ABSTRACT

HIV self-testing (HIVST) empowers individuals to decide when and where to test and with whom to share their results. From 2019 to 2022, the ATLAS program distributed ~ 400 000 HIVST kits in Côte d'Ivoire, Mali, and Senegal. It prioritised key populations, including female sex workers and men who have sex with men, and encouraged secondary distribution of HIVST to their partners, peers and clients.

To preserve the confidential nature of HIVST, use of kits and their results were not systematically tracked. Instead, an anonymous phone survey was carried out in two phases during 2021 to estimate HIVST positivity rates (phase 1) and linkage to confirmatory testing (phase 2). Initially, participants were recruited via leaflets from March to June and completed a sociobehavioural questionnaire. In the second phase (September to October), those with a reactive HIVST result were re-contacted for another questionnaire. Of the 2 615 initial participants, 89.7% reported consistent results between their interpretation and the number of lines on the HIVST (i.e., 1 for negative, 2 for reactive). The HIVST positivity rates ranged between 2.4% and 9.1% depending on calculations.

The second phase saw 78 out of 126 eligible participants complete the questionnaire. Of the 27 who reported a consistent reactive result in the first phase, 15 (56%, 95%CI: 36 to 74%) underwent confirmatory HIV testing, with 12 (80%) confirmed as HIV-positive, all of whom began antiretroviral treatment.

NOTE: This preprint reports new research that has not been certified by peer review and should not be used to guide clinical practice.

43 The confirmation rate of HIVST results was fast, with 53% doing so within a week and 91% within
44 three months of self-testing. Two-thirds (65%) went to a general public facility, and one-third to
45 a facility dedicated to key populations.

46 The ATLAS HIVST distribution strategy reached people living with HIV in West Africa. Linkage to
47 confirmatory testing remained sub-optimal in these first years of HIVST implementation.
48 However, if confirmed HIV-positive, almost all initiated treatment. HIVST constitutes a relevant
49 complementary tool to existing screening services.

56

Introduction

57 Early testing followed by successful linkage to antiretroviral treatment for those diagnosed with HIV can
58 drastically reduce the risk of onward HIV transmission and mortality [1–6]. In 2021, according to the United
59 Nations Program for HIV/AIDS (UNAIDS), 81% of the adult population living with HIV in West and Central Africa
60 knew their status. Only 77% of them were on antiretroviral treatment[7], below the 95-95-95 UNAIDS targets
61 for 2025 [8]. The 95-95-95 targets aim for 95% of people living with HIV to know their status, 95% of those
62 diagnosed to receive treatment, and 95% of those on treatment to achieve viral suppression. Improving
63 diagnosis coverage, especially among vulnerable key populations at high risk of HIV acquisition and
64 transmission, is the necessary first step to achieve this goal.

65 HIV self-testing (HIVST) is the process by which a person who wants to know their HIV status collects their
66 own sample (oral fluid or blood), performs the test, and then interprets the results themselves, often in a private
67 setting [9]. It is an innovative tool that empowers individuals and guarantees the confidentiality of the test
68 [10]. Individuals may decide when and where to test and with whom they want to share their result. It's a tool
69 that is widely accepted by various populations, including key populations [11–18]. It has been shown to be
70 effective in screening populations vulnerable to HIV acquisition and transmission that are often hardly reached
71 through conventional approaches [19–21]. The World Health Organization (WHO) has recommended HIVST as
72 a complementary testing approach since 2016 [22].

73 The STAR project carried in Eastern and Southern Africa and funded by Unitaid aimed to boost the global
74 market for HIVST . The project unfolded in three phases: Phase 1 ran from September 2015 to August 2017,
75 Phase 2 spanned from August 2017 to July 2020, and Phase 3 took place between January 2020 and July 2021
76 (<https://www.psi.org/fr/project/star/>). Following the experience gained in Eastern and Southern Africa under
77 the STAR project [11, 23–28], the Unitaid funding agency sought to stimulate HIVST in West Africa where HIV
78 epidemics differs, are more concentrated, and where key populations (e.g., female sex workers and men who
79 have sex with men) share a disproportionate HIV burden. The ATLAS programme (*AutoTest de dépistage du*
80 *VIH : Libre d'Accéder à la connaissance de son Statut*) aimed to promote, implement, and expand HIVST in Côte
81 d'Ivoire, Mali, and Senegal [29] where the national HIV prevalence in 2021 were was 1.9% (1.7%-2.2%) , 0.8%
82 (0.6%-1%) , and 0.3% (0.3%-0.4%) respectively [30].

83 To preserve the anonymity and confidentiality of HIVST and not impede their use, ATLAS decided, in line
84 with WHO recommendations, not to track the use and outcomes of distributed HIVST kits systematically. Such
85 tracking can be logistically challenging and costly and could limit the distribution, redistribution and use of
86 HIVST [31]. Without systematic tracking, it is challenging to obtain information on the users of the HIVST,
87 their results and on linkage to confirmatory testing and treatment, which are crucial indicators to assess
88 program effectiveness and impact. For instance, the positivity rate can reflect the yield of new individuals
89 diagnosed with HIV and if the testing modality is indeed reaching those in need. Diagnosed individuals must
90 seek confirmatory testing and be linked to care to maximise health benefits and decrease onward transmission

91 We conducted an innovative survey by setting up an anonymous and free telephone platform in Côte
92 d'Ivoire, Mali and Senegal while preserving anonymity and encouraging voluntary participation. A second
93 phase of the survey was conducted among those with an HIVST reactive result in the first survey. Here we
94 present the HIV test positivity rates from the phase 1 questionnaire and the links with confirmatory tests and
95 care.

