HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

HYDRODYNAMIC BEHAVIOR OF QUINOA SEEDS IN A ROTARY DRUM USING THE DISCRETE ELEMENT METHOD (DEM)

Marcela V. C. MACHADO¹, Artemio PLANAS-FATTORI¹, Kevin LACHIN¹, Stephane VITU^{1,2}, Marie DEBACQ^{1,2}

1 - Introduction

Rotary drums

- particulate systems + fluids
- isothermal or non-isothermal
- a large number of industrial processes: rotary kilns, dryers, mills, etc
- But lack of simple tools for the industry

Experimental

- Dimensioning of process variables
- Materials properties

Modeling

- Understanding the flow material behavior with more details
- Overcoming industrial safety limitations

Discrete Element Method (DEM):

Requires the specification of input parameters related to the particle properties and particle-particle (PP) and particle-wall (PW) interactions.

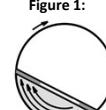

CALIBRATION STEP: varying the parameters until the model response corresponds to the equivalent experimental responses.

Problem in this approach:

Possibility of non-uniqueness in the set of parameters.

2 - Goals

- To study the influence of static friction (SF) and rolling friction (RF) coefficients in both interactions particle-particle (PP) and particle-wall (PW) on the dynamic repose angle of quinoa seeds in a rotary drum in rolling regime.
- To develop a Central Composite Design to combine the friction parameters of DEM input used in the calibration procedure.
- To obtain the regression models of the response surface methodology, which allows analyzing the interaction between the parameters and their significance.

3 - Methodology

3.1. DIRECT COMPUTATION

Lagrangian Method or Discrete Element Method (DEM):

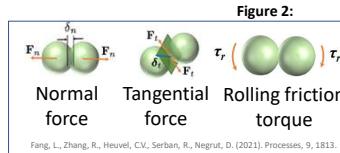

- All the particles trajectories are tracked
- Temporal integration is applied to each of them using Newton's laws:

$$\text{Translation: } m_i \frac{dv_i}{dt} = \sum_j (F_{ij}^y + F_t^y) + m_i g$$

$$\text{Rotation: } I_i \frac{d\omega_i}{dt} = \sum_j (R_i \times F_t^y) + \tau_{ri}$$

$$\text{Normal force: } F_N = \lambda_{AN} v_{Nij} - k_N \delta_N$$

$$\text{Tangential force: } F_T = \begin{cases} \mu_p F_N, & \text{se } |F_T| \leq \mu |F_N| \\ \lambda_{AT} v_T - k_T \delta_T, & \text{se } |F_T| > \mu |F_N| \end{cases}$$

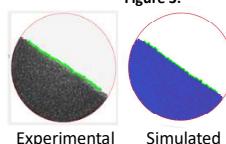

$$\text{Torque: } \vec{\tau}_y = \mu_p \vec{F}_N R_i \vec{\omega}_i$$

μ_p : Static friction coefficient (SF)
 μ_R : Rolling friction coefficient (RF)

3.2. MODEL PARAMETERS

- Drum: diameter 0.084m and length 0.020m
- Quinoa seeds: $d = 0.0017m$, $\rho = 1058 \text{ kg/m}^3$
- Speed rotation: 12 rpm (rolling regime)
- Froude number: $Fr = 0.0068$
- Time-step: $8.6 \times 10^{-6} \text{ s}^{-1}$ (5% of Rayleigh time)

3.3. PARAMETERS IDENTIFICATION

Response: dynamic repose angle: θ

1st step:

Analysis with 2 variables and interactions PP = PW

Static friction: 0.1, 0.3, 0.5, 0.7, 0.9
Rolling friction: 0.1, 0.3, 0.5, 0.7, 0.9

All the combinations

2nd step:

Analysis with 4 variables and interactions PP \neq PW

Varying: Static friction: 0.1, 0.3, 0.5, 0.7, 0.9
Rolling friction: 0.1, 0.3, 0.5, 0.7, 0.9
Other parameters are fixed.

