HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Effect of leavening agents on Maillard reaction products in the crust of traditional French bread.

Romane Troadec, Céline Niquet-Leridon, Sofia Nestora, Stéphanie Regnault, Pauline M. Anton, Céline Jouquand ULR 7519 Transformations & AgroResources, Institut Polytechnique UniLaSalle, Université d'Artois, France.

INTRODUCTION

Consumption of bread in France:

45 kg of bread / year / person – Main source of carbohydrates in the daily diet. Yeast and sourdough fermented bread most commonly consumed.

Maillard reaction products (MRPs) in bread:

Contribution to the development of the aroma, taste (volatile compounds) and color (melanoidins) of bread.

Among MRPs In the crust:

- -Aldehydes: Volatile compounds generated by the Strecker degradation.
- -Melanoidins formed at the last stages of MR: suggested to have health benefits (anti-inflammatory and bifidogenic effects). (1) (2)

AIM

Evaluate the effect of leavening agents on the formation of the Strecker aldehydes and melanoidins in the crust of yeast or sourdough french breads.

MATERIALS AND METHODS

Yeast bread (YB) and sourdough bread (SB) were prepared according to an artisanal process.

In the dough - Maillard reaction precursors assays:

- HPLC-ELSD → Fermentable sugar content
- SDS PAGE ——Protein fractions

In the crust – Maillard reaction products assays:

- GC-MS → volatile compounds
- HPLC system coupled to a fluorescence detector—→Water soluble melanoidins

RESULTS

BREAD DOUGH:

Table 1: Fermentable sugar contents (g/100g of dry matter) in YB and SB doughs (n=9). AFTER 26.5H OF **SUGARS TYPE OF BEGINNING OF** (g/100g of **BREAD FERMENTATION FERMENTATION** dry matter) YB $2814.5 \pm 326.6 \, \mathbf{b}$ Maltose $1654.6 \pm 84.2 a$ 2245.1 ± 62.7 a $3336.0 \pm 108.1 \, \mathbf{b}$ Glucose 217.2 ± 34.3 a $78.2 \pm 7.2 \, \mathbf{b}$ SB 176.7 ± 21.6 a $267.0 \pm 34.4 b$ **Fructose** $316.9 \pm 33.0 a$ $176.6 \pm 42.2 \, b$

Different letters in the same row indicate significant differences (p < 0.05). Student t-test for unpaired samples.

 $170.5 \pm 24.9 a$

 $126.9 \pm 27.1 \, \mathbf{b}$

SB

(p < 0.05). Student t-test for unpaired samples.

