## Context

- Fish may face wide variation of salinity in their environment
- Water salinity may affect transfer of essential elements
- Euryhaline species are more adapt to salinity changes

Does a gradient of salinity modifies  
Assimilation Efficiencies  
of Zn and Mn in Turbot ?

## Materials and methods

### Radiotracers

<sup>54</sup>Mn & <sup>65</sup>Zn

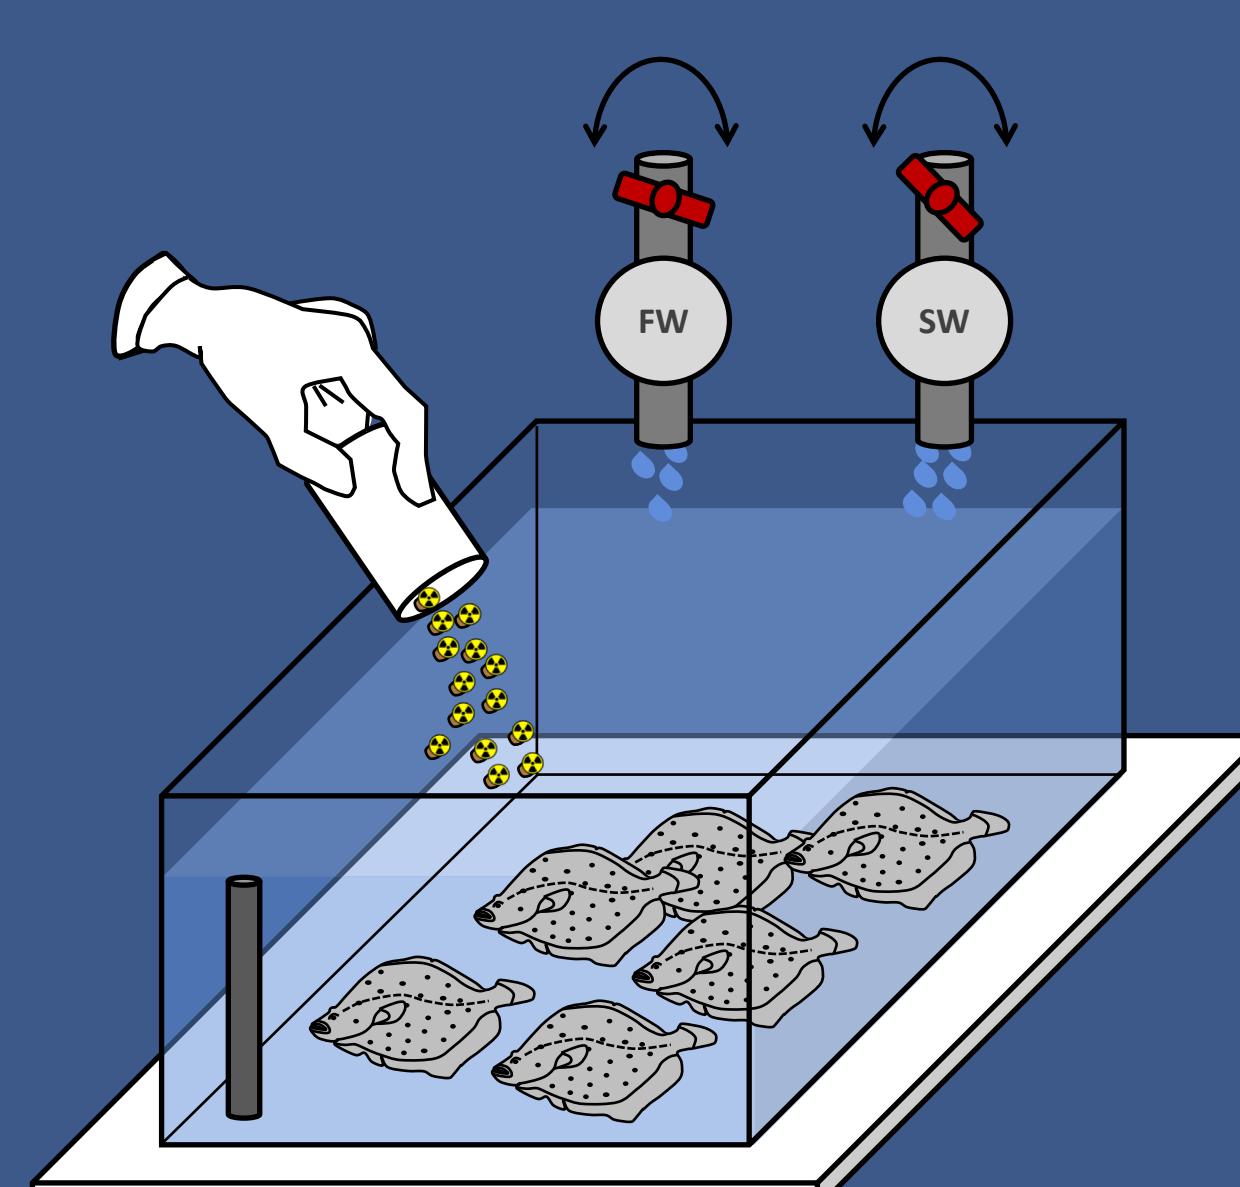

### Salinity conditions

3 salinities (10, 25 & 38)