96

Materials and Methods

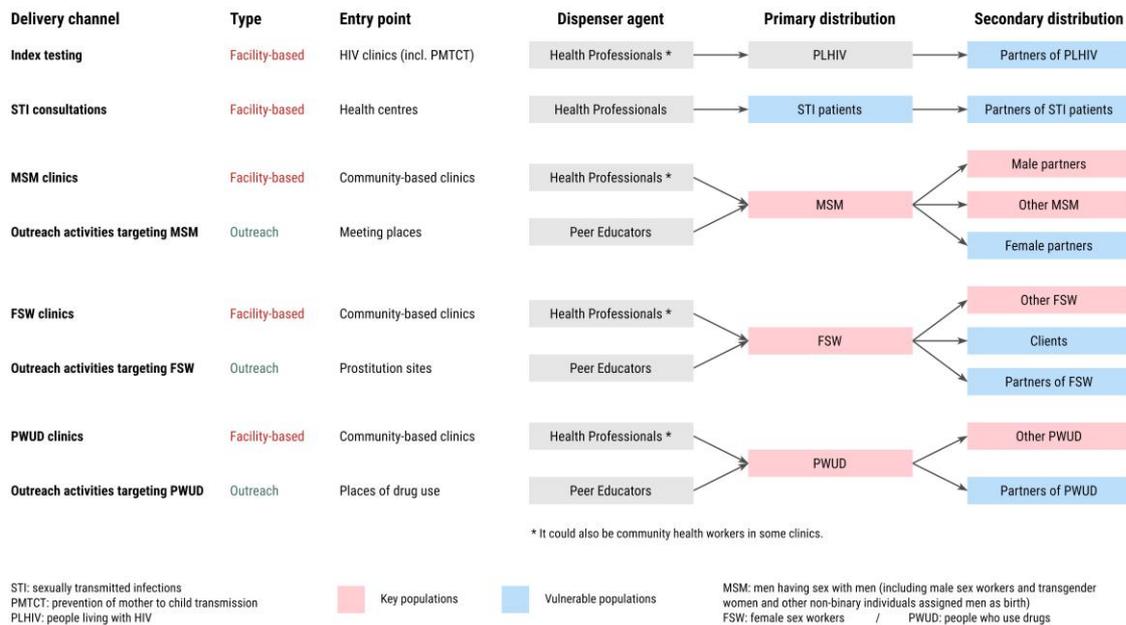

97 ATLAS program description

98 ATLAS HIVST distribution was integrated into existing testing policies, programmes and activities in each
99 country; 397 367 HIVST kits were freely distributed between July 2019 and February 2022 as part of the three
100 countries' national AIDS strategies. At the time of ATLAS's implementation in 2019, only small-scale HIVST pilot
101 programs had been previously conducted in Senegal and Côte d'Ivoire, whereas Mali had no previous
102 experience of HIVST. In Senegal, for instance, the first pilot survey took place between April 2017 and June
103 2018 [32].

104 The design of the different delivery channels and the priority populations were developed with country
105 stakeholders including national AIDS programs/councils, international institutions including the WHO,

106 international and national non-governmental organisations involved in local HIV programs, and civil society
 107 and community leaders. ATLAS HIVST distribution was organised through eight different operational delivery
 108 channels (Figure 1), i.e. five facility-based approaches (delivery of HIVST kits through public or community-
 109 based health facilities) and three community-based approaches involving outreach activities engaging female
 110 sex workers (FSW), men who have sex with men (MSM), and people who use drugs (PWUD) [29]. Peer
 111 educators conducted these outreach activities through group activities (e.g. talks, discussion groups, night
 112 visits, social events, or parties) and face-to-face activities (e.g. home visits). Outreach activities represented
 113 the majority (~85%) of ATLAS's distribution volume.
 114

ATLAS delivery channels to reach key populations and other vulnerable populations

115

116 **Figure 1.** ATLAS delivery channels (adapted from Rouveau et al., 2021, Describing, analysing and
 117 understanding the effects of the introduction of HIV self-testing in West Africa through the ATLAS
 118 programme in Côte d'Ivoire, Mali and Senegal, BMC Public Health, <https://doi.org/10.1186/s12889-021-10212-1>). FSW=female sex workers, MSM=men who have sex with men, PLHIV=people living with HIV
 119 PMTCT=prevention of mother-to-child transmission, PWUD=people who use drugs, STI=sexually
 120 transmitted infection.
 121

122
 123 ATLAS activities relied on both primary and secondary distribution. HIVST kits were distributed by peer
 124 educators and healthcare professionals to primary contacts for their personal use (primary distribution). With
 125 secondary distribution, primary contacts were provided HIVST kits and invited to redistribute them to their
 126 peers, partners, and clients. These secondary contacts were often members of key populations that can be
 127 more difficult to engage in HIV prevention, along with other peripheral vulnerable populations. This chain-
 128 referral distribution of HIVST implies that end-users were not limited to primary contacts.

129 Only oral self-testing (OraQuick HIV Self-Test®) has been distributed through ATLAS. OraSure Technologies,
 130 the manufacturer of the OraQuick test, accompanies each HIVST kit with a user manual for result
 131 interpretation. OraQuick HIVST results should be interpreted as follow. It is reactive if two lines (C & T) are
 132 visible (even barely), non-reactive if only the C (control) line is visible, and invalid if no line is visible or if only
 133 the T (test) line is visible.

134 In addition to the manufacturer's instructions (Figure 2), locally adapted brochures and explanatory videos
 135 in French and local languages have been developed to help users perform the test, interpret the result and
 136 know what actions should be taken following a non-reactive, a reactive or indeterminate result. They also
 137 encouraged people with a reactive HIVST to seek confirmatory HIV testing and care. Individuals with a non-
 138 reactive test were invited to retest after 3 months if still exposed to HIV. Existing toll-free hotlines in each

139 country were strengthened and trained on HIVST, to offer information about HIV, prevention, testing, use and
140 interpretation of HIVST and counseling.
141

ORAQUICK® HIV SELF-TEST

INTERPRETING RESULTS Read test results in a well-lit area

HIV POSITIVE RESULT

Two complete lines, even if the line is faint, means you may be HIV POSITIVE and you need to seek additional testing by a trained professional to confirm an HIV diagnosis.

As soon as possible . . .
Visit your nearest
HIV Testing Centre or
Health Facility

HIV NEGATIVE RESULT

IF READ BEFORE 20 MINUTES, RESULT MAY NOT BE CORRECT

ONE LINE next to the "C" and NO line next to the "T", your result is HIV NEGATIVE.

Seek regular testing. If you may have been exposed to HIV, test again in 3 months.

INVALID RESULT

If there is no line next to the "C" (even when there is a line next to the "T"), the test line or control line are not complete (all the way across the window), or a red background makes it impossible to read the test, the test is not working and should be repeated. **You will need to obtain another test.**

The test did not work properly.
Visit your nearest HIV Testing
Centre or Health Facility to
test again.

NOT SURE OF RESULT

You do not know your result or you are unsure of your result. Visit your nearest HIV Testing Centre or Health Facility to test again.

DISPOSE

Remove the test stick, put the cap on the test tube, place in the disposal bag provided and throw away all contents in the normal trash.

142

143
144

Figure 2. Guidelines for interpreting HIVST result, extracted from the English version of the manufacturer instructions for use (OraQuick HIV Self-Test®)

145 Study design and data collection

146 The ATLAS program embedded multiple research activities, from qualitative studies to economic analyses,
147 which have been described in detail elsewhere [17, 29, 33–36].

148 The program included a voluntary anonymous phone survey. Between mid-March and mid-June 2021,
149 dedicated survey flyers were distributed with the HIVST kits inviting self-test users in each country to call a toll-

150 free number to complete a questionnaire (phase 1). All calls from the three countries, over the same period,
151 were rerouted to a telephone platform located in Abidjan and operated by Ipsos Côte d'Ivoire, which was
152 selected following an international call for tenders.

