HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers. L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

The Italian National Research Infrastructure MIRRI-IT and new challenges to face

The Joint Research Unit (JRU) MIRRI-IT is mainly aimed at the development of the Italian network of collections of microbial resources supporting the implementation of the Microbial Resource Research Infrastructure MIRRI-ERIC.

It was recognized by the Italian government as a *National Research* Infrastructure in 2021. Recently, the project "Strengthening the MIRRI Italian Research Infrastructure for Sustainable Bioscience and Bioeconomy" (SUS-MIRRI.IT) has been funded to support its empowerment.

SUS-MIRRI.IT project

OSPEDALE POLICLINICO SAN MARTINO

Total fonded budget: +16M €

The main objectives of this project are:

- to implement MIRRI-IT's organisation and set up its operative procedures and quality standards;
- to improve the Italian microbial Biological Resource Centers database quality and conceive MIRRI-IT's services based on the partners' expertise and genetic resources;
- to set up a single entry point platform to promote MIRRI-IT's resources in terms of data, services, cutting-edge technologies and expertise.

How to enhance the FAIRness of MIRRI-IT data

In the context of this project, the new needs for data *integration* and system *interoperability*, stressed by the FAIR *approach* to data sharing, have become evident and urgent.

We propose a pilot project to investigate how the semantic annotation of microbial information could be suitably stored using the open-source repository software Dataverse Harvard, one of the most common tools for improving data FAIRness.

It will be carried out thanks to a strong collaboration between *MIRRI-IT* and the *MIRRI task force for the FAIRification of* **MIRRI Information System (MIRRI-IS)**, potentially leading to new best practices for semantic annotation of microbial information.

Dataverse MIRRI infrastructure

This pilot project will be based on a **Dataverse repository instance** made up of five main components: the application, the database, the search engine, the file storage and the Digital Object Identifier (DOI) service (Fig. 1). To ensure a high level of performance, security and scalability for the whole project an open-source cloud Platform-as-a-Service (PaaS), namely OpenDeep (OD) will be specifically developed (Fig. 2). OD platform will be a template to deploy an "HPC secure tenant". Technically, OD deploys a virtual compute cluster on encrypted storage volume pre-configured with software components including an authentication service (Keycloack), docker registry (Harbor), micro-service orchestrator (Kubernetes), a multi-tenancy manager (capsule), a firewall+VPN (Pfsense). Fig. 3 reports the common exploitation of the developed infrastructure.

