Abstract

The A.I.R. Taletorium is an artificial intelligence-based collaborative learning environment based on Human-AI co-creation and social relationship development between users. A.I.R. Taletorium is designed to achieve a common creative experience between groups of users with different preferences and not necessarily at the same location. The system is built upon a character-centric interactive storytelling framework. AI follows users' personal characteristics to transfer participants into the AI-generated story environment via their avatars. Additionally, the multimodal interface helps users to participate in the story creation and stimulate their perceptive and emotional engagement. In the "1001 Cyber Nights" series of AI-created fairy tales, our focus is on the neural-network-based automated storytelling part of the A.I.R. Taletorium project. We are inspired by the collection of 1001 Middle Eastern folk tales and Scheherazade, who fought for her life by telling stories 1001 nights. We are using our A.I.R. Taletorium automated storytelling system to challenge AI creativity and imagination in creating fairytales for children. Like in the story about Scheherazade, we see this as an important paradigm of AI creativity that favours its further emancipation.

Keywords

Introduction

A.I.R. Taletorium: is an artificial intelligence-based collaborative storytelling system that offers children with inclusive needs an opportunity to experience a remote interactive AI fairy tales storytelling experience while actively involving them in creating a story's narrative with their normal peers. We use artificial intelligence, facial characteristics, computer vision and playful interactive collaboration. We aim to provoke positive social interactions between children, help develop social, creative and communication skills in the early childhood stage, and improve their imagination and social competencies. In the art project A.I.R. Taletorium: Artificial Intelligence 1001 Cyber Nights, we are inspired by "One Thousand and One Nights" collection of Middle Eastern folk tales and its vast cultural influence on world exchange between East and West. Furthermore, in this project, we are developing the concept of Artificial Intelligence Reality (A.I.R.)

as a novel reality paradigm designed with robot creativity and artificial intelligence processed data collected via sensors and cameras from an environment. Besides textual dataset and visual data analysis, we use the users' facial recognition features, and emotional data as inputs for total user immersion into AI created realm. Our platform's key novelty is the use of artificial intelligence, facial characteristics, and visual content generated by users to conceptualize and direct fairy tales created by a trained AI storytelling agent. The system is operating online and in real-time. Users can invite more participants to make fairy tales or start a new one upon invitation. The AI agent also creates dynamic illustrations of the generated storyline and allows the user to draw additional objects or characters that are integrated into the story afterwards. The system offers a collective entertaining and imaginative experience without location and time limitations, helping children stay together and improving their psychological health through creative collaboration.

Background

The precoding project to A.I.R. Taletorium was InVisible Island, a collaborative, nonlinear storytelling platform for visually impaired children [13] and exhibited in 2019 at the Ars Electronica Festival in Linz Austria. The project's aims were to accelerate the social learning curve for visually impaired children and educate sighted children to have more empathy for their peers with physical limitations. We used multisensory storytelling through board game interaction to improve understanding and communication between these groups. With A.I.R. Taletorium project, we moved from a smart to an intelligent storytelling system. The stories are created by artificial intelligence trained with a fairy tales dataset (890 stories), facial recognition data and live user-generated visual content. The A.I.R. Taletorium platform is now open to a wide range of inclusive groups of users and is flexible enough to be implemented in other systems with a focus on interactive narrative experience design.

A.I.R. Taletorium Design

A.I.R. Taletorium is a character-centric multi-modal AI fairy tale telling system that aims at connecting users with different backgrounds and physical needs into a unified fairy-tale co-creation process with AI. The system consists of four parts:

1. Learning unit story characters definition based on users' facial properties.
2. Neural-network-based automated storytelling.
3. Visualizer of the AI-generated story unit.
4. Human-AI co-creative interface for the real-time users 'content contribution.

As mentioned before, in “1001 Cyber Nights” we are focused on AI automated fairy tales generation and participants' perceptual and emotional transition into the virtual world of artificial intelligence fantasy. Applied facial analysis and the character matching models have crucial roles in supporting such a virtual presence concept.

Being in the virtual world of AI Fantasy

In our user's facial analysis we use a hybrid approach which combines the ML algorithm, which uses a supervised image classification to match the face and the group to extract the facial features, and Facial Landmarks Detection + Psychological and Cultural Stereotypical Analysis to classify characters by their typical characteristics. Since characters in a story are highly abstract, we intentionally let some AI abstraction and randomness of character design flow between this process. To develop our model, we are using a combination of the following: FaceNet [11]: facial landmark recognition, Mxnet [1]: facial attribute extraction, AgeNet [6]: pre-trained caffe model used for Age detection and GenderNet: caffe model used for Gender detection. In the process of transferring users into the story as the characters, we combine multiple facial characteristics collected by web camera to extract the attributes by using the main algorithm with pre-trained FaceNet, MxNet, AgeNet, and GenderNet. The algorithm classifies the players by calling the grading algorithm. This algorithm compares the players' facial attributes with the characters' ones, appoints them to each other based on each character's similarity, and then ranks the similarities to appoint the character with the highest match. If the character is already chosen for some of the other users, the system chooses the second-best choice.

AI Fairy Tales Storytelling

We combined the basic version of the facial prototype with the AI story generation model to take a set of facial pictures, map them into corresponding characters, and subsequently generate a storyline and story content. Based on the plan-and-write NLP story generation model, we trained two separate sub-models to plan a storyline and generate a story [14]. The first sub-model takes n characters from the facial mapping process and generates n storylines accordingly, each of which is around 10 steps.

$$C_i \rightarrow S1, S2, \dots, S10$$

This way we are producing CISL(Complete Insertion Story Line). Subsequently, each section consists of one character and its two steps ($C_i \# S_i \# S_i$). To form one section, the model randomly picks one character C_i and moves forward two steps on its storyline. Thus the final complete storyline would be around 3 words * 20 sections = 60 words. The

CISL will finally be input into the second sub-model to generate the complete story. As for training, we collected 890 fairy tale stories and trained our two sub-models with them. To generate the keywords as the storyline for each story example, we applied a modified RAKE algorithm [10]. After dividing a story into an appropriate number of segments, we extract a set of keywords from a story and get their s_{id} (indicates which segment it belongs to) and score (indicates its importance calculated by RAKE). We then picked the word with the highest score for each segment and form the story's keyword line. The top 4 characters with the highest frequency of appearance are selected as the main characters in the story.

As results, we generate the following story text: *Long long ago , there lived a rich lion who lived in the jungle . He was very fond of his family because they were very smart and hence . He made it a bad temper , but sometimes just whether Ponnan should guess his husband was to go to the school and see him . He made himself very cautious about him in pain . sowed the forests in the forest and tried to play as a servant.*
The Characters: *monkey, lion, rabbit, princess*

Story Visualization

Our system includes a system for visualizing fairy tales. To deal with the absence of a training dataset for text to image translation for fairy tale stories we splitted this task in four key components:

- An automatic text-to-mesh generator
- A scene composer to locate objects into the 3D scene
- An automatic Auto-Rigging (AR) and Inverse Kinematic (IK) system to move characters and perform actions
- A structures builder to generate more detailed architectures

AI.R Taleorium provides a very flexible environment in which the appearance of objects can be influenced by the user who will also be able to change poses and move objects within the scene thanks to the AR and IK system. This 3D approach allows for complete control over the entire scene and helps preserve the appearance of the characters in different scenes.

Text-To-Mesh

Our algorithm generates the 3D object from a text description using propositions to similar visualisation issues [5], but differ in some key points: we regularize mesh generation without laplacian loss and we optimize two nets instead of normal maps, positions and texture. We represent the 3D object as a set of vertices $\mathbf{V} \in \mathbb{R}^3$, a 2D texture \mathbf{T} and faces. In our pipeline we do not directly optimize the vertices positions, instead we learn a Neural Mesh Flow (NMF) [2] Network that act as deformer. This approach does not requires to use regularizers to obtain a smooth mesh. The texture is generated by a SirenNet (SN) [12]. We found that using this architecture instead of directly optimizing a 2D image improve texture quality and reduce the time for the convergence.

With pytorch3d [9] differentiable render we generate a batch of images from multiple view angles and distances $I_i = R(\mathbf{V}, \mathbf{T}, \theta_i, \phi_i, d_i)$, then we use CLIP [8] to encode images in the same embed space of the text prompt. Finally

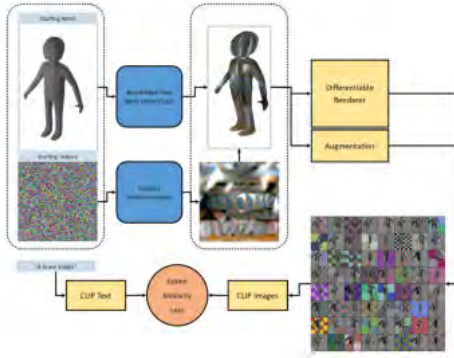

Figure 1: Overview of optimization pipeline: We optimize a Neural Mesh Flow Net [2] and a SirenNet [12] to learn a deformation and a texture to maximize the similarity between the encoding of a prompt text and multiple views with random background

Figure 2: Sample of generated images: A knight, a ghost and an Halloween pumpkin near a dead tree. A Gothic Castle on foggy hills in a dark night

we compute the loss as the average cosine similarity between the encoded images and the text \mathbf{p} .

$$\mathcal{L}_{CLIP}(\mathbf{V}, \mathbf{T}, \mathbf{p}) = -\frac{1}{N_{samples}} \sum_{i=0}^{N_{samples}} C_{img}(I_i)^T C_{txt}(\mathbf{p})$$

To encourage a better frontal view representation we sample azimuth ϕ from a beta distribution with $\alpha = 1.0$, $\beta = 5.0$ within a range of $[-180^\circ, 180^\circ]$, while elevation θ is uniformly sampled between $[-10^\circ, 45^\circ]$ and distance d in $[4.2, 5.7]$. To force the net to focus on the shape the mesh center is translated of a vector ϵ sampled from a normal distribution with $\sigma = 0.5$. The weights of NMF Net are adjourned 3 times more frequently than the texture. The background is generated by randomly merging a chessboard with casual number of squares and a random noise, then augmented with Gaussian blur and random desaturation.

Scene composition

Given the scene graph, the system generates a loss that represents the discrepancy between the actual configuration and

the target scene graph, then choose the variables to optimize according to the objects relations (if an object is ‘on’ a plane only two parameters are needed). Finally find the optimal translation and rotation for the objects to visualize. The loss to minimize is: $\mathcal{L} = \sum_{i,j \in \mathcal{E}_{directions}} 1 - \left(\frac{\mathbf{r}_i - \mathbf{r}_j}{|\mathbf{r}_i - \mathbf{r}_j|} \cdot \hat{\mathbf{t}}_{i,j}\right) + w_0 \sum_{i,j \in \mathcal{E}_{inside}} (\mathbf{r}_i - \mathbf{r}_j)^2 \theta(|\mathbf{r}_i - \mathbf{r}_j|, r_{max}) + w_1 \sum_{i,j \in \mathcal{E}_{distance}} \left| |\mathbf{r}_i - \mathbf{r}_j| - d_{target} \right|$ with $\hat{\mathbf{t}}_{i,j}$ the target direction for the relation i, j , where \mathbf{r} are the position and $\hat{\mathbf{t}}$ represent the target direction according to the objects orientation and the relation between the two objects. Finally positions can be refined using CLIP as before.

Figure 3: Scene Generation: Find the configuration that minimize a loss representing the agreement between this configuration and the scene graph. The algorithm stop if the loss is under a certain threshold in order to have a certain randomization of the scene, so with multiple runs we can generate a set of scenes but a good variance between them

Scene Animation

Figure 4: Armature and weights of ‘upper-arm.L’ bone automatically computed for a simple human figure

To allow the user to freely interact with the scene we developed an auto-rigging and an inverse kinematic system. In our implementation bones are surrounded by a mesh representing the area of influence of the single bone. During the auto-rigging procedure the bones positions and respective area of influence are adjusted in order to minimize the distance with the vertices of the target mesh. Weights are assigned by interpolating the different area of influence. Thanks to this system we can animate the images with simple movements involving one body part and an object.

Structures and Building Generation

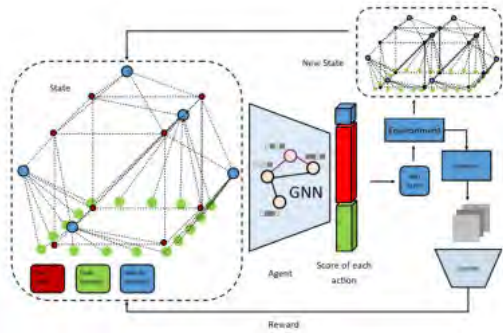

Figure 5: Neural Network architecture: The agent predict the next move given a graph representing the state. Nodes represent the verts of the mesh, available direction of expansion for the structure, locations for architectural elements

Figure 6: Building Generation: Example of a output of our building generator system

To augment the diversity between illustrations of different stories we created a system of procedural generation driven by a graph neural network (GNN) to generate buildings. This GNN (with GINConv layers [3]) is trained using Deep Q learning [7] on a mutable action space. The mesh is transformed into a graph and nodes representing the next possible action are added, allowing the net to be aware of the structure of the building and choose wisely the next modification. For the nodes representing the architectonic elements, the features are obtained from objects renders and a Convolutional Neural Network (CNN). At each step, the net can choose if add a new volume or architectural element from a database of meshes, or change the textures. The reward is computed using a classifier (we trained a DenseNet121 [4] with growing step 14 on 4000 images of 25 architectural styles) that distinguishes between architectural styles: we compare this result with a target style in order to promote the choice of elements coherent with the required architectural style (Fig. 5). A possible output can be seen in Fig. 6

Night Walks Through Asynchronously-Networked Space

Aaron Oldenburg
University of Baltimore
Baltimore, Maryland, USA
aoldenburg@ubalt.edu

Abstract

Night Walks is a series of distinct software objects connected to one another asynchronously through a private server. The intent is that these objects function together to form one videogame, distributed throughout multiple players and play sessions. This talk will discuss the benefits and challenges of using this as a form of artistic process. The author will discuss the creation of different software objects that communicate with one another indirectly and interpret one-another's communications abstractly. It will demonstrate how this leads to an iterative and expansive creative process, with novel forms of inspiration and constraint.

Keywords

memory, virtual reality, sound art, videogame, network, audio, multiplayer

Introduction

Night Walks is a videogame work-in-progress created as a series of individual networked computer programs. These are all connected to one another asynchronously and abstractly through a private server. The player's actions in some programs are recorded and sent to the server. Other programs pull that information from the server and use it within their real-time systems. The connections between the actions in one game instance and the results in another are obscured and abstracted. Each software part is created through an iterative process: new games added to the series change and add to the data on the server. This creates new opportunities for expressive use of this data in the previous computer programs.

Currently there are four parts/programs. Although they are different programs, often created using different development software, I consider these all part of the same single videogame. The goal is continuous expansion, with no set number of parts. There are themes and tones that tie the pieces together, with the varying manifestations and lives of memory being a primary theme.

The title was inspired by a passage from Jorge Luis Borges's "The New Refutation of Time": "I cannot walk through the suburbs in the solitude of the night without thinking that the night pleases us because it suppresses idle details, just as our memory does." [1] Much of the content and processes of these software objects involve forms of memory, as well as corruption, abstraction, or suppression of detail.

Descriptions of Software Objects

Night Walk 1

Figure 1: Two screenshots of Night Walk 1. (cc) (i) (by) Author

In Night Walk 1, the player stands on a balcony in virtual reality. The foreground is a pitch-black silhouette against an expansive landscape. Balconies to the left and right of the player hold 3D characters with motion-captured movements. They do not respond to the player except to randomly change animations when the player looks away. Beyond the edge of the balcony, there are pixels moving and fading in and out of being. If the player reaches their hand (via VR controller) past the railing, pixelated ripples appear around the hand. A vibration alerts them that they can grab a floating pixel. When

they do so, it turns into an animated silhouette, that the player can pull into their balcony, place, pick up and move.

The origins of the imagery for these animated objects are in the second software object in the series, Night Walk 2, and will be discussed in the next subsection.

This program uses the Godot game engine and the Oculus Quest for its virtual reality implementation. The non-player characters on other balconies were created with MakeHuman and their actions were recorded with the program iPi Motion Capture. This allowed me to perform bodily what I felt should be the other characters' relationships with the player and the environment.

The system records what objects the player pulls from the landscape. It sends this data to a private server, where a PHP script adds it to a MariaDB database to be used by other parts of the series.

Night Walk 2

Figure 2: Screenshot of Night Walk 2. (© ⓘ ⓘ Author)

The second in the series is a non-interactive, real-time work. It reads the data from Night Walk 1 that has been stored on the server. Using this information, it configures and reconfigures 2D vignettes. Abstract objects, landscape elements, architectural structures and anonymized drawings of people come into and out of the frame as the player of Night Walk 1 arranges the objects they find in the landscape. The form the vignette takes is an impression of the state of the game's central server.

The images are hand-drawn from personal photographs, most of which are 15-20 years old. The process of hand-drawing abstracted outlines anonymizes and defamiliarizes the content.

I did not have a vision for what types of objects the player would be pulling out of the landscape in Night Walk 1 until I created this part of the series. The pixelated, animated objects the player manipulates in the virtual environment were created from the elements of the vignettes in Night Walk 2. In black, low-resolution pixel animations, they are not necessarily recognizable.

Night Walk 3

The third game in the series began as a non-visual exploration of a generated environment. The primary sounds were those of rain hitting various objects with different tonalities. I was

Figure 3: Scene view of Night Walk 3 played in the Unity editor showing locations of invisible sound objects and areas. (© ⓘ ⓘ Author)

inspired by author John Hull's reflections on blindness and his experience of the sound of rain activating a landscape: "Rain has a way of bringing out the contours of everything; it throws a coloured blanket over previously invisible things; instead of an intermittent and thus fragmented world, the steadily falling rain creates continuity of acoustic experience." [2]

There are several entities in this world that use simple game artificial intelligence for their behaviors, such as state machines and flocking patterns. These animals wander, sleep, sniff the air and search for food and water, among other behaviors. The player notices them when, in proximity, they audibly emerge from the ambient sounds of the environment.

The 3D environment, created in the Unity game engine, is randomly generated and destroyed as the player progresses. There is a realtime networked component, as multiple players using the same software will synchronously enter the same space, but with no potential to interact with one another, just the sounds of their footsteps as they pass. The player is meant to play the game while reclining with their eyes closed. Movement through space is along a horizontal plane, using arrow keys or a game controller. Although gameplay does not have a limit, there is a five-minute loop within which the types of potential encounters change based on the player's point in the loop.

Initially, this was a separate project, but was later absorbed into the Night Walks series. When I did this, I created a new set of more abstract audio events that are triggered when changes are made on the server, specifically when certain categories of objects are found in Night Walk 1. To bring the audio into the world, I created new AI entities with the same state machines as the previous creatures. This time, though, instead of using recognizable animal sounds, I'm giving animal behaviors to the abstract auditory representations of the objects found in Night Walk 1. The audio representations of these objects then become an active, "living" presence activating the player's environment, but one that is not necessarily recognizably related to the original form.

Figure 4: Screenshot of Night Walk 4. (© Author)

Night Walk 4

In the most recent software object of the series, two players pull limbs from a tree against a changing video background. Through the server, their actions trigger events within the landscape of Night Walk 1, and changes in the data on the server cause the video background to change. This particular part of the series is more developed audiovisually than conceptually, and the gameplay is currently unresolved.

Part of the process of working on these programs involves putting each of them aside for periods and working on other software objects in the series. When a new software object is created, new data is added to the server. This results in new iterations on previous works in the series.