153 The questionnaire, which lasted 20 to 30 minutes, collected information on sociodemographic
154 characteristics of HIVST users, testing history, sexual and preventive behaviours, HIVST use and difficulties
155 encountered. Specifically, each participant was asked about the number of lines that appeared when reading
156 the HIVST result and their self-interpretation of it (reactive or non-reactive). A pilot survey was initially
157 conducted without offering financial compensation to the participants.[37] Following the results, we decided
158 to introduce a reward as a token of appreciation for the time participants dedicated to the survey
159 Consequently, completion of the questionnaire was rewarded with 2 000 XOF (\approx 3.40 USD) of phone
160 communication credit. In order to participate in the survey, participants had to be of legal age to use an HIVST
161 on their own without parental permission (16 years in Côte d'Ivoire, 18 years in Mali, and 15 years in Senegal)
162 and had to have used an HIVST provided to them through the ATLAS project.

163 As the survey was anonymous, there was a risk that some HIVST users may participate more than once or
164 that individuals who have never used HIVST tried to participate to receive the financial incentive. To limit these
165 risks, several measures were taken: (i) the leaflet distributed with the HIVST kits had a unique 9-digit number
166 generated by the research team that was requested prior to participation in the survey, (ii) the same unique
167 number could not be used twice, (iii) the financial incentive was only paid out once the questionnaire was fully
168 completed (however individuals could refuse to answer any particular question), (iv) the same telephone
169 number could not be used twice to receive the telephone credit. These unique 9-digit numbers were generated
170 non-sequentially and were grouped by country, delivery channel and implementing partner. Thus, any unique
171 number could indirectly identify the delivery channel where the HIVST kit was initially dispensed.

172 The time when participants received their HIVST kit was not collected. However, as a survey leaflet was
173 mandatory to participate, we could estimate that all participants received their HIVST kit during the survey
174 period (i.e. between mid-March and mid-June 2021).

175 In total, 2 615 participants were recruited for phase 1[38]. Those who reported two lines or a reactive
176 result ($n=126$) were asked for their consent to be called back a few months later to participate in a
177 complementary survey and, if consented, to provide a phone contact ($n=120$). As some individuals may delay
178 their decision to undergo a confirmatory test by several weeks/months after using an HIV self-test, we chose
179 a minimum of 3-month gap between our two surveys to potentially get an estimate of the maximum number
180 of participants who eventually underwent confirmatory testing. From September 27th to October 22nd, 2021,
181 96 were successfully recontacted and invited to complete a 5-minute questionnaire (phase 2) on linkage to
182 confirmatory testing and care. Among those, 89 accepted to participate in phase 2 and 78 fully completed
183 phase 2 questionnaire.

184 The interviews were conducted in either French, English, Bambara, or Wolof. On-the-fly translation into
185 other local languages was also available. Compensation of XOF 2 000 (\approx 3.40 USD) in the form of telephone
186 credit was given to participants who completed the phase 2 questionnaire. Unlike in phase 1, it was not a
187 financial incentive as participants were informed about it only at the end of the interview. Interviews were not
188 audio-recorded. Questionnaires' responses were captured on a computer and stored in a database managed
189 by PAC-CI, an Ivorian research institute with expertise in clinical research.

190 At the end of the survey, collected telephone numbers (for appointments and rewards) were deleted from
191 the database. All procedures have been described in a publicly available data management plan
192 (<https://dmp.opidor.fr/plans/3354/export.pdf>). The complete project protocol, including the data
193 management plan (required by the ethics committees), was written in French .

194 **Data analysis**

195 Based on phase 1 participants' self-reports, we distinguished those having reported an HIVST result
196 consistent with both the reported number of visible lines and the reported self-interpretation (2 visible lines
197 and result interpreted as reactive, one line and interpreted as non-reactive, or no/one line and interpreted as
198 invalid), an inconsistent result, or a partial result (they refused to answer or answered they didn't know to one
199 or both questions).

200 To estimate HIVST positivity rates, we separately considered the self-interpreted results and the reported
201 number of lines on the HIVST. For each source, we made three hypotheses (low, central, and high) about "don't
202 know" and refusals (DK-R). Using self-reported results (respectively the reported number of visible lines), the

203 low hypothesis considered DK-R as non-reactive (as one line), and the high hypothesis as reactive (as two lines),
204 while DK-R were excluded from both the numerator and the denominator in the central hypothesis. Positivity
205 rates were stratified by respondents' gender, country, and distribution channel.

206 We described the selection of eligible participants for phase 2 questionnaires and corresponding
207 participation rates. To assess any participation bias, characteristics of phase 2 participants were compared
208 with individuals eligible for phase 2 but who did not participate and with phase 1 participants not eligible for
209 phase 2.

210 Among phase 2 eligible participants who completed their questionnaire, linkage to confirmatory testing,
211 the proportion being confirmed HIV positive, and the proportion who initiated treatment were described,
212 stratified by the reported number of lines and self-interpreted HIVST result in phase 1 questionnaire.

213 We also describe (i) for those who did not link to confirmatory testing, the main reported reason; and (ii)
214 for those who did link to confirmatory testing, the type of facility attended for confirmation and the time
215 between HIVST and confirmatory testing.

216 A dedicated anonymised dataset and the corresponding R script are available on Zenodo
217 (<https://doi.org/10.5281/zenodo.8329454>) to allow replication of the analysis. All analyses have been
218 performed using R version 4.3.1 [39]. All the descriptive tables were generated using the *tbl_summary()*
219 function from the *gtsummary* package [40]. Confidence intervals (95% confidence interval, 95%CI) were
220 computed using Wilson's method with Yate's continuity correction (*prop.test()* function).
221

222 **Ethics**

223 ATLAS research protocol (version 3.0, October 8 2020) has been approved by the WHO Ethical Research
224 Committee (January 12, 2021, reference: ERC 0003181), the National Ethics Committee for Life Sciences and
225 Health of Côte d'Ivoire (November 27, 2020, reference: 191-20/MSHP/CNESVS-km, IRB:000111917), the Ethics
226 Committee of the Faculty of Medicine and Pharmacy of the University of Bamako, Mali (November 16, 2020,
227 reference: 2020/254/CE/FMPOS/FAPH), and the National Ethics Committee for Health Research of Senegal
228 (January 26, 2021, protocol SEN19/32, n°8 MSAS/CNERS/Sec).

229 The full research protocol was written in French (https://hal.science/ATLAS_ADVIH/hal-04121482v1). The
230 peer-reviewed protocol has been published in English elsewhere [29].

231 **Results**

232 **HIVST results**

233 Of the 2 615 participants recruited in phase 1, 2 346 (89.7%) reported a self-interpreted HIVST result
234 consistent with their reported number of visible lines on the HIVST: 2 292 (88.0%) reported one line self-
235 interpreted as non-reactive, 50 (1.9%) two lines self-interpreted as reactive, and 4 (0.2%) no/one line self-
236 interpreted as invalid (table 1). In contrast, 48 (1.8%) reported inconsistent answers: 10 (0.4%) one line self-
237 interpreted as reactive, 35 (1.3%) two lines self-interpreted as non-reactive/ and 3 (0.1%) no line self-
238 interpreted as non-reactive.

