(c) ADEME, Angers, France; (d) Aix Marseille Univ., CNRS, IRD, INRAE, Coll France, CEREGE, Aix-en-Provence, France

Context

Children **below 6 years old** = **sensitive population** to environmental contaminants

Specific exposure by ingestion:

Crawling, playing on the ground, bringing objects/hands to mouth

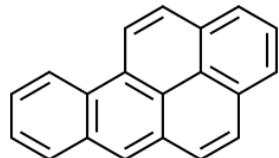

→ Up to **100 mg of dust per day** (US EPA, 2017)

Context

« All particles settled onto objects or surfaces, regardless of nature and origin »
(ANSES, 2019; US EPA, 2011)

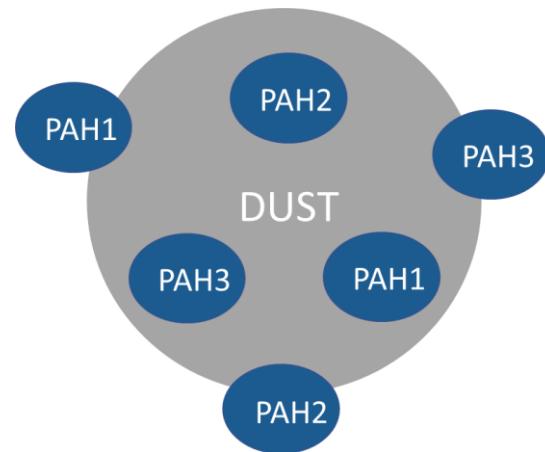

Settled dust = environmental **sink** for **organic contaminants**, especially
Polycyclic Aromatic Hydrocarbons (PAHs)

Benzo(a)pyrene
(BaP)

PAHs = **ubiquitous**

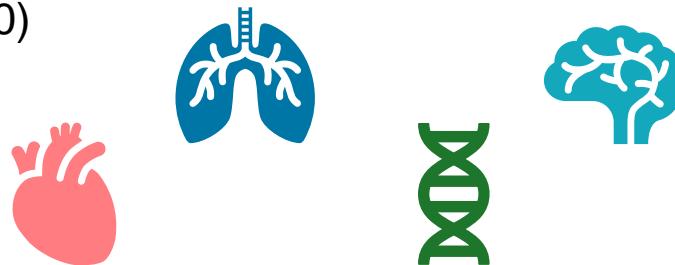

→ 16 PAHs on priority list of US EPA

Context

Health outcomes linked to PAHs (WHO, 2010)

- Bronchitis
- Ischemic cardiopathy
- Cognitive delay
- Cancers

Toxic Equivalent Factors (TEFs)

Regulatory use to assess carcinogenic potential of PAH mixtures

$$\text{TEQ} = \sum (C_i \times \text{TEF}_i)$$

Little knowledge about PAHs' mixtures

Limited to binary mixtures in literature

PROPOSED TOXICITY EQUIVALENCY FACTORS (TEFs) FOR INDIVIDUAL PAHS

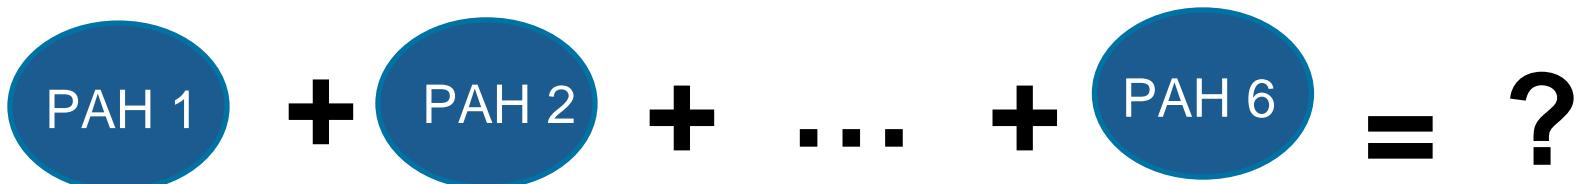

Compound	TEF
Dibenzo[<i>a,h</i>]anthracene	5 ^a
Benzo[<i>a</i>]pyrene	1
Benzo[<i>a</i>]anthracene	0.1
Benzo[<i>b</i>]fluoranthene	0.1
Benzo[<i>k</i>]fluoranthene	0.1
Indeno[123- <i>c,d</i>]pyrene	0.1
Anthracene	0.01
Benzo[<i>g,h,i</i>]perylene	0.01
Chrysene	0.01
Acenaphthene	0.001
Acenaphthylene	0.001
Fluoranthene	0.001
Fluorene	0.001
2-Methylnaphthalene	0.001
Naphthalene	0.001
Phenanthrene	0.001
Pyrene	0.001

Scientific question:

Are the effects of PAHs additive, when adjusted by their TEFs and when in mixture?

