HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Empirical analysis on external factors affecting pedestrian dynamics in high-density situations

HUU-TU DANG¹, BENOIT GAUDOU¹, NICOLAS VERSTAEVEL¹

Motivation

- In **high-density scenarios**, the increased number of neighbors leads to more interactions among pedestrians.
- Existing approaches primarily model pedestrian interactions using either **relative positions, velocities**, or both with respect to neighbors.
- Predicting pedestrian dynamics in **crowded environments** is a complex task as pedestrian speed is influenced by multiple **external factors**.

Objectives

- Propose a set of **perspective variables** and extract data of these features from **Jülich experiment** [1].
- Investigate the impact of the proposed variables on **pedestrian walking speed**, and subsequently **identify the key factors** affecting pedestrian walking speed in the high-density situations.

Data preparation

Proposed variables are extracted for **K nearest neighbors**:

- Fundamental Information (**FI**): $FI = \{||v_i||, \Delta x_{ij}, \Delta y_{ij}, \Delta v_{x_{ij}}, \Delta v_{y_{ij}} | 1 \leq j \leq K\}$
- Environmental Effect (**EE**): $d_W = \sqrt{(x_i - x_W)^2 + (y_i - y_W)^2}$
- Time-to-Collision (**TTC**) [2]: $TTC = \min_{1 \leq j \leq K} \tau_{ij}$
- Mean Distance (**MD**): $d = \frac{1}{K} \sum_{j=1}^K \sqrt{(x_i - x_j)^2 + (y_i - y_j)^2}$
- Frontal Effect (**FE**): FI_{Front}

Method

- Neural network (NN): a Multilayer Perceptron (**MLP**) with hidden layers $h = (6, 3)$
- Different types of input are fed into the neural network:
 $I_0 = FI, I_1 = (FI, d_W), I_2 = (FI, TTC), I_3 = (FI, d), I_4 = FI_{Front}$
- Training and testing: $s(t + \Delta t) = NN(I_i(t))$
- Evaluation metric: Mean Absolute Error (**MAE**)

Results

- **Frontal Effect** and **Mean Distance** exhibit a noticeable improvement in accuracy in both unidirectional and bidirectional scenarios in the Jülich datasets.
- **Better accuracy improvement** is observed in the **unidirectional** dataset, which has less complex interactions compared to the bidirectional dataset.
- In high-density scenarios, neural networks are unable to achieve improved accuracy by incorporating **Time-to-Collision**.