239 Finally, 221 (8.5%) reported a partial result: 147 (5.6%) reported 0, 1 or 2 lines but did not know how to
240 interpret the result or refused to answer, 46 (1.7%) self-interpreted their result but did not know or refused to
241 report the number of lines, and 28 (1.1%) did not know or refused to answer to both questions

242

243 **Table 1.** Self-reported HIV self-test (HIVST) result, reported number of lines on the HIVST, and positivity rates
 244 according to different hypotheses among participants of the first phase of the survey in Côte d'Ivoire, Mali,
 245 and Senegal (2021).

Phase 1 participants	Formula	2615 (100%)
Consistent answer (C)	C = C₁ + C₂ + C₃	2346 (89.7%)
2 lines / reactive [†]	C ₁	50 (1.9%)
1 line / non-reactive	C ₂	2 292 (88%)
0-1 line/ invalid	C ₃	4 (0.2%)
Inconsistent answer (I)	I = I₁ + I₂ + I₃ + I₄ + I₅	48 (1.8%)
1 line / reactive [†]	I ₁	10 (0.4%)
0 line / reactive [†]	I ₂	0 (0%)
2 lines/ non-reactive [†]	I ₃	35 (1.3%)
0 line / non-reactive	I ₄	3 (0.1%)
2 lines/ invalid [†]	I ₅	0 (0%)
Partial answer (P)	P = P₁ + P₂ + P₃ + P₄ + P₅ + P₆ + P₇	221 (8.5%)
0 line / DK-R	P ₁	1 (<0.1%)
1 line / DK-R	P ₂	117 (4.5%)
2 lines/ DK-R [†]	P ₃	29 (1.1%)
DK-R / reactive [†]	P ₄	2 (<0.1%)
DK-R / non-reactive	P ₅	44 (1.7%)
DK-R / invalid	P ₆	0 (0%)
DK-R / DK-R	P ₇	28 (1.1%)
Positivity Rate		
Based on self-interpreted test results		
Low hypothesis (DK-R as not reactive)	$(C_1 + I_1 + I_2 + P_4) / n$	62 / 2615 (2.4 %)
Central hypothesis (DK-R excluded)	$(C_1 + I_1 + I_2 + P_4) / (C + I + P_4 + P_5 + P_6)$	62 / 2440 (2.5 %)
High hypothesis (DK-R as reactive)	$(C_1 + I_1 + I_2 + P_1 + P_2 + P_3 + P_4 + P_7) / n$	237 / 2615 (9.1%)
Based on the reported number of lines		
Low hypothesis (DK-R as 1 line)	$(C_1 + I_3 + I_5 + P_3) / n$	114 / 2615 (4.4 %)
Central hypothesis mid (DK-R excluded)	$(C_1 + I_3 + I_5 + P_3) / (C + I + P_1 + P_2 + P_3)$	114 / 2541 (4.5 %)
High hypothesis (DK-R as 2 lines)	$(C_1 + I_3 + I_5 + P_3 + P_4 + P_5 + P_6 + P_7) / (C + I + P_1 + P_2 + P_3)$	188 / 2615 (7.2 %)
†: Eligible for phase 2 Survey		
DK: don't know. R: refused to answer		

246

247 HIVST positivity rates

248 Based on self-interpreted HIVST results, the overall positivity rate was 2.4% when DK-R were considered
 249 non-reactive (low hypothesis, Figure 3, Table S2). Rate was similar at 2.5% by excluding DK-R from the
 250 numerator and the denominator (central hypothesis). Considering DK-R as reactive (high hypothesis) increased
 251 the positivity rate to 9.1%. Estimates based on the reported number of visible lines on the HIVST were 4.4%,
 252 4.5% and 7.2%, respectively, for the low, central, and high hypotheses. Positivity rates ranged from 1.8% to
 253 9.8% in Côte d'Ivoire, 3.5% to 7.8% in Mali, and 1.2% to 15.0% in Senegal depending on the hypothesis (e.g.,
 254 low or high; Figure S4, Table S2).