My intention is that by continuing to develop other programs that make up this multipart game, I will create actions or behaviors that upload new data to the server, thus providing the opportunity to create more meaningful interactions and events in Night Walk 4 via the program's interpretation of new server data.

The more parts I make in the series, the more iterations I can make on previous programs. This will add to the complexity of interaction and simulation. For instance, the random behaviors of the non-player character neighbors in Night Walk 1 are so-far unrelated to any data coming from the server. I could add behaviors that specifically respond to new data received from the server.

Continuation

Currently, if only one person is playing part of the game, there will be no new data coming from other games to change the server data, which means they will experience less of the game world than they would if there were another player. This is a typical problem in multiplayer games, where the richness of gameplay experience is dependent on the number and quality of players. This is not an issue if the player leaves the game and revisits over time, or jumps between different programs during their gameplay session, as this will allow them to see the variation triggered by changing server data. However, it is also possible that a solo player will only experience a brief session with no observable network behavior.

My current plan for a fifth program in the Night Walks game series is that of a self-playing, exploratory AI entity. In the development of this, I am using the handbook, *Lost Person Behavior: A Search and Rescue Guide on Where to Look – for Land, Air and Water*. [3] The AI character I am developing will have behavior inspired by studies on irrational movement of people who are in distress. These behaviors will trigger new data to be uploaded to the server, and thus create new data for other programs to work with. There will still be other forms of data from other parts of the series that require the actions of human players.

Currently there is no processing of the data sent to the server aside from storing and categorizing. The server scripts serve only as memory, but do not run any processes that would give this software additional behavior as an AI entity, such as analysis or decision-making. This is an area of opportunity for continued iteration and abstraction of recorded game data.

Author Biography

Aaron Oldenburg is a Baltimore-based game, interactive and video artist. His work has exhibited in festivals and galleries in New York, Johannesburg, London, Buenos Aires, São Paulo and Los Angeles, including SIGGRAPH, A MAZE. International Games and Playful Media Festival, the LeftField Collection at EGX Rezzed, Slamdance DIG, Game On! - El arte en el juego, and FILE Electronic Language International Festival. His games have been written about in Kill Screen, Baltimore City Paper, and Rock, Paper, Shotgun.

He teaches game design as a professor in The University of Baltimore's Simulation and Game Design program and has an MFA from the University of Maryland, Baltimore County. His writing on games has been published in Game Studies, Journal of Gaming and Virtual Worlds, and the proceedings of the International Symposium on Electronic Art (ISEA). In October 2003 he finished two years as an HIV Health Extension Agent for the Peace Corps in Mali.

“Atlantis”: cables, bunkers, ruins, and myth in the ocean floor

Juan Pablo Pacheco Bejarano

Independent artist

Bogota, Colombia

juan.pacheco.bejarano@gmail.com

Abstract

In this short paper I present my ongoing research for the production of the video essay “Atlantis”, which will present a speculative myth around the internet’s material infrastructure, based on ethnographic, archival, and creative research into the Atlantis-2 submarine cable, the first to create a direct internet connection between Europe and South America, and its landing station in the south of Spain. Starting with a contemporary interpretation of the myths around the lost city of Atlantis and its relation to the ocean floor, this video essay will weave interviews, archives, and original footage gathered in the Atlantic coast of southern Spain, seeking to tell a story about the internet as a ruin of colonial, military, and maritime infrastructures.

Keywords

Infrastructure. Internet. Video essay. Coloniality. Ruins. Mythology.

Introduction

Installed in the year 2000, Atlantis-2 was the first submarine fiber optic cable to create a direct internet connection between Europe and South America (see fig. 1). One of its seven landing sites is located in an underground bunker in Conil, a small coastal town in the Atlantic coast of southern Spain, built in 1970 for the TAT-5/MAT-1 telephone cable that connected the Mediterranean to the United States during the Cold War. Next to the bunker’s main entrance there is a commemorative bronze plaque featuring a relief of the Italian, Portuguese, Spanish, and United States flags connected by a meandering cable. In the background, there is yet another relief that shows three ships with crosses on their sails navigating through the Ocean, most likely referring to the three caravels used by Christopher Columbus when he first sailed to America: La Pinta, La Niña, and La Santa María (see fig. 2). The image inserts submarine cables into a genealogy that originates from the European colonization of America, establishing a historical relation between colonial and digital transatlantic infrastructures.

Taking this image as a starting point, I am currently working on a video essay entitled “Atlantis”, which proposes a speculative myth around the internet’s material infrastructure, based on an ethnographic, archival, and creative research into the Atlantis-2 submarine cable that I conducted during the first semester of 2021. Starting with a contemporary interpretation of the myths around the lost city of Atlantis

and its relation to oceanic technology, this video essay will weave and interpret a network of historical, material, and semiotic relations emerging from the Atlantis-2 undersea cable and its landing site in Conil, seeking to shed light on the entanglements between coloniality, the internet’s material infrastructure, submarine ruins, and mythology.

Interdisciplinary research on the internet’s material infrastructure for “Atlantis”

Between March and May of 2021, I lived in Conil, a small town in the Atlantic coast of Southern Spain, where I conducted an interdisciplinary research into the internet’s material infrastructure. While living at the

southernmost region of continental Europe, I recorded five interviews, four in Conil and one with the Latin America senior analyst for Telegeography, along with hours of original footage of the material and social landscape in which the cable landing station is inserted. Besides the interviews, most of the audiovisual material shows the ocean, telecommunication infrastructures, and ruins of military infrastructures from the 15th and 20th centuries. Since I was not able to record inside the 1970s bunker in Conil, I am currently working with a 3D designer to create an architectural render based on my memory of the single visit I was allowed to do inside the bunker (see fig. 3).

I am currently organizing all of this audiovisual, archival, and textual material in order to construct the script for the video essay “Atlantis”. [On this link](#) you can view several screenshots from the original footage, interviews, and archives I gathered throughout my 3-month research (see fig. 4). The intention of the video essay is to combine a historical analysis with a poetic tone, following the methodology of the audiovisual and interactive projects I have developed throughout my artistic career. For a reference to my work you can view “The blue dot”, a video essay on the Internet Archive that I completed in 2020, or “Underworld”, a transmedia narrative on bio-technological relations at the ocean floor.

Figure 3. Conil’s telecommunications bunker. Photo by Juan Pablo Pacheco Bejarano, 2021.

Figure 4. A collection of screenshots

Earlier this year, I brought together this research through my MA thesis, entitled “Cables, frontiers, bunkers, and ruins: relating anew to the internet’s material infrastructure through non-linear speculative assemblies”, which you can consult [on this link](#). The video essay “Atlantis” will highlight certain sections of this thesis, emphasizing the mythology of the lost city of

Atlantis and its relation to the internet as a narrative thread.

The research I have conducted for the creation of this video essay is deeply connected to recent discussions on the study of infrastructure, which bridge the gap between social, material, and technical considerations when studying technological systems (Sandvig, 2013). On the one hand, some researchers characterize infrastructures as historical processes of situated social and technical relations (Star and Bowker, 2006). And on the other hand, other researchers highlight a materialist perspective focused on artefacts and their relation to the natural and social surroundings where they are located (Parks and Starosielski, 2015). Far from being mutually exclusive, both outlooks emphasize the importance of combining different methodologies to study the material and symbolic correspondences between social relations, material environments and infrastructures. Drawing from this interdisciplinary perspective, “Atlantis” proposes that speculative interpretation is also a key methodological strategy to enrich our understanding of the internet’s technosocial complexity.

The imaginative quality of speculative interpretation is also deeply tied to storytelling (Latour, 2005; Haraway, 2016), a creative analytical method that enables me to trace different patterns from those that have been already established. The speculative interpretation that I am interested in is also profoundly implicated with non-linear thinking, which allows me to grasp the correspondences between occurrences across different times and spaces (Ferreira da Silva, 2016). The relations between technology and reality are always layered and multiple, a network that goes back in time and tends to be obscured by distance. In order to shed light on these complexities, “Atlantis” proposes a set of non-linear speculative interpretations to plot the multi-layered material and semiotic relations embedded in the internet’s infrastructure.

Between myth and technology

Atlantis-2 is named after the mythological city of Atlantis, so, in order to construct the script for “Atlantis”, I have read three main works of literature and philosophy that mention Atlantis: Plato’s dialogues *Critias* and *Timaeus*, Francis Bacon’s *New Atlantis*, and Ursula Le Guin’s *The New Atlantis*. These have given me insights in order to weave the mythology around the internet as a submarine ruin. The purpose of this story is to highlight what Star and Bowker (2016) have already pointed out when they refer to “the importance of the metaphors that we use to think through technology” (233). Infrastructural metaphors bring certain aspects of technology to light while simultaneously hiding others from view, and upon close examination they reveal aspects of technology that we might take for granted.

In the *Timaeus* and *Critias* dialogues Plato refers to Atlantis as a technologically advanced island that stretched from the Pillars of Heracles to the mainland on the other side of the Atlantic Ocean. Inspired by this

dream of transatlantic connectivity, in 1678 Athanasius Kircher drew a map depicting Atlantis as a huge island in the middle of the Atlantic Ocean (see fig. 5). In this sense, the Atlantis-2 cable is the only remnant of the mythological city of Atlantis, inheriting the might of the Atlantean civilization as an intercontinental link.

Figure 5. Map of Atlantis, Athanasius Kircher (1678), *Mundus Subterraneus*, Vol. 1, Amsterdam. Source: <https://doi.org/10.3931/e-rara-52686>

The connection between the Atlantic coast of Spain and South America are very deep, since most of the ships that sailed to America during the Spanish colonial rule came out of this region. When I mentioned my research to several people in Conil, they pointed me towards a set of variations in Flamenco music that originate from this transatlantic connection. Even though Flamenco originated in the south of Spain as a cultural expression of the nomadic Roma people, its rhythms were influenced by the migrants and traders who travelled between Spain and America. Some Flamenco styles are known today as *Cantes de Ida y Vuelta* (Songs of Coming and Going in English). One of them is called “La Colombiana” (The Colombian), to which I developed a deep relation. As a researcher of the Atlantis-2 fiber optic cable system, I am reminded of my own roots as a Colombian with mixed Spanish and South American heritage, a result of complex colonial relations. Notably, while I was in Andalucía, some people told me that my last name, Pacheco, is a typical last name for Roma people in the region. What is my personal relation to these historical, mythological, and technological networks connecting the Iberian Peninsula and South America? In order to explore this assembly, I collaborated with Patricia Peces to create an audiovisual piece that depicts her dressed in a surfing wetsuit with the traditional hairdo and heels used in Flamenco, dancing to a Colombian on top of the Telefónica manhole where Atlantis-2 passes through (see fig. 6). This video, which I imagine as the ending for “Atlantis”, highlights the deep relations that tie me to the people of Conil and technological infrastructure. These practices and narratives reveal that colonial and modern technologies are usually more porous than stable.

Figure 6. Still from the audiovisual collaboration with Patricia Peces at Telefónica’s manhole in Conil. Photo: Juan Pablo Pacheco Bejarano, 2021.

Submarine cables do not last forever; they have an approximate life expectancy of 20 to 25 years. When cables cannot be fixed or reused anymore, they are typically just turned off and left at the sea bed since dismantling the entire infrastructure is very expensive. However, sometimes cables are either repurposed to create other connections or become a recycled infrastructure for other species to dwell in. Starosielski (2015) mentions that at the end of the 1990s, several cables retrieved by AT&T from the seafloor were deposited in the Ocean close to Maryland to create a Cable Wire Reef, which is inhabited now by many marine species. When cables become submarine ruins, they also become the home for other forms of life. If the city of Atlantis is indeed sunk somewhere in the Atlantic Ocean as Plato narrated, it has probably been undetected by modern machines because of how quickly life spreads at the Ocean floor.

Atlantis-2 will soon become a submarine ruin since it will be put out of service at some point of 2021. These inhabited ruins under the Ocean slowly turn into an anthropogenic geological layer of the maritime biosphere. The seafloor is filled with anthropogenic debris such as the ruins of ancient civilizations, sunk colonial galleons and telecommunications infrastructure. The footprints of human maritime infrastructure are evidenced in the sunk ruins of colonial and modern history. Jussi Parikka (2015) has proposed to think about media from the standpoint of geological time, raising questions about the deep spatial and temporal roots of contemporary media as well as its possible futures. Drawing from this invitation, “Atlantis” seeks to highlight the complex geological relationship between cables and the Ocean floor.

The lost undersea city of Atlantis was described by Plato as a vast colonial empire with the capacity of extracting multiple metals from the Earth. The city was founded by the god of the Ocean himself, and it was gifted with an advanced set of metallurgic technologies. In a similar way to contemporary society, Atlantis depended on the extraction of minerals in order to power their technology, harnessing the energy contained in underground matter. However, incapable of bearing their own prosperity, Atlantis collapsed because of the greed

and corruption of its rulers in the face of high technological advancements.

The tragic story of Atlantis inspired Francis Bacon to write *New Atlantis* in 1627, which proposed the emergence of a future society where scientific knowledge was organized in order to produce increased wealth and welfare, reflecting early modern thinking and the trust it deposited in rationalism and technoscience. At a point of the narrative Bacon mentions that Atlantis is just another name for America, and points towards the ancient might of amerindian civilizations. The convergence of myth and reality during the European colonization of America shows that the story of Atlantis was appropriated to make sense of a new world order, marked by western globalization and the destruction of indigenous civilizations. If Atlantis was the antithesis of Athens, America became the antithesis of Europe. Moreover, if Atlantis was a cautionary tale during Plato's time inviting Athenians to revise their relationship to technology and prosperity, during the age of European colonial empires Atlantis became a site for speculative imagination about the possibility of a global utopia. Bearing in mind the collapse of Atlantis narrated by Plato, I am tempted to think that the seed for failure is always contained in utopian narratives about the future. In this sense, the seed for the internet's failure is probably contained in the utopian narratives about frictionless interconnectivity.

As the world faces increased social and environmental catastrophes, Atlantis becomes a cautionary tale for us. If the lost city of Atlantis was doomed to flood because of its misuse of the resources it possessed, will our digital society face the same future because of the destabilization of the biosphere ushered in by our extractive technologies? When the climate crisis brings upon us the inevitable flooding of coastal areas, will the internet's cable stations and datacenter be sunk underneath the sea just like Atlantis once was? This is the central premise of Ursula Le Guin's *The New Atlantis*, which acquires new tones today as the technological utopia inaugurated by the internet seems to be slowly turning into a ruin itself. What will happen when the internet's submarine infrastructure turns into a ruin? Atlantis-2, the first internet cable that connected Europe and South America, will be remembered as the lost echelon in the mythology of the lost city of Atlantis. Whether the internet's ruins will become coral reefs or nesting grounds for humans as an endangered species remains to be seen.

“entre Margaridas” (between Margaridas)

Luisa Paraguai
Pontifical Catholic University of Campinas
Campinas, Brazil
luisa.donati@puc-campinas.edu.br

Abstract

The work-in-progress “entre Margaridas” (“between Margaridas”) intends to operationalize female representations through the cartography of daisy family Asteraceae, as a common endemic flora in Brazil, which, when developing in unexpected places and adapting to different soils, it evokes the same strength and resistance built by the many Brazilian Margaridas, such as Teresa Margarida da Silva e Orta, Margarida Maria Alves and Maria Margarida da Conceição, and many others not so famous.

Keywords

Art and technology, art and design, interactive database, data visualization, geolocated and visual narrative.

Introduction

We operate in our daily lives as a structured social fabric between different databases articulated in networks. In this contemporaneous cultural process, I have observed other patterns of local and global assemblages, which I am interested on investigating as an artist.

Although *data* is etymologically derived from *dare* – the Latin for to give – Kitchin and Dodge observes that data might be better referred to as *capta*, because it is “what is selectively captured through measurement and information flows across a range of infrastructures” [1] and it is never transparent. “Rather, we are within a dynamic sharing assemblage: always already sharing, relinquishing data with human or nonhuman agents” [2]. Thus, it is possible to think of artistic representations as a dynamic mapping in which the experiences of an individual or community are rearranged in a visual structure.

There is a need to approach technology as humanly controlled, to the detriment of autonomy and the recognition of values that point to an improbable neutrality. Thus, the technological poetics are inscribed as a full exercise of a subversive sensitization, potentiating a democratic action of technology, thus displacing the productive order to include the potential of marginalized interests in the remodeling of the design process [3].

The work-in-progress “Entre Margaridas” (“Between Margaridas”)

The work-in-progress “Entre Margaridas” (“Between Margaridas”) intends to operationalize female representation by mapping the family of daisies and the many Brazilian Margaridas, known or unknown, in their uniqueness, difference and multiplicity. Both data will be geolocated on the same map (figure 1).

The female representation is inspired by the rural women workers’ narratives named “Marcha das Margaridas”, on August 10, 2000, bringing together more than 20,000 women in Brasília, the Federal Capital.

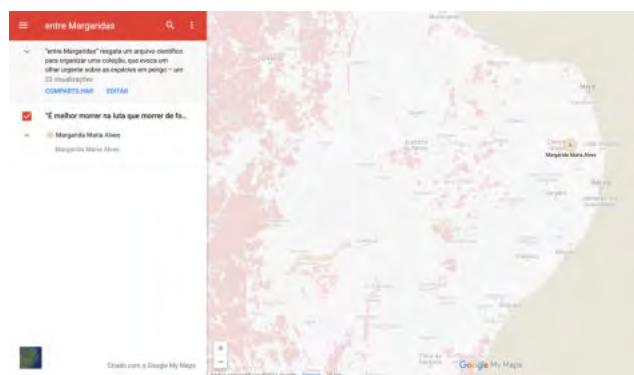

“It has consolidated itself as a broad struggle strategy that aggregates thousands of women from the

countryside all over Brazil. The women perform, in public, an act-manifesto based on agendas from the north to the south of Brazil in the fight against retrocessions and for the guarantee of rights” [4].

The daisy family (Asteraceae), a common endemic flora in Brazil, that develops in unexpected places and adapt to different soils, evokes the same strength and resistance by Brazilian women, such as Teresa Margarida da Silva e Orta, Margarida Maria Alves and Maria Margarida da Conceição.

Born in the city of São Paulo, probably in late 1711 or early 1712, the daughter of a wealthy Portuguese man and a woman from São Paulo, Teresa Margarida da Silva e Orta, still a child, went to Portugal with her parents and siblings. In 1752, she published, under the pseudonym Dorotéia Engrassia Tavadra Dalmira, the *Maxims of Virtue and Beauty* - or *Aventuras de Diophanes*, as it came to be called from the second edition onwards - the first work of fiction in Portuguese to clearly oppose the Absolutism, claiming the rights of women, defending the autonomy of the lands of the “ex-barbarians” (in a veiled allusion to the Portuguese colony in America). It is, in addition, the oldest fictional text written by Brazilian authorship that is known [5]. Margarida Maria Alves was descended from indigenous peoples on her father's side and blacks on her mother's side, both peasants, parents of eleven children. Catholic since childhood, her involvement with the church brought her, in the 1970s, to the Pastoral Land Commission (CPT). She married in 1971 with Casemiro, also a peasant, with whom she had the son José de Arimatéia, born in 1975 [6]. Maria Margarida da Conceição was born in Alagoas, Maceió. Known as Margarida Guerreiro, she arrived in Cariri at the age of eight. She had experienced the popular arts in her homeland and, living in Juazeiro do Norte, she dedicated herself to Guerreiro, a sequence of danced songs. She was titled Master of Culture in 2004 [7].

