} y_{0 A}-\Delta y_{0 A}-\alpha \phi_{1} y_{0 A}-\beta \phi_{2} z_{0 A}-\Theta_{1} \cdot \nabla y_{0 A}-\Theta_{2} \cdot \nabla z_{0 A}\right. \\
\left.-\eta \nabla(\chi h) \cdot \nabla \tilde{u}_{A}-T_{1 A}\right)-\tilde{u}_{A}\left(\partial_{t} y_{0 B}-\Delta y_{0 B}-\alpha \phi_{1} y_{0 B}-\beta \phi_{2} z_{0 B}-\Theta_{1} \cdot \nabla y_{0 B}\right. \\
\left.-\Theta_{2} \cdot \nabla z_{0 B}-\eta \nabla(\chi h) \cdot \nabla \tilde{u}_{B}-T_{1 B}\right) \tag{3.50}
\end{gather*}
$$

Therefore, evaluating (3.50) at $t=\theta$, still using hypothesis (3.3), from (3.46) we get

$$
\begin{gather*}
\int_{\Omega_{L}} e^{2 s \phi(\theta)} b^{2} \chi^{2} d x \leq C \int_{\Omega_{L}} e^{2 s \phi(\theta)}|\nabla(\chi h)|^{2} d x \\
+C s^{2} \int_{Q_{L}} e^{2 s \phi}\left(\left(b^{2}+c^{2}+d^{2}\right) \chi^{2}+|\nabla(\chi h)|^{2}\right) d x d t+C s^{5} e^{2 s d_{1}}+C s^{3} e^{2 s d_{2}} F_{1}\left(\gamma_{L}\right) \tag{3.51}
\end{gather*}
$$

Thus from (3.49)-(3.51) we obtain

$$
\begin{align*}
\int_{\Omega_{L}} e^{2 s \phi(\theta)}(b \chi)^{2} d x \leq & C s^{2} \int_{Q_{L}} e^{2 s \phi}\left(\left(b^{2}+c^{2}+d^{2}\right) \chi^{2}+|\nabla(\chi h)|^{2}\right) d x d t \\
& +C s^{5} e^{2 s d_{1}}+C s^{3} e^{2 s d_{2}} F_{5}(\theta) \tag{3.52}
\end{align*}
$$

Finally adding (3.47), (3.49), (3.52), as in the proof of Theorem 3.1 we can neglect $s^{2} \int_{Q_{L}} e^{2 s \phi}\left(\left(b^{2}+\right.\right.$ $\left.\left.c^{2}+d^{2}\right) \chi^{2}+|\nabla(\chi h)|^{2}\right) d x d t$ by the left-hand side so we get

$$
\int_{\Omega_{L}} e^{2 s \phi(\theta)}\left(\left(b^{2}+c^{2}+d^{2}\right) \chi^{2}+|\nabla(\chi h)|^{2}\right) \leq C s^{5} e^{2 s d_{1}}+C s^{3} e^{2 s d_{2}} F_{5}(\theta)
$$

and we conclude as in Theorem 3.1.