Aims

1. Investigate binary interaction effects of 6 PAHs in mixtures with *in vitro* assays
2. Examine whether the TEFs can roughly predict the *in vitro* DNA damage & chromosomal damage

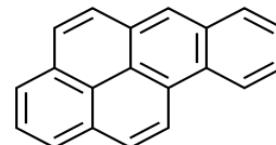

PAH 1 + PAH 2 + ... + PAH 6 = ?

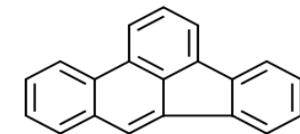

The diagram consists of six blue circles arranged horizontally. The first circle contains the text "PAH 1", the second "PAH 2", the third "...", the fourth "+", the fifth "PAH 6", and the sixth "=" followed by a question mark. This visual representation suggests the summation of individual PAH components to determine their collective effect.

Methodology

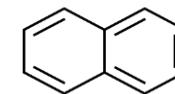

- Use of experimental design = maximize useful data with minimal number of experiments
- 6 PAHs for mixtures
- Selection based on carcinogenicity / environmental distribution / source linked to a specific activity

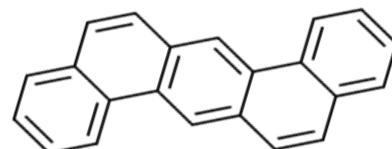

Benzo(a)pyrene
(BaP); IARC: 1

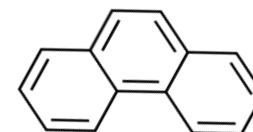

Benzo(b)fluoranthene
(BbF); IARC: 2B

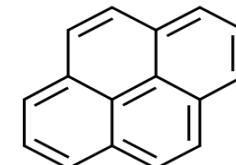

Naphthalene
(Nap); IARC: 2B

Dibenz(a,h)anthracene
(dBahA); IARC: 2A

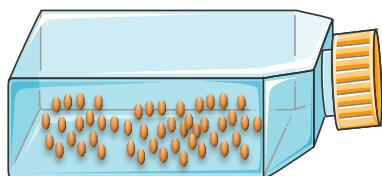

Phenanthrene
(Phe); IARC: 3

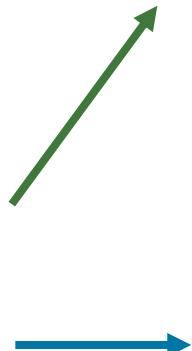

Pyrene
(Pyr); IARC: 3

Methodology

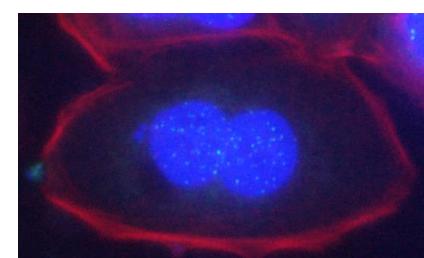

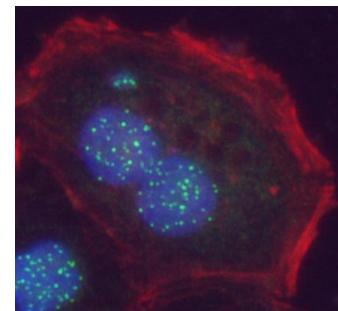

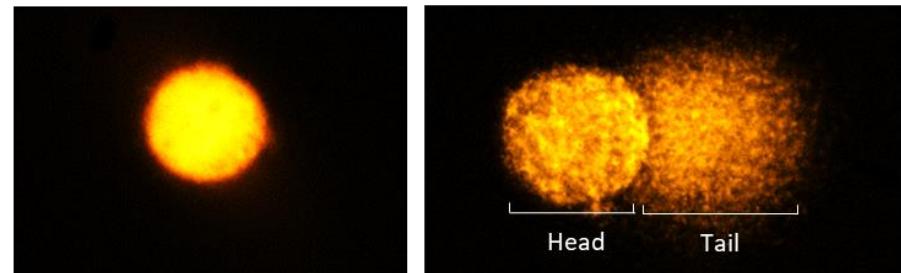

4h exposure to mixtures
+ 10% S9 mix

Adenoma Gastric Cells
(AGS), passage #42-43
Doubling time = 20h

Alkaline comet assay –
DNA damage (Tice *et al.*, 2000)

Cytokinesis Block Micronucleus assay–
Chromosomal damage (Fenech, 2007)