Figure 1. *Margarida Maria Alves*. Font: <https://www.google.com/maps/d/viewer?hl=pt-BR&mid=1lkMoztCwda4Mqm4FkfpqCt7NfLLYSoZJ&ll=-8.222406622247643%2C-37.51610919877176&z=7>

Using the structure of Google Maps, species of the Asteraceae family in extinction in Brazil will be mapped,

according to the “Red Lists” database of the National Center for Flora Conservation (CNCFLora). “Among the tasks of CNCFLora is to assess the risk of extinction of species of flora in Brazil, by the year 2020, to achieve goal 2 of the ‘Global Strategy for Plant Conservation’. Red lists are an important tool for prioritizing investments in species conservation, as they need a lot of resources for their construction and updating” [8] [9].

And in combination with those scientific information, personal stories will be geolocated with the collaboration of different web users’ stories, sent by email [short life story, photography, location]. An affective cartography is going to be installed, which intends to map and disseminate the context of these endangered daisies and Margaridas in their botanical and socio-political dimensions, respectively. The work-in-progress “entre Margaridas” (between Margaridas”) rescues a scientific archive to organize an affective collection, which updates an urgent look at endangered species – an environmental and historical-cultural territory that has been gradually destroyed, to bring it closer to another socio-political reality, our Margaridas, which also have survived in different political, historical and/or social Brazilian environments. A poetic collaborative database is going to be created according to web-users’ contributions and their Margarida’s personal narratives, that even they are not notorious ones, daisies and Margaridas share the same strength of adapting to survives. Poetics, by forging elements of the world, triggering meanings that are accommodated there, acts as a “tactic” [10] for the production of enchantment, responding to the insertion of values, notably aesthetic, and in an ontological way. Technological art manipulates data and coded language, subverting the “technical arrangements” [11], which generate practices and order perceptions, privileging some aspects of the human being and marginalizing others.

We understand that expanding and diversifying the actors involved in the establishment of this visual narrative implies formalizing technology awareness processes, which give visibility to the exercises and disputes of power in the technical choices that guide our technocratic society [12].

Abstract

The launch of Sputnik in 1957, humanity's first satellite, ushered in a new era in the conquest of outer space; but it also marked the beginning of a new type of pollution invisible to our eyes, space pollution. Since then, our planet has surrounded itself with numerous satellites tasked with studying our climate, predicting disasters, helping us answer scientific questions important to human evolution, and keeping us continuously connected and monitored. The useful life of these satellites is threatened by the saturation of objects orbiting the Earth. Accidental collisions between objects orbiting outer space can produce debris clouds that move at high speeds. The greater the planetary connectivity, the more increase in space pollution.

Space Debris :: Waste Constellations, is part of an artistic investigation that combines art, science and technology. The project analyzes and evidences the huge swarm of space debris that revolves around the Earth in its four main orbits. Relying on data extracted from scientific sources, it identifies the eleven powers responsible for the exponential accumulation of space debris, classifies and categorizes the data, and shows how this entire constellation of space debris is distributed in the Cosmos.

Mapping the artificial environment

We are exposed to constant exercise in polluted and polluting environments. The human being, in his tireless scale towards an artificial environment, is producing a saturation of waste, of useless artifacts, of non-degradable materials whose effects are already more than evident in the climate change that is taking place.

Ezio Manzini, in his essay entitled *Artefactos. Towards a new ecology of the artificial environment*, was already announcing to us, in the nineties, what he calls "the experiences of the artificial". His argument is that the artificial environment has a geological structure where the new modifies the existing.

The artificial environment, like the natural one, has a geological structure. Each historical phase sediments its products, the result of its techniques, its forms of social organization, its consumption systems, its culture. Something disappears, other things remain and become a substrate for successive sediments. [1]

Manzini postulates the concept of "high saturation": "Between the dematerialization of high technology and the search for the materiality of high sensoriality, there is an unwanted materiality due to the density of things, people and waste." [2]

To understand the problem of waste pollution, not only in terrestrial space, but also in outer space, it is important to reflect on the perception of the limit. The Earth is not a storage room, a corner where we can store, throw away or keep things that are no longer useful to us, that we do not want to see; Like the oceans, they are not that fluid fold

where to hide the huge amount of plastics dumped into the sea.

When a satellite camera was first turned towards the earth far enough away to show it as a small ball suspended in a great black and inhospitable void, everyone immediately and directly perceived the existence of the boundary, the fact that in our time horizon no longer exist new borders, that this small sphere is our only home. [3]

To this saturation scenario, we must add one more, of enormous relevance, and of which we are not always aware, since until now it is certainly strange and distant to us: spatial contamination. The greater the planetary connectivity, the more satellites and, as a consequence, the greater the increase in space pollution.

Our planet is surrounded by a dense mesh of useless space debris and impossible to visualize from Earth. The human being has exerted a great influence in the conquest of new spaces, but also in the consequences that this entails. One of these effects is spatial contamination, also known as "space debris". We are used to receiving news related to different types of pollution: atmospheric, water, light, visual, acoustic, thermal, radioactive, genetic, electromagnetic...; but perhaps the most unknown, for reasons of scale and visibility, would be space debris. Being a globalized and continuously connected planet also has a price that until now we are not being able to manage.

Space pollution

According to the report of the National Aeronautics & Space Administration (NASA) Orbital Debris Program Office, it is estimated that there are about 18,000 debris from satellites and rockets orbiting our planet, and more than 7,000 tons of satellite scrap. 70% of the waste is housed in a strip of space that extends between 200 and 2,000 kilometers high; in the orbit called LEO, a low orbit that surrounds the Earth, and where the satellites that map the planet are located for its observation and study. In this orbit, the fragments move at speeds between seven and eight kilometers per second, with the consequent risk of collision with active satellites.

Between 50 and 100 tons per year of space debris fall to Earth, according to information from NASA. These are just some of the overwhelming data that we can find in official sources.

Under the name of Space Debris we find any artificial object that is in the earth's orbits and that is in disuse. (Fig. 1)

The simple definition of space debris affects any man-made object, orbiting and not in active use. The debris can be obsolete or inactive spacecraft, parts of satellites or launch vehicles, or fragments of spacecraft and rockets that have been fragmented in some way. Space debris is found in all sizes, from microscopic particles to non-operational satellites and rocket bodies tens of meters long. [4]

NASA estimates that about 100 million pieces of debris float in the sky, of which 27,000 are larger than 10 centimeters. The speed at which these residues travel reaches 28,000 kilometers per hour, so any small fragment could damage satellites or ships; for this reason they are under the supervision of NASA and the United States Department of Defense.

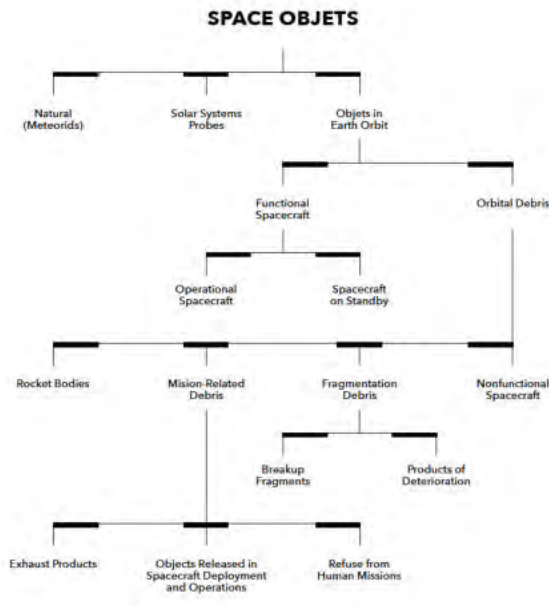

Figure 1. Space Objects. Own elaboration: ©Esther Pizarro

Space debris has become a growing concern in recent years, as collisions at orbital speeds can be highly detrimental to the operation of satellites and can also produce even more space debris in a process called Kessler Syndrome. In a domino effect, the Kessler Syndrome or ablation cascade is a scenario proposed by NASA consultant Donald J. Kessler, in which the volume of space debris in low Earth orbit (also called LEO) would be so high that objects in orbit would be frequently impacted by debris, thus creating even more debris and a greater risk of other impacts on other objects. As the number of satellites in orbit grows and old satellites accumulate, the risk of this Kessler cascade collision scenario increases, to the point that it could render the orbits unusable.

Since the launch of the first satellite in the 1960s, the exponential growth of space debris has multiplied by 94%. [5]

According to the different orbital height, four orbits are distinguished and shelter the different satellites depending on their application (exploration, communications, navigation, observation ...; constituting what is called satellite constellation of the Earth. These orbits are:

Low Earth Orbit (LEO), also called Low Orbit. Among the missions carried out in this orbit by means of satellites are: scientific experimentation, astronomical observation, terrestrial observation, communications, and parking orbits. Continuous eclipses are carried out and its ease of putting into orbit stands out, which is why it is the most populated, and therefore the most polluted. It constitutes a true space dump. It has an orbital time of 90 minutes and is located in an altitude range between 200 and 2,000 km. This orbit houses 70% of space debris. Its speed is high, it can reach 7 km / s.

Medium Earth Orbit (MEO), called Intermediate Orbit. It is more difficult to put into orbit than the LEO, since it requires several stages. Its missions include: navigation, constellations (GPS, Glonass, Galileo). It houses the GIOVE-A satellites. It has the advantages of having a global coverage, lower losses than GEO and medium delays. Its drawbacks are the large constellation of satellites, a variable signal, short visibility, and space

debris. It has an orbital time of 6 hours and its altitude is between 10,000 and 14,000 km. This orbit has greater visibility than LEO, and the satellites move at a speed that ranges between 3 and 7 km / s.

High Earth Orbit (HEO), known as Elliptical Orbit. It is used for communications and space observation. Among its advantages is the coverage of polar zones, a greater elevation angle, lower launch cost and does not require a backup satellite. However, it has link losses, does not provide global coverage and is very sensitive to the asymmetry of the Earth. Its orbital time is 12 hours and its altitude is between 1,000 and 70,000 km.

Geostationary Earth Orbit (GEO), called Geostationary Orbit. Its services are focused on broadcasting and contribution links, fleet communication, mobile communication, meteorology (Meteosat), VISAT networks, etc. Among its advantages are its advanced technology, coverage of populated areas, good visibility, predictable interference and a known launch into orbit. As drawbacks we find that it does not cover polar areas, there are link losses, high launch cost, low viewing angle and space debris. It has an orbital time of 24 hours, positioning itself at an altitude of 35,786 km.

Space environment statistics

The Satellite Catalog (SATCAT) is a catalog that records the satellite position of all objects larger than 10 cm. and that they are orbiting around the Earth. Each object has a nine-digit number assigned by the United States Space Command (USSPACECOM). The objective of SATCAT is to continuously track the movements of these objects to avoid future collisions with other active or inactive satellites.

The main categories recorded by the SATCAT, and on which this research has been based, are:

DEBRIS :: Any man-made object in orbit around the Earth that no longer has any use.

PAYLOAD :: Any object that is not classified in the SATCAT as a rocket body or as debris (debris) is considered a payload. Payloads can contain both functional and non-functional experiments.

ROCKET BODY :: Rocket bodies are used to place payloads and the platform, if one is used, into orbit. Some launches may use more than one rocket body due to the weight of the payload or the type of orbit or experiment.

Additionally, USSPACECOM has added scale values to SATCAT tracked by the Radar Cross Section (RCS) and known as RCSVALUE. These are distributed in three scales or sizes:

SMALL :: (<0.1 m²)

MEDIUM :: (0.1 m² - 1 m²)

LARGE :: (> 1 m²)

We will point out some significant data that allow us to get an idea of the magnitude of the problem we are facing¹:

- Rocket launch since the beginning of the space age in 1957 = 6,060
- Earth-orbiting satellites placed by rocket launch = 11,670
- Satellites still in orbit = 7,200
- Active satellites = 4,300
- Number of junk objects tracked and included in their catalog by spatial surveillance networks = 28,600
- Estimated number of ruptures, explosions, collisions or anomalous events that lead to fragmentation = more than 560
- Total mass of all space objects in Earth orbit = more than 9,400 tons
- Number of debris objects that statistical models

¹ Last update: 20 Mayo 2021. Fuente: <https://sdup.esoc.esa.int/discosweb/statistics/>

estimate to be in orbit =
 34,000 objects larger than 10 cm
 900,000 objects from 1 cm to 10 cm
 128 million objects from 1mm to 1cm

Artistic visualization. Space Debris :: Debris Constellations

Figure 2. Installation Space Debris :: Waste Constellations, Cigarreras, Alicante. ©Esther Pizarro

The artistic project entitled Space Debris :: Waste Constellations (Fig. 2) is structured around two axes. The first, the conceptual one, reveals the data collected from scientific sources and produces graphs that try to clarify the understanding of the analyzed information. (Fig.3)

Figure 3. Data Visualization, Space Debris :: Constelaciones de Desechos, Las Cigarreras, Alicante. ©Esther Pizarro

The eleven powers responsible for the greatest impact in space debris production have been identified in the research. The analyzed powers and their percentage of space pollution in outer space, generates the following ranking: USA (35%), Russia (33%), China (20%), France (3%), Japan (1.4%), India (1.2%), European Space Agency (1.1%), United Kingdom (0.6%), Germany (0.3%), Canada (0.3%), and Spain (0.1%).

Each country has been classified based on the four Earth orbits, LEO, MEO, GEO and HEO; and around the three main categories of space debris: debris, rocket body and payload.

The second axis, and the main one, is made up of a large interactive three-dimensional installation that interprets outer space and its four main orbits.

Figure 4. Installation Space Debris :: Waste Constellations, Cigarreras, Alicante. ©Esther Pizarro

A projection of the Earth acts as a center. Around it, 44 circular devices woven with fiber optics and activated by light sensors are distributed (Fig. 4). In its upper part, a seven-segment screen shows the country analyzed, the orbit under study, and the number of objects cataloged in that orbit. This screen is activated by a motion sensor. A cool white LED spot lightly feeds the fiber optic ellipses that sew the circular platform. The sensors, the screen, and the LEDs are controlled by an Arduino nano (Fig. 5).

Figure 5. Detail Space Debris :: Debris Constellations, Las Cigarreras, Alicante. ©Esther Pizarro

A systematization of sizes has been established for each country based on its percentage of special garbage; the greater the impact of contamination, the greater the diameter of the platform.

The countries with the highest incidence in terms of spatial contamination are identified with a double LED and an acoustic sensor that interacts with the viewer, and that activates a generative video mapping on a wall of the room.

In the perpendicular projection of the device, a circular platform, made of mirror methacrylate, shows us the data for that country in the form of a graph of circular rings, using laser engraving.

The image returned by the mirror on the reverse side of the circular platform is shown to us as a cosmic constellation of light points (ends of the optical fiber); while its reverse contains all the technological devices used in the installation.

Figure 5. Detail Space Debris :: Debris Constellations, Las Cigarreras, Alicante. ©Esther Pizarro

Each of the eleven powers is represented by a circular device in the corresponding orbit. The 44 devices are arranged according to four heights, with the LEO orbit being the lowest and the HEO the highest. Its distribution

Author Biography

Esther Pizarro is a visual artist, researcher and Professor at the European University of Madrid. She has recognized four six-year research periods. She has exhibited individually and collectively inside and outside our country. Among the scholarships received are the Pollock-Krasner, the Academy of Spain in Rome, the College of Spain in Paris and the Fulbright scholarship. She has received numerous awards: Ramón Acín, Antón Scholarship, VEGAP Proposals, Critical Eye RNE, and Pámpana de Oro Valdepeñas. She has participated with large-scale installations in the Shanghai World Expo, China 2010; and at Expo Zaragoza 2008. Her installations have been exhibited at Las Cigarreras, Alicante; Tabacalera, Madrid; LABoral Center for Art and Industrial Creation, Gijón; Matadero Madrid; Metròpoli Foundation, Madrid; Casa Asia, Barcelona; Hospital Real, Granada; San Telmo Museum, San Sebastián; Tomás y Valiente Art Center, Fuenlabrada. Her work has been represented in various collections such as the Academy of Spain, Rome; Institut Valencià d'Art Modern, IVAM, and the Ministry of Foreign Affairs.

in the plane of the room corresponds to the scientific arrangement of the four main orbits in outer space.

Conclusion

We could conclude that, from mobile phones or satellite television to the Global Positioning System (GPS), going through innumerable scientific, astronomical or military missions; the gear of the contemporary world, a globally connected world, inevitably depends on how what happens in the orbits closest to the earth's surface and subject to the laws of gravity is managed. The exponential growth of the spatial swarm above our heads, although we are not able to see it, is there; It should be the object of reflection and concern, not only by scientists, astronomers, politicians or the military, among others; but also on the part of thinkers, artists, sociologists; since together we form the great community of human knowledge.

In an exercise of reflection on the proposed problem, the project, Space debris :: Constellations of waste, aims to generate a three-dimensional and installation visualization that shows the notable increase in spatial pollution that the connectivity of today's society is generating; based on the data collected from open and official sources that Internet 2.0 and technological advances contribute today to the multi-connected user.

The space conquest has generated great advances on our planet; now is the time to act, to assume responsibilities, and to avoid this exponential growth of space pollution. A look from the disruptive thought that art proposes to one of the great challenges of the 21st century, how to control the pollution we produce.

INTELLIGENT HABITAT: An Intelligent Audiovisual Environment Using Internal Bodily Signals and Emotion AI

Claudia Robles-Angel

Independent Artist
Cologne, Germany
post@clauderobles.de

Abstract

The main aim of the artistic project described hereby is to create an intelligent audiovisual installation exploring the combination of technologies such as biomedical signals and machine learning techniques used in affective computing (also known as Emotion Artificial Intelligence), in order to create an intelligent environment capable of recognising the emotional state of visitors and react empathetically. Furthermore, such environment is hereby conceived as a prototype of possible future homes, where the space itself is able to recognise the emotional current condition of its inhabitants and produce an empathetic reaction. In a first stage, visitors are not only audio-and visually confronted with their own current emotional state, but also are invited to raise awareness about the possibility of future home technologies and their implications. Consequently, this fact does not limit participation of common visitors, but also and specially invites scientists, artists, philosophers and producers and consumers of global digital technologies to a fundamental discussion about how our future homes may be and how new technologies inside them may or may not be beneficial to everyone's well-being.

Keywords

Emotion AI, machine learning, biomedical signals, affective computing.

Introduction

The artistic project hereby explained is currently being developed, and thus, a work in progress still. It is based on Affective Computing, a study field that combines psychology, cognitive, physiology and computer sciences [1], and which, according to Vesterinen [2], is a field that deals with emotions and computers and questions such as:

“What is the foundation of recognizing, understanding and expressing emotions?”

and/or

“How can we build a computer able to feel?”

The project consists of an intelligent space composed by an immersive audiovisual environment (IAE hereafter),

featuring multichannel sound and multiple video projections generated in real-time. The IAE is constantly modified by visitors via diverse technologies, mainly Facial Emotion Recognition (FER hereafter) combined with other body signals, for example ECG (Electrocardiogram, measuring heart rates), GSR (Galvanic Skin Response, measuring levels of humidity in the skin) and/or BCI (Brain Computer Interface, measuring brain activity). The FER system starts by scanning the visitor's current emotional state and the IAE reacts by projecting an audiovisual reaction corresponding to that mood. Once visitors have been made aware of their current mood by the IAE, the system generates a different audiovisual environment made of images and sounds inspired by nature that empathise with the visitor.

One of the goals of this project is focused on the creation of intelligent environments not only capable of recognising the emotional state of their owners or visitors but also, of reacting empathetically. Another goal is to explore fundamental questions of how our future homes may look like, in particular how new technologies inside them may or may not be beneficial to our well-being and how we can connect with nature using these technologies.

There are several software packages that allow for the realization of this project: while the installation's sound and visuals are generated in real-time by the software *Max* (www.cycling74.com), the different systems for each of the steps required by the project include also machine learning via *Python*, *TensorFlow* and diverse libraries for emotional recognition.