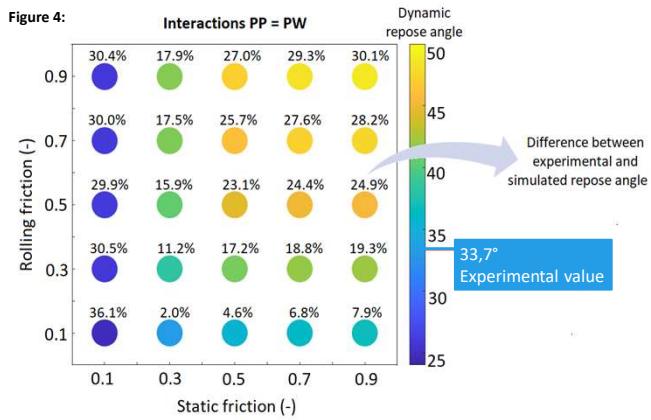

3rd step:

Central Composite Design (CCD) + Response Surface Method

Dynamic repose angle as a function of metamodel:
 $\theta = f(SF_{PP}, SF_{PW}, RF_{PP}, RF_{PW})$

4 - Simulation results

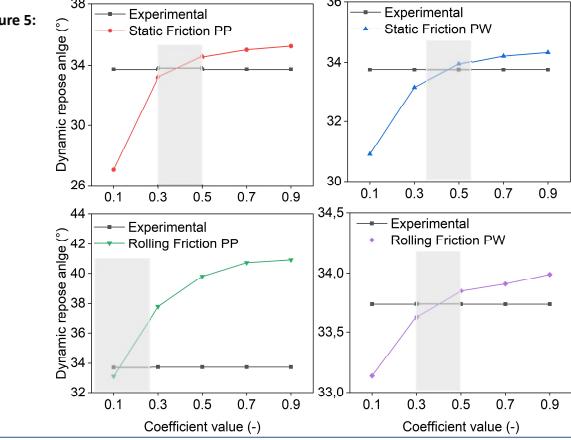

4.1. Parameter analysis with 2 variables: static and rolling friction

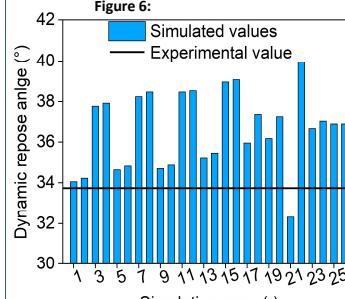

Difference between experimental and simulated repose angle

33.7° Experimental value

4.2. Parameter analysis with 4 variables: static and rolling friction, in each interaction particle-particle and particle-wall

4.3. Central Composite Design and Response Surface Method with 4 variables:

Variable	Coded levels				
	$-\alpha$	-1	0	+1	$+\alpha$
SF PP	0.300	0.350	0.400	0.450	0.500
SF PW	0.350	0.400	0.450	0.500	0.550
RF PP	0.005	0.070	0.135	0.200	0.265
RF PW	0.300	0.350	0.400	0.450	0.500

α : axial points

Case	SFPP	SFPW	RFPP	RFPW	Angle	Error
1	0.35	0.40	0.07	0.35	34.05°	0.9%
2	0.35	0.40	0.07	0.45	34.20°	1.4%

Metamodel of the dynamic repose angle (°) at 12 rpm:

$$R^2 = 0.999.. \quad \Theta = 20.13 + \underline{x} a_1 + \underline{x} A_1 \underline{x}$$

$$a_1 = \begin{bmatrix} 23.08 \\ 18.98 \\ 39.95 \\ 1.68 \end{bmatrix}, A_1 = \begin{bmatrix} -20.61 & 0 & 0 & 0 \\ 0 & -15.11 & 0 & 0 \\ 0 & 0 & -41.78 & 0 \\ 0 & 0 & 0 & 0 \end{bmatrix}, \underline{x} = \begin{bmatrix} SFPP \\ SFPW \\ RFPP \\ RFPW \end{bmatrix}$$

5 - Conclusions & perspectives

- The DEM provides a good representation of the phenomenon, allowing a satisfactory visualization, in Figure 3 (experimental and simulation comparison);
- The same methodology to measure the dynamic repose angle was used (implemented by MatLab code) for both experimental and simulated pictures;
- The Response Surface Method can satisfactorily represent static and rolling friction interaction parameters.
- Quantitatively, the simulation can represent the bed flow so that the dynamic repose angle simulated is very close to the experimental (Figure 4).
- ONGOING WORK:** to analyze the influence of parameters in the bed flow of quinoa in other speed rotations using the metamodels.
- NEXT STEPS:** to validate a set of parameters from the mixing assessment.