Methodology: design of experiment

Experiment	Nap	Phe	Pyr	BbF	BaP	dBahA	TEQ

→ BaP = only factor with effect on cytostasis

Results: Binary interactions – comet assay

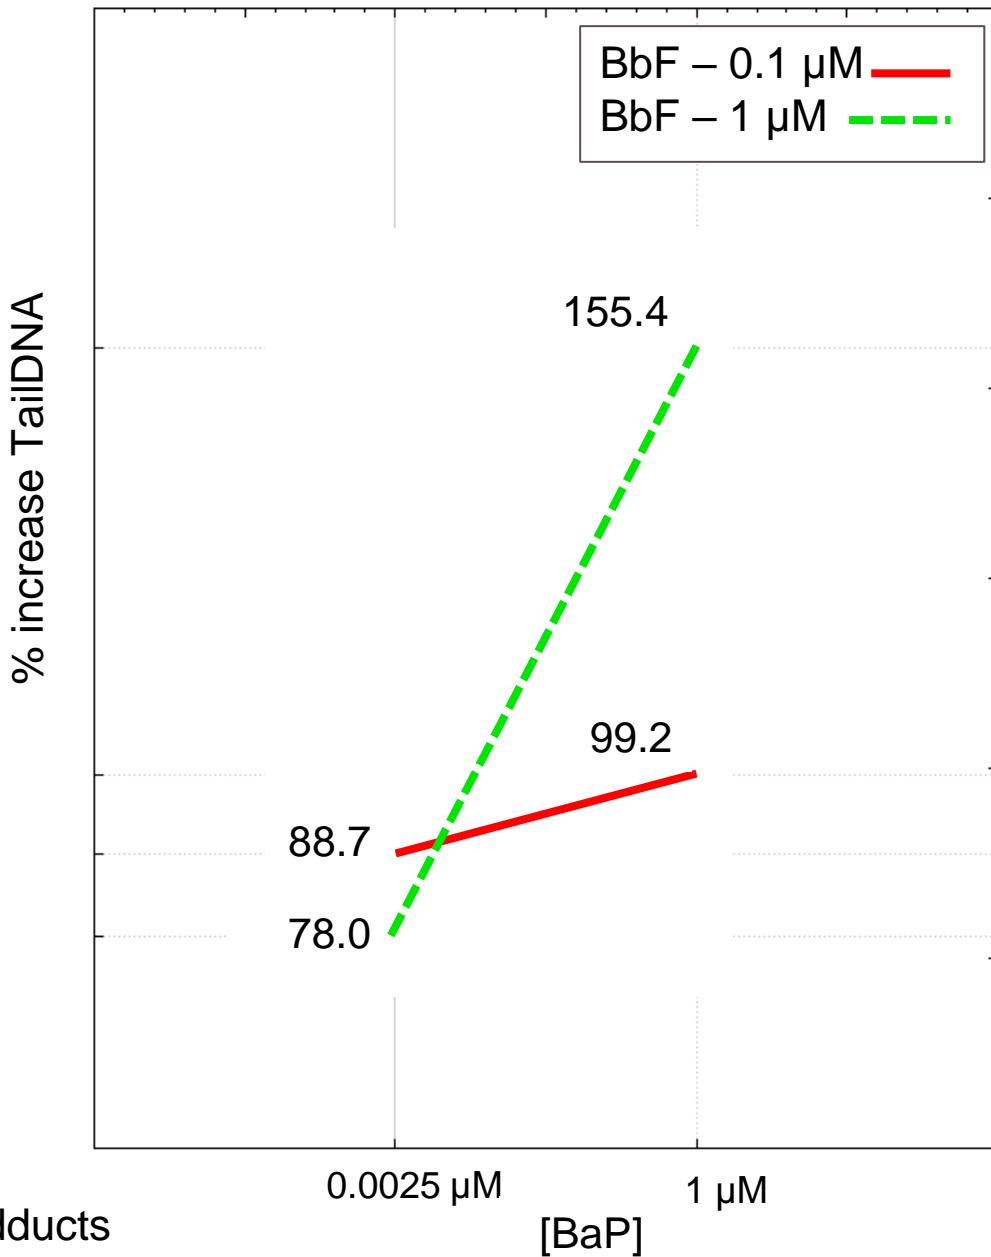