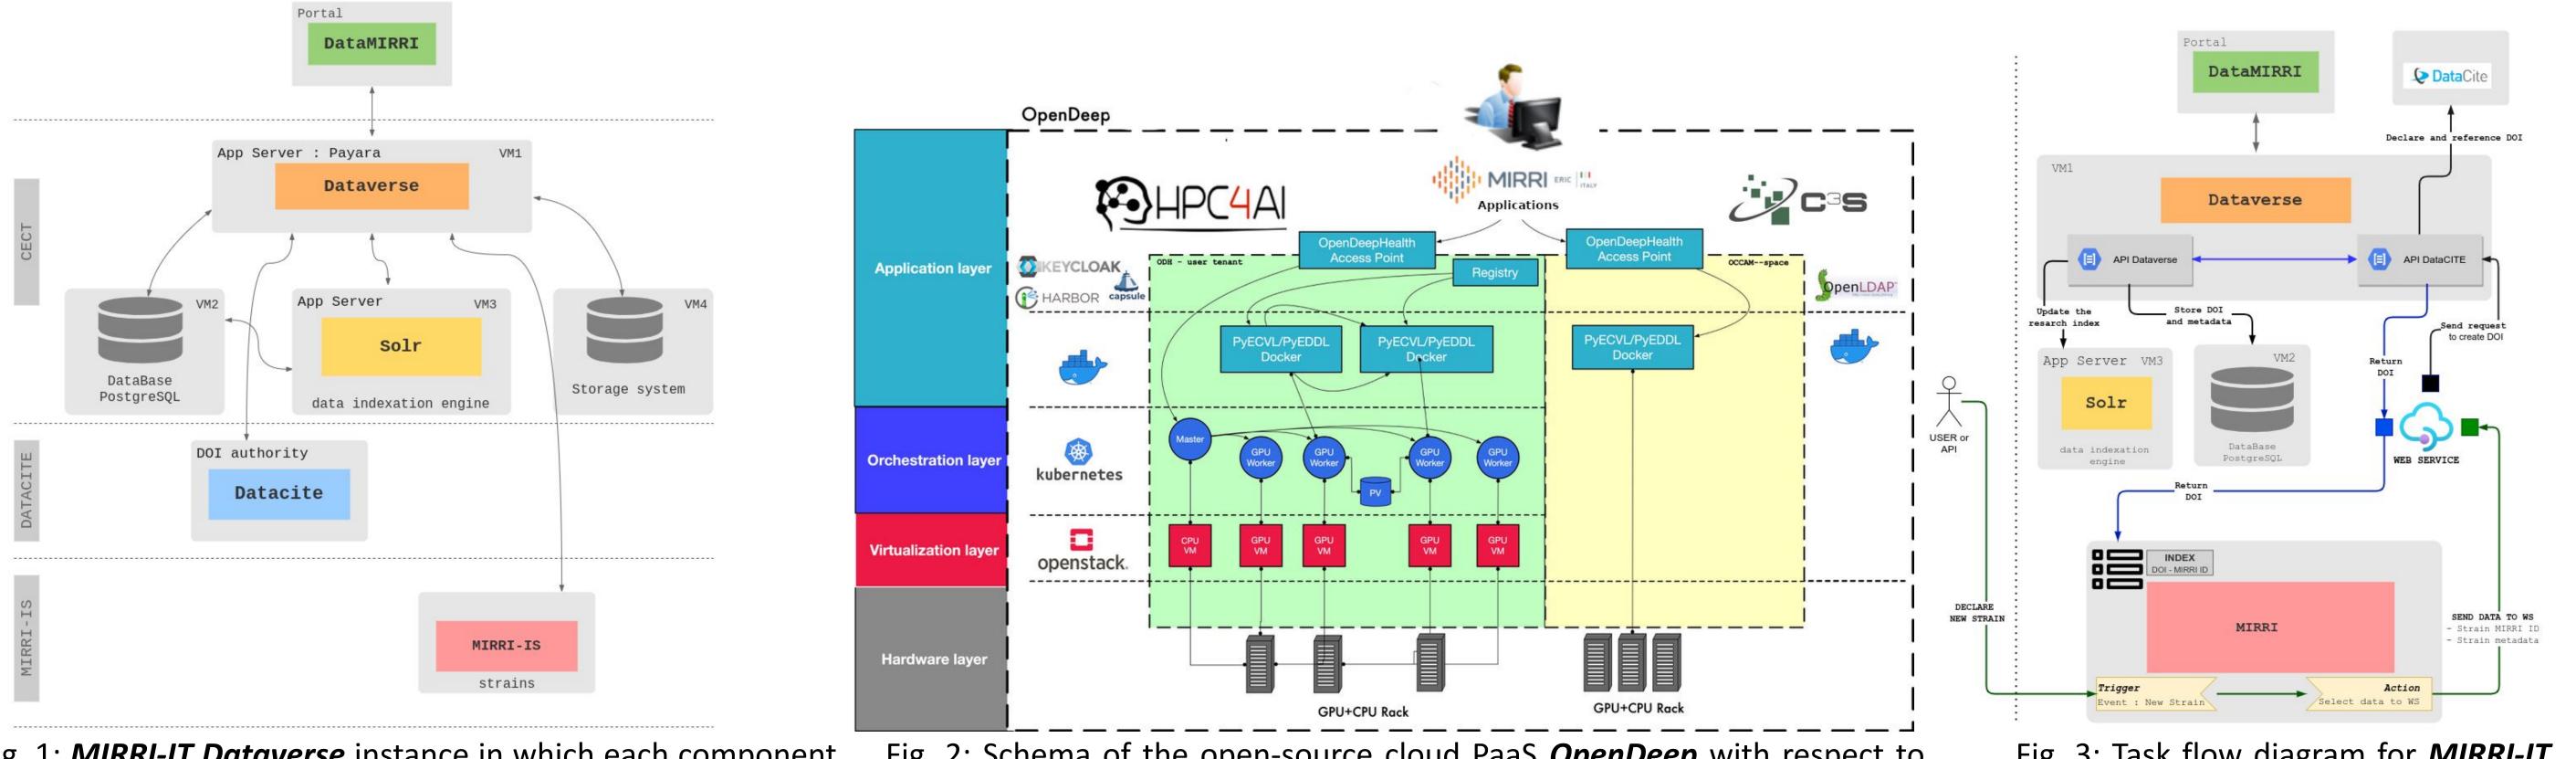

Fig. 1: *MIRRI-IT Dataverse* instance in which each component is a Docker Container deployed on **OD**.