For the conception and development of INTELLIGENT HABITAT, the author was inspired by her last two interactive installations, namely LEIKHEN (2018) and REFLEXION (2019), both based on a long track record of experience in creating works connecting the human body and the machine through biomedical interfaces. In both works, the main intention is to explore from different perspectives questions regarding relationships between human beings, with particular attention to “the other” and to the environment. With this new project, the interest lies primarily in the experimentation of combining AI (particularly Emotional AI), because it offers new perspectives (and

consequently, raises new questions) about the relationship between human beings and the machine, especially the topic of constant change in the current interplay between man, nature, machine/technologies and body.

Facial Emotion Recognition (FER) System

The FER system is a technology that analyses emotions through pictures and/or videos. The conventional approach consists of three steps: a) face detection, b) facial expression detection, c) expression classification to an emotional state [3]. A different approach is the deep-learning-based and one of the most popular models available is the Convolutional Neural Network (CNN):

“the input image is convolved through a filter collection in the convolution layers to produce a feature map. Each feature map is then combined to fully connected networks, and the face expression is recognized as belonging to a particular class-based [of] the output of the softmax algorithm.” [3].

The software implemented in this artistic work is programmed in *Python* using a machine learning model for recognition called *Multi-task Cascaded Convolutional Networks*, further improved by also using the *OpenCV's Haar Cascade classifier*.

Immersive Audiovisual Environment (IAE)

The IAE consists of multiple video projections featuring images made mostly of macrophotography from diverse nature surfaces (Fig. No. 1), creating audiovisual natural habitats inspired by nature structures with the purpose of inviting visitors to reflect about the interplay human-nature through technology and how such interplay impacts on our well-being.

Figure 1: Draft. Example of image inspired in nature (© Claudia Robles-Angel).

The sonic section of the installation consists, on the one hand of field recordings collected from different nature

reserves; on the other hand, of sounds corresponding to a generated poem by the system.

The technologies of the IAE comprise the following:

- i) an emotion recognition system (FER) programmed in *Python* using the afore-mentioned libraries, that sends the results to the *Max* software via OSC (Open Sound Control protocol)
- ii) an interface measuring additional biomedical signals e.g. ECG (measuring heartbeats), BCI (measuring brain activity) or GSR (measuring skin's moisture)
- iii) a real-time audiovisual system programmed in *Max*, which generates visuals and sounds into the IAE; this audiovisual output corresponds to different emotional states, e.g. happiness, sadness, etc.
- iv) a space provided with multiple projectors and surround sound (up to 16x channels and 2x LFEs).

A complete chart flow of this steps in presented in Figure 2 below.

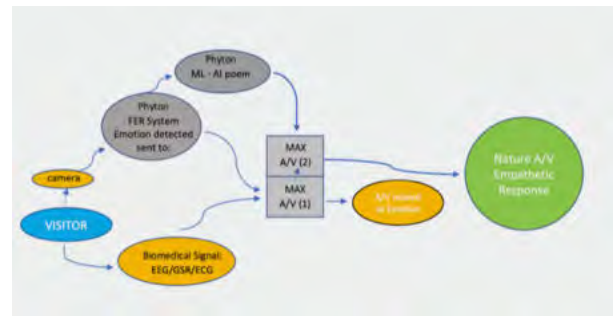

Figure 2: Flow-chart of system process (© Claudia Robles-Angel).

IAE: Interaction with Visitors

The IAE interacts with visitors/users in two different ways:

- (1) **DIAGNOSIS:** in a first instance, the IAE scans the current visitor's mood using algorithms based on affective computing technologies. This diagnosis process consists of identifying the subject's emotional state through the afore-mentioned FER system (Fig. No. 3), which recognises basic human emotions such as e.g. happiness, surprise, anger, sadness, fear, disgust, etc.

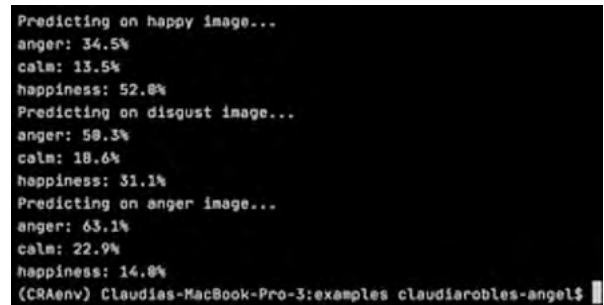

Figure 3: FER system (Python software) screenshot (© Claudia Robles-Angel).

Thereafter the system sends the results of the visitor's current emotion to the *Max* software via OSC; these results are combined by the *Max* software with data received

from the other biomedical signals from the visitor which could be from either their heartbeats, their brainwaves or their skin moisture. These additional signals reveal mostly levels of stress, engagement, excitement and relaxation. The combination of these two sets of data from the FER and from the selected biomedical signal offer a rather accurate description of the visitor's current emotional state.

(2) EMPATHETIC REACTION: after the Diagnosis step is completed, algorithms programmed in *Max* select and project into the IAE the visual and sound material corresponding to the type of emotion detected during facial recognition. The purpose of this is twofold: on the one hand, the IAE reflects the current visitor's mood; on the other hand, it stimulates the raise of awareness of visitors about their current emotional state. The IAE is therefore continuously transformed by the constant fluctuation of values received from the corresponding body signal measured, while DSP processes in *Max* (including audio spatialisation and video) reflect and intensify through the IAE the mood in which the visitor is in.

Thereafter the algorithm continues by generating an audiovisual environment inviting visitors to connect with a nature environment combined with generated poems as an empathetic response from the IAE. For the creation of these poems, machine learning algorithms via a Markov chain model are implemented (*Markovify* library, used to generate random sentences), while for each type of emotion detected by the FER System, the installation selects keywords related to the current emotion to generate a poem thereafter. The resulting poems are turned into audible sound (via text-to-speech algorithms) and thereafter, these texts are used to produce further sound material, creating a variety of rhythms and sonic results in order to autogenerate different types of sound poetry, all of which spatialised in 3D-Audio using immersive sound systems such as, for example Ambisonics.

The final outcome of the project envisages the creation of an autopoietic sonic space continuously defined by new combinations of sounds and words.

New media and audiovisual artist. Her work and research cover different aspects of visual and sound art, which extend from audiovisual fixed-media compositions to performances and installations interacting with biomedical signals. She has been artist-in-residence in several outstanding institutions, for example at ZKM (Karlsruhe) and at the ICST-ZHdK in Zurich.

Her work is constantly featured in not only media and sound-based festivals/conferences but also in group and solo exhibitions around the globe, for example, the ZKM Karlsruhe; KIBLA Centre Maribor, Bauhaus Museum Berlin; Festival de la Imagen Manizales, DRHA2010 Sensual Technologies London; SIGGRAPH Asia Yokohama; Re-New Festival Copenhagen; New Interfaces for Musical Expression NIME Oslo; ISEA Istanbul, Manizales and Durban, CAMP audiovisual concert - Salon Suisse, Official collateral event of the 55th Venice Biennale, Audio Art Festival Cracow, Harvestworks Digital Media Arts Center NYC, Museum of Contemporary Art MAC Bogotá, MADATAC Madrid, ADAF Athens, Heroines of Sound Berlin. www.claudearobles.de

DESCENT ≈ An Atlas of Relation

Dawn Roe

Rollins College

Winter Park, FL, U.S.A.

droe@rollin.edu or dawnroe@gmail.com

Abstract

DESCENT ≈ An Atlas of Relation, looks to the fish – who have occupied our planet for millions of years in a constant struggle for survival – as an entryway to visualize the entanglements of interspecies relation through time-based imaging systems referencing the imperceptible slowness of evolutionary processes. Digital photographs, scans, and video documentation are combined with UV-sensitive direct contact printing methods that require multiple minutes, hours, or days to construct an image of/with the natural world. While these camera-less works archive the durational period of each exposure – appearing as frozen traces serving as documents or specimens – the digital images and time-based video clips function as infinitely reproducible experience. Thus far works have been produced throughout the U.S. in locations undergoing restoration or habitat conservation, and where relationships to land and water are disputed, revered, mourned, misunderstood, or unacknowledged.

Keywords

environment; site-specificity; water; habitat; evolution; climate; temporality; multi-species; embodiment; relation

Introduction

DESCENT ≈ An Atlas of Relation extends from a long term, site-responsive series drawing on the dormant pathos embedded within lands where human and more-than-human lives correspond. This talk will share works-in-progress resulting from repeated observations of both routine and remarkable situations among the many Beings who cohabit on this planet, together. Using the resultant recordings as an entryway to visualize the entanglements of interspecies relation, this phase of the project moves from dry to watery terrain as a means of thinking through how “we”¹, along with along with fish and

other aquatic organisms, find ways of being and living together within the midst of a globally shifting climate impacting our shared spaces and, subsequently, our relation(s). As a collective of inhabitants, how do we persist, together, within the relentless ongoing-ness of our worlds?

Figure 2. Work-in-Progress Study. Digital collage comprised of scanned, X-ray film and HD video stills.

Looking to the fish – who have occupied our planet for millions of years in a constant struggle for survival – offers opportunities to visualize interspecies dynamics through photo-based systems referencing the imperceptible slowness of evolutionary processes. Digital photographs, scans, and video documentation are combined with UV-sensitive direct contact printing methods requiring multiple minutes, hours, or days to construct an image of/with the natural world. While these camera-less works archive the durational period of each exposure – appearing as frozen traces serving as documents or specimens – the digital images and time-based video clips function as infinitely reproducible experience. Together, these recording techniques result in unpredictable visuals corresponding with feminist perspectives on Darwin’s theories of descent, emphasizing anti-essentialist understandings of matter and nature, considering all aspects of Being as forever transformed by and within time.

Site-Responsivity/Responsibility

With awareness of my identity as a white woman with settler ancestry, I approach land and water tentatively, with care and patience. Cultivating methods centered around ethics and mindfulness led me to begin this engagement in places most familiar. Initial studies from this phase of the project have been produced within and around my hometown of Sault Ste. Marie,

Figure 1. Work-in-Progress Study. Digital collage comprised of scanned, analog prints and HD video stills.

¹ As noted by scholars such as Astrida Neimanis (drawing upon Adrienne Rich and Donna Haraway) and Max Liboiron, there is no

universal “we,” and thinking in terms of “we” requires individual, place, and situation-based specificity.

Michigan², with a particular focus on sections of Lake Superior and the St. Marys River³. As shaped by colonial powers, these aquatic habitats have become commonly known as a maritime border between what is now the U.S. and Canada, encompassing the shipping lanes within the commerce driven Soo Locks. Yet, these waters have long served Indigenous nations as a sacred source of life and continue to provide for many Anishinaabe citizens who rely on fishing for sustenance, income, and culture. Disruptions to this biodiverse ecosystem mirror those of other regions, where contemporary species management has become relentlessly interconnected with maintaining healthy fisheries and waters.

Figure 3. Work-in-Progress Study. Digital collage comprised of scanned, X-ray film and HD video still.

Further/Future Work

Though the rich histories and fish populations of The Great Lakes⁴ are foundational to the project, the work extends from this region to consider bodies of water with comparable cultural and ecological characteristics, where relationships to land and water are disputed, revered, mourned, misunderstood, or unacknowledged. This requires recognition of how private and public land acquisition and corresponding histories of displacement (have and continue to) physically and culturally shape our watersheds. Connecting this knowledge with the unimaginable span of deep time embedded within the lives of fish and their watery homes to varied understandings of descent – as passage, downward movement, decline, sinking, legacy,

² The Anishinaabe name for Sault Ste. Marie is Bahweting, as noted by The Sault Tribe of Chippewa Indians (Original, Indigenous place names for locations depicted will be incorporated into written materials as the project unfolds and as they are learned through conversation, research, and resource sharing.)

³ The Anishinaabe name for Lake Superior is Anishinaabe-gichigami, and Baawiting for the St. Marys River as noted in the Anishinaabe

lineage, origination – I visualize our human-made worlds as a continuum, suggesting both the promise and peril of ecological longevity.

Author Biography

Dawn Roe (b. 1971, Sault Ste. Marie, MI, U.S.A.) is Professor of Studio Art in the Rollins College Department of Art & Art History in Winter Park, FL. Working between and within the still and moving image, her projects examine the role of these media in shaping personal and social understandings of our environment through site-responsive engagement. Roe's work is exhibited regularly throughout the U.S. and internationally and has recently been recognized by Urbanautica Institute Awards, and LensCulture Critics Choice Awards. Her imagery and writing has been featured in many print and on-line publications including Lenscratch, Floorr, Aint-Bad, Oxford American, The Detroit Center for Contemporary Photography's series Frame/s, and the Routledge publication, *photographies*. Roe's work is represented by Tracey Morgan Gallery in Asheville, NC.

Art. Science, Nature and Culture: Expressive Science in the Digital Age

Cynthia Beth Rubin

C B Rubin Studio / GSO University of Rhode Island
Connecticut and Rhode Island, USA
info@cbrubin.net

Abstract

In this artist presentation I describe the trajectory of explorations in art and science that brought me to the current work of colliding nature and culture. Included is the case for more awareness of the importance of microscopic life in the age of climate change, with the role of technology in enabling this odd mixture. This is described in the context of my practice as an early adopter of digital imaging (mid-1980s), with a return to direct gestural drawing motivated by responding to scientific microphotography of plankton

Keywords

microphotography, gesture, drawing, plankton, manuscripts, art, science, culture, patterns, oceanography

Introduction

“Everyone knows that art is round and science is flat.” So begins the 1975 essay by Joseph R. Burke and M. S. Gussenhoven entitled *tides and the affairs of men: reflections on art and science*.¹ This line, this entire essay, has stayed with me in the decades since I first read it.

In the days when there was a rush to find the convergence of the two disciplines, when the argument was that both are based on observation, the words of this essay came rushing back. As the argument goes, art and science are both about making observations and compiling connections, so they must be the same. I rejected that argument. Everyone knows that art and science are not the same, even in basic processes. Art gets to jump around and unapologetically make adventuresome connections in the pursuit of creating a provoking visceral experience, while science is required to follow procedures and methods that lead to solid evidence.

Decades later, I celebrate this difference by putting art into science, nature into culture, both disciplines in the same imagery, letting them fight out who gets ownership of patterns that yes, do seem to point to a similarity in the universe of human - organism interaction, as celebrated in the image *Plankton Universe* which photographic and hand-drawn microscopic life with patterns from a Hebrew manuscript that is more than 1000 years old.

Plankton Universe

© Cynthia Beth Rubin with Susanne Menden-Deuer, 2020- 2022
mixed media digital and analogue

Exploring Microscopic Life

One of the primary themes of my work for over a decade has been making visible the invisible microscopic world of plankton. The forms of plankton, in their endless variety, stir my imagination and impulse to observe, draw, and create.

I began my own plankton artwork with the common attitude that I had to be careful not to distort or misrepresent the plankton. At the time, I was teaching Digital Nature at the Rhode Island School of Design, in an elective course open to students of all levels and areas of concentration, mixing designers, architects, painters, and sculptors. As the course morphed into Digital Plankton, we visited the Graduate School of Oceanography at the University of Rhode Island, learning from the plankton researchers Susanne Menden-Deuer and Tatiana Rynearson.

When I stopped teaching at RISD, Susanne Menden-Deuer invited me to join her lab as an artist in

residence, solidifying my interest in bringing the world of plankton to a broader audience. Influenced by the scientists in the Menden-Deuer lab, as well as current events, my commitment to depicting plankton grew in the face of climate change. In addition to producing 50% oxygen we breathe they are at the bottom of the food chain. Without plankton we die. Therefore creating empathy for the plankton is now an essential aspect of my work.

Merging the Streams of Influence

This body of work also brings us into conversation with culture, with the past, with the very meaning of humanity that invites us to stretch back more than 1000 years and imagine why decorating sacred text and embellishing stories was so essential to so many cultures.

In parallel with my investigations plankton, I was, from time to time, working on imagery incorporating the visual structures of Hebrew manuscripts. Early in my career I turned to researching influences beyond the Western wall painting that was so central to my educational experience. After looking at the visual cultural legacy of a variety of cultures, I crept towards one related to my own heritage. By accident, not by intention, but nonetheless it happened.

While still attached to earlier works in which I digitally combined photographic imagery of specimens with painterly environments, I kept thinking of the tradition of Hebrew manuscripts, including those in which micrography (little writing) turned into decorative patterns and sometimes fanciful beasts. There had to be a convergence.

Drawing Plankton into Old Cairo Text
© Cynthia Beth Rubin with Susanne Menden-Deuer, 2021
mixed media digital and analogue

The bits of the Biblical manuscripts that are present in this series are intended as a signifier, not as religious Text per se. This echoes what was often the intention in the original micrography that was difficult to read but intended as embellishment and reference to the more readable Text. In this series I use motifs from the Leningrad Codex, created in Old Cairo in 1008, most likely by artists from the Asher scriptorium. I do not read Hebrew, but with the help of my artist colleagues I identified and avoided references to God in the completed imagery, leaving open a more general signifier.

New Technology, New Methods

As new media digital artists, we are enamored of the big innovations and the subsequent leaps into new forms of art. What we think about less often are the small, incremental developments that make new artistic directions possible.

Since I began working digitally in the early 1980s, I have continually been intrigued by the ease of seamlessly merging disparate elements in creating compositions. With the advent of affordable scanning, and then later the introduction of digital photography, this combining beyond collage became even more important in my artistic practice.

At the same time, scientific imaging was going through a similar evolution. I first saw plankton on the big screen in 1970, when I was working at the Pacific Science Center (as a student). One of my colleagues attached a video camera to a microscope so that we could show plankton to visiting school groups. This was before digital imaging, and we were not recording what we saw. Today, scientific researchers

Copepod in a Red Sea in Old Cairo
© Cynthia Beth Rubin with Susanne Menden-Deuer, 2021-2022
mixed media digital and analogue

may look into a microscope to focus, but the important visual material is digitally photographed and studied later. Scientists, like artists, are working in the realm of digital imaging, using similar software tools to refine what they observe. This easy exchange of visual data is vital to my work.

The other seemingly trivial innovation is the emergence of low-cost printing, a development that cannot be dismissed as inconsequential. To execute this work, I returned to drawing. We have microphotography, what we do not have is expressionist drawing. Drawing into my evolving artwork was only possible because I could have large prints, big enough for gestures, allowing drawing and redrawing right onto the surface of more subdued plankton and cultural patterns. It is impossible to imagine how such lively combinations would have evolved without this innovation.

Conclusion

Always intrigued by science, I jumped into bringing all of the lessons of painterly abstraction into work with scientists, including my experience with life drawing. If I could be loose and expressive in drawing humans, why not with plankton? Although in theory this could have been done with old technology, it was the new technology of cross-discipline digital photography, scanning and image processing, combined with inexpensive printing, that prompted this body of work to emerge.

This is my most current work, which continues to evolve. My goal is to bring Nature and Culture together in touching our inner thoughts, and save the planet now.

Acknowledgements

I am deeply indebted to Susanne Menden-Deuer for opening this path in my artistic practice, and to the members of her lab who gathered data, provided raw imagery, and gave feedback and encouragement. I thank Jason Schaedler, Gayantonia Franze, Pierre Marrec, Françoise Morrison, Heather McNair, and Mary Kane. I also thank Neal Overstrom, former director of the RISD Nature Lab, who first suggested and facilitated work with plankton. Special thanks to the artist Leah Caroline, who guided my use of Hebrew text.