1 Radi labelling of pellets with dissolved radiotracers

2 Single-feeding with radiolabeled pellets  
Turbots acclimated to 3 salinities (10, 25 and 38)

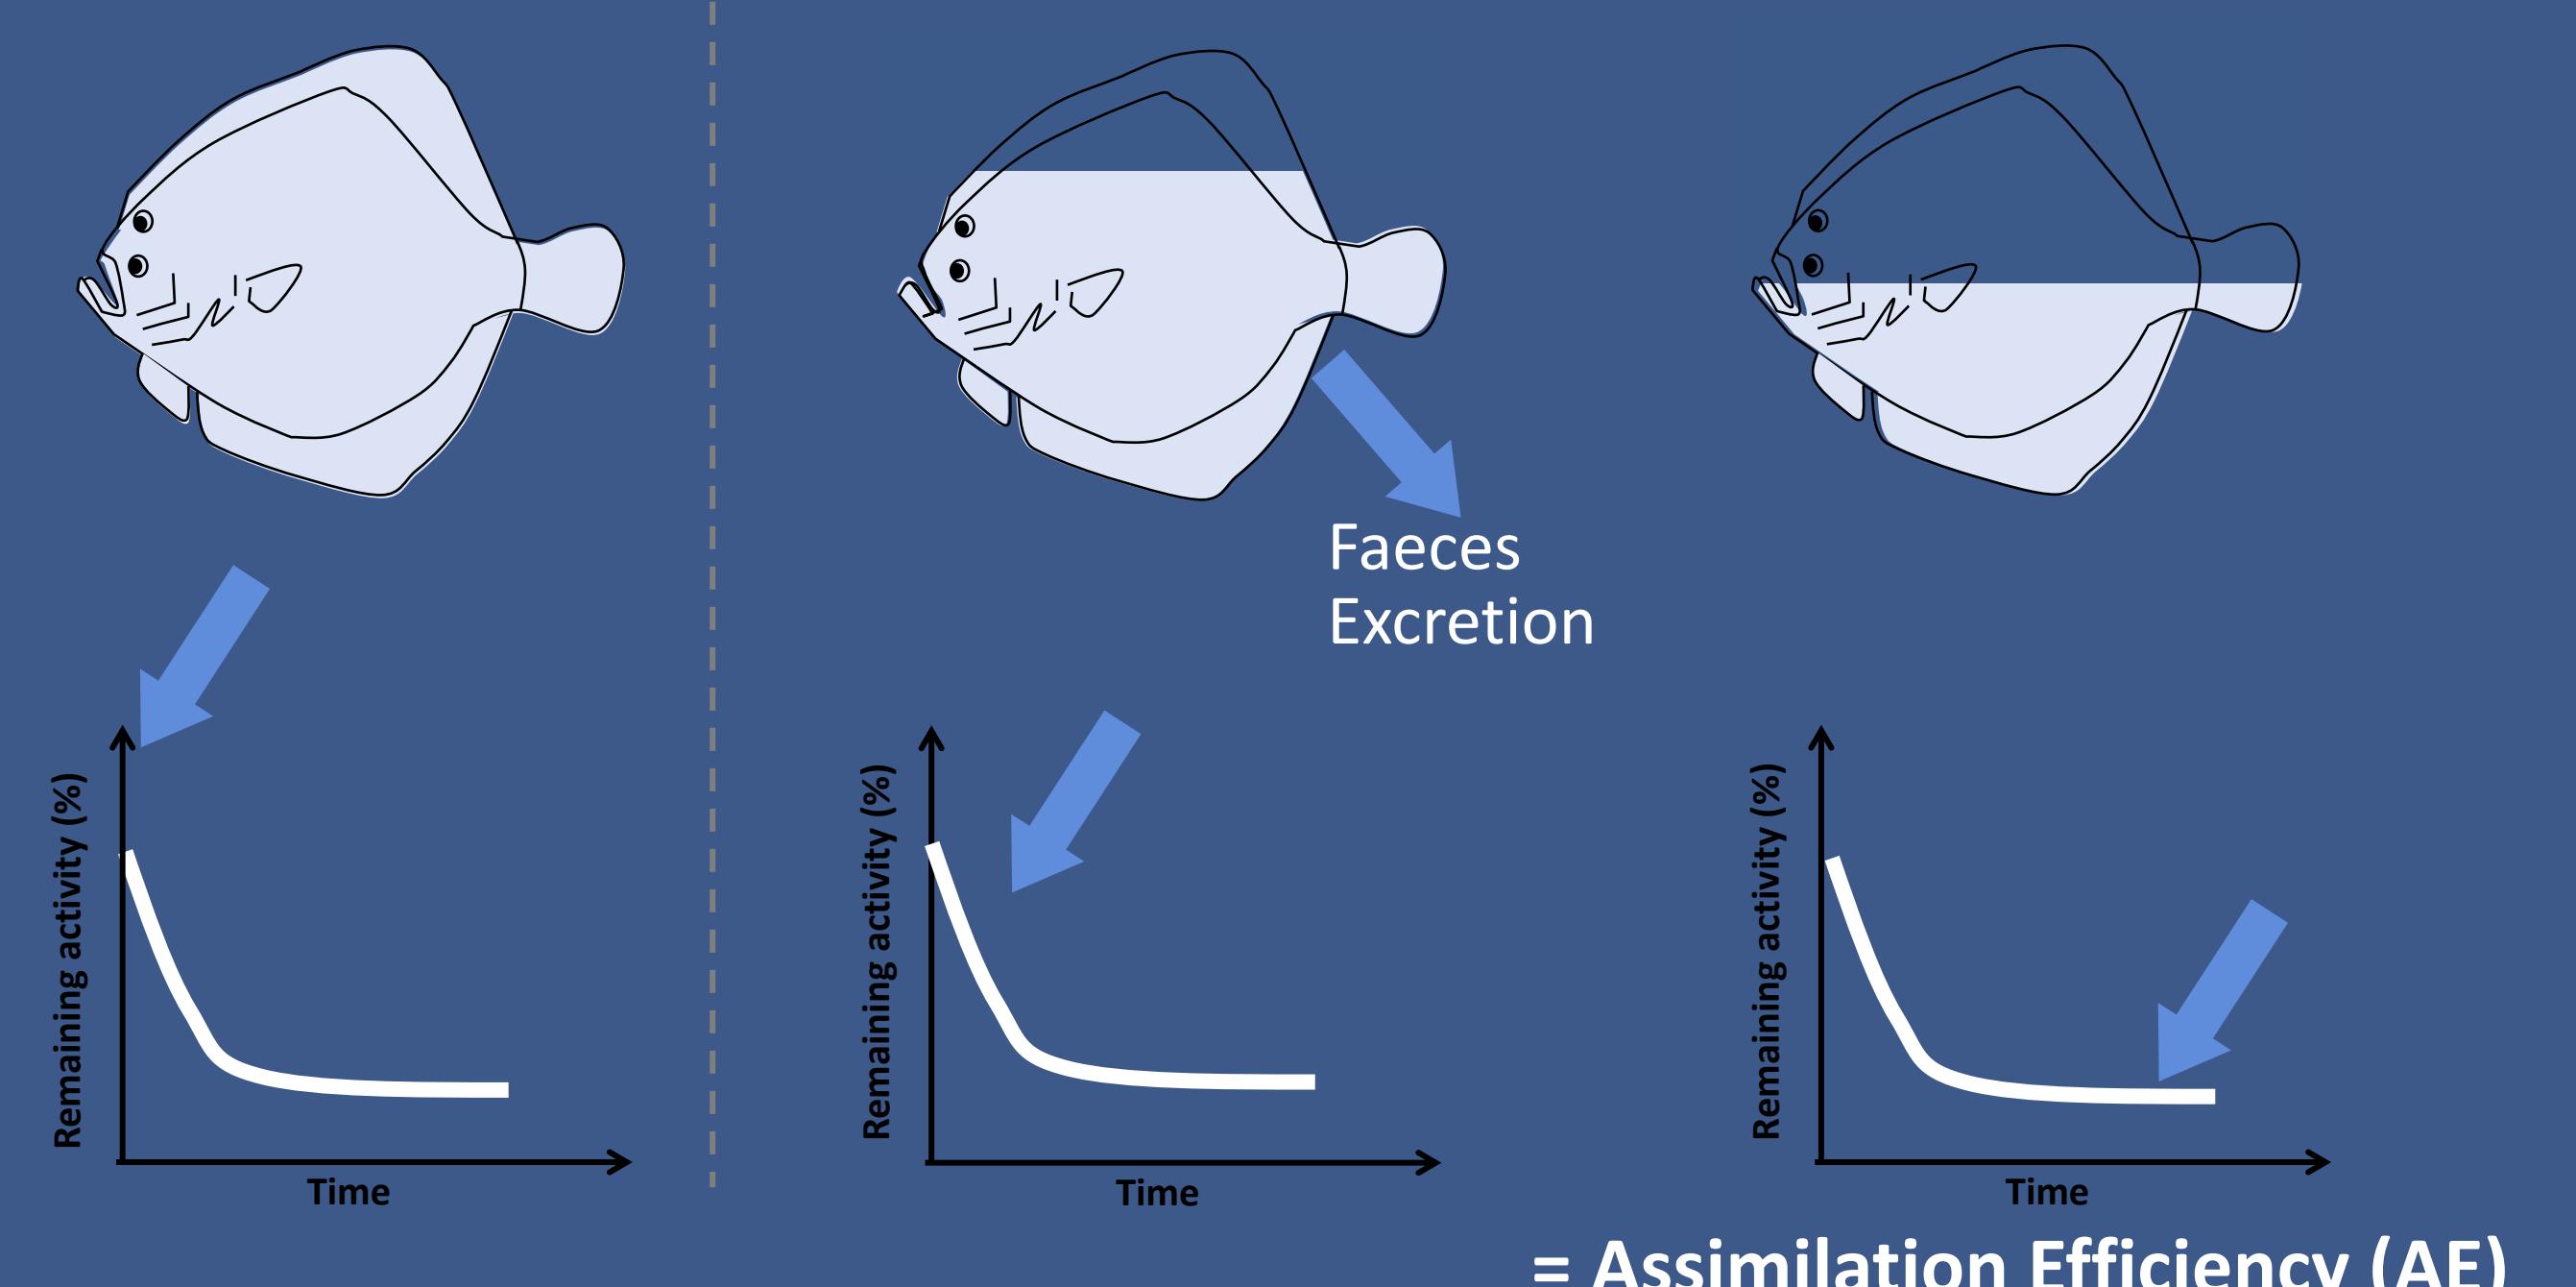

### Trophic transfer

Pulse-chase feeding (=one single feeding)