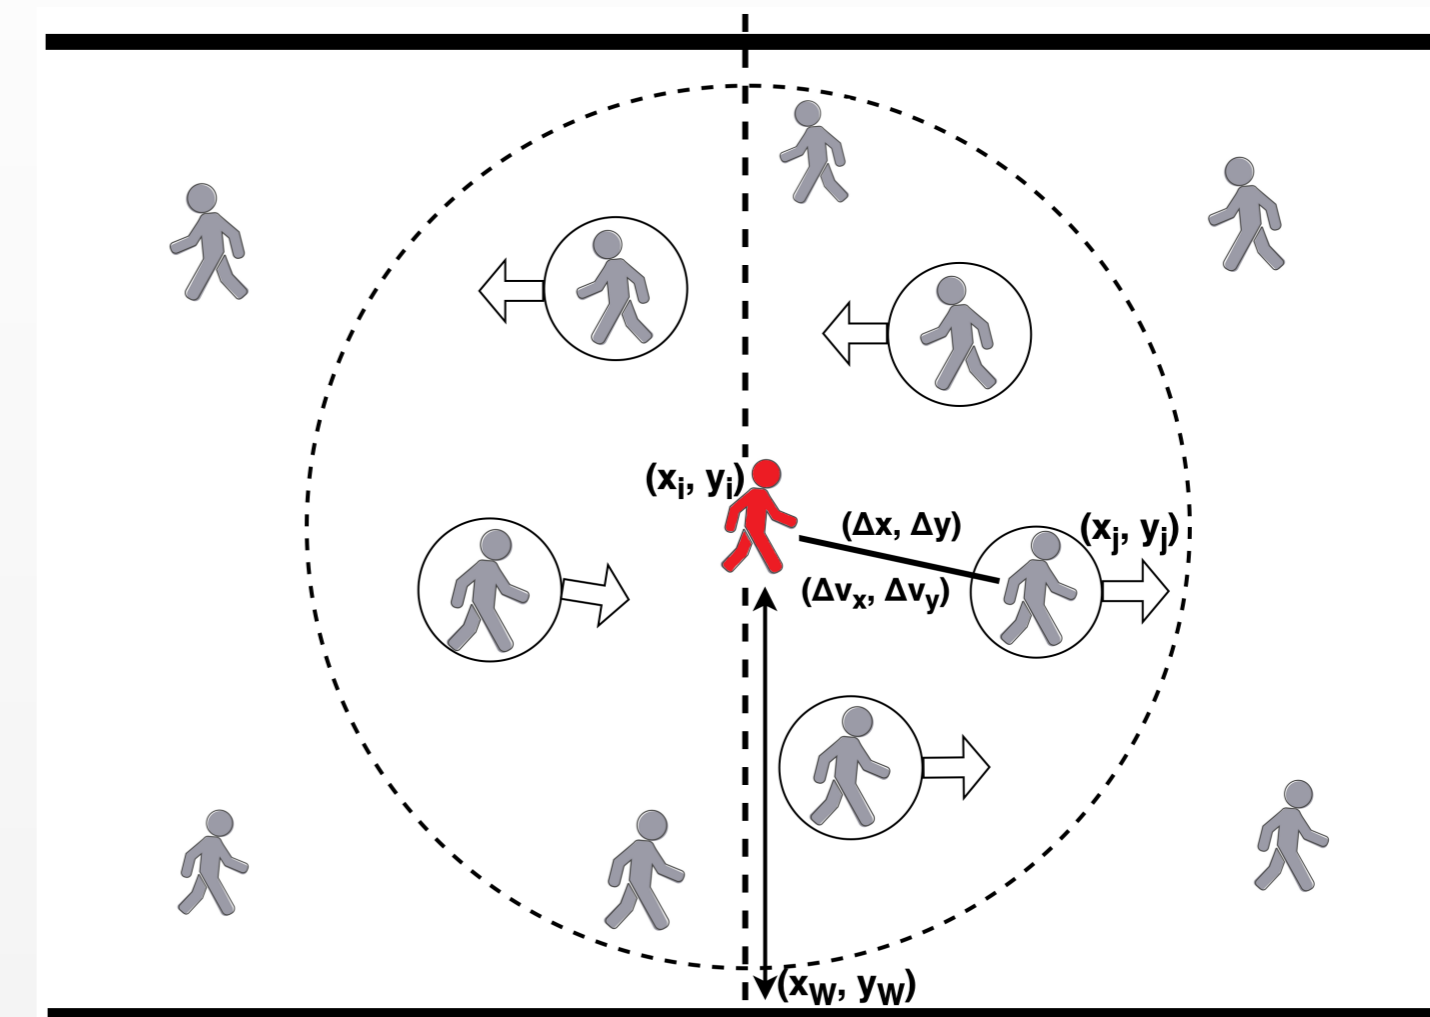

Fig. 1: Data preparation for K = 5.