Author Biography

Cynthia Beth Rubin began the transition from painting to digital imaging in the early 1980's. Her prints, videos, and interactive works have been shown in the Techspressionism exhibition, NY Creative Tech Week, Jewish Museum in Prague, Siberia State Museum in Novosibirsk, Kyrgyzstan State Museum, on the ICC tower in Hong Kong, Cotton Club screen in Harlem, and numerous editions of ISEA and SIGGRAPH. Rubin's awards include multiple Connecticut Artist Fellowships, New England Foundation on the Arts, among others, and artist residencies in France, Israel, Canada, and Scotland. She is artist-in-residence in the Menden-Deuer lab at the University of Rhode Island, School of Oceanography, thus her practice includes collaborations with scientists studying plankton and their predators. Based in New Haven, Connecticut, her studio practice extends to New York City, Narragansett RI and beyond.

Abstract

Fragments is an ongoing series of audiovisual research-creation works that bring together live performance, generative music, video game design, photogrammetry, lighting design, audiovisual production, and theater dramaturgy. By using a collage approach that mesh together autonomous computational systems, human performance, and real-world imagery and sound, the series explore the complex feelings of living in an algorithm-driven world, living away from one's homeland, meeting and sharing across cultural differences, sustaining social lives at a distance and across borders, and relating to the mediatised lives of strangers.

Three pieces are discussed: *Poetics of Otherness*, that explores the hyper-mediatisation of warzones, *Stabat Mater*, that inquires into the anonymity of living in urban metropolis, and *The Shape of Things*, that dives into the atemporality of large-scale infrastructures.

Keywords

Machine agency, Live performance, photogrammetry, generative music, video-game engine

Introduction

Fragments is an ongoing series of audiovisual research-creation works that bring together live performance, generative music, video game design, photogrammetry, lighting design, audiovisual production, and theater dramaturgy. By using a collage approach that meshes together autonomous computational systems, human performance, and real-world imagery and sound, the series explore the complex feelings of living in an algorithm-driven world, living away from one's homeland, meeting and sharing across cultural differences, sustaining social lives at a distance and across borders, and relating to the mediatised lives of strangers.

Three pieces are presented: *Poetics of Otherness*, that explores the hyper-mediatisation of warzones, *Stabat Mater*, that inquires into the anonymity of living in urban metropolis, and *The Shape of Things*, that dives into the atemporality of large-scale infrastructures.

Concept

Each of the pieces of the series uses the concept of “fragments,” small elements that are transformed and reconfigured, to explore technologically mediated human connections, perceptions, and memories. These fragments consist of sounds, videos, and photogrammetric objects that are scavenged from the news, created by the artists, or generated by algorithms. During the performance, those fragments are analyzed and modulated live by a set of Markov chains, Spiking Neural Networks, Machine Learning, optical flow, and other AI & A-Life techniques. In front of the audience, the artists orchestrate the action of those algorithms and guide the public into a journey that moves from darkness and absence into a growing torrent of sonic and visual stimuli.

Fragments is presented as an onstage audiovisual performance in which 2 human performers act live on Artificial Intelligence and Artificial Life algorithms to generate and modulate a poetic immersive experience (Figure 1).

Figure 1. *Fragments* performed at Mutek 2021 (Montréal, Canada) (photo: Bruno Destombes).

Photogrammetry and Video Game

The visual material of *Fragments* results from an original combination of found footage, photogrammetry, and video game engine.

First, we collect video images from archival, news, and personal material. This material consists mostly of video containing tracking shots through spaces that echo different themes such as war ruins, cities, or abandoned buildings.

The collected videos are then processed with Agisoft's Metashape photogrammetry software¹ to generate 3D spaces. Given that our video material consists mostly of video footage not intended for photogrammetry, the 3D spaces obtained are not accurate reconstructions of the actual spaces. Instead, they are riddled with glitches and algorithmic extrapolations that produce uncanny aesthetic objects at the intersection between material and digital worlds.

Finally, the 3D spaces are imported inside Epic Games' Unreal Engine² where they are arranged into the virtual world of the performance. This video game engine enables us to create powerful virtual lighting effects, play with the materiality of the photogrammetric object, and experiment with the emergent properties of complex dynamic systems such as point clouds.

The visual component of *Fragments* consists of refined camera tracking shots through a virtual stage composed of uncanny photogrammetric objects based on real-life spaces. All camera movement, lighting effects, and dynamic system animations are performed live.

Generative Music

Fragments explores the expressive potential of human-computer interaction and collaboration through the use of generative music algorithms coupled with human

improvisation on electronic music instruments. In this section, we describe the conception and use of autonomous algorithms for musical composition as well as the methods used to create a live collaboration between the human performers and the machine.

Various strategies have been used since the early days of computer music to generate compositions, many relying on probabilistic models driven by pseudo-random number generators. While this technique proved useful for creating ever-changing pieces with no predetermined duration [1, 2] it relies on an implementation of musical theory concepts and rules in the computer to orient the generated content reminiscent of the GOFAI approach to artificial intelligence in the 1960s to the 1980s [3, 4]

Our approach uses a Markov Chain model to create new musical compositions in real time [5]. Based on a series of discrete states representing musical notes, the algorithm determines the probabilities of going from one state to another at each prompt. Concretely, if the initial note is a middle C, the Markov chain will compute the probabilities of changing state and determine which state is the most probable at the next prompt, sending for instance a G (the fifth note of the scale) to our synthesizer. Multiple queries, organized rhythmically, can thus create rich and evolving melodies and harmonies.

The use of this technique removes the need for an implementation of rules in the algorithm. Instead, carefully crafted series of musical notes representing chords and harmonies are used as training data for the algorithm. The impact of this training data is important in two ways. First, it dictates the possible states of the chain (i.e., the possible musical notes to play). This can be used to indicate to the algorithm to play on a specific scale. Additionally, the data indicates the most likely intervals to play, creating a sense of harmony or dissonance in the composition. Finally, observations realized when creating *Fragments* showed us that many Markov chains trained on the same data set will diverge and generate slight variations in the melodies. When joined together on various instrumental arrangements, these changes create emerging patterns and new harmonies that are not represented in the original data.

The human performers play an important role in the performance of *Fragments*. While the algorithm can efficiently select states (musical notes) the temporal organization of events remains a challenge for computer science and artificial intelligence programs [6]. For this reason, the rhythmic aspects of the composition are organized by the performers. Inside a digital audio workstation (DAW), events are arranged rhythmically using the MIDI protocol (Musical Instrument Digital Interface). On each MIDI event, the Markov chain selects the note to play while the MIDI data dictates when and how long each note should be played. Furthermore, the performer's control which instruments are playing at any given time. Similar to a conductor with an orchestra, the role of the performer is to organize all the instruments in time to create the musical experience. For this reason,

¹ <https://www.agisoft.com/>

² <https://www.unrealengine.com>

Fragments represents an experiment in human-computer collaboration, a negotiation between the intention of the performer and the agency of the machine in front of the public.

Poetics of Otherness

Fragments: Poetics of Otherness (Figure 2) is a 20-minute piece that reflects on how data processing algorithms and Artificial Intelligence systems anonymize and aestheticize human conflicts. The piece consists of a fly-through journey through 3D reconstructed ruins of cities that suffered heavy warfare accompanied by haunting music morphing electronic rhythms into evocative sonic textures. At times, the piece is subtitled with extracts from Bertolt Brecht's theatre plays *Mother Courage and Her Children* (1938) [7] and *The Exception and the Rule* (1930) [8].

Poetics of Otherness is composed as a counterpoint between 3D reconstructed real-life news footage, video game visual aesthetic, drone imagery, techno music rhythms, narrative soundscape, and pre-WWII epic theater. This multimedia collage intends to create a time of reflection on our aesthetic perception of war and suffering in an era of overwhelming instantaneity, hypermediatization, war video games, and data analysis.

Figure 2. *Fragments: Poetics of Otherness*

Stabat Mater

Fragment: Stabat Mater (Figure 3) is a 5 minute fly-through in a cityscape populated by human shadows walking to the sound of an interpretation of Antonio Vivaldi's *Stabat Mater* (1727) for a voice and electronic drones. The short piece meshes baroque music and Indonesian shadow theater influences with noise drones and video game cinematic aesthetics to express the feelings of uniformity and anonymity of modern metropolis.

Figure 3. *Fragments: Stabat Mater*

The Shape of Things

Fragments: The Shape of Things (Figure 4) is a 15-minute travel through abandoned corridors, factory halls, train tunnels, and malls to an increasingly dance-y electronic music before vanishing into an abstract space of point clouds and minimalist drones. In a continuous motion, the piece stages the dissolution of realistic 3D spaces into disappearing topographic meshes while emerging point clouds slowly reveal the hidden structures that traverse the virtual spaces. The piece eventually culminates in a suspended moment of contemplation where large structures of point clouds and sustained drones are subtitled with the poetry of T.S. Eliot's *The Hollow Men* (1925) [9].

Authors Biographies

ALMA (Alexandre Saunier & Marc-André Cossette) mixes together cutting-edge AI & A-Life algorithms with drum machines, analog and virtual synthesizers, photogrammetry, procedural graphics, and video-game engines to invoke memories of inaccessible places, the sensations of the material world, and the feeling of being together.

Alexandre Saunier is a interdisciplinary artist and PhD Candidate at Concordia University. His research addresses the intersection between artistic creation with light, autonomous systems, and sensory perception. His artistic work is regularly presented in international festival such as Mutek, Bcn_Llum, Impakt, and Festival de la Imagen.

Marc-André Cossette is a transdisciplinary artist and PhD Candidate at Concordia University working on the relation between technology and performing arts using sound, visual, interaction design and Artificial. His work has been presented both in Canada and internationally, notably at Tangente Danse (Canada), Ars Electronica Festival (Austria), El Matadero (Spain) and CMMAS (Mexico).

Syndemic Sublime: Rematerializing the Expanded Biotechnological Apparatus in the Age of Remote Intimacy and Immediate Precarity

Laura Splan / Brooklyn, NY US / www.laurasplan.com

Keywords

interspecies, entanglement, embodiment, remote sensing, biotechnology, biology, data, networks, bioart, sciart

Author Biography

Laura Splan's biomedical themed artworks have been commissioned by The Centers for Disease Control Foundation. Her projects combining digital fabrication and textiles have been exhibited at the Museum of Arts & Design and Beall Center for Art + Technology and are represented in the collection of the Thoma Art Foundation. Articles including her work have appeared in *The New York Times*, *Discover*, and *Frieze*. Splan has received research funding from The Jerome Foundation and her residencies have been supported by The Institute for Electronic Arts, and Harvestworks. She has been a visiting lecturer at Stanford University. Her recent research as a member of the New Museum's NEW INC Creative Science incubator included collaborations with biotech laboratories to interrogate interspecies entanglements in the contemporary biomedical landscape. Her lace viruses created in 2004 were exhibited in the 2021 Triennale Brugge in a former medieval hospital that once served plague victims.

Abstract

In my research-driven studio practice, I connect hidden artifacts of biotechnology to everyday lives through embodied interactions and sensory engagement. My conceptually based work combines a wide range of media including experimental materials, digital media, and craft processes. Recent projects explore the interconnectedness of cultural and biological systems during the pandemic with data-driven animations created with molecular visualization software and coronavirus models. Immersive video installations and soundscapes evoke liminal states of perception and interspecies entanglements in an expanded biotechnological landscape. A series of data-driven networked sculptures and Zoom performances with scientists examines invisible systems, hidden artifacts, and poetic materialities of biotechnology. Tactile sculptures created from the fiber of laboratory animals who produce antibodies for human vaccines engage viewers with the invisible labor of pharmaceutical production. The textile material is also brought into the laboratory in a series of experiments to add color to the fiber using genetically modified bacteria.

I often leverage the material artifacts of biotechnology to reveal poetic subjectivities of the seemingly mundane. I attempt to destabilize and reframe our relationship with the everyday—and even redefine what the everyday means. I created a lace SARS doily in response to the first 2003 SARS outbreak as part of a body of work grounded in the intricacy of textiles and its associations with the familiarity

and comforts of domesticity. But in the speculative narrative of a lace virus, collective traumas borne from disease, from epidemic, from pandemic are rematerialized in an heirloom artifact to be passed on from one generation to the next. I often try to compel an intimate engagement with detail calling into question how things are made and what they are made of. And I use processes and tools that challenge notions of what is made "by hand" and what is made by "machine", what is "natural" and what is "constructed", and what is "science" and what is "culture".

This work has led me deeper into the layers of scientific representation and the ways that biological forms are translated and abstracted with technology. In 2018, I was invited to be a bioartist in residence at the Science Center in Philadelphia. During my residency, I had the opportunity to shadow scientists as well as learn software used for antibody research. With a sensibility informed by textiles, I began to unravel antibody protein structures using a feature in the software called "sculpting". In response, the software-rendered uncanny disturbances in the form of sometimes spastic and sometimes sublime movements which I began to incorporate into a series of animations.

While sheltering in place for the pandemic in 2020, I collaborated with scientists remotely to create new molecular animations and soundscapes based on the coronavirus. I often repurpose tools and techniques of

science to engage with them both creatively and critically while searching for new possibilities. And I choreograph poetic confrontations with science inside the gallery to foster deeper engagement with science outside the gallery while framing complex biomedical issues with provocations of curiosity and wonder.

Unraveling is a series of animations that present mesmerizing meditations on invisible entanglements between natural and constructed worlds. The digital animations are created using molecular visualization software and SARS-CoV-2 spike protein models. They include playful manipulations of folded protein forms, known as “conformations”, which determine biological function including infectivity. Using specialized features of molecular visualization software in unconventional ways, the coronavirus spike protein is transformed by unraveling and morphing the folded and unfolded forms. The colors are chosen from the software’s palette for their references to nature such as plants, animals, and chemical elements. The video titles in the series echo the colors’ names that are evocative of idyllic representations of the natural world such as blue skies, green forests, ripe fruit and romantic flowers. The mere act of adding color is another layer of translation and fabrication since most viruses are smaller than visible wavelengths and therefore have no color. The color palette

and its naming conventions reveal additional layers of abstraction built into the interfaces of the technologies we use to engage with and manipulate the natural world.

The animations were exhibited at BioBAT Art Space at the Brooklyn Army Terminal along with an immersive soundscape inspired by the genetic sequence of the coronavirus. I invited scientists and lab technicians to play the SARS-CoV-2 nucleotide sequence on guitar in recorded zoom meetings. The recordings, entitled *Termination Sequences*, were made by simply prompting participants to play “A” on guitar 33 times, the number of adenine nucleotides at the end of the mRNA sequence.

Syndemic Sublime is a series of data-driven computer-generated animations created using molecular visualization software, python programming, and COVID-19 data reported by The Centers for Disease Control. The animations intertwine molecular models of SARS-CoV-2 with both human and non-human protein structures such as antibodies and cell receptors. The generative movement is created using data from COVID deaths in the U.S. over the first twenty months of the pandemic to disrupt the twenty amino acid residues along the protein structures. The resulting disruptions create mesmerizing tableaux. Each animation has a unique starting and ending form as it slowly morphs from its biological folded form or “conformation” to its technologically distorted form. The generative quality

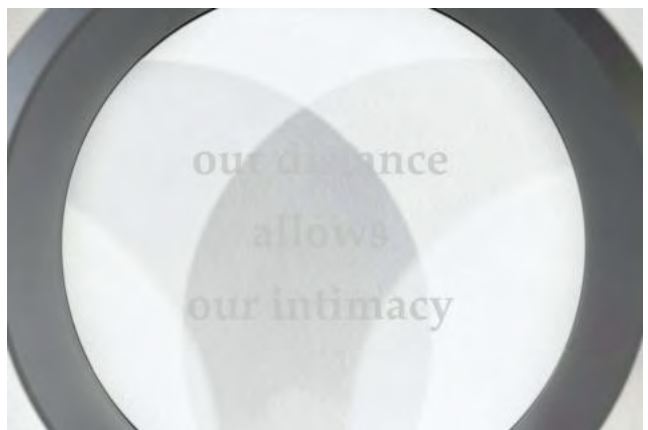

of the process allows for unpredictable and unique transformations within each animation as the software creates unexpected visuals. The unraveling and collision of the proteins results in both jarring glitches and in soothing movements. The animations combine models of proteins from the coronavirus with proteins from llamas, alpacas, cats, dogs, pangolins, bats, and humans evoking our increasing interspecies entanglements in the contemporary biotechnological landscape. From zoonotic diseases to transgenic vaccine development, our understanding of what it means to be “human” in the “natural world” is becoming increasingly complex.

During my 2018 bioart residency, I was also struck by the lab’s use of non-human species for the production of antibodies. My conversations with the scientists led to receiving over 200 pounds of wool from laboratory llamas who produce antibodies for human drugs including vaccines. Since then, I have been spinning their wool into yarn. I situate sculptures made with the yarn among other artworks that examine the hidden systems and invisible labor of biotechnology. This work questions notions of the presence and absence of bodies evoking the mutability of categories that delineate their status.

While processing the wool, I would often find clumps of feces which I began to collect for a series of networked laboratory mixers. The devices in *Contested Territories* agitate when Twitter hashtags associated with the culturally contested status of Science are tweeted. When taking office, the Trump administration advised how to improve the chances of receiving research funding with the suggestion to avoid phrases like “diversity”, transgender” and “science-based”. The mere mention of hashtag “vaccination” agitates tubes filled with laboratory llama feces. In *Remote Entanglements*, faint text on a wall invites viewers to come close to read “our distance allows our intimacy”. The sculpture blows a breeze in the viewer's face as they read the text. The speed of the networked fan intermittently adjusts

based on the wind conditions near a farm in rural Pennsylvania. This farm is actually the 600-acre biological laboratory that gave me the wool from the shearing of their llamas.

Before the pandemic, I was experimenting with dyeing the hand-spun llama yarn using genetically manipulated bacteria. I’m continuing to collaborate with scientists and laboratories to continue these experiments for new work that engages audiences in sublime complexity and contested territories of the contemporary biotechnological landscape.

ISEA2022 Artist talk / lecture performance

The Reflection of the Man

Or how to get closer to our nonhuman companions

Martine Stig

Abstract

What does it mean to be human in a more-than-human world? How do we relate to our digital representations and can facial recognition technology contribute to a new digital sensibility in a truly shared space? Now organic entities no longer have a monopoly on seeing, we can ask ourselves: does the graphical language of machine vision enable communication between the human and the more-than-human?

Keywords

Machine vision, biometry, image, inclusivity, more-than-human, identity, perception, algorithms.

© Martine Stig, The Reflection of the Man, 2021, videostill

Introduction

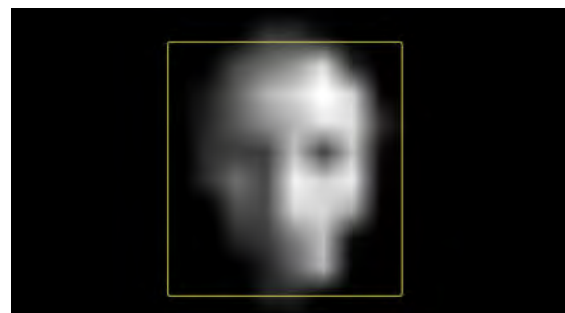

Within Western scientific discourse, technology has traditionally been perceived and used as an instrument for reaching human goals; technology belongs to the realm of resources and can be regarded as an expression of human intelligence. However, this deterministic and instrumental view causes fear and culture pessimism. Technology would alienate people from themselves and from the world around them.

The contemporary view on the human-technology relationship can be described as one of mediation. Technology is not neutral or alienating, it mediates between people and the world. We interact with machines or even incorporate them, still *we* set the goals and use technology to realize *our* goals. The machines themselves do not play an

active role, unless a subject-object reversal occurs, a sci-fi scenario feared by cultural pessimists.

The Western concept of a unified, autonomous and conscious (human) self, that has emerged from the reflection of the (technological) other, is shifting. Is it still possible to separate, or even distinguish, human and technology? Or is man, as the German philosopher and sociologist Plessner states, a 'naturally artificial' being?