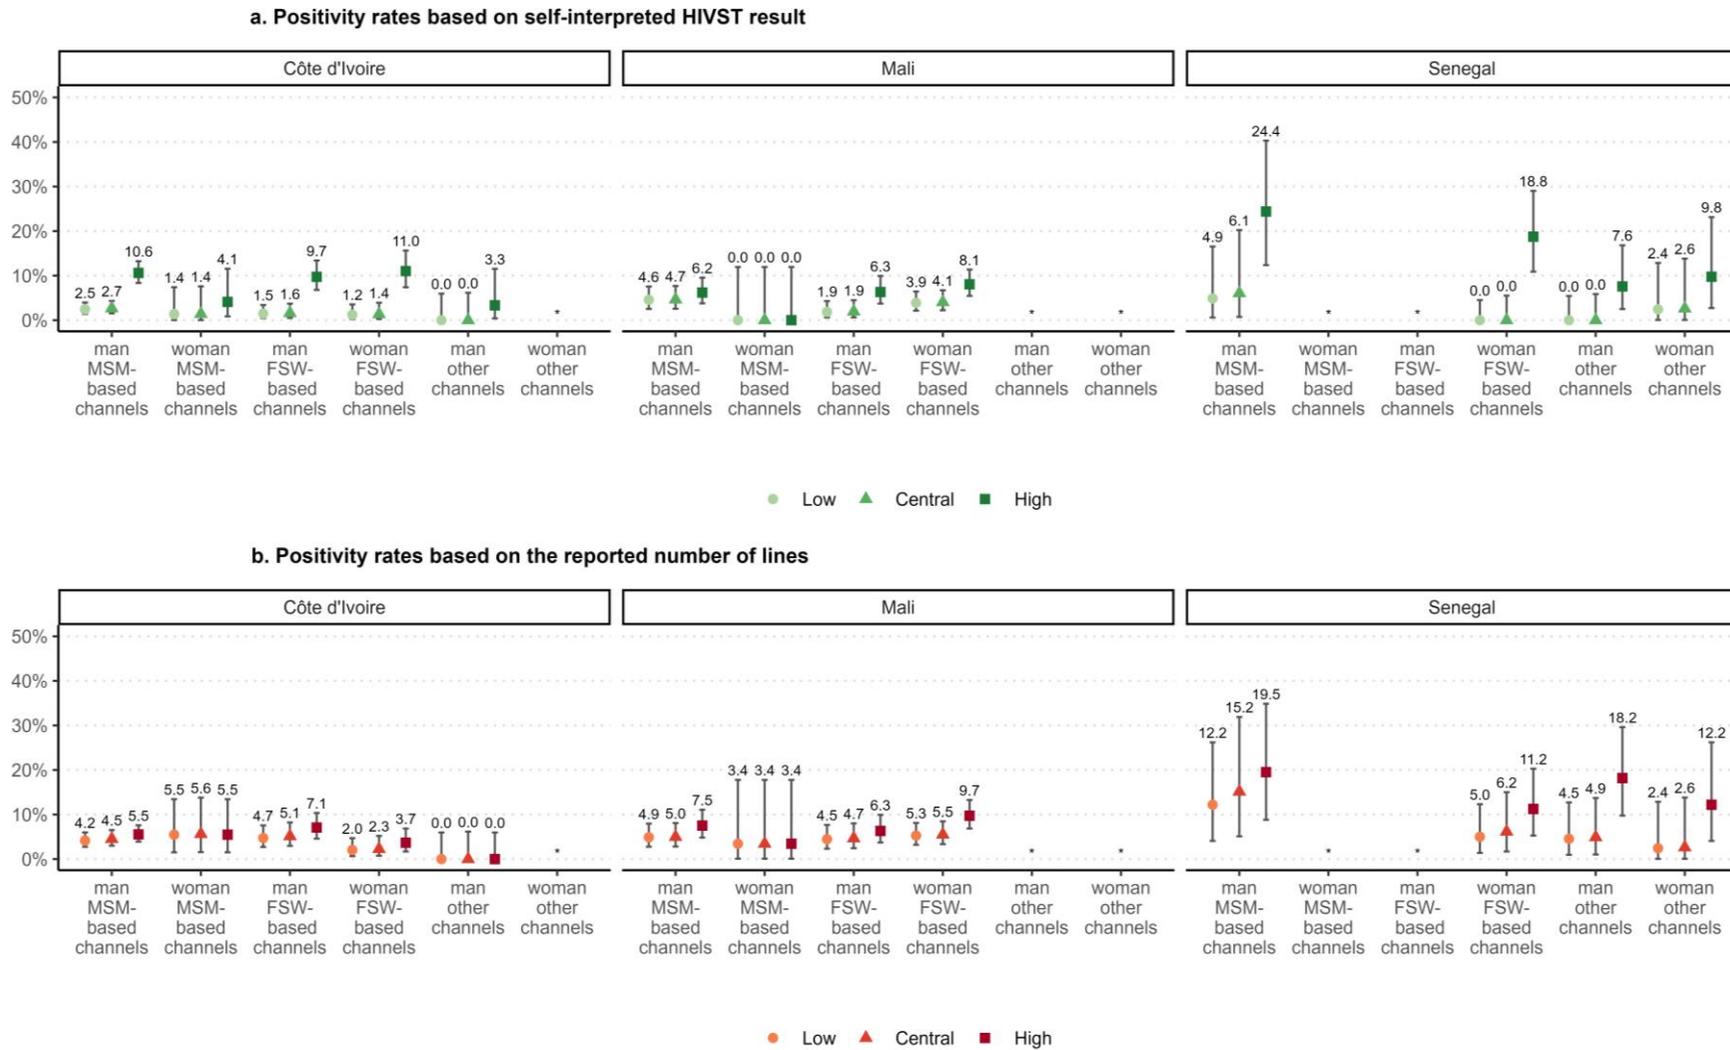

255 Positivity rates (central hypothesis based on the number of lines) were higher among participants recruited
256 through community-based distribution channels. It was 4.8% for men and 4.9% for women in the MSM-based
257 channels, and 4.6% for men and 4.2% for women in the FSW-based channels. Compared to 3.1% for men and
258 2.9% for women in the other distribution channels (PWUD-based and facility-based).

259 When analyzing positivity rates by age group (Table S3), for those under 24 years old, the rates ranged
260 from 2.2% to 7.4% based on the reported self-interpreted result and from 3.1% to 5.9% based on the reported
261 number of lines. Among those aged 25 to 34 years old, it fluctuated between 2.7% and 9.5% based on the
262 reported self-interpreted result and from 4.9% to 7.8% based on the reported number of lines. Lastly, for
263 individuals 35 years old or older, the rate layed between 1.8% and 12% based on the reported self-interpreted
264 result and between 4.9% and 9.3% based on the reported number of lines.

265 **Participation in phase 2**

266 During phase 1, 126 individuals reported two lines or self-interpreted their result as reactive and were
267 therefore eligible for phase 2 (Table 1). Among them, 6 refused to be re-contacted after phase 1 (Figure 4).
268 Among the 120 (95%) who agreed to be re-contacted, 24 (20%) were unreachable at the time of the phase 2
269 survey, and 96 (80%) were successfully re-contacted. Among the latest, 89 (93%) accepted to participate in the
270 phase 2 survey. Ten dropped out before the end of the interview, and 1 disconnected and was unreachable
271 afterwards. As a result, 78 participants completed phase 2 questionnaire. Of the 78 participants, 39 (50%) were
272 from Côte d'Ivoire, 31 (40%) from Mali, and 8 (10%) from Senegal (Table S1). Participation rates were 54% for
273 participants who reported a consistent result (2 lines and reactive), 71.1% for those with an inconsistent result
274 (either 2 lines & non-reactive, or 1 line & reactive), and 65.5% for those reporting a partial result (2 lines & DK-
275 R or DK-R & reactive).