0 Feeding 100% of activity

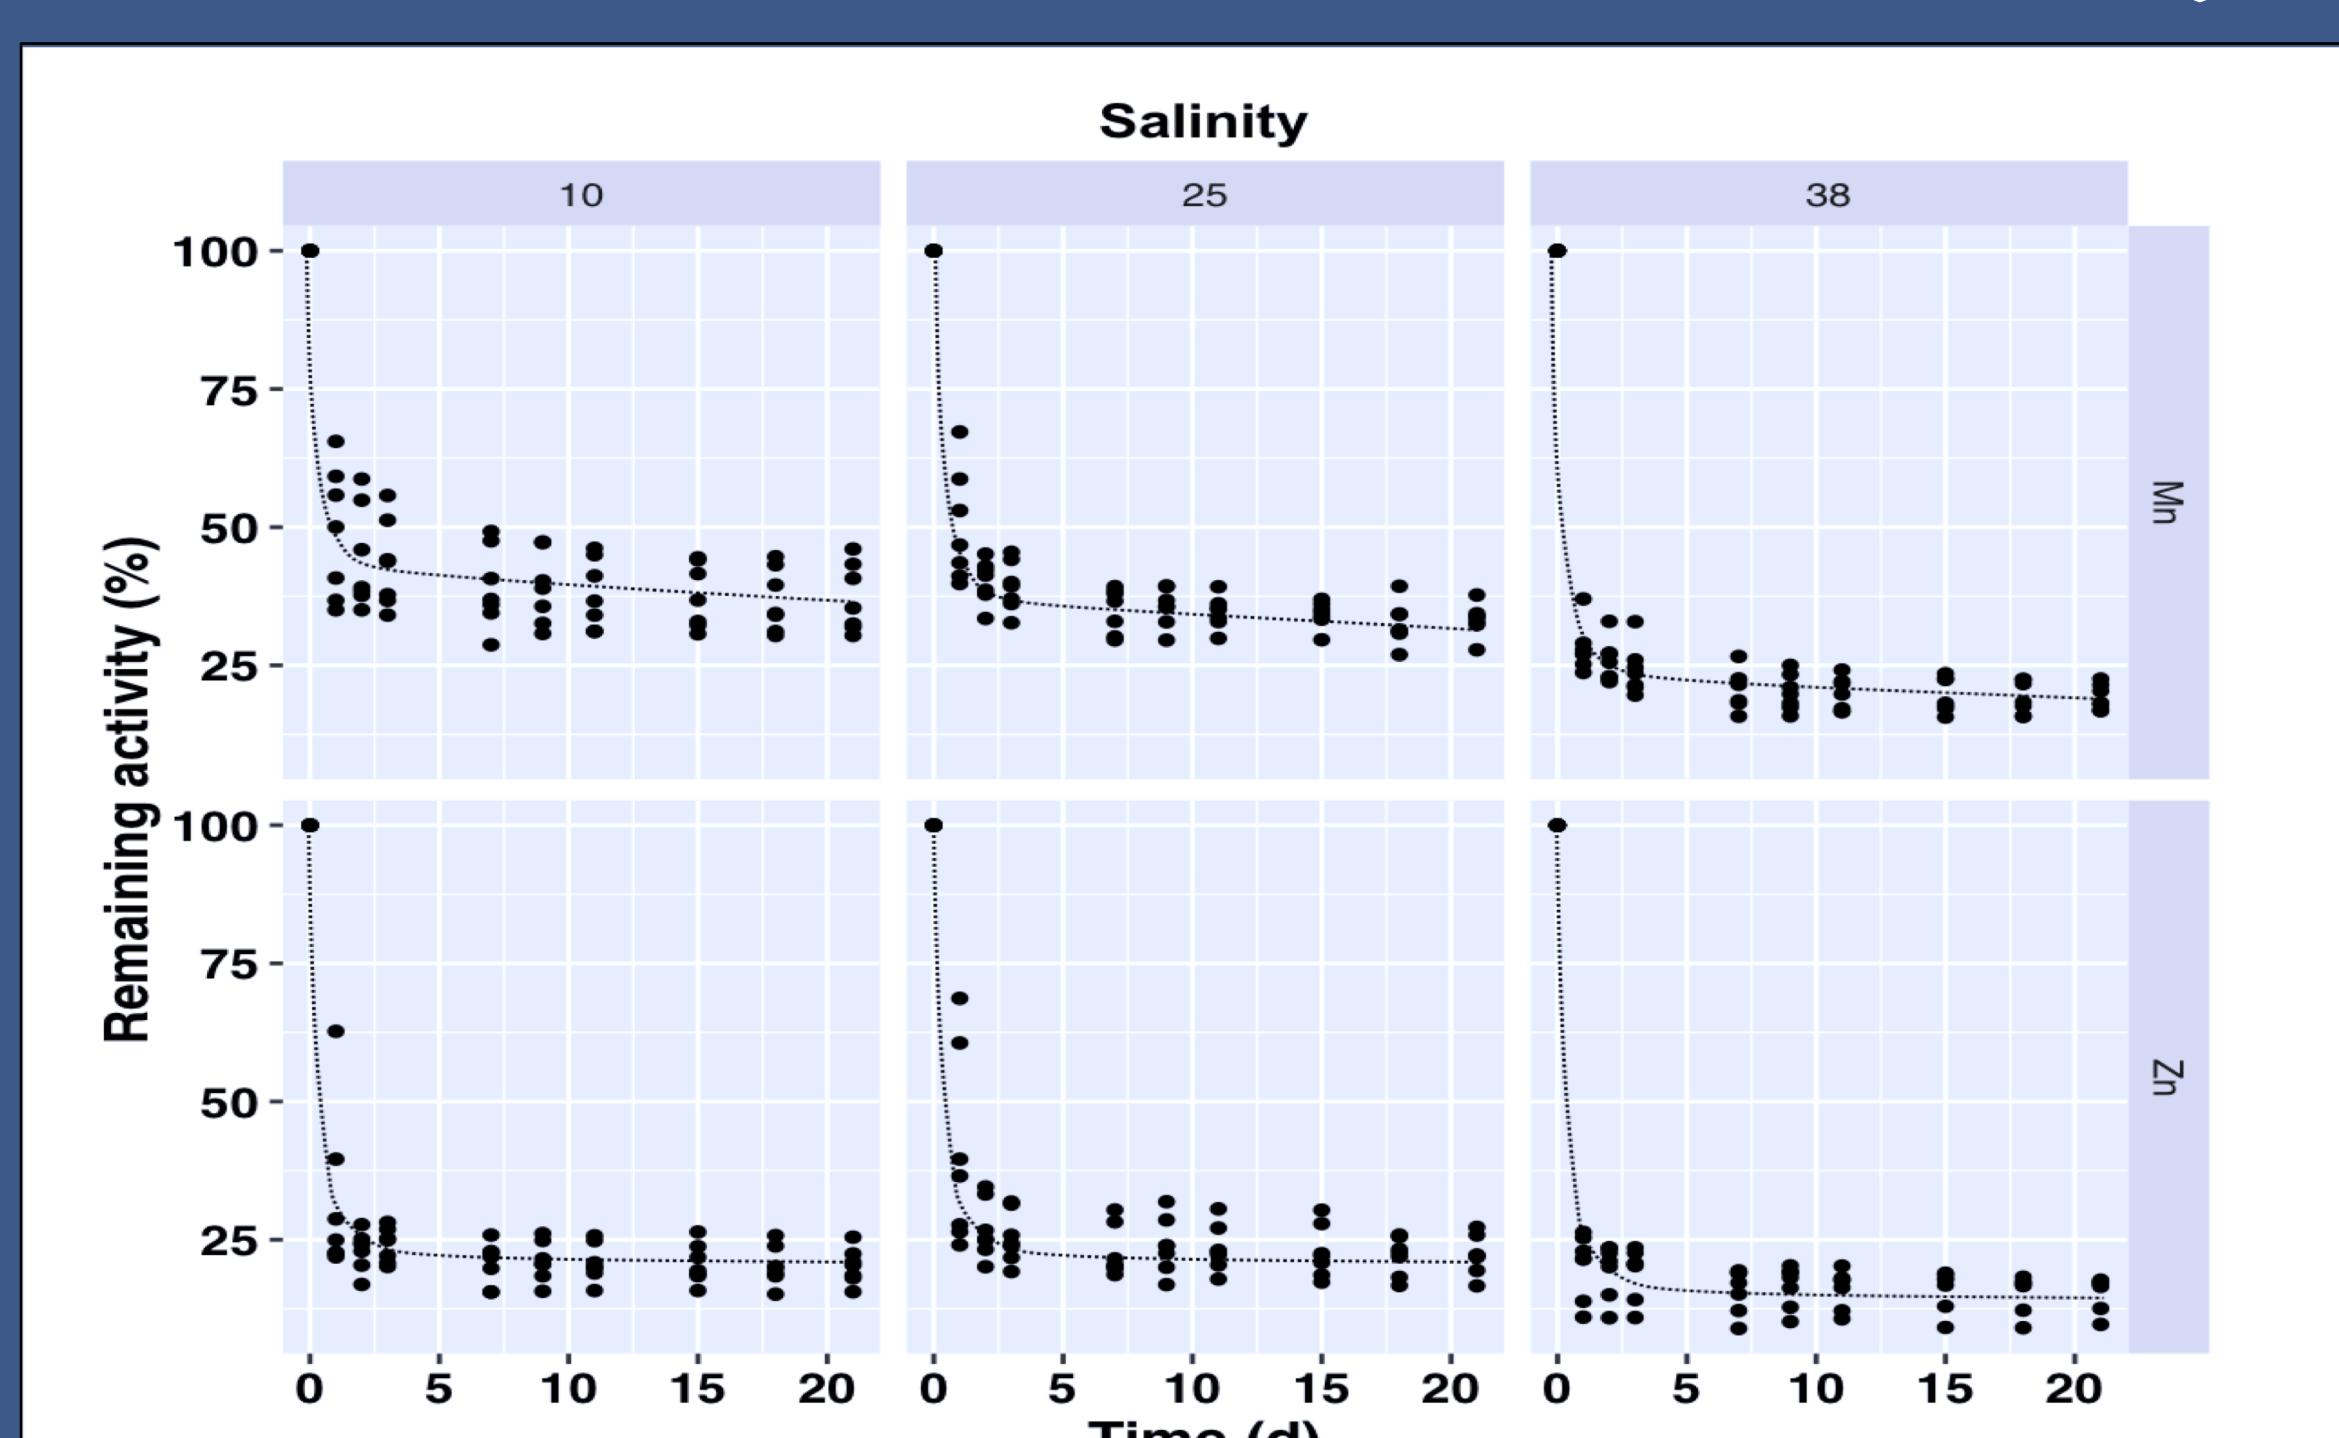

1 1<sup>st</sup> Depuration phase Decrease of activity