The human-technology entanglement changes what it means to be human. Our eccentric position -living from our center of experience and being spectator of ourself- is enhanced by the use of technology. Whether our experiences are intensified by technology is a matter of debate, but the way and frequency with which we look at ourselves is certainly intensified. With selfies and socials, medical apps and biometry, a multi-perspective self-image is being constructed. Inviting man and machines to contribute to this image, a meta- or hyper-eccentricity is being created.

© Martine Stig, The Reflection of the Man, 2021, videostill

How are the seer, the seen and the act of seeing entangled now organic entities no longer have a monopoly on seeing? Does it change the way we depict, portray, recognise? Is 'seeing' a mutual act and can we see beyond the human spectrum? Can we perceive the world in a reciprocal way, recognising the agency of the more-than-human?

New technological developments call for a new understanding of inclusiveness. To share a space with all that exists, going beyond dichotomies such as me/ other, culture/ nature, human/ non-human, real/ virtual and subject/ object, requires a shared (visual?) language and extends beyond physical space. An investigation into our non-human companions and the possibilities of such a (virtual) space is a first step.

© Martine Stig, *The Reflection of the Man*, 2021, videostill

In my practice I try to get closer to our non-human companions. I employ consumer apps and machine vision in order to create a hyper-eccentric self-image. I subject algorithms to a Rorschach test to find out their personality structure. Using biometry,

I create a shared virtual space to experience fluidity and intimacy with *all others*.

In my artist talk I focus on the changing concept of seeing, depicting and the (human) self-image in a more-than-human world. I will elaborate on the thinking and making process of *The Reflection of the Man*, a film-essay about being human in a hybrid world, and demonstrate wealgo.org, a shared space for biometric avatars. I will talk about the collaborations and team that co-created the projects.

Discovering Urban Pasts:

Activating Archival Material with Site-Specific Urban Media Installation

Minka Stoyanova, Reece Auguiste

Department of Critical Media Practices, University of Colorado
Boulder, Colorado, United States

minka.stoyanova@colorado.edu, reece.auguiste@colorado.edu

Abstract

Digital media is increasingly being used to create affective, embodied, and/or meditative experiences in the urban landscape that are not primarily commercial in nature. This project seeks to apply this approach to site-specific historical narrative by working with culture bearers and community stakeholders to celebrate the histories of local communities. Currently focused on the Tremé neighborhood of New Orleans, LA, this project hopes to highlight the significant cultural and political contributions of the oldest historically Black neighborhood in the United States.

By working directly with community stakeholders in the curation and development of media experiences, this project also intends to outline a model for centering the voices and narratives of underrepresented groups in urban environments. This talk considers the successes and challenges of the installations created to date – covering both the technical and the social components of the project.

Finally, under the umbrella of locative media, these works are part of a larger research project seeking ways in which digital technologies can allow users to experientially discover place-based histories. Therefore, this artist talk also looks to the future in a discussion of intended plans for both these media installations and an augmented reality application.

Keywords

Urban Media, Interactive Media, Projection, Archives, Museography, History, Tremé, Community, Community Media, Cultural history

Discovering Urban Pasts

Introduction

While much research in the growing field of ubiquitous computing focuses on how digital information technologies can be used to create embodied and affective user experiences, [1, 2] this project focuses on how locative and site-specific media have the potential to enrich the urban landscape by embedding historic and culturally relevant multimedia experiences in situ. [3]

The increasing popularity of GIS (Geographic Information System) mapping applications like MapMyStory (<http://www.mapmystory.xyz/>) suggest that locative media is the next logical step in community or place-based

storytelling [4, 5]. However, GIS mapping or marker-based Augmented Reality (AR), do not provide the kind of seamless engagement or immersive experience that are possible with interactive site-specific installation and emerging geolocation technologies.

New Orleans, Louisiana, USA is a city that is rich in multicultural history and therefore, an ideal subject for this research. Thus, I am working with cultural institutions in the city to invent digital solutions that augment the urban landscape with culturally relevant historic material (video, image, sound, 3D objects, and text). These are currently taking the form of interactive media projections onto the facades of historic structures.

While this type of projection is not new in urban media [6], the novelty of this project is in the combination of site-specific archival material with immersive interactive media experiences – using future technologies to bring the past of a site into its present. By applying techniques of urban informatics and interaction design we can discover novel modes of presenting information and material that would otherwise only be accessible to residents through archives or museums.

Locative and Site-Specific Media: Project Aims

These objectives are being met through the completion of two distinct investigations. First, I am creating a series of interactive urban installations in collaboration with archives, museums, and community centers/initiatives. It is this first investigation that this talk primarily engages. The second component of the project, however, will be the production of a location-based AR application using material from those same archives and institutions. Through this process, I hope to eventually create a platform that will allow institutions to author their own similar locative experiences.

Case Study: LaBranche Pharmacy

The Tremé neighborhood is of particular interest as it is the oldest historically Black community in the United States; its formation precedes the US Civil War. As such the neighborhood contains many examples of the contributions of Black citizens as well as the ways systemic racism has (and continues to) effect(ed) Black communities and other

communities of color. For instance, one planned media installation recreates a lost mural from the 1970s entitled, “The Destruction of Tremé.” This mural portrays the demolition of many of the oldest blocks of Tremé and the forced removal of their inhabitants to create a ‘cultural compound’ in the oldest part of the city; this compound is now Louis Armstrong Park. It is of note that the design and construction of the park intentionally restricts Tremé residents’ access. Instead, the primary (and often only open) entrance to the park faces the touristic French Quarter.

The installation discussed in this text explores the history of the Black-owned and operated family business, LaBranche pharmacy and how it (along with the neighborhood) succumbed to the construction of the I-10 interstate through the neighborhood. LaBranche pharmacy was opened in 1907 and prospered until its closure in 1970, almost immediately after the construction of the interstate along the previously tree-lined Claiborne Avenue was completed. Opened by Emile LaBranche Sr., LaBranche was not simply a pharmacy, but a community hub -- a place where people congregated to share community information over a soda, ice cream, or sandwich or even to leave their children while they went shopping along the avenue. Emile LaBranche Sr. (and Junior) were also active community leaders. They were members of several social organizations and served on the boards of local Black universities.

Community Stakeholders

My initial engagement with LaBranche pharmacy was through the Claiborne Avenue History Project (CAHP) -- one of many organizations attempting to draw attention to the history of the Claiborne corridor; the systemic racism that has affected it, and the potential social and economic development that might revive and reinvigorate it. CAHP specifically is a documentary project that has for several years been collecting historic material about various locations of community and historic interest along the avenue. The sites researched by the organization range from sites that acted (or still act) as community hubs to sites of national or international cultural and political importance.

CAHP has worked with me to identify sites relevant to my own site-specific media project and has provided initial information and source documents for the creation of the media experiences. In the case of the LaBranche pharmacy, CAHP was able to provide imagery and data regarding the family and the pharmacy as well as to introduce me to the surviving LaBranche family members. In addition, CAHP helped me to work with the New Orleans Pharmacy Museum -- which also holds material and ephemera related to LaBranche. Ultimately, I was able to collect rich interview audio and high-resolution images of the pharmacy and the surrounding area for inclusion in the interactive projection.

Centering community voices Working with an organization like CAHP is particularly important to projects like this one. Some members of the Tremé community --

accustomed to being exploited by outside artists and researchers -- are hesitant to talk with or work with unknown entities. However, by working with CAHP, I am not only able to assuage their concerns, I am also able to ensure that my activity is adding value to a larger community initiatives.

This consideration is imperative to the process of ‘centering community voices or needs. As an outside researcher, it is vitally important to ensure work is not being created in a vacuum -- alienated from community input. Instead, one should always consider:

- What value does my project bring to this community or organization in the short and long terms?
- Is this something that the community/organizations values?

Working with existing organizations and projects in the community at various stages of the project, one is doing their due diligence to ensure that both these questions are being answered positively.

Installation/Observation

Using the material collected, I created a media projection that allows users to interactively explore the history of the LaBranche family, the pharmacy building, and the street in a both informative and poetic manner. This interactive experience was projected onto the side of the LaBranche building from sunset to about 8:30pm for two weekend nights in February.

The interactive system was created using Open Frameworks. Archival images are animated with a zoom effect and paired with interview audio that relates to the pictured area. Using a standard game controller, users can move through images such that the controls mimic moving through the actual space. For instance, to move forward to a new area in the pharmacy users press the FWD (or UP) arrow. Scanning the room (moving laterally through the images) occurs by moving the LEFT and RIGHT arrows. Some areas are ‘dead ends’ and attempting to leave them by the improper means results in being shuttled out of the pharmacy to a progressive animation of the construction of the bridge. This animation, created from an archival image of the bridge’s construction as of 1968 depicts segments of the bridge encroaching on the LaBranche location. Once the bridge has ‘arrived,’ the credits are displayed and the interactive experience resets.

Challenges Initially, gesture-based interaction was envisioned for these installations. However, there were many inconsistencies in the currently available libraries and interfaces for gesture-based interaction. Moreover, it was determined more of a priority to rapidly create a working prototype (proof of concept) for community stakeholders to experience. Therefore, the gesture-based system was temporarily set aside, and the game controller was introduced as an alternative.

Secondly, as the project is not primarily aimed at educating or entertaining individuals outside of the community,

invitations were not created for the projection events. Instead, while CAHP did post on their social media about the pop-up, I hoped organic foot traffic would provide the bulk of the engagement. Unfortunately, there was significantly less foot traffic in the installation area than I had expected on a weekend evening during Carnival. While the events were scheduled during a high-traffic season, the bars/nightlife are located a few blocks down Claiborne Ave – too far to create the hoped-for foot traffic. In total there were only three individuals that engaged the project who were not previously aware of it.

Finally, as noted by residents of the area, the background noise of traffic on the interstate is overwhelming. For interview voices to be audible, the gain had to be increased beyond what was ideal for the quality of the original audio recording.

Observation Method and Outcomes

Approximately twenty individuals engaged with the installation over two evenings. Many of the participants were LaBranche family members or CAHP researchers who were aware of the event. Though, other individuals that had heard about the event via social media or word-of-mouth did come out to view and participate. As such there was sufficient engagement to make preliminary conclusions regarding the user interface, effectiveness of the project/media, and necessary adjustments for future iterations.

Interaction outcomes It was observed that children were more comfortable with and/or interested in the controller-based interface than adults. This included children who were not regularly allowed to play video games as well as children who were very familiar with game controllers as an interface. In contrast, older participants were more inclined to physically move toward the projection and were drawn to interact with the images directly on the wall. Similarly, the pedestrians that did walk by or into the projection, as well as some visitors, tended to overlook the potential for interaction and to avoid what would be the interaction area. Finally, the controller does not allow multiple users to collaboratively control the media – an initial goal of the media installation.

Based on the above observations, I've determined that the controller is not a suitable substitute for the initially planned gesture-based interaction. Future iterations will use machine-learning based image recognition techniques (such as Google's MediaPipe) to recognize human skeletons and allows for gesture-based control. In addition to catering to a wider age range of participants, gesture-based controls could also create 'passive' or 'unintentional'

control scenarios – situations in which a person passing through the interaction space causes a change in the projection. This function would not only provide an interesting twist to the experience of controlling the media, it could also draw in passers-by to engage with the work further.

Community engagement outcomes Community members not directly related to the project did come out to see the work, even if they did not engage with it directly in all cases. In addition, community members like the owner of the business currently using the building were supportive of the project, its goals, and my installation team. Finally, the LaBranche family as well as CAHP were excited about the project, thankful for the engagement, and interested in collaborating and building on the project further.

Therefore, I believe this was a successful first iteration. However, alternative interaction techniques (gesture-based) will make the work more compelling and immersive and will likely draw in more external participation. Additionally, future iterations will not rely primarily on foot traffic for engagement. While in some areas that could be viable, I should check the foot traffic on any given block before determining a specific installation will rely solely on foot traffic for engagement.

Conclusions

By placing interactive media highlighting history back in the locations that spawned it, we can educate current residents as well as re-assert a community's rich cultural identity. This is of particular importance as contemporary gentrification threatens to visually erase this history. For instance, the Brice mural was painted over when the building was turned into an upscale bed and breakfast while the LaBranche building – which was about to be razed -- was saved by a local community organization, but there was no mention of the building's past importance to the neighborhood. This project is a first step in a series of explorations that seek to push back against the erasure of the contributions of communities of color throughout (particularly US) cities.

Forensic Love and Visceral Data: Bio-Antidote for Romantic Love

Cecilia Vilca Ocharan, Lorena Lo Peña

MyAP - Microscopía Electrónica y Aplicaciones en el Perú, elgalpon.espacio Cultural Association

Lima, Peru

cecivilca@gmail.com transita.lo@gmail.com

Abstract

Forensic Love and Visceral Data is a work-in-progress, an art project that proposes the urgent creation of a bio-antidote, a biomaterial, performative-ritualistic-scientific-medical, to cure (us) of romantic love and eradicate this chronic pandemic. A disease, a linguistic virus, the malware that constitutes one of the basic pillars of patriarchy, diluted in songs, sayings, and compliments. The raw material of the bio-antidote(s) will be our visceral data, which is obtained from the contrast and verification of romantic love sayings with some medical analysis techniques hacked into their significance and interaction (dose/spell indication) with the participant-patient. The bio-antidote is created from the data and matter of the "sick" organ that is the one that has received and assimilated the curse of romantic love.

Keywords

Body Politics, DIY-DIT-DIWO Epigenetics, Bio-Antidote, Gender Technologies, Decolonizing science, Microphysics of power, Biomaterials.

Background

Forensic Love and Visceral Data was born with an air of predestination a couple of weeks before the COVID-19 pandemic started. Thus, we met our first virus of the year, without even imagining what would come immediately afterwards.

We, Cecilia Vilca from Media Art and Lorena Lo Peña, from Performance Art, work together transdisciplinary join forces to work at the intersection of art, technology, and science. We research transversally in Gender technologies, Body politics, Aesthetic Colonization and Microphysics of Power. This involves us as artists but also as social individuals that do not escape their environment. Our methodology has two aspects: the artistic practice and its reflection, which is completed with the retro feed of the audience/participant without which it would have no meaning. A true co-creation on the border of disciplines where each one nurtures the practice of the other.

When the health emergency was declared, we found ourselves in a paradoxically contradictory situation, on the one hand we were unable to access the medical facilities: laboratories and hospitals, necessary to develop our pro-

ject. On the other hand, suddenly, we were immersed in precisely what we had decided to research and combat: the scenario of a pandemic with a lethal virus. What were the chances in a lifetime that this would happen? This is how our projects are, they are born from our personal crusades and therefore they are made of the matter of cyclones and dreams. They are micropolitical flesh.

Hypothesis

"A labyrinth of blue cells and acids / A tower of words that never reaches heaven." (EIELSON, 1964)

We start from the hypothesis that romantic love is a disease. It is the beginning of all violence that is inflicted on our body-booty. Diluted in songs, sayings and compliments is "gently" inoculated in us. A linguistic virus, the malware that constitutes one of the basic pillars of patriarchy, as a social technology. (Figure 1)

Figure 1. Emblem image of the project. Animated GIF made with internet royalty-free historical medical images. ©Lorena Lo Peña and Cecilia Vilca.

Proposal

Based on our hypothesis, we propose the urgent creation of a biomaterial, performative - ritualistic - scientific - medical, an antidote to cure (us) of romantic love and stop, eradicate this chronic pandemic.

The raw material of the bio-antidote (s) will be our visceral data, which is obtained from the contrast and verification of these romantic love sayings with some medical analysis techniques (imaging tests, biochemical analysis, pathological studies, chromatography research, neurological exams, etc.) hacked into their significance and interaction (dose/spell indication) with the participant-patient. Therefore, in this project, biomaterial meaning comes from bio fabrication but especially from medicine: a material that the organism can tolerate and that is often made up of parts of the recipient human body itself. In this case ours.

Fundamentals

Since romantic love is a virus, medical protocols will be followed to identify and treat the disease: Diagnosis, Creation of antidote and finally Dosing, dividing the project into three stages. Our preliminary diagnosis is that the language being a virus enters the body from an initial point to expand and affect the different organs.

On the other hand, the power granted to these phrases makes them sentences, often of death. Each saying acts on a specific organ, curses it. The bio-antidote is created from data and matter of the "sick" organ that is the one that has received and assimilated the curse of romantic love.

The project begins by analyzing these popular sayings, the internal programming of romantic love and its physical effect on our emotional body. Phrases that not only refer to an "interior" and organs, but also use mostly physical terms (death, killing) and even medical (breathing, palpitations). These are the symptoms of the disease called "love", but they are not just ours, they are the choral symptoms of our sick society. As in every diagnostic start what we do is listening.

Sequence of propagation

This group of "symptoms" (sayings) will establish the possible sequence of spread and severity levels of the disease, as well as the possible medical techniques to collect and analyze the visceral data to create the bio-antidote and its dosage in specific spells to combat each "saying-curse". Some of these techniques will be less invasive (imaging tests and analysis) than others (tissue and cell extraction) and will mix scientific-medical and ritualistic protocols. Making fiction with Western medicine, creating a body performative narrative.

We propose these medical techniques as a starting point. These are those that could combat phrases-curse we selected previously. From this set, some will be discarded along the development of the project.

Figure 2. Animated GIF of endoscopic wireless camera self-explorations and our medical history images. Collage ©Lorena Lo Peña and Cecilia Vilca. Royalty-free images.

Contagion/Inoculation

Phrase: "Love enters through the eyes." Medical techniques proposed: Optical Coherence Tomography-OCT, Schirmer Test, Corneal Topography. (Figure 2)

First symptoms

Phrase: "I feel butterflies in my stomach." Medical techniques proposed: Abdominal Ultrasound, Gastrointestinal Endoscopy, Stool Culture

Initial stage

Phrase: "You accelerate my pulse and take my breath away." Medical techniques proposed: Pulse Wave Analysis-PWA and Echocardiogram.

Febrile stage

Phrase: "There is chemistry between us." Medical techniques proposed: SMAC Study 24, Saliva Test, Mineral Hair Analysis-HTMA, Skin puncture and scrape tests.

Phrase: "We are made for each other." Medical techniques proposed: Histocompatibility Antigen Test, DNA test, Biopsy.

Critical / Peak Stage

Phrase: "You broke my heart." Medical techniques proposed: Complete Blood Count, Cardiac Computed Tomography Scan.

Possibility of recurrence

Phrase: "I don't know if I will be able to forget your scent." Medical techniques proposed: Liquid Chromatography-HPLC, Brain Ultrasound, Electroencephalography.

Final stage

Phrase: "I can't live without you." Medical techniques proposed: Respiratory Rate Analysis, Heart Rate Measurement, Magnetic Resonance Imaging-MRI.

Declaration of War

Then, analyzing our social fabric, we respond, returning to it, not only the possibility of a cure with a bio-antidote but also its dosage as indications-spells, created from the same sayings that will be re-evaluated through social networks. This performatic dimension of the project allows us to hack our body-minds and at the same time decolonize the western medical tradition. Because what assumptions are behind these traditional myths about love? What medical-historical references endorse these sayings-curses?

We contaminate each other the methodologies of science and belief to give a ritualistic dimension to a heteronormative white western medical apparatus. We light the candle to all the saints, we call all the specialists, we dance to all the gods. A DIY/DIWO/DIT epigenetics. We are the modest inoculated witnesses of Donna Haraway and at the same time we enchant everything as Paul Preciado reflects.

We the zero patients, Lorena, and Cecilia, offer our visceral data in-love: blood, feces, sweat, tears. What will be the selected components? (Figure 3) We do not know but as a starting point we have a corpse, a metaphorical body full of other deaths and hopes. Ready to be read. A Forensic Love.