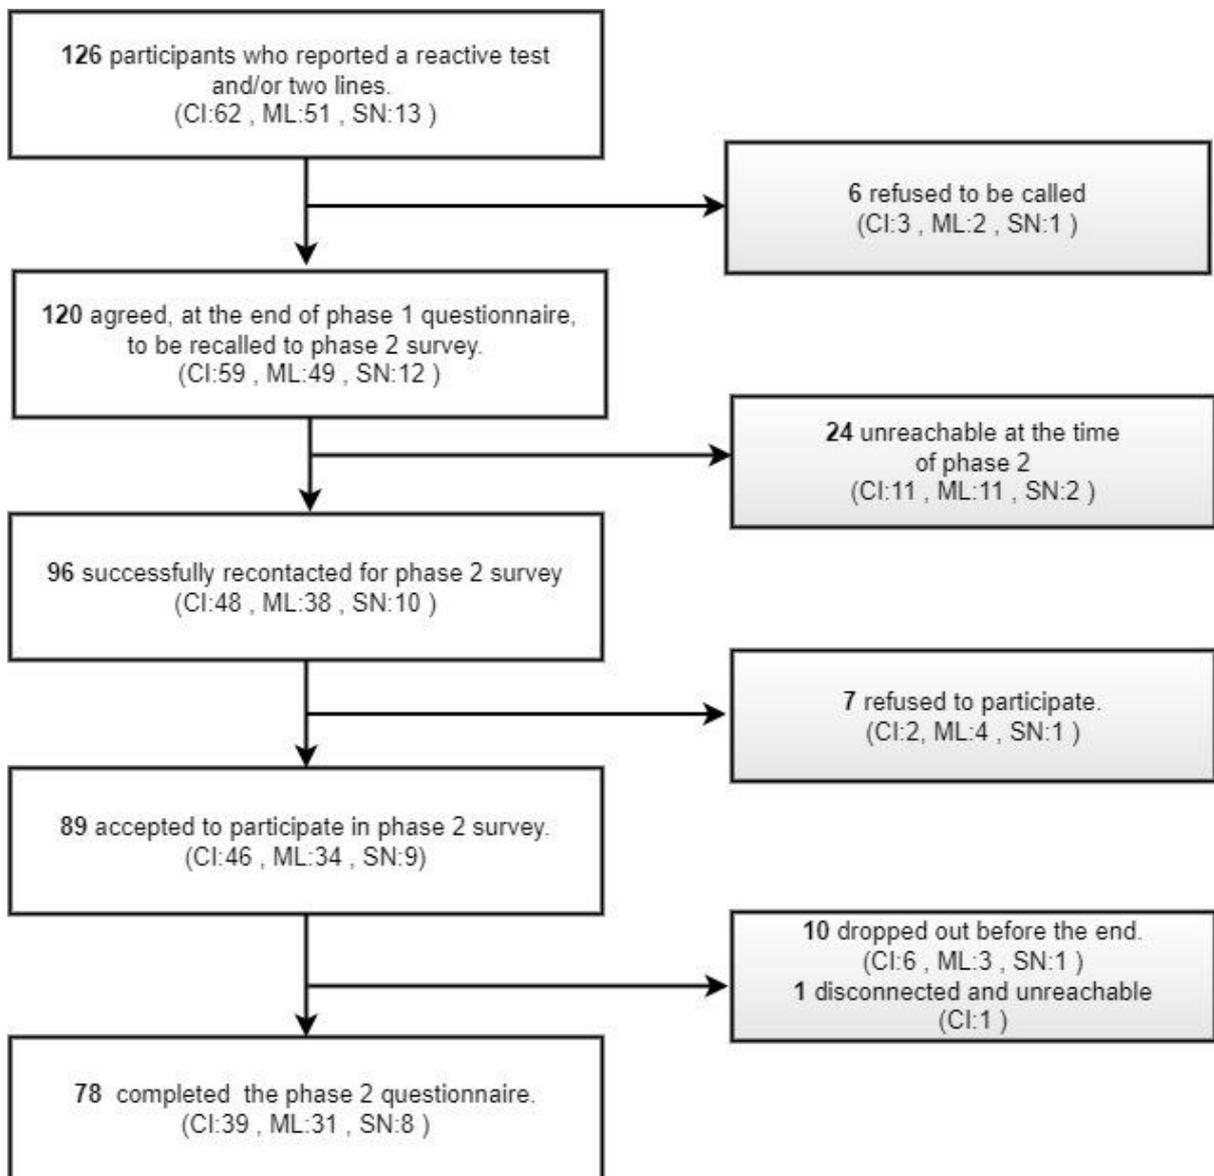

276 The participants who completed the phase 2 questionnaire had similar sociodemographic characteristics
277 (e.g. country, sex, distribution channel, age group, marital status) compared to those eligible for phase 2, but
278 that did not complete it, and to phase 1 participants not eligible for phase 2 (Table S1). For most participants
279 (86%), phase 2 questionnaire was completed between 4 and 6 months after phase 1 questionnaire (Table S5).

288 **Linkage to confirmatory testing and care**

289 Overall, 34 of the 78 who completed the phase 2 questionnaire (44%) reported having performed
290 confirmatory testing. Linkage was higher for those who reported 2 lines and correctly self-interpreted their
291 result as reactive (56%,95%CI: 36-74%), than for those who reported two lines but did not know or refused
292 to report their test interpretation (44%, (95%CI: 22-69%) and those who reported 2 lines but incorrectly
293 self-interpreted the result as non-reactive (36%, 95%CI: 19-57%) (Table 3). Finally, among the 8 participants
294 who reported none/one line or did not know how many lines and incorrectly self-interpreted the result as
295 reactive, only 2 linked to confirmatory testing.

296 The main reason given for not linking to confirmatory testing was that *“their HIVST was non-reactive”*
297 (18/44, 41%, and although 8 of these 18 reported a reactive result in phase 1 questionnaire), followed by
298 *“not knowing that a confirmation test was required”* (10/44, 23%), and *“not having time”* (8/44, 18%) (Table
299 S4).

300 When participants were linked to confirmatory testing, it was usually shortly after performing their
301 HIVST: 53% linked in less than one week and 91% in less than 3 months (Table S5). Most participants (65%)
302 performed their confirmatory testing in a general public facility (health centre, hospital, clinic or maternity)
303 whereas 35% chose a community-based clinic or health centre dedicated to key populations (Table S6).

304 Among the 34 that linked to confirmatory testing, 19 (56%, 95%CI: 38-72%) were confirmed HIV-
305 positive, and 18 (95%, 95%CI; 72-100%) initiated antiretroviral treatment. Of the 18 participants who
306 initiated ART, 11 (72%) underwent their confirmation test less than a week after their self-test, 2 (11%) did
307 so between 1 and 2 weeks, 1 (5.6%) between 3 and 4 weeks, 1 (5.6%) waited between 1 and 2 months, and
308 1 (5.6%) proceeded with the test three months later. Among the 27 who reported a consistent reactive
309 result in the phase 1 questionnaire, 15 (56%, 95%CI: 36-74%) linked to confirmatory test, 12 (80%) were
310 confirmed HIV-positive and all started treatment (100%).

314

Table 2. Linkage to confirmatory testing, proportion being confirmed HIV positive and treatment initiation, by reported number of lines and self-interpreted HIVST result among eligible participants of the second phase of the survey who completed their questionnaire in Côte d'Ivoire, Mali, and Senegal (2021).

Reported number of lines/ self-interpreted HIVST result	Completed phase 2 n	Linked to confirmatory testing		Confirmed HIV positive		Initiated ART	
		n (%)	95%CI	n (%)	95%CI	n (%)	95%CI
Overall	78	34 (44%)	33% to 55%	19 (56%)	38% to 72%	18 (95%)	72% to 100%
2 lines / reactive	27	15 (56%)	36% to 74%	12 (80%)	51% to 95%	12 (100%)	70% to 100%
1 line / reactive	7	1 (14%)	1% to 58%	0 (0%)	0% to 80%		
2 lines / non-reactive	25	9 (36%)	19% to 57%	3 (33%)	9% to 69%	3 (100%)	31% to 100%
2 lines / DK-R	18	8 (44%)	22% to 69%	4 (50%)	22% to 78%	3 (75%)	22% to 99%
DK-R / reactive	1	1(100%)	5% to 100%	0 (0%)	0% to 95%		

315
316

DK: don't know. R: refuse to answer. CI: confidence interval.

317

Discussion

318 Our study shows that the strategy implemented by the ATLAS program, through the secondary
319 distribution of HIVST kits and dedicated channels, achieved HIV positivity rates ranging from 2.4% to 9.1%
320 based on the reported result, and from 3.8% to 7.2% based on the number of lines reported. The proportion
321 of participants with a reactive HIVST that sought confirmatory testing was 44% (95% CI: 33%-55%). Of
322 those who underwent confirmatory testing, 56% (95% CI: 38%-72%) were found to be HIV-positive and,
323 among them, 95% (95% CI: 72%-100%) initiated treatment. Among the participants who confirmed their
324 reactive HIVST with a traditional facility-based HIV test, 65% did so within a week and 91% within three
325 months.