Results: Binary interactions – comet assay

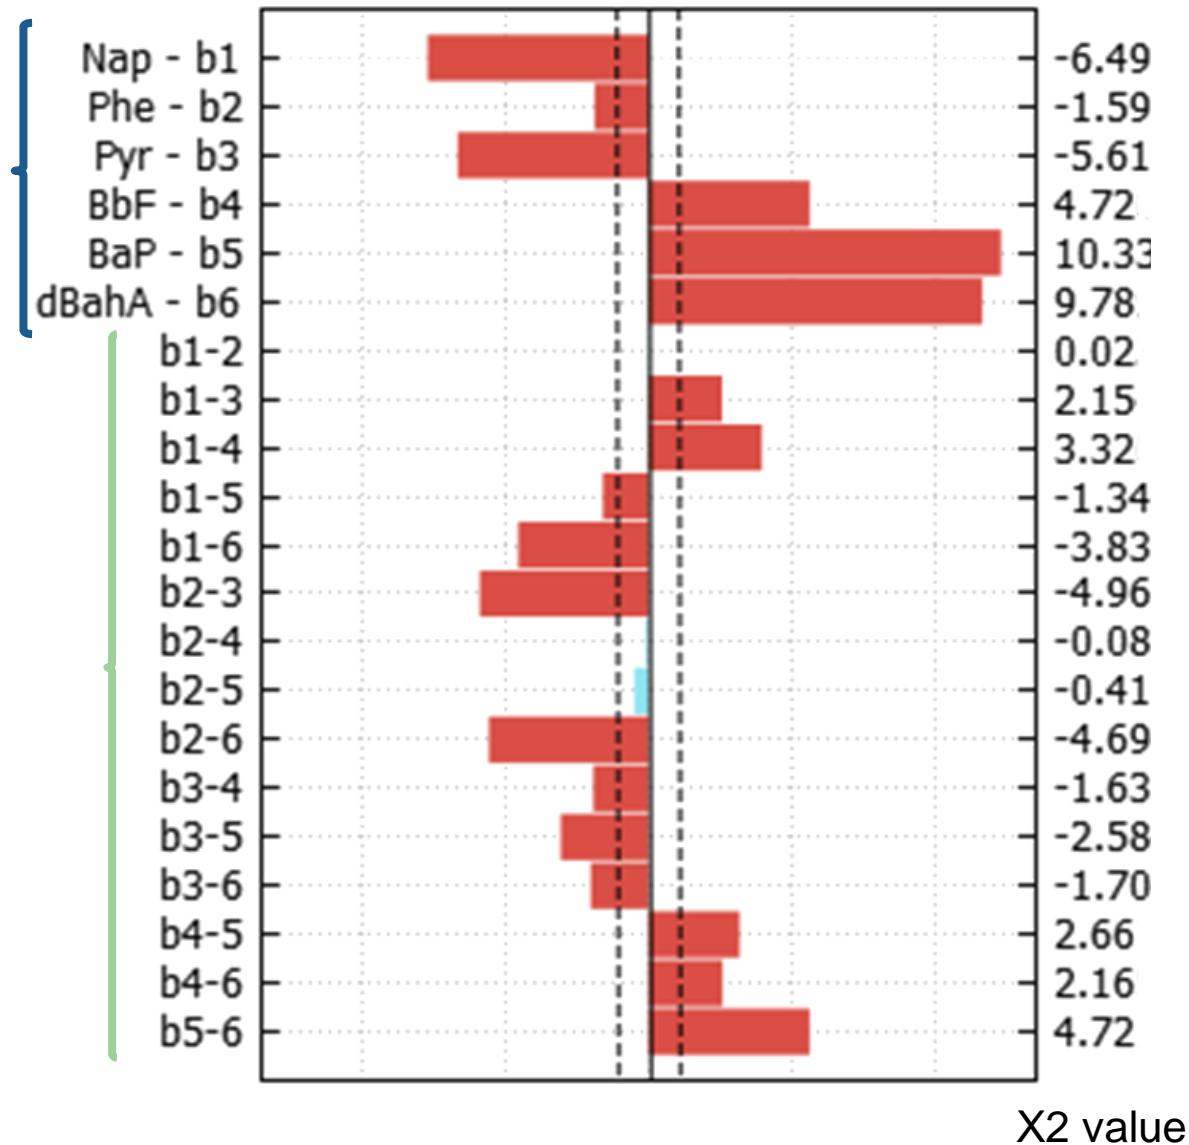

→ Synergistic interaction

Tarantini *et al.*, 2011 → DNA adducts

Results: binary interactions – CBMN assay

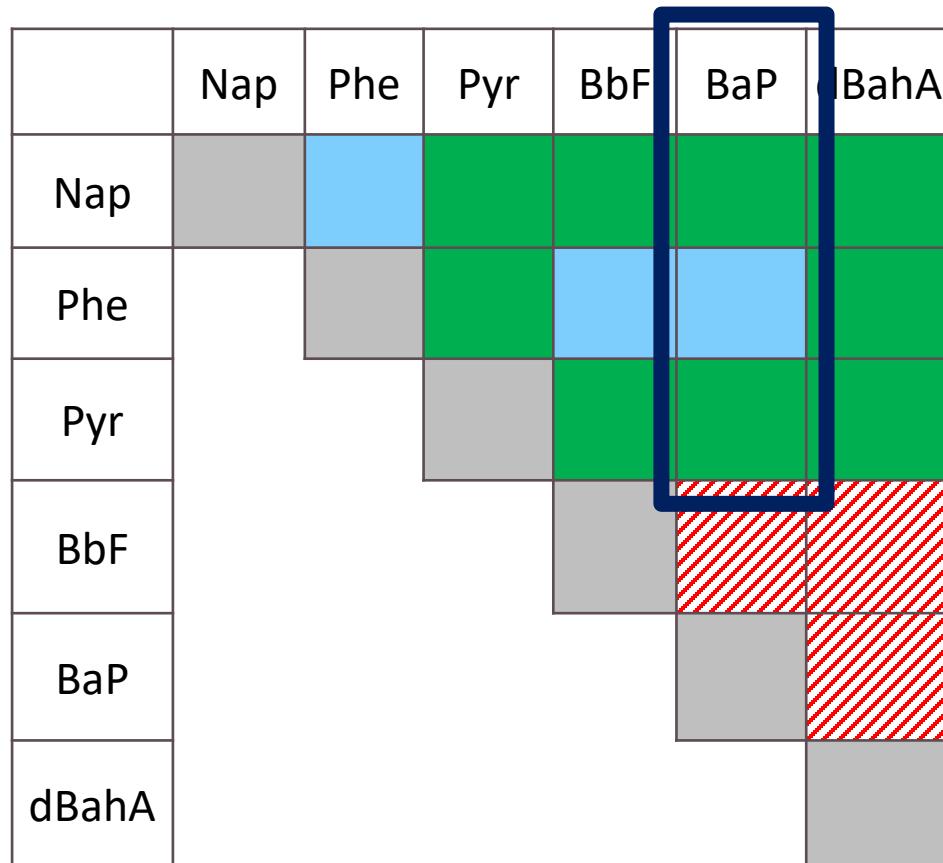

Many significant binary interactions effects

Most important are:

- b2-3: Phe – Pyr
- b2-6: Phe – dBahA
- b5-6: BaP – dBahA

Results: Binary interactions matrix – CBMN assay

Additivity ($1+1 = 2$)

Synergistic ($1+1 > 2$)