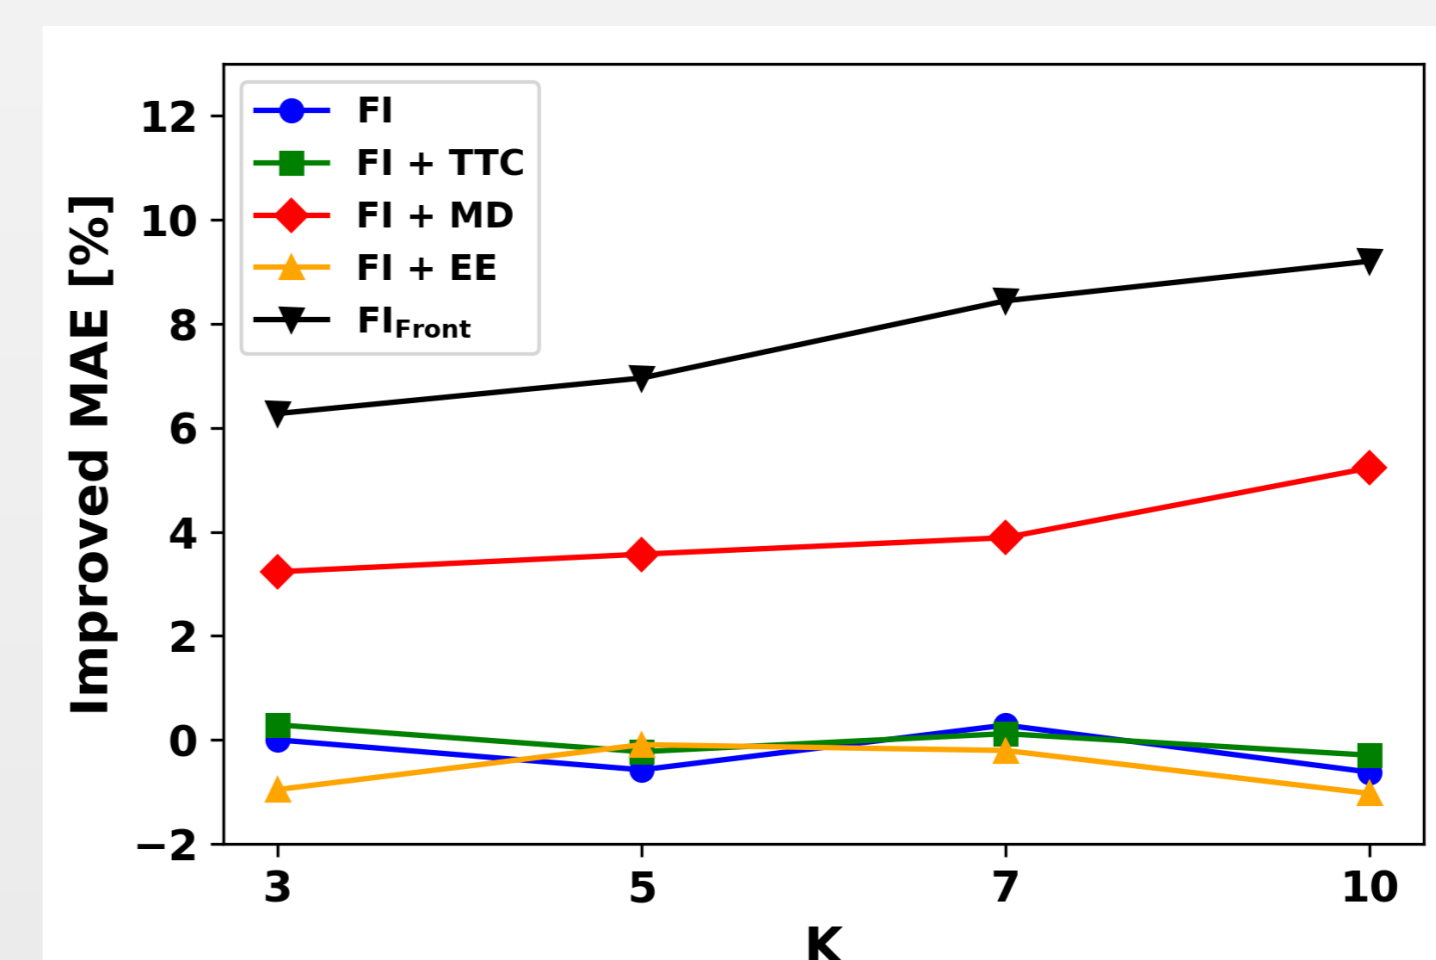

Fig. 2: Unidirectional flow, $\Delta t = 0.4$ s.

Fig. 3: Bidirectional flow, $\Delta t = 0.375$ s.

Future works

- Conducting a **sensitivity analysis** to determine the relative importance of the key variables.
- Comparing results with those from **low-density datasets**.
- Incorporating useful variables as **additional features** in pedestrian simulation models.