2 2<sup>nd</sup> Depuration phase Stability of activity

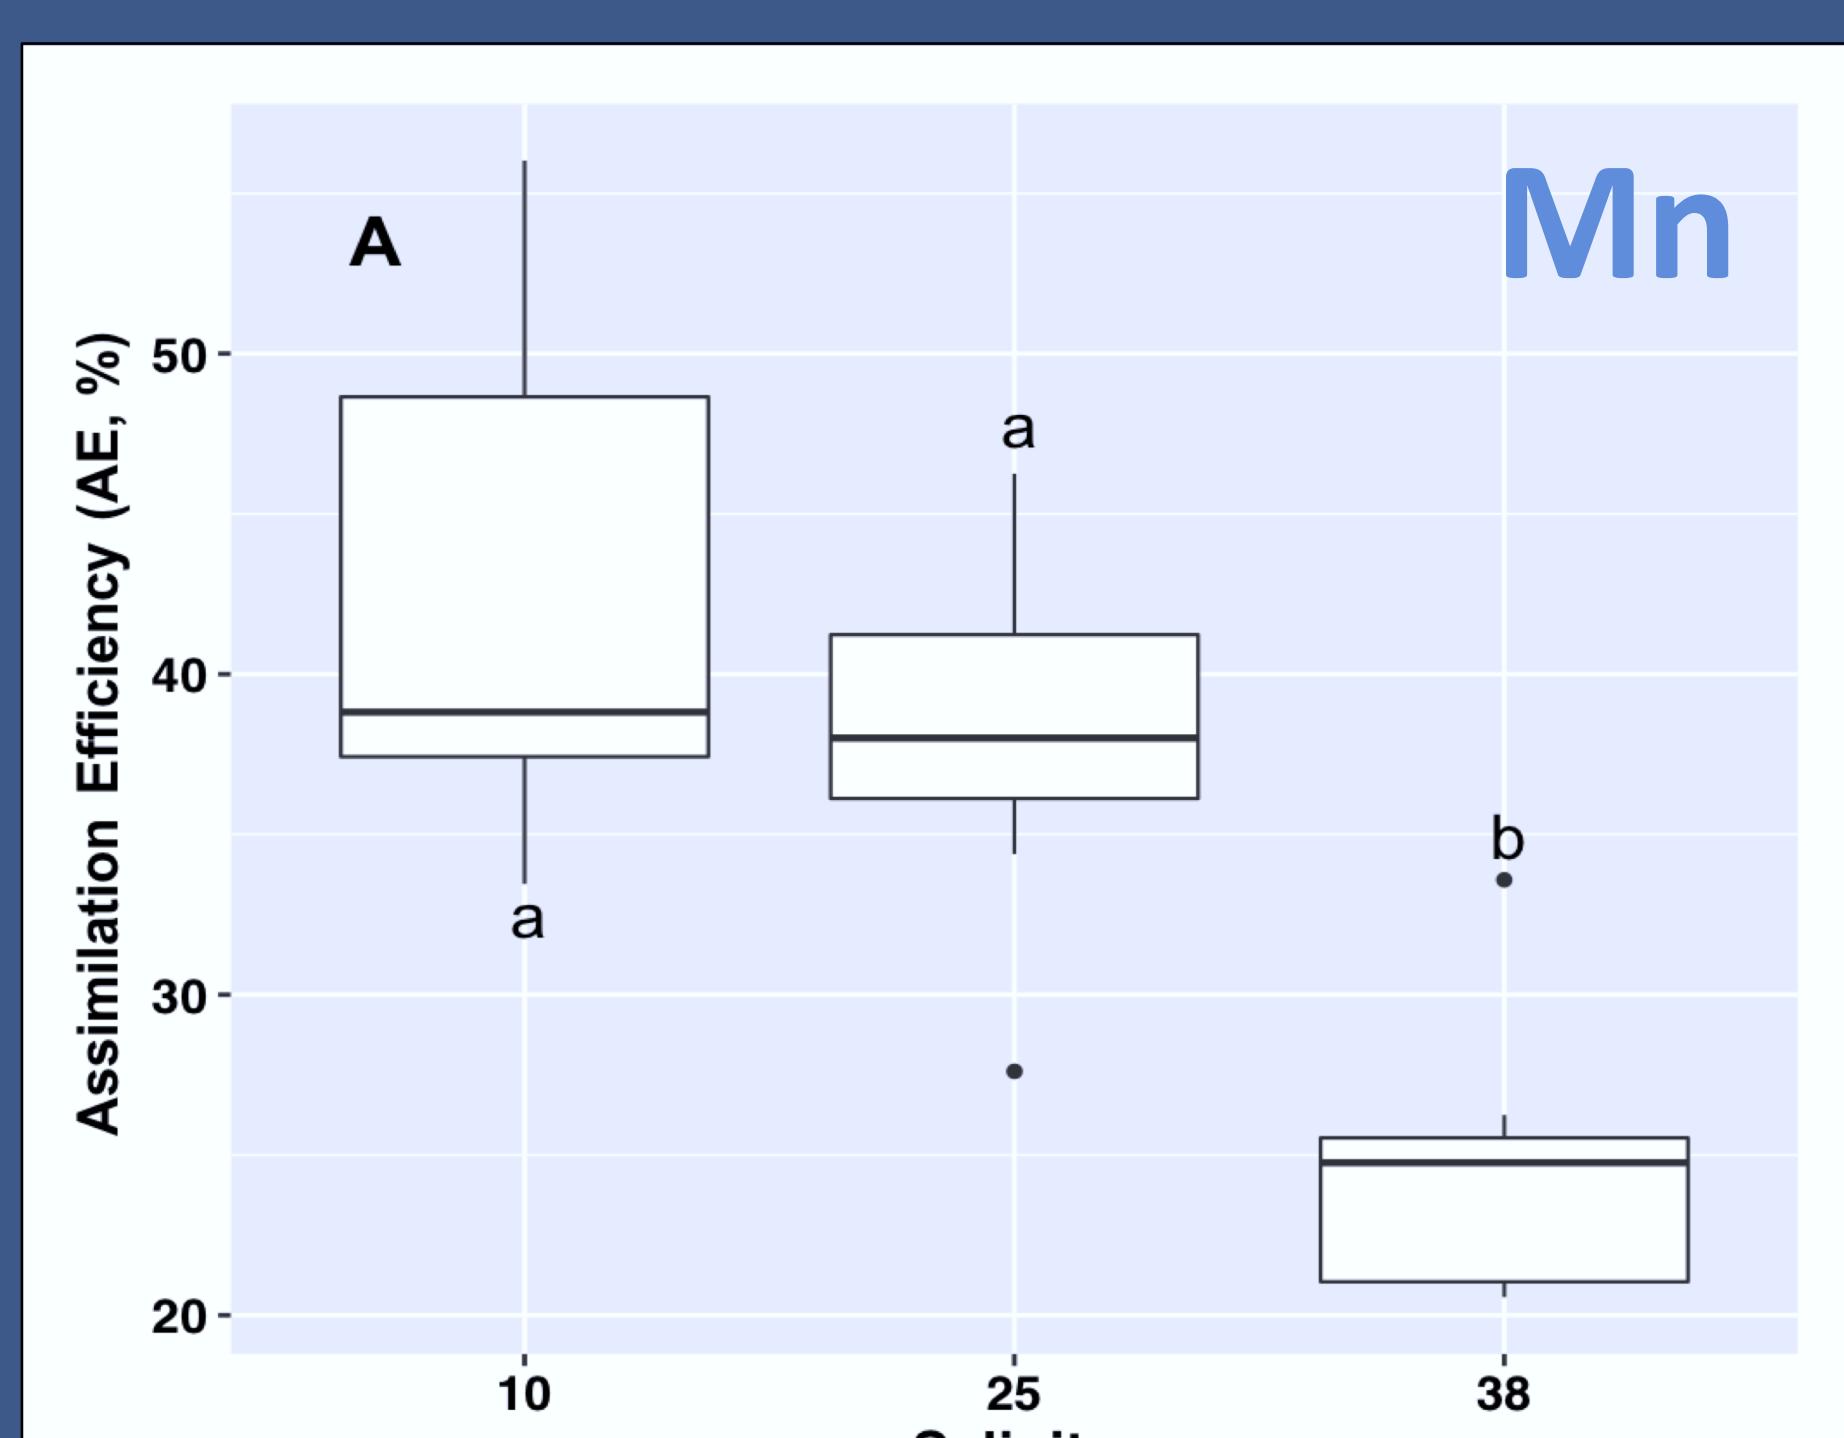

## Results and Discussion

Mn

Zn

- Trophic transfer of Mn at the highest salinity was significantly lower than for the other conditions whereas salinity did not significantly influence Zn trophic transfer.
- Differences in the processes involved in the regulation (homeostasis) of the two tested trace elements should explain the contrasting influence of water salinity for Mn and Zn.