Antagonistic ($1+1 < 2$)

Muthusamy *et al.*, 2018: *in vitro* flow cytometry micronucleus assay

- BaP + Nap = antagonistic
- BaP + Phe = antagonistic
- BaP + Pyr = additive

Results: Determination of Genotoxic Equivalent Factors (GEF)

Single PAH		
PAH	TEF	GEF (γ H ₂ AX)
Nap	0.001	0
Phe	0.001	0
Pyr	0.001	0
BbF	0.1	[0.69-1.46]
dBahA	1	[0.5-2.77]
BaP	1	1.00

Tomasetig *et al.*, 2020

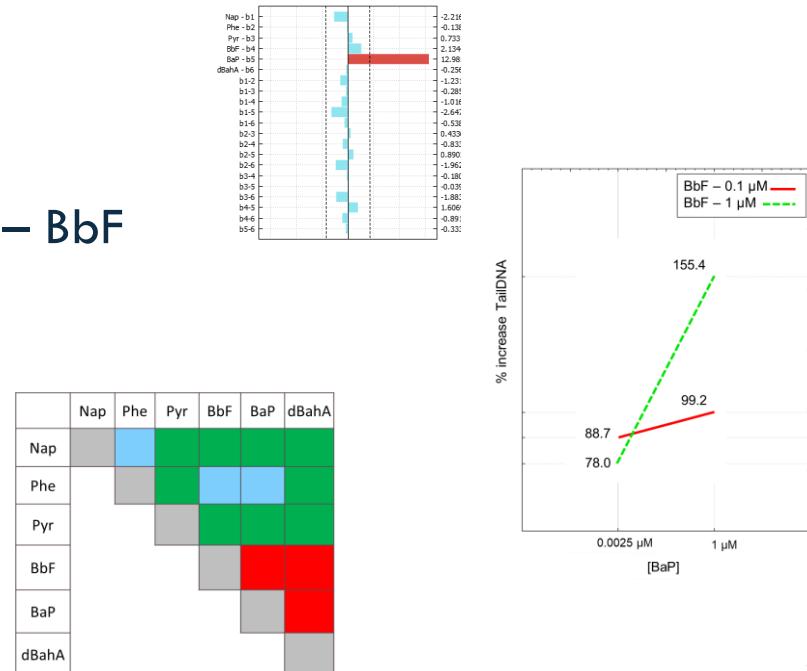

Determination of scaled coefficients with a least square regression without intercept model

Conclusion

- Experimental designs = binary interaction effects of 6 PAHs in mixtures
- *In vitro* comet assay & CBMN assay on AGS cells
- Determination of GEFs & comparison to TEFs

Main results

- No interaction for cytostasis
- Comet assay: synergistic interaction BaP – BbF
- CBMN: many interactions
- GEFs consistent with TEFs

Future prospects

GEF for PAHs : more testing necessary of PAHs in mixtures with other genotoxicity assays and other cell lines

Experimental designs = optimized method to study contaminants' interactions in mixtures → useful approach

Further study of interactions

- Ternary and other levels of interactions
- Different contaminants in mixtures: inorganic / organic

Annex: Methodology

- Statistical analysis for binary interactions
 - Comet assay: Kruskall-Wallis multiple comparison test
 - CBMN: chi-2 test
 - Experimental design: Student test
- PAH behavior in mixtures and TEF
 - Linear regression coefficients without intercept calculated for each PAH
 - Scaling on BaP values and comparison