Abstract

The perception of the four-dimensional tesseract from three-space relies on motion, lending it an inherently cinematic nature. Virtual reality is uniquely positioned to visualize four-dimensional, cinematic space. The three-dimensional, time-based space and embodied navigability of virtual reality creates a supra-dimensional media space, providing an opportunity to experience higher-dimensional landscapes and acoustic, cinematic environments from within the fourth dimension. *TesserIce* is a four-dimensional, VR mediascape that utilizes this feature, allowing participants to enter the 4D space-time of glacial ice. The mediascape constructs an embodied cine-poem examining the effects of climate change in which participants propel themselves through the space-time of Earth's polar ice. The stark imagery of ice serves as a distinct access point into the overwhelming complexity of climate change and its ramifications, creating an embodied experience of climate change's time, scale, causes, and effects.

Keywords

Cinema, Virtual Reality, Tesseract, Climate Change, Hyperspace, Fourth Dimension, Embodiment, Space-Time.

Fathoming

Each individual life plays a small role in the history of the world, like the role of a single snowflake in creating a flowing glacier. We are challenged to see beyond our immediate surroundings, envisage our effects on distant parts of the world, or grasp the scale of our collective impact.

Climate change is the defining issue of our time, yet are we capable of comprehending data representing planetary scales of matter and timeframes that progress over generations, far beyond the limits of our physical perception? The geological provides a glimpse of time as a supra-dimensional force, a four-dimensional perspective that subsumes both past and future and whose deep time view far exceeds human perception. For example, the Earth's cryosphere, the frozen poles, is a four-dimensional space-time archive of atmospheric history. Ice cores drilled from glaciers in Greenland and Antarctica provide a physical timeline 800,000 years back into the chronicle of

Earth's climate (Figure 1). Glaciers are crystal tesseracts, manifesting a hyperspace of environmental time.

TesserIce [1] is a four-dimensional, virtual reality mediascape that allows one to enter the space-time of glacial ice. It is a hyper-documentary poem within a crystal tesseract – a 4D hypercube enacting the space-time of glacial ice. *TesserIce* brings the human into the space-time of glaciers, creating an immersive, embodied experience of the time, scale, causes, and effects of climate change on ice.

Figure 1. An ice core from the National Ice Core Lab. © Clea T. Waite.

The Fourth Dimension

Reality is a hyper-volume of past and future matter extending along the limitless axis of time into a higher dimension of space beyond our sensory perception. The present moment is a continually shifting, metamorphosing, three-dimensional shadow of this hyper-solid as it passes through our space. Visible evidence of this space-time polytope is our perception of changing matter over time: rusting metals, geological strata, coral reefs, and melting icecaps.

Common experience has three directions in it: up-down, side-to-side, and forward-back. This world consists of three orthogonal dimensions laid out along the construct known as the Cartesian coordinate system (x,y,z). Visualizing four-dimensional architectures from the confines of our three-dimensional space is a question that continually challenges mathematicians and artists. Most solutions envision these structures from a distance, looking at them rather than experiencing them from within. These are shadows of shadows – the two-dimensional screen renderings of three-dimensional shadow projections of the four-dimensional object.

The three-dimensional space and navigability of virtual reality are uniquely positioned to visualize a four-

dimensional space. Thus, VR provides an opportunity to geometrically construct and experience the shifting landscape and acoustic environment of the fourth dimension.

Two strands of interpreting the fourth dimension developed at its inception at the turn of the twentieth century. One defined the fourth dimension as an additional dimension of space perpendicular to our own three (x,y,z,w), unimaginable to us yet encompassing our three-dimensional scope as the cube encompasses the square. The other defined the fourth dimension as time (x,y,z,t), imagining space and time as a continuous, four-dimensional volume of past and future spread along a linear time axis, all moments existing simultaneously. In this interpretation, the present constitutes a continually shifting moment, manifested as a three-dimensional slice of this space-time polytope passing through our lower-dimensional space.

Supra-dimensional Cinema

Three-dimensional film space – the two-dimensional image plane and the timeline dimension – is a closed system. The passage through this narrative space is strictly passive, ocular, linear, and virtual. In contrast, the four-dimensional film space is hyper-spatial, somatic, relativistic, and non-deterministic. Within 4D film space, perspective is a function of the sentient spectator's point of view. The narrative is dependent on the orientation of the participant. Linear progression is augmented by spatial simultaneity. Navigation through narrative space engages multiple vectors of physical engagement and perception, occupying a liminal space between the real and the virtual.

The notion of an object that is only perceivable in time, an object containing time within its own space, is what makes the tesseract so intriguing. Motion is essential for comprehending a four-dimensional object from three-dimensional space. As a result, the tesseract as perceived from three-space has an inherently cinematic nature.

We use the notion of the cinematic tesseract to formally explore immersive cinema in hyperspace. This supra-dimensional cinema creates a spatiotemporal flow structure that explodes the screen into an architectonic, immersive hyper-mediascape – a poly-perspectival narrative deciphered by the somatic perambulations of the beholder. The sentient spectator of immersive cinema navigates different patterns of juxtapositions and associations within a four-dimensional cinematic space. The spectator moves freely amid a multiplex geography of audio-visual facets, building interpretations and decoding the poetic cipher.

Our approach to visualizing and navigating a supra-dimensional, immersive cinema involves considering narrative as both time and space, faceted into simultaneous streams distributed in the cinematic architecture. The spectator is placed in a supra-dimensional position relative to the geometry of the film, creating alternative spatio-narrative perspectives. No hierarchy, no explicit viewing direction or pathway dominates the flow. Instead, the

narrative is composed as an open work, a “work in movement” in the sense advanced by philosopher Umberto Eco. He described the open work as “a work of art stripped of necessary and foreseeable conclusions ...” [2]. The open work is a prepared field of possibilities for the unpredictable performance of the beholder.

Supra-dimensional cinema, poetry, and montage are manifestations of the same idiom, communicating through fragmentation, juxtaposition, and association. With our supra-dimensional cinema, we aim to create an explicit connection to a poetics of space, an enfolding of embodiment and participation within the spatiotemporal experience of the cinematic.

Figure 2. Stillframe from *TesserIce* (2021), a four-dimensional, VR mediascape that allows one to enter the four-dimensional space-time of glacial ice. © Clea T. Waite 2021

TesserIce: The Fourth Dimension of Climate Change

The geological provides a real-world manifestation of deep time. It demonstrates this supra-dimensional force, allowing us a glimpse into a four-dimensional perspective that subsumes both past and future and whose scope far exceeds human perception.

The *Ice-Time* [3] series of motion-picture works are a document of our unique moment in glacial space-time. This series of immersive films realizes a hyper-dimensional, cinematic space that transforms the audience's subjective perception of time. The works transpose non-human scales of time, in particular the time scales of glacial ice, to visualize the temporal reality of climate change.

TesserIce [1], the newest work in the *Ice-Time* series, is a four-dimensional, virtual reality mediascape that allows one to enter the space-time of glacial ice. It is a hyper-documentary poem constructed within a crystal tesseract, a 4D hypercube that reveals the space-time effects of climate change on the ice as an individual experience. *TesserIce* brings human perception into the supra-dimensional space-time of glaciers, creating an immersive, embodied experience of the time, scale, causes, and effects of climate change on the ice. The three-dimensional space and

navigability of VR provide an opportunity to fully experience the shifting landscape and acoustic environment of the tesseract of polar ice from within the fourth dimension.

The participant enters a crystalline tesseract architecture composed of different scales, locations, and speeds of ice filmed in the cryosphere (Figure 3). The observer's movements propel them through the hyper dimensions of this tesseract (x,y,z,w) through different cube rooms. The 4D cinema unfolds in uncharted vistas, juxtapositions, and timeframes, revealing the space-time of Earth's polar ice.

Figure 3. External VR view of *TesserIce* (2021), a crystalline, tesseract architecture. Image J.C. Kelley. © Clea T. Waite, 2021.

The images of *TesserIce* present hyper-realistic, magnified views of ice taken at all scales, from the microscopic to the planetary. Movements of ice in the film are geological, perceived as the effect of time on matter. The diegetic scales of time expand and contract. Movement often occurs at speeds beyond human perception – until the timescale of the ice is transposed to meet the perceptual timeframe of the spectator. Time then reverts, drawing the sensate viewer back into the perceptual time of ice. The body of the beholder is enfolded, collapsing its sensory distance to the ice.

In *TesserIce*, the participant is free to walk through walls and along floors, ceilings, and time within the four-dimensional space. The paths connect cubes following the true geometry of the tesseract (Figure 4). The navigation is inspired by Robert A. Heinlein's "Crooked House," [4] a four-dimensional architecture that infinitely wraps back on itself. Viewing back into the third dimension from the four-

space of the tesseract, the head and the tail of an object are coextensive. Neither inside and outside, nor top and bottom as we know them, are distinguishable. Linear perspective is fractured into crystalline, poly-perspectival facets or curved into a space of relativistic proximities.

Figure 4. Tesseract navigation model for the development of *TesserIce*. © Clea T. Waite, 2021

Hyperspatial Audio

Within cinematic hyperspace, action is as pervasive as sound. In immersive cinema, immersive sound plays a critical role as a key sensory component of defining space. The acoustics of the *TesserIce* mediascape are essential to the sensory environment of the experience. We have recreated a 9.1 surround-sound mix in the Unity VR environment (Figure 5), experimenting with how this immersive soundscape "behaves" in a four-dimensional, navigable space while adding essential additional spatialized information cues to the immersive experience.

Conclusion

Reality is a hyper-volume of past and future matter extending along the limitless axis of time and beyond our sensory perception. Our present moment is a continually shifting, metamorphosing shadow of this polytope as it passes through our three-dimensional space. We are immersed in the meta-dimensions of a redefined world, full of strange data vistas that surround us in manifold, crystalline perspectives. Within this supra-dimensional reality, glaciers are crystal tesseracts, three-dimensional containers of Earth's environmental time. The three-dimensional, cinematic, and navigable space of virtual reality is uniquely positioned to visualize the four-dimensional space-time of glaciers. VR provides an opportunity to geometrically construct an embodied experience of the fourth dimension from within, to experience the shifting landscape and acoustic environment of four-dimensional space, the space-time tesseract of polar ice.

Figure 5. 9.1-surround virtual sound field in Unity for one cube in *Tesseract*. Image J.C. Kelley. © Clea T. Waite, 2021.

Humans are existentially confined to the third dimension in the physical world, never able to physically experience the fourth dimension. Still, the human mind can transcend these constraints. We can challenge these experiential limits with immersive technologies, creating interactions that defy physics, three-dimensional space, and linear time. *Tesseract* fosters a relationship between the space-time of the human and the geological. The VR experience constructs a tesseract of polar ice in time as an embodied cine-poem – a hyperspace of spatialized meaning and navigable time, enacting the meta-dimensional data vistas of climate research. The artwork examines our culture’s altering perceptions of space and time, the deep time of Earth’s environment, by using virtual reality to present polar ice as a unique, four-dimensional window onto issues of climate change.

Author Biographies

Jared Christopher Kelley draws connections between digital simulations and their physical counterparts. Utilizing the desire, mechanisms, and far-reaching implications of achieving immortality through exponential advances in biotechnology and digital simulation, he creates works that connect, conduct, tunnel, and bridge the space between virtual and physical worlds, contemplating this restless “space between” as a psychological membrane used to transit freely between the virtual and physical. His performances and exhibitions include the Museum of Contemporary Art of Georgia, Roman Susan, and Gallery 400, and internationally in Australia and South Korea, including CICA Museum Gimpo.

Max Orozco is a designer and creative technologist exploring human-centered applications of engineering. Utilizing Computer Vision, Augmented/Virtual Reality, Deepfakes, and IoT, Orozco’s work focuses on human-computer interaction, healthcare, and creative problem-solving. Orozco’s background is in academic neuroscience where for seven years he used MRI techniques to discover new insights into the developing brain. He’s had the privilege of working with brilliant minds in science. He continues to apply the same academic rigor to the applied research of emerging technologies.

Clea T. Waite, Ph.D. is an intermedia artist, scholar, engineer, and experimental filmmaker whose artworks investigate the material poetics that emerge at the intersection of art, science, and technology. She creates immersive, cinematic works engaging embodied perception, dynamic composition, and sensual interfaces – as well as one inter-species collaboration with several hundred tropical spiders. Her themes examine climate change, astronomy, particle physics, history, feminism, and popular culture. Waite received her Ph.D. at the University of Southern California in interdisciplinary Media Arts + Practice, combining a background in physics and computer graphics from the MIT Media Lab with her current research in cinema, media art, and critical theory. She brings a unique blend of expertise to her projects from which cross-disciplinary synergies emerge.

Acknowledgements

Many thanks to Caleb Foss and Angelika von Chamier for their brilliant sound contribution to this project. *Tesseract* was created during the Immensiva 2021 VR residency at the Espronceda Institute of Art & Culture, Barcelona, and builds upon the *Ice-Time* (2017) immersive video installation by Clea T. Waite. What is Research-based Design Practice? A Collective Inquiry through A Graduate Seminar

Niloufar Abdolmaleki, Hafsa Akter, Diana Araiza Soto, Cristina Gomez, Valentyna Hrushkevych, Justin Marsh, Fatema Mostafa, Alejandra Ruiz, Pachia Lucy Vang, Ofelia Pulido, Marcy Wacker, Iris Xie, Rova Yilmaz, Jiayi Young

University of California, Davis
Davis, USA
jdyoung@ucdavis.edu

Abstract

What is Research-based Design Practice? This graduate seminar provides a framework for research-based Design, defines a structure to carry out Design practice, and offers ways of understanding, giving, and receiving critical feedback on practice-based projects. As a class, we come together to make collective contributions to answer this question through Case Study presentations. Students conduct careful research on an artist or designer's creative work that helps address this question. Presented at the conference is a collection of this inquiry to exchange with other universities and institutions who are endeavored with a similar question.

Keywords

Research-based design, practice framework, case study, collective inquiry, creative problem-solving, universities, institutions

Introduction

The UC Davis Department of Design is the only comprehensive academic design department in the University of California system. Our M.F.A. in Design is a two-year program that encourages an interdisciplinary approach through research and practice that align with social and environmental responsibilities. Our two-year program guides students to develop their research and creative practices based on key understandings of design issues in history, theory, and practice. Through a series of carefully designed core courses, students progress alongside their cohort members while simultaneously advancing their individual theses. The M.F.A. program culminates in a written thesis and a thesis project in a widely publicized exhibition.

This graduate seminar, Des 226 (Studio Practice and Critique), is one of our core courses in the MFA program. This course is designed to generate viable building blocks to prepare first-year students to formulate thesis direction and to propel second-year students to stay on track to

pursue defined thesis objectives. The class focuses on contemporary design practice in the context of theory and history. Through the exchange of a wide range of topics, students are exposed to current issues in design.

One of the key questions we are tackling in the course is none other than *What is Research-based Design Practice?* This graduate seminar provides a framework for research-based design, defines a structure to carry out Design practice, and offers ways of understanding, giving, and receiving critical feedback on practice-based projects. As a class, we come together to make collective contributions to answer this question through Case Study presentations. Students conduct careful research on an artist or designer's creative work that helps address the question of what research-based design practice is. The students then take turns to make presentations to each other and write a short paper on the subject. Each Case Study covers the following questions:

1. What is the project?
2. Who did the project?
3. When and where was the project conducted and/or exhibited?
4. Describe the project's setting. Include a photo and video documentation of the project along with associated citations.
5. What is the significance of the project situated in its discipline?
6. What is the project's significance in the context of our inquiry about what research-based design is?
7. Which aspect of the project was research-based, or which design decisions were informed by research?

For each Case Study, the students dissect, unpack, and pinpoint specific research elements that contribute to the collective definition of the framework of research-based design practice. We discuss creative solutions based on

aesthetics and craft and look at prototypes that leverage scientific methods, concepts, and findings. We talk about design's reliance on iterations as design solutions and user-based or participatory design approaches. We understand that we access a wide range of disciplines for design work, and we not only utilize existing knowledge but also generate, analyze, and evaluate data. We are ultimately interested in the possibility of generating new knowledge through design practice, and we do so by examining through an expanded lens and definition of this collective inquiry.

Presented during this conference is a collection of this inquiry to exchange with other universities and institutions who are endeavored with a similar question.

The list of the Case Studies includes Yuri Suzuki's Sonic Bloom (Niloufar Abdolmaleki); Jacket for Upper Body Immobility using a Wrapping Process (Hafsa Akter); Half A House Builds A Whole Community (Diana Araiza Soto); How Summer of Soul Was Brought Back to Life (Cristina Gomez); PROEF by Louise Knoppert (Valentyna Hrushkevych); Folded Skies (Justin Marsh); Your Rainbow Panorama (Fatema Mostafa); Subjective participatory mapping as research-based design in Subjective Atlas of Colombia (Alejandra Ruiz); Case Study: The Visible Invisibles (Pachia Lucy Vang); Neri Oxman's Silk Pavilion, 2013 (Ofelia Viloche); en | gulf: Eco-poetics of the Gulf and Bay (Marcy Wacker); Anna Berry's Breathing Room (Iris Xie); and Universal Materiality Exhibition, 2018, New York (Rova Yilmaz).

Authors Biographies

Niloufar Abdolmaleki earned a B.F.A. in 2020 in Visual Communication Design from the Dr. Shariaty University in Tehran, Iran. She is an artist and a designer. Her research interests include experiential and environmental graphic design. **Hafsa Akter** earned a B.Sc. in Fashion Design and Technology from the BGMEA University of Fashion and Technology in Dhaka, Bangladesh. Her ongoing research is developing soft sensors for clothing, developing vision inclusive clothing design criteria, and sustainable fashion. **Diana Araiza Soto** earned an M.A. in Architecture, Building, and Sustainable Planning from the Universidad Autonoma de Guadalajara, Mexico. She plans to focus her thesis on the study of lighting in commercial buildings. **Cristina Gomez** earned a B.A. in English Literature and an M.A. in Interdisciplinary Humanities from the University of California, Merced, USA. Her focus is on costume exhibitions and the analysis of clothing's social role. Her planned thesis project is an exhibition on the Central Valley of California's field worker's clothing to discuss their working conditions. **Valentyna Hrushkevych**

earned a B.A. in Industrial Design from the Pedagogical University of Krakow in Poland. Her area of interest is focused on smell and taste research as well as on sustainable design and wearable technologies. **Justin Marsh** earned a B.F.A. in Pictorial Arts from San Jose State University, USA. His practice intersects interior and exterior spaces of cultural production, seeking to embrace marginal, liminal, and heterotopic territories. **Fatema Mostafa** earned a B.S. in Architectural Engineering from The German University in Cairo. She is an architect and an interior designer interested in the use of color in architecture. She strongly believes that colors are crucial in any designed environment as it helps generate remarkable impressions and enhanced functionality for the end-users. **Alejandra Ruiz** earned a B.A. in Fashion Design from the Universidad Pontificia, Bolivariana, Colombia. As a designer, Ruiz has been interested in exploring, performing, and reflecting on alternative practices of design. She is interested in exploring material design, its life cycles, and possible applications. **Pachia Lucy Vang** earned a B.A. in Anthropology from the University of California, Berkeley, USA. Her design work is informed by her experiences as a Hmong-American navigating culture, art, trauma, and society with a pluriversal imagination that speaks from Hmong-centered knowledge. **Ofelia Pulido** earned a B.S. in Architecture and Urbanism from Ricardo Palma University in Lima, Peru. Her area of interest is focused on sustainable design and interactive design. **Marcy Wacker** earned a B.S. in Design from the University of California, Davis, USA. She examines how visual communication influences the evolving narrative of the human experience in social, political, cultural, economic, scientific, and environmental contexts. **Iris Xie** earned a dual bachelor's degree in Gender, Sexuality and Women's Studies and English from the University of California, Davis, USA. Their research interest is in 'crip technoscience,' 'disability justice,' and 'crip time' and altering and creating environments that would suit those who are neurodivergent and disabled. **Rova Yilmaz** earned a B.S. in Civil Engineering from the Middle East Technical University, an M.B.A. from the Sabanci University in Istanbul, Turkey, and a B.A. in Fashion Design from the Fashion Institute of Technology in New York, USA. She is a designer interested in smart clothing and functional clothing design. **Jiayi Young** is an Associate Professor of Design at the University of California, Davis, USA. She creates large-scale installations that leverage data and cutting-edge technology. She is interested in the human condition and the present-day human experience. Her recent projects are about the geopolitics of racial displacement of Asians in America and the dynamics of identity and influencers on social media.