326

327 According to our estimates, HIVST positivity rates ranged from 1.8% to 9.8% in Côte d'Ivoire, 3.5% to
328 7.8% in Mali, and 1.2% to 15.0% in Senegal depending on how missing results (e.g., “don't know” and
329 refusals) were classified. Overall, these results for HIVST positivity are generally higher than the average
330 overall positivity of HIV testing services (excluding HIVST) in West Africa. For instance, in 2020 an estimated
331 1.9% of all HIV tests performed were found to be positive in the region (95% credible intervals: 1.3 to 2.7%)
332 [41]. Further, among 15-24 and 25-34 years old, which constitute more than 80% of our sample, overall
333 positivity was 0.9% (0.7 to 1.3%) and 1.6% (1.2 to 2.2%), respectively. Collectively, these results provide
334 evidence that HIVST is a high-yield testing modality that can address the unmet HIV testing needs of key
335 populations and their partners.

336

337 It is important to interpret these HIV positivity rates while considering the treatment-adjusted
338 prevalence (i.e., removing those on treatment from the numerator and denominator of HIV prevalence), a
339 more reliable indicator for evaluating the effectiveness of targeted screening programs [42]. In West Africa,
340 the treatment-adjusted prevalence remained relatively low in 2021: 0.6% in Côte d'Ivoire, 0.7% in Mali,
341 and 0.06% in Senegal, according to UNAIDS data (<https://aidsinfo.unaids.org/>). Our results suggest that the
342 ATLAS HIVST distribution strategy successfully reached people living with HIV. In 2021, a study based on
343 the UNAIDS-supported *Shiny90* mathematical model [43] estimated, using data from 184 population
344 surveys and reports from national HIV screening programs from 40 sub-Saharan African countries, that the
345 positivity rates for conventional HIV testing were 1.4% in Côte d'Ivoire, 2.2% in Mali, and 1.0% in Senegal.
346 These rates were lower than our estimates for HIVST, even when using our lower (conservative) estimate.
347 These rates are also in lines with those collected by ATLAS implementing partners. Between 2020 and 2021,
348 these ATLAS partners collected spontaneous feedback from HIVST users. This unpublished data collection
349 was non-systematic and varied from one partner to another. Among 4 463 documented feedbacks, HIVST
350 was reactive for 188 cases (4.2%), consistent with our estimates based on the reported number of visible
351 lines (4.5%, central hypothesis).

352

353 In our study, most participants (90%) demonstrated a consistent interpretation between the number
354 of lines reported and the reported HIVST result. However, 2% of them inconsistently interpreted the
355 results. Among them, a small number reported the presence of two visible lines, suggesting potential issues
356 in interpreting the number of visible lines on HIVST kits. In the context of the ATLAS program, the
357 distribution strategy combining primary and secondary approaches has led many HIVST users to perform
358 their HIVST without receiving advice from a healthcare professional or a trained peer educator. Although
359 the HIVST is not designed to require supervision, it is essential to have received information on its use
360 before proceeding with the test. A study conducted within the framework of the ATLAS program
361 demonstrated that the manufacturer's instructions alone were insufficient in a multilingual context with
362 low literacy levels. The use of additional aids, such as a demonstration video or a toll-free helpline, proved
363 necessary [44]. Similarly, a study carried out in China in 2018 on the unsupervised use of HIVST among 27
364 MSM found that only 5 (or 19%) made no errors, and 44% received an invalid test result due to various
365 mistakes made [45]. However, the lack of supervision is likely insufficient to explain the inconsistencies
366 observed [23]. Some inconsistencies may result from a misunderstanding of the terms “reactive” and “non-
367 reactive”, particularly considering that HIVST was a new tool in our context and that traditional terms used
368 to describe conventional HIV testing are “positive” and “negative”. This possible misunderstanding of the
369 terms is also highlighted by the fact that 8 participants reported a “reactive” result in phase 1 questionnaire

370 and then in phase 2 that their test was “*non-reactive*” as the main reason for not linking to confirmatory
371 testing. Specific qualitative interviews or focus groups discussion with HIVST users could help better
372 understand how they perceive different terms.

373
374 Our linkage to confirmatory testing estimates were based on small numbers resulting in large
375 confidence intervals. Nevertheless, the overall proportion was clearly sub-optimal (44%, 95% confidence
376 interval from 33% to 55%). However, this estimate includes some individuals who did not adequately self-
377 interpreted their HIVST result as reactive. When considering only those who reported two lines and self-
378 interpreted their result as reactive, the linkage rate increased to 56% (36% to 74%). This percentage is
379 closer to that was observed in a study conducted in Kenya on HIV testing of FSW male partners using HIVST
380 secondary distribution, where 65% of men with a reactive result had a confirmatory test [46]. Linkage to
381 confirmatory testing happened relatively quickly after HIVST use: 53% did it in less than a week and 91% in
382 less than three months. Similar results were observed in a study in the general population in Zambia[47],
383 and a study among MSM in Nigeria [48].

384
385 The main reasons given for not linking to confirmatory testing suggest potential misinterpretation of
386 the result or misunderstanding about the need to perform a confirmatory HIV test, highlighting the need
387 to improve messaging around HIVST, in particular when HIV self-testing policies will be scaled-up. For those
388 who did confirmatory testing and were confirmed HIV positive, initiation of antiretroviral treatment was
389 almost systematic, showing good linkage to care after confirmatory testing, as observed in many HIVST
390 studies in sub-Saharan Africa [49–51].

391
392 Previous analyses of ATLAS data showed that HIVST could reach people not reached by conventional
393 HIV testing approaches [52], particularly partners and clients of key populations and key population
394 members not self-identifying as such [38]. It is consistent with the finding that two-thirds of participants
395 who did confirmatory testing went to a general health facility rather than a community clinic dedicated to
396 key populations. In a study conducted in 2018 in Côte d’Ivoire among MSM, one-third of the participants
397 preferred community-based testing, one-third expressed no preference, and one-third preferred
398 undifferentiated HIV testing services (general population), mentioning the lack of discretion and anonymity
399 of community-based sites and the desire to avoid the gaze of others [53].

400
401 The implementation of a telephone survey, aimed at gathering information from HIVST users while
402 preserving anonymity and without interfering with secondary distribution, has proven to be very useful to
403 evaluate the ATLAS program. However, its high cost makes it difficult to integrate it into national strategies
404 for assessing the impact of HIVST. Nevertheless, other impact evaluation methods, such as data
405 triangulation [35] and modelling [36], may prove more suitable for routine monitoring of HIVST’s impacts.

406
407 A previous analysis of this survey among ATLAS HIVST users showed that HIVST secondary distribution
408 was feasible and acceptable [38]: participants reported that they appreciated the ease of use of HIVST, its
409 discretion and the fact that they are autonomous in carrying out the test. Finally, HIVST appeared as a
410 relevant additional approach for those usually distant from community activities and HIV testing services,
411 and has the potential to reach, beyond key populations, partners, clients, and other groups vulnerable to
412 HIV.