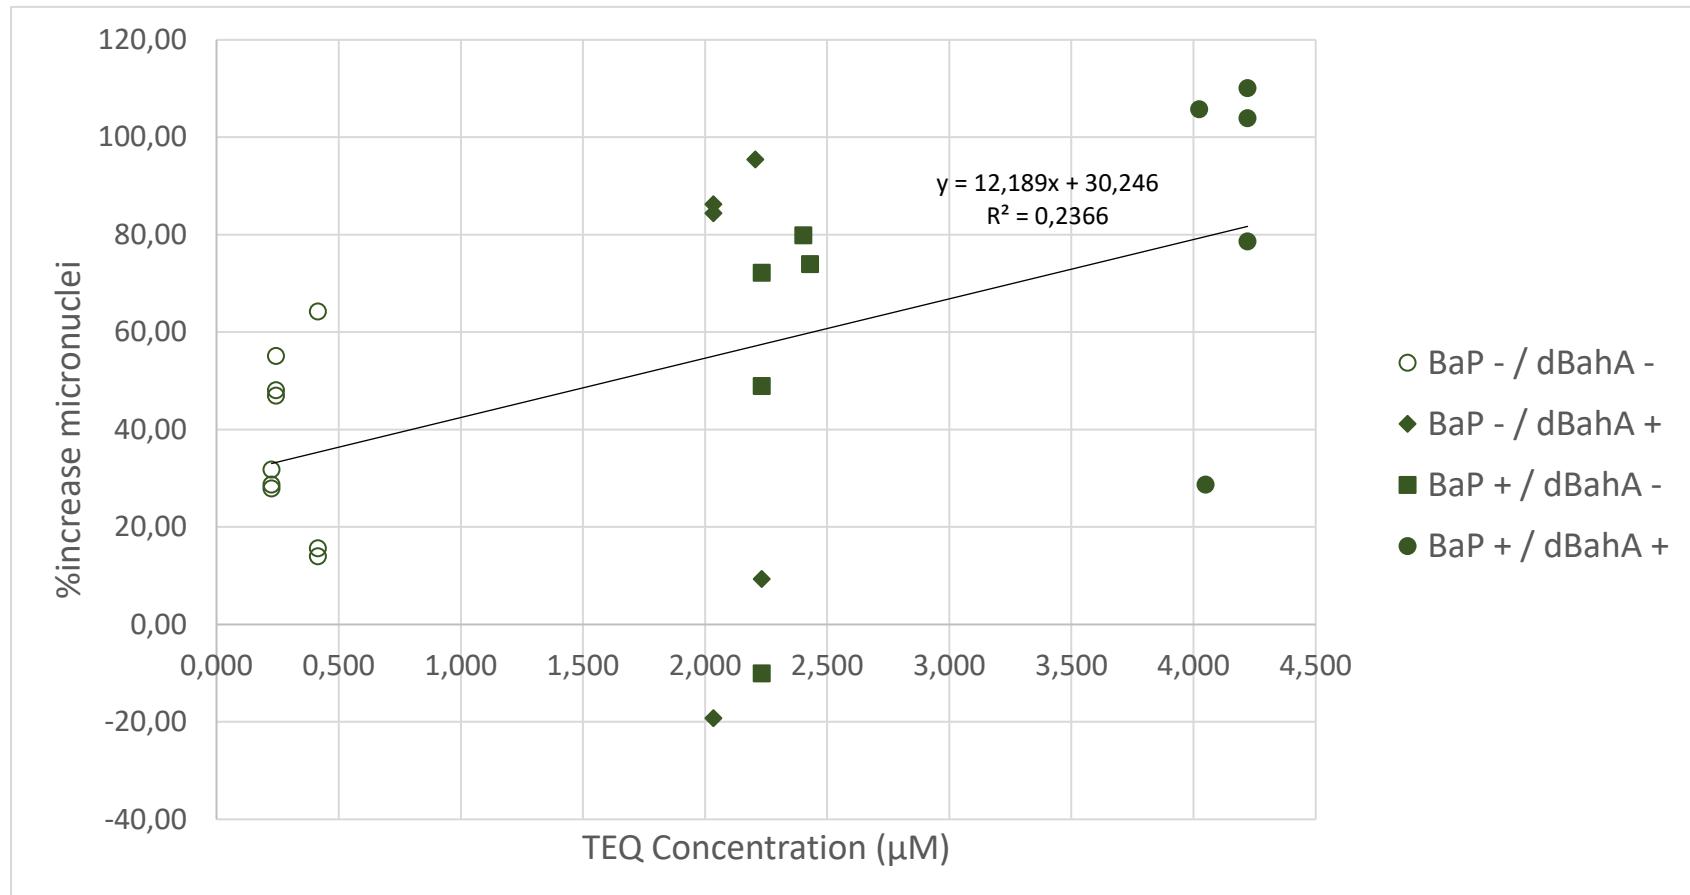

Results

- TEQ and DNA damage

Results

- TEQ and micronuclei

Results

- Binary interactions – CBMN assay