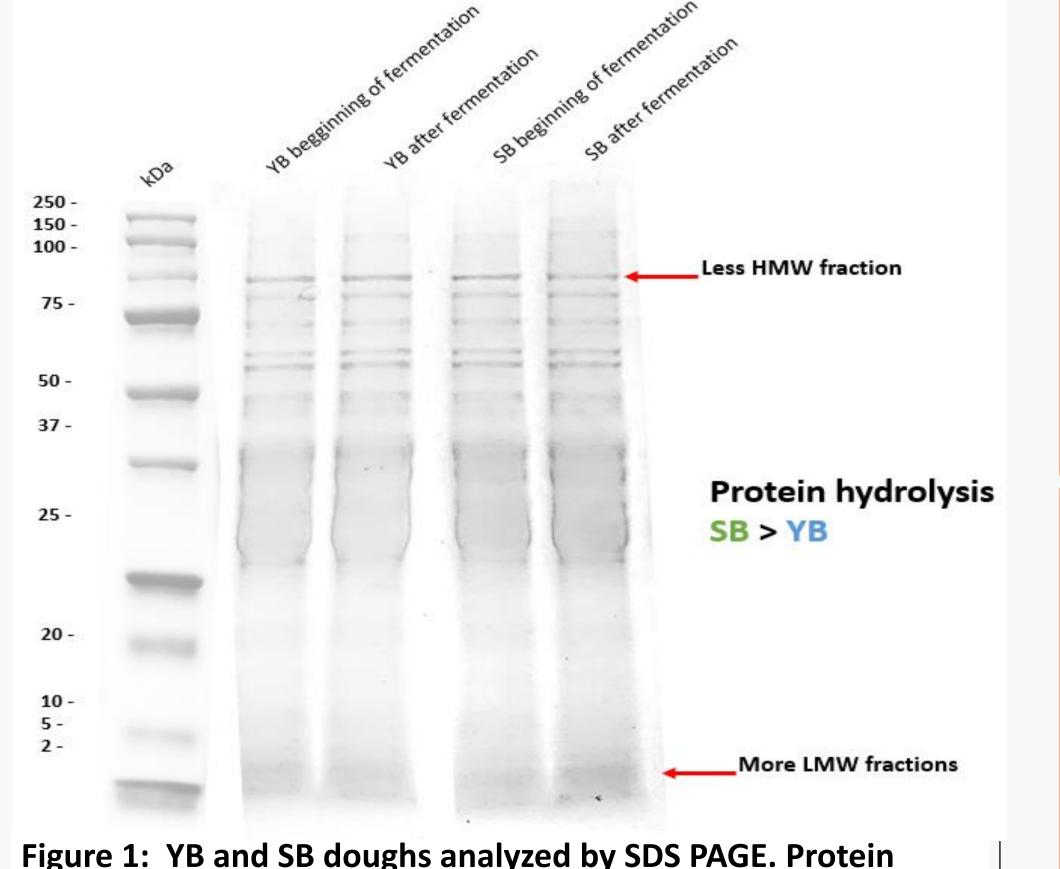

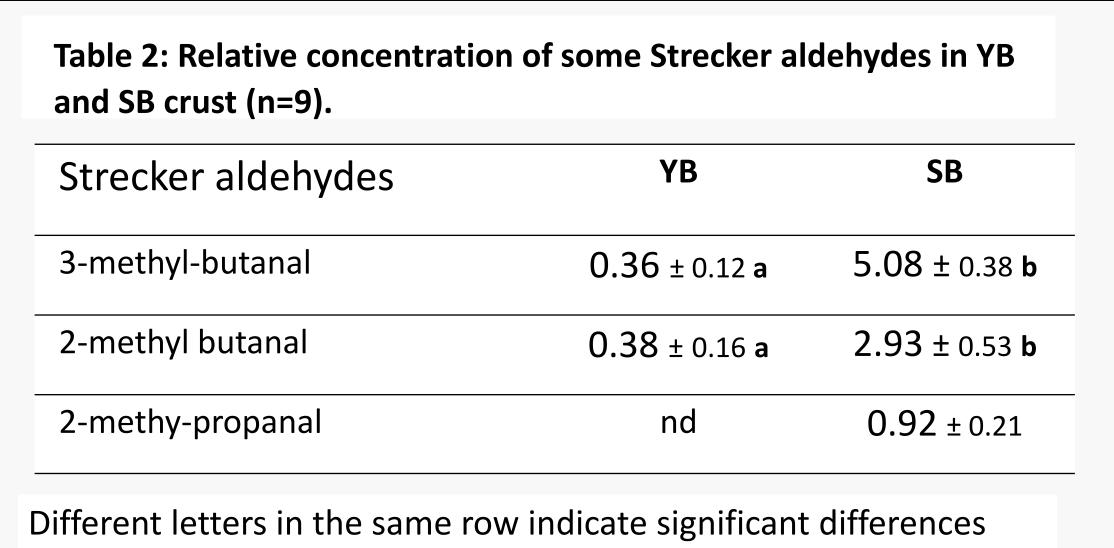

Figure 1: YB and SB doughs analyzed by SDS PAGE. Protein marker is on the left side. The molecular weight of the markers ranges from 5 kDa up to 250 kDa.

The Maillard reaction precursors were predominant in the dough of SB compared to YB.

BREAD CRUST:

Figure 2: Melanoidins in the crust of YB (White mark) and SB (black mark) according to the lightness (L*) of the crust (n=9).

Different MRPs formation pathways:

-Sourdough bread: Strecker

degradation

-Yeast bread : Melanoidization

pathway

CONCLUSION

Both types of leavening agent had a significant effect on the Maillard reaction pathways. The Strecker degradation could direct the Maillard reaction towards aroma generation rather than melanoidins formation, thus affecting the sensory quality of the crust.