413
414 ATLAS’ HIVST distribution strategy successfully reached people living with HIV in West Africa, although
415 linkage to confirmatory testing remained sub-optimal in these first years of HIVST implementation.
416 However, among participants who confirmed their reactive self-test result with a traditional facility-based
417 HIV test, a substantial proportion quickly proceeded with this confirmation (more than half in less than a
418 week and the vast majority in less than three months). Furthermore, if individuals were confirmed HIV-
419 positive, almost all began antiretroviral treatment. We showed that HIVST has the potential to reach more
420 hidden populations and constitutes a relevant complementary tool to existing screening services. To fully
421 harness the potential of self-tests, messaging around HIVST and its interpretation could be improved.

422

435
436

Table S3. Positivity rates based on self-interpreted HIVST results or the reported number of visible lines, by age group and country, among participants of the first survey phase in Côte d'Ivoire, Mali, and Senegal (2021).

			15-24 years	25-34 years old	35 years or more	Total
Positivity rate based on self-reported HIVST results	Low	Côte d'Ivoire	1.7% (11/645)	2.0% (11/553)	1.6% (3/192)	1.8% (25/1 390)
		Mali	3.3% (15/455)	3.9% (16/415)	2.6% (3/114)	3.5% (34/984)
		Senegal	0.0% (0/64)	2.1% (2/95)	1.2% (1/82)	1.2% (3/241)
		Overall	2.2% (26/1 164)	2.7% (29/1 063)	1.8% (7/388)	2.4% (62/2 615)
	Central	Côte d'Ivoire	1.8% (11/604)	2.2% (11/506)	1.8% (3/169)	2.0% (25/1 279)
		Mali	3.4% (15/439)	4.0% (16/403)	2.7% (3/110)	3.6% (34/952)
		Senegal	0.0% (0/56)	2.4% (2/82)	1.4% (1/71)	1.4% (3/209)
		Overall	2.4% (26/1 099)	2.9% (29/991)	2.0% (7/350)	2.5% (62/2 440)
	High	Côte d'Ivoire	8.1% (52/645)	10.0% (58/553)	14.0% (26/192)	9.8% (136/1 390)
		Mali	6.8% (31/455)	6.7% (28/415)	6.1% (7/114)	6.7% (66/984)
		Senegal	13.0% (8/64)	16.0% (15/95)	15.0% (12/82)	15.0% (35/241)
		Overall	7.8% (91/1 164)	9.5% (101/1 063)	12.0% (45/388)	9.1% (237/2 615)
Positivity rate based on the reported number of visible lines	Low	Côte d'Ivoire	3.1% (20/645)	4.5% (25/553)	4.2% (8/192)	3.8% (53/1 390)
		Mali	4.8% (22/455)	4.8% (20/415)	5.3% (6/114)	4.9% (48/984)
		Senegal	1.6% (1/64)	7.4% (7/95)	6.1% (5/82)	5.4% (13/241)
		Overall	3.7% (43/1 164)	4.9% (52/1 063)	4.9% (19/388)	4.4% (114/2 615)
	Central	Côte d'Ivoire	3.1% (20/637)	4.6% (25/546)	4.3% (8/185)	3.9% (53/1 368)
		Mali	4.9% (22/447)	5.0% (20/401)	5.6% (6/107)	5.0% (48/955)
		Senegal	1.9% (1/54)	8.2% (7/85)	6.3% (5/79)	6.0% (13/218)
		Overall	3.8% (43/1 138)	5.0% (52/1 032)	5.1% (19/371)	4.5% (114/2 541)
	High	Côte d'Ivoire	4.3% (28/645)	5.8% (32/553)	7.8% (15/192)	5.4% (75/1 390)
		Mali	6.6% (30/455)	8.2% (34/415)	11.0% (13/114)	7.8% (77/984)
		Senegal	17.0% (11/64)	18.0% (17/95)	9.8% (8/82)	15.0% (36/241)
		Overall	5.9% (69/1 164)	7.8% (83/1 063)	9.3% (36/388)	7.2% (188/2 615)

437

438 **Table S4.** Main reason for not linking to confirmatory testing among phase 2 participants who did not link to confirmatory testing, by reported number of lines and
 439 self-interpreted HIVST result.

	Overall	2 lines / reactive	1 line / reactive	2 lines / non-reactive	2 lines / DK-R
My test was non-reactive	18 (41%)	6 (50%)	2 (33%)	5 (31%)	5 (50%)
I didn't know we should get a confirmatory test	10 (23%)	2 (17%)	2 (33%)	5 (31%)	1 (10%)
I didn't have time	8 (18%)	3 (25%)	0 (0%)	3 (19%)	2 (20%)
I feared that others would know the result	2 (4.5%)	0 (0%)	0 (0%)	1 (6.2%)	1 (10%)
I already knew the result before using HIVST	2 (4.5%)	1 (8.3%)	1 (17%)	0 (0%)	0 (0%)
I had no specific reason	2 (4.5%)	0 (0%)	1 (17%)	1 (6.2%)	0 (0%)
I didn't know where to take the test	1 (2.3%)	0 (0%)	0 (0%)	1 (6.2%)	0 (0%)
The testing site was too far away	1 (2.3%)	0 (0%)	0 (0%)	0 (0%)	1 (10%)
Total	44 (100%)	12 (27.3%)	6 (13.6%)	16 (36.4%)	10 (22.7%)

455

Acknowledgements

456 We wish to acknowledge the commitment and determination of all the ATLAS program teams, which
457 made this research possible. We would also like to thank the interviewers for their professionalism in
458 collecting this sensitive data. Finally, we are grateful to the participants who were kind enough to give us
459 some of their time by agreeing to take part in the survey.

460

Data, scripts, code, and supplementary information availability

461 Data, scripts and code are available online on the Zenodo website.
462 (<https://doi.org/10.5281/zenodo.8329454>).

463

Conflict of interest disclosure

464 The authors declare that they comply with the PCI rule of no financial conflicts of interest in relation to
465 the content of the article. They declare no conflict of interest.

466

Funding

467 This work was supported by Unitaid (Grant Number: 2018-23 ATLAS) with additional funding from
468 Agence Française pour le Développement (AFD). AKK benefits from an ANRS thesis allowance. MMG's
469 research program is supported by a Canada Research Chair (Tier 2) in Population Health Modeling. The
470 funding bodies were not involved in the design of the study and collection, analysis, and interpretation of
471 data and in writing the manuscript.

472 MCB and RS acknowledge funding from the MRC Centre for Global Infectious Disease Analysis (reference
473 MR/R015600/1), jointly funded by the UK Medical Research Council (MRC) and the UK Foreign,
474 Commonwealth & Development Office (FCDO), under the MRC/FCDO Concordat agreement and is also
475 part of the EDCTP2 programme supported by the European Union. For the purpose of open access, the
476 author has applied a Creative Commons Attribution (CC BY) license to any Author Accepted Manuscript
477 version arising.
