Abstract. In a previous article we gave a collection of continued fractions involving Catalan's constant. In this note we provide the general formula governing those continued fractions.

We also show that a single formula involving $\log 2$ discovered by the Ramanujan machine is part of a large family of which we provide examples.

1 Introduction

In a previous article [2] we gave a collection of continued fractions involving Catalan's constant. In this note we provide the general formula governing those continued fractions.

We also show that a single formula involving $\log 2$ discovered by the Ramanujan Machine Project [1, 3, 4] is part of a large family of which we provide examples.

2 Notations

We denote by $n!!$ the semifactorial of, i.e. the product of all the integers from 1 up to n having the same parity as n :

$$n!! = \prod_{k=0}^{\lceil \frac{n}{2} \rceil - 1} (n - 2k) = n(n-2)(n-4)\cdots$$

Because in all the following we will only apply semifactorials to odd numbers, this can simplified as:

$$n!! = \prod_{k=1}^{\frac{n+1}{2}} (2k-1) = n(n-2)(n-4)\cdots 3 \cdot 1$$

We denote by Catalan's constant by $G = 0.91596559\ldots$ and let C_n be the n -th Catalan number:

$$C_n = \frac{1}{n+1} \binom{2n}{n} = \frac{(2n)!}{(n+1)! n!} = \prod_{k=2}^n \frac{n+k}{k} \quad \text{for } n \geq 0$$

The first Catalan numbers are:

$$1, 1, 2, 5, 14, 42, 132, 429, 1430, 4862, 16796, 58786, \dots$$

3 The Explicit Formulae

Consider:

$$Q_{c,\kappa} = 2\kappa + 1 + \sum_{n=1}^{\infty} \left(\frac{-2n^2(n+2\kappa)(n+c)}{3n^2 + (3+4\kappa)n + 2\kappa + 1} \right)$$

Define the functions:

$$\begin{aligned} \Delta_{c,\kappa}(\alpha, \beta) &= \begin{cases} \alpha + \beta c & \text{if } c < 2 \\ -2c(2c-1)(2(c-\kappa)-1)^2 \Delta_{c-2,\kappa} & \text{if } c \geq 2 \\ + (8c^2 + (2-8\kappa)c - 2\kappa + 1) \Delta_{c-1,\kappa} \end{cases} \\ \Gamma_{c,\kappa}(\alpha, \beta) &= (2c-1)!! G + \Delta_{c-1,\kappa}(\alpha, \beta) \cdot \prod_{i=0}^{\kappa} (2(c-i)-1) \\ \delta_{\kappa} &= \frac{4^{\kappa-1}}{(2\kappa-1)C_{\kappa-1}} \text{ and } \rho_{\kappa} = \frac{\delta_{\kappa}(-1)^k(1-2k)}{(2k)!(2k-3)!!} \\ \alpha_{\kappa} &= \rho_{\kappa} \Delta_{k-1,1}(1, -2) \text{ and } \beta_{\kappa} = -\rho_{\kappa} (2k-3)^2 \Delta_{k-1,2}(1, 12) - \alpha_{\kappa} \\ \text{Then } \forall \kappa, c \in \mathbb{N}^2, \quad Q_{c,\kappa} &= \frac{\delta_{\kappa}(2c)!}{\Gamma_{c,\kappa}(\alpha_{\kappa}, \beta_{\kappa})} \end{aligned}$$

$Q_{c,\kappa}$ is hence an explicitly computable fraction of the form:

$$Q_{c,\kappa} = \frac{a_0}{a_1 + a_2 G} \text{ where } a_0, a_1, a_2 \in \mathbb{Z}$$

```

1 QNum[c_, k_] :=
2 2 k + 1 +
3 ContinuedFractionK[-2 n^2 (n + 2 k) (n + c), 3 n^2 + (3 + 4 k) n + 2 k +
4 1, {n, 1, 2000}];
5 Del[a_, b_, c_, k_] := If[c < 2, a + b c,
6 -2 c (2 c - 1) (2 (c - k) - 1)^2 Del[a, b, c - 2,
7 k] + (8 c^2 + (2 - 8 k) c - 2 k + 1) Del[a, b, c - 1, k]];
8
9 Gam[a_, b_, c_, k_] := ((2 c - 1)!!)^2 Catalan +
10 Product[(2 (c - j) - 1), {j, 0, k - 1}] * Del[a, b, c - 1, k];
11
12 d[k_] := 4^(k - 1)/(2 k - 1)/CatalanNumber[k - 1];
13
14 Rho[k_] := d[k] (-1)^(k) (1 - 2 k)/((2 k)! (2 k - 3)!!);

```

```

15
16 Alp[k_] := Rho[k] Del[1, -2, k - 1, 1];
17 Bet[k_] := - Rho[k] (2 k - 3)^2 Del[1, 12, k - 1, 2] - Alp[k];
18
19 QFor[c_, k_] := d[k] (2 c)!/Gam[Alp[k], Bet[k], c, k];
20
21 Union[Flatten[Table[N[QFor[c, k], 200] == N[QNum[c, k], 200], {c, 1, 20}, {
22 {k, 1, 20}]]]

```

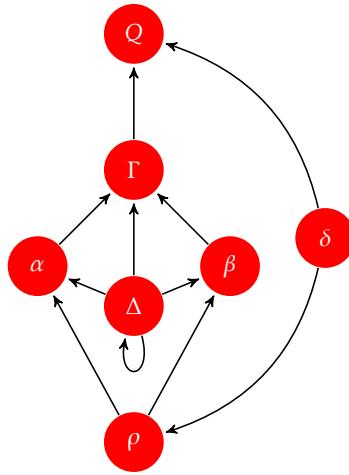

Fig. 1. Functional dependency between the functions computing $Q_{c,k}$

Note that, as described, the complexity of $\Delta_{c,k}$ is exponential in c , however, using classical Fibonacci memoization, this complexity can be reduced to $O(c)$ thereby resulting in a very efficient algorithm for computing $Q_{c,k}$.

