HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Johann Dreo

Institut Pasteur & Université Paris Cité } Computational Biology dept. & Bioinformatics and Biostatistics hub } Computational Systems Biomedicine lab.

Paradiseo is an open-source **full-featured evolutionary computation framework** which main purpose is to help you **write your own stochastic optimization algorithms**, insanely fast:

Choose an algorithm template, select operators of interest, plug a benchmark and let it design the algorithm for you!

WHY PARADISEO?

Full-featured

Paradiseo provides the **largest mature codebase** of state-of-the-art algorithms, and focuses on (automatically) find the **most efficient solvers**.

The most classical impediment to the use of Paradiseo is that you just want to check if your problem can actually be solved with heuristics. You feel that it would be a loss of time to learn complex stuff if it ends being useless.

However, you should keep in mind that:

- Metaheuristics do seem very easy to implement in textbooks, but the state-of-the-art versions of efficient algorithms can be a lot more complex.
- It is usually easy to get something to actually run, but it is far more difficult to get an efficient solver.
- Metaheuristics performances on a given problem are very sensitive to small variations in the parameter setting or the choice of some operators. Which render large experimental plans and algorithm selection compulsory to attain peak efficiency.

Fortunately, Paradiseo have the largest codebase of the market, hardened along 20 years of development of tens of solvers.

Additionally, it provides the tools to rapidly search for the best combination of algorithms to solve your problem, even searching for this combination automatically.

Fast Benchmarking

Paradiseo is **the fastest** framework on the market, which is a crucial feature for modern and robust approach to solver **design and validation**.

To give an order of magnitude:

- If you use the "official" vanilla implementation of CMA-ES in Python/Numpy solving the BBOB problem suite through the COCO platform, running the whole benchmark will take approximately 10 minutes on a single Intel Core i5 @ 2.50GHz with a solid state disk.
- The same experiment, running the Paradiseo implementation using the seamless binding to the IOHprofiler BBOB implementation, will take 1 minute.