4 Low Degree Continued Fractions Involving log 2

Continued fractions involving $\log 2$ can be also obtained with lower degree polynomials, e.g.:

$$\frac{2}{L(\frac{1}{2}, 1, c-1)} = \frac{2}{\sum_{n=0}^{\infty} \frac{e^{\pi i n}}{(n+c-1)}} = \frac{1}{2^{c-2} \log(2) - \sum_{j=1}^{c-2} \frac{2^{c-j-2}}{j}} = c + \sum_{n=1}^{\infty} \left(\frac{-2n^2}{3n+c} \right)$$

```

1 Q[c_] := c + ContinuedFractionK[-2 n^2, 3 n + c, {n, 1, 2000}];
2 For[c = 2, c <= 25,
3   r = N[Q[c], 80];
4   v = FindIntegerNullVector[{1, r, N[Log[2] r, 80]}];
5   Print[{b, c,
6     Simplify[
7       2/LerchPhi[1/2, 1, -1 + c] == -v[[1]]/(v[[2]] + Log[2] v[[3]]) ==
8       1/(Log[2] 2^(c - 2) - Sum[2^(c - j - 2)/j, {j, c - 2}])}]};
9 c++];
```

We get a similar behavior for:

$$R_c = c + \sum_{n=1}^{\infty} \left(\frac{-2n^2 - 2n}{3n + c} \right)$$

where $2^{c-4} \cdot (c-3) \cdot a_0 = a_2$ and for which we provide numerical examples in Table 5.

```

1 R[c_] := c + ContinuedFractionK[-2 n^2 - 2 n, 3 n + c, {n, 1, 2000}];
2 For[c = 3, c <= 20,
3   r = N[R[c], 200];
4   v = FindIntegerNullVector[{1, r, N[Log[2] r, 200]}];
5   Print[{c,
6     2^(c - 4)*(c - 3)*v[[1]] ==
7     v[[3]], -v[[1]]/(v[[2]] + Log[2] v[[3]])}];
8 c++];
```

5 Further Generalizations

$Q_{c,k} = Q_{1,c,k}$ is a particular case $j = 1$ of a more general continued fraction:

$$Q_{j,c,k} = j(2-j+2\kappa) + \sum_{n=1}^{\infty} \left(\frac{-2n(c+n)(j+n-1)(1-j+2\kappa+n)}{j(2-j+2\kappa)+(3+4\kappa)n+3n^2} \right)$$

When $Q_{j,c,k}$ is not a rational, $Q_{j,c,k}$ converges to:

$$Q_{j,c,k} = \begin{cases} \frac{a_0}{a_1 + a_2 G} & \text{if } j \text{ is odd} \\ \frac{a_0}{a_1 + a_2 \log 2} & \text{if } j \text{ is even} \end{cases}$$

In the examples given in the appendix we adopt the notation:

$$\frac{a_0}{a_1 + a_2 \cdot \text{constant}} = T(0) + \sum_{n=1}^{\infty} \left(\frac{P(n)}{T(n)} \right)$$

For odd j , we have (whenever there is no division by zero):

$$\frac{a_0}{a_2} = \frac{(2c)! \cdot 2^{\lfloor 1/j \rfloor + 2k} \cdot \prod_{i=1}^{\frac{j-1}{2}} \frac{(4c - 4i + 2) \cdot (2k - 2i + 1)}{(k - i + 1) \cdot (2c + 2i - 2k - 1)}}{8 \cdot C_{\frac{j-3}{2}} \cdot (j - 2) \cdot (2c - 1)!^2 \cdot (2k - 1) \cdot C_{k-1}}$$

```

1 Num := Function[{j, c, k},
2   j (2 - j + 2 k) +
3     ContinuedFractionK[-2 n (c + n) (j + n - 1) (1 - j + 2 k + n),
4       3 n^2 + (3 + 4 k) n + j (2 - j + 2 k), {n, 1, 100000}]];
5
6 For[j = 1, j <= 7,
7   For[k = 1, k <= 7,
8     For[c = 1, c <= 7,
9       r = N[Num[j, c, k], 3000];
10      v = FindIntegerNullVector[{1, r, N[Catalan r, 3000]}];
11      q = {-v[[1]]/
12        v[[3]] == ((2 c)! 2^(2 k + (j - 7)/2 + Floor[1/j])/(
13          CatalanNumber[k - 1]/(2 k - 1)/(2 c - 1)!!^2/(j - 2)/
14          Product[(2 c - 2 k + 2 i -
15            1) (k - i + 1)/(2 c - 2 i + 1)/(2 k - 2 i + 1), {i,
16              1, (j - 1)/2}]/CatalanNumber[(j - 3)/2])};
17      Print[{j, k, c, q}];
18      c++];
19      k++];
20      j += 2]

```