ISEA2022: Manifestations festival, the Netherlands

Viola van Alphen, Agnes van Dijk +316 2090 2632

Manifestations produced by Stichting Art & Technology

Eindhoven, the Netherlands

organisatie@manifestations.nl | www.manifestations.nl

Abstract

Manifestations is a nine-day festival in the field of art and technology during the Dutch Design Week (DDW) in Eindhoven, the Netherlands. With this festival, the organization wants to initiate a movement to make people more aware of the role of technology in our society and in our future. Within the DDW, Manifestations shows a new image of the world around us through the lens of digital activism and offers an opportunity to the visitors to interact with the art.

Keywords

Art, technology, fun, innovation, digital activism, Dutch design week, Dutch, young talent, graduates, robots, e-fashion, tech, hackers, hacking

Introduction

The technological possibilities and their role in society change at lightning speed and offer both opportunities and risks. Stichting Art & Technology, the organization that started Manifestations, notes that the fear of technology often arises from ignorance. This "technological illiteracy" - and the mission to change it - are the reason for creating Manifestations.

Manifestations challenges people's views on what role we want technology to play in the future (more humane, more lifelike, more beautiful, loving, caring, etc.) in a fun and easily accessible way. The festival aims to facilitate a wide and diverse audience including minority groups such as refugees, the elderly, children, blind and handicapped visitors.

Manifestations, Art, Tech & Fun, has about 35,000 visitors every year during Dutch Design Week, in Eindhoven, the Netherlands. It presents the best of graduate works, Dutch art academies and international talents. As about 80% of the artworks are created by young talents, most of the art pieces had never been seen before by a large audience and were exhibited for the first time.

Additionally, Manifestations works with more than 50 partners including most of the Dutch Art Funds, Dutch Art Academies, Universities, but also the High Tech Campus, tech companies and startups (as Eindhoven is the tech area of the Netherlands).

In the last 15 years we have been presenting innovative, cutting-edge, engaging media art. We were first involved at GOGBOT, TEC ART, PLANETART and Twente Biennale. We have been working on topics around digital

resilience, e-fashion, robots, hackers, activism, bio-art, DNA hacking, AI and others. Earlier we also won the Art-Pie Award as best artist initiative of the Netherlands and the National Innovation Award.

Manifestations

The theme of the fifth edition of Manifestations was *Monsters: Free the Byte* (earlier topics included Superpower to the People, Technology as the Perfect Boyfriend, Internet of Women Things, Big Brother or Smart Sister). Monsters are usually seen as terrifying, ugly and superhumanly large creatures, or on the contrary, as endearing figures such as the Cookie Monster. However, as sweet the Cookie Monster may seem, he also stands for excessive consumption and the creation of waste. Thus, *Monsters* is about the blurred line between good and bad, the Beauty and the Beast, and between other monsters and the monster that might be inside us.

In this way, Manifestations challenges us to take a critical look at ourselves and our relationship with nature and our surroundings. To what extent does technology determine our world, the way we think and act? What dilemmas do technical developments entail?

Manifestations was organised online on 7+ virtual platforms and was a great success, reaching 170,000+ visitors, 100+ local and international press reports and participating artists being extended an invitation to other events or platforms like VPRO, Milan Design Week, Unbore Venice and others.

Institutional Presentation

We will do an institutional presentation on Manifestations and the Dutch artistic scene in relation to ISEA 2022 main theme POSSIBLES and sub-theme *Natures and Worlds on June 13, 2022*. Our creative team, Viola van Alphen and Agnes van Dijk, has obtained extensive knowledge and experience in the art & technology culture, both Dutch and international. Over the past 15 years, we have accumulated a network of more than 5000 innovative talented artists worldwide and presented worldwide.

Author Information

Viola van Alphen (ViolaVirus), Creative director and curator at Manifestations, Stichting Art & Technology

Manifestations Associated Artists: Natures and Worlds

Bio Art, Biotechnologies, Space Art, Quantum Art or Nano Arts, Speculative Design

Tim Dekkers – The Parasitic Humanity

The garments made from crystals show repetition and symmetry. These characteristics reflect mankind's control over its surroundings.

Jip van Leeuwenstein – A Diverse Monoculture

Is it possible to deploy robots to find a new balance within our eco-system? 'A Diverse Monoculture' is a deployment of several robots which together form a hive of new predators. These predators are used to attempt to restore the balance within our eco-system, eating caterpillars.

Daniëlle Ooms - Life Centered Design

Bioluminescent algae jacket.

Maartje Dijkstra – Braindrain, TranSwarm Entities, Surface Distortion, Optic Traces

The sculptural, totally black dress is built up out dozens of small, repeated fragments in the shape of bird skulls sculptured together like cells building an organism, with bird-drones landing and using the dress as a mothership. Made in 3000 hours with a 3D print-pen.

APPENDIX:

Manifestations exhibition June 2022 at the Disseny Hub Barcelona building, Materfad headquarters. Materfad is the Barcelona Materials Centre, created and driven by the FAD, Fostering Arts and Design.

Tim Dekkers – The Parasitic Humanity

More pictures of setup:

Tim Dekkers is one of Manifestations Young Talents who was nominated for the Young Talent Awards 2018. In 2018, Tim graduated from the Utrecht School of the Arts, the Netherlands, with his fashion collection “The Parasitic Humanity”. During his studies he did an internship at Jólán van der Wiel collaborative design practice in collaboration with Iris van Herpen. In January 2019, Tim received the HKU Award for Artistic Performance for this work. Almost immediately after graduation, he started as a Designer in the field of fashion, interior and art. In his designs, Tim likes to explore the boundaries between fashion, design and art.

Tim’s work is typical for the use of unique materials that can support and tell his story and concept. He is guided by the material. The material determines what he can and cannot do. Tim’s preference, therefore, lies in the search for materials that are not used directly within the fashion field. The final silhouette is formed directly on the doll or human body. For more: <https://www.timdekkers.com>

Thematic Statement

Our vision fits well with the "Natures and Worlds". The self-growing clothing, and humans as parasites are topics that indicate our relationship with nature. We expose the (im)balance between humans and nature, the environment, the climate, but also with our mutual "mental ecologies". Bio art and fashion offer an easily understandable way to show how we transform and inhabit this world. This, in turn, opens new possibilities to transition from our current toxic behaviour to another that would benefit nature's future wellbeing. And the design and shapes are an appealing and personal way for the public to experience the story.

“Mankind is a parasite of the earth”, says Tim Dekkers. “We need the earth to live on but at the same time we also destroy her. We need self-growing fashion instead of products we throw away every season.” We are producing more and more materials and products that contribute to the problems of the earth. Namely, the waste and pollution problem. We have an incredible urge to control everything that happens on Earth. In this way we also want to gain control over the negative consequences that we have as humans. The Earth is being affected and we know it is because of us. We want to reduce this happening.

Artwork

The garments in the collection “The Parasitic Humanity” are made of crystals and show repetition and symmetry. These characteristics reflect mankind’s control over its surroundings. One can also recognize more abstract lines

and structures, reflecting nature and its ways of being. The model is practically covered and overgrown by mankind’s excesses while still, in some small measure, under the control of human influence. Tim was looking for materials that have a certain growth habit and that is how he found the Polyurethane and Alum, two completely different materials. The Alum is a natural material and therefore easily biodegradable, while the Polyurethane is a plastic that cannot be broken down naturally. He experimented with these materials to see how he could grow them and to what extent he can influence them as a person.

**Maartje Dijkstra – Braindrain, TranSwarm
Entities, Surface Distortion, Optic Traces**

Artist Biography

Maartje Dijkstra is a fashion designer based in Rotterdam, the Netherlands. She graduated in fashion design from ArtEZ Art Academy, Arnhem. She did an internship at Alexander McQueen in London, where her interest in Couture developed more. After her graduation, she decided not to work for a big fashion house where she had to create another designer's story and dream. In 2007 she started her own Couture and technology studio, where she designs and creates individualistic, sculptural, innovative and hand-crafted fashion collections, accessories and interactive Couture designs.

Within her label she designs sculptural, totally hand executed fashion collections and accessories, interactive Couture designs and innovative hand (3D) printed textiles, that became an essential part of her label's signature.

Imagination, electronic music, and complexity in nature are a big source of inspiration for her. She translates and expresses this by using technology as a means to create endless possibilities. Some of the designs are enriched with integrated technical elements that are used to show what is possible, presented as a fashion performance. They are developed together with music producer Newk (NL), him capturing the perfect atmosphere in sound and has the same style and complex mindset as her when producing. <https://maartjedijkstra.com/>

Thematic Statement

Maartje Dijkstra's vision fits well in the "Natures and Worlds" sub-theme.

Maartje's work is about bodies and circuits. It presents infinite patterns that form a new world in an environment of ecological shapes, as it is in the natural world. It depicts fashion as a second protective layer, as an identity layer, as an ecosystem of our environment.

The use of sculptural shapes originated from the fascination and freedom to alienate the body in a strange way, using fashion as a tool. Other important sources of inspiration crucial for her design process are imagination, electronic music, melancholy and complexity in nature. In her work as a fashion designer, there is less focus on practicality and therefore, she has the freedom to create and show possibilities. She is curious about what lies ahead, and so designs with the future in mind. This way of designing is reflected by integrating technology and craftsmanship into an inseparable whole, creating a unique style.

In addition, the work consists of a human form that expresses the human relationship with our ecosystem. The human form is a form that is quickly picked up by the visitor as a presentation method. It is not a block or a box far outside the human being, but a part of the person. Fashion is a way of storytelling that arrives quicker because you literally see the design on a human figure.

Artwork

Fashion designer, Maartje Dijkstra, would like to show one of her most significant, all manually 3D printed, fashion/technology pieces: TranSwarm Entities (2016/17).

TranSwarm Entities is a couture piece developed by fashion designer Maartje Dijkstra in collaboration with creative programmer and music producer Newk. This interactive design was created during Fashion Fusion, a fashion/technology program of T-Mobile in Berlin, in 2016/2017. The sculptural, totally black dress is built up out of dozens of small, repeated fragments in the shape of bird skulls sculptured together like cells building an organism. The parts of the dress are all manually 3D printed, meaning using a 3D printer pen to create fabrics. These parts are all connected together by hand with black polyester wires. The technology part is not directly all integrated within the design but is connected and presented in a more surprising way. 4 small drones, that were customized to appear the same as the dress design, fly up out of the design so it looks like parts of the dress are flying away. The drones fly on the beats and melodies of music producer Newk around the model creating a little swarm.

Important elements within her individualistic work are that she combines innovative technology with unique embroidery techniques, bombastic shapes in design and special material use. To be able to create she uses the power of her own imagination, complexity and repetition in nature and loud/fast/dark electronic music as her biggest inspiration sources.

Daniëlle Ooms - Life Centered Design

Bioluminescent

algae

jacket.

Artist Biography

Daniëlle Ooms is a designer interested in a life-centered future, using fashion as a vehicle. She is one of Manifestations Young Talents who was nominated for the Young Talent Awards 2019.

Daniëlle is currently studying master's in Industrial Design at Eindhoven Technical University. Her main focus is developing materials for a sustainable fashion future while provoking a conversation about the current fashion industry. Daniëlle constructed garments made out of her own biodegradable material, completely based on apples. She is also currently developing a bioluminescent algae jacket that aims to explore the topic of life-centered design. Daniëlle has exhibited her work for "Future Fashion", "Material District Rotterdam", "Future Life of Materials" and the "Embassy of Sustainable Design" among others.

Thematic Statement

Our vision fits well in the "Natures and Worlds" sub-theme.

To really make a difference in sustainable innovation we need to challenge the natural order of things. This project addresses a shift from a human-centered world, as we live in today, to a life-centered one; a life-centered world where human join with all other life. We as designers are responsible for our to-morrow, and therefore need to shift our design approach. Imagine a world where the human is among all the living.

I conducted an autoethnographic research about a life-centered design process. I, as a human designer, collaborated with living organisms to design a situation where human is equal to life. I believe that we cannot solve current issues with technology alone. For me it is important to look beyond people and technology, to approach design as an ecosystem and to include living non-human organisms. With my research and design I want to show how we can become part of nature in a different way instead of placing ourselves above it.

My work is easily accessible and can resonate with the audience because, even though it is a post-humanist idea, the artifact still has recognizable shapes from the world in which we currently find our-selves. It is a bridge between the current human central world to a life central world.

Artwork

The goal of Life Centered Design is a balanced human-non-human relationship. The human designer and user is equal to any living organism involved in the design process and the end result. The non-human in this can be any living organism: an animal, a plant and/or a micro-organism.

Within this project I researched the relationship and collaboration between humans and bioluminescent algae within the fashion design context. The outcome of this process was a bioluminescent algae jacket. The bioluminescent algae jacket creates a habitat for algae and a garment for humans. This artifact embraces the relationship between humans and algae. Humans come into contact with the algae. They care for the algae by providing it with oxygen and exposing it to sunlight. The algae in the jacket give back a blue glow to the wearer of the jacket in the dark. This artifact is a speculation about what a post-humanist future might look like and a critical look at how we currently apply other living beings in design.

Jip van Leeuwenstein – A Diverse Monoculture

Robot:

Artist Biography

Jip van Leeuwenstein is a speculative designer questioning today's society. Jip graduated from the Design Department at HKU, Utrecht School of the Arts, Utrecht, the Netherlands, in 2017. In that year he was a part of Manifestations' Young Talent program and was nominated for the Young Talent Award.

Jip's work balances between design and science. His projects are designed to make the spectator wonder: how did we come to this point?

Jip's work has been exhibited at Ars Electronica, Art Rotterdam Week, Dutch Design Week, 'Robotica' Transnatural Art & Design and others.

Thematic Statement

"Natures and Worlds": searching for balance in our ecosystem, by using a (robot) predator.

Nature is a common good, however we seem to be claiming it for ourselves as a way of expanding our capital. The question arises to what extent humanity can satisfy its urge to control everything.

Humanity has always had a contradictory and ambiguous relationship with nature. On the one hand, nature is ought to be protected and preserved in national parks and reserves. On the other hand, pollution and destruction threaten the environment and no responsibilities is taken. Profits and gains seem to be more important than moral obligations. We all feel the urge to control everything all the time. This urge introduces new problems and challenges to our current society.

The cultivation of crops and increasing demand of food facilitated us to justify the continuing manipulation of our environment. The whole system is profit oriented and optimized to generate these profits disregarding the balance in the eco-system. Examples can be found in the use of pesticides or genetic modification to maintain a monoculture of crops.

Within this project, Jip provides a different point of view on nature. He tries to dissolve the border between culture and nature and question the current definition of nature. He investigates whether it is possible to use robots to find a new balance in our ecosystem. After all, mankind naturally deploys new predators when something needs to be restored in an ecosystem. In 'A Diverse Monoculture' various robots come together to form 'a beehive' of new predators. These predators are used to restore the balance in our ecosystem by eating processionary caterpillars. The caterpillars are then converted into the fuel cells of the robots, so that they serve as fuel to keep the robot alive.

The project: 'A Diverse Monoculture' questions the future relation between mankind and nature. Is it possible to deploy robots to find a new balance within our eco-system? 'A Diverse Monoculture' is a deployment of several robots which together form a hive of new predators. These predators are used to attempt to restore the balance within our eco-system.

Introducing a new predator into the eco-system has been tried several times in history, most of the time with catastrophic consequences. For example, in Australia, where the giant neotropical toad was introduced to eradicate the cane beetle. Afterwards, this solution became the problem since the population of toads increased rapidly and became a plague themselves.

The eco-system around the caterpillars of the oak processionary is out of balance. The cultured man-made lanes of oak trees do not provide small vegetation to attract the natural predators of the caterpillars. Therefore, increasing its population tremendously and turning the population of oak processionary into a plague.

The 'Dionaea Mechanica Muscipula' is developed to reduce the population of oak processionary. The moths of the oak processionary are active at night and attracted to light. The robot will lure in nearby moths by light up its mouth. The mouth acts as a trap that contains the curious moths. Some moths purposely remain in the mouth since they spread pheromones that attract other moths. This will increase the speed of the process. The other moths are processed toward the stomach of the robot where the chemical reaction of the Micro Fuel Cells will power the robot. In other words, the robot will operate and actively participate in the nutrient cycle by using Micro Fuel Cells. The reaction within these cells will chemically transform the insects into electricity. The electricity will be used to power the robot and keep the predator alive.

The introduction of the robot predator within the eco-system has all the advantages of the predator without losing control. Using the robot predator, a new balance for the eco-system can be found.

avalero@hactebcn.org , xvxaviervillanueva@gmail.com

Abstract

This presentation will introduce Hac Te, the new Art, Science and Technology Hub from Barcelona. The initiative has been promoted by Catalan institutions such as universities, scientific centers and cultural organizations of great relevance to make Barcelona a global center for research, training, dissemination, transfer and production in this interdisciplinary field. The presentation will explain the global, national and local context on the hub and its main strategies to interconnect agents from different backgrounds and to boost the digital transformation of society.

Keywords

ASTS, interdisciplinarity, digital transformation, New European Bauhaus, network society.

Introduction

Hac Te is an association that brings together and interrelates Arts, Science, Technology and Society stakeholders. The initiative creates transdisciplinary knowledge and culture to meet the digital and green challenges of the 21st century and designs common responses that re-imagine our coexistence in the network society, following the steps of the New European Bauhaus.

Why now and why in Barcelona

Digital technologies have transformed all spheres of human activity. This process of transformation has been even more accelerated due to the irruption of the pandemic. In this context, when the transformative potential of science and technology merges with the creativity of the arts, the result is a strategic knowledge for the development of the net society in which we live.

On a smaller scale, in the last few years, we have experienced significant changes that favor the development of Hac Te.

Firstly, Catalonia has created the General Direction for Innovation and Digital Culture [1] with the aim of defining and promoting policies for the development of projects and programs that relate art and culture to the digital world.

Secondly, at the state level Spain has reactivated the cultural and scientific co-capitality of Barcelona, which recognizes the uniqueness of the city in these matters and establishes the participation of the General Administration of the State in sectoral policies with an economic endowment of €20 million by 2022. [2]

And thirdly, from the European Union the S+T+ARTS program calls for a closer link between technology and artistic practice and initiatives like the New European Bauhaus support interdisciplinary movements to address complex societal problems through co-creation. [3]

In this context, Barcelona accumulates numerous agents working separately in the development of this interdisciplinary field. There is a powerful scientific, industrial and cultural substrat (Biennial de la Ciència, Smart City Week, Sónar+D, Mobile World Congress, programs for the schools such as Escolab or En Residència, the municipal Art Factories, research centers and universities supporting artistic residences...). But it is a tract of punctual and fragmented initiatives. There is no structure nor space to interact, advance and expand. Therefore, it is necessary to have not just a neutral meeting point, but also a catalyst that constantly promotes the relations between all these agents in order to convert it into an ecosystem.

The value chain as a competitive advantage

The four sectors represented in Hac Te [4] through its founding members are:

-Academic and research field represented by UPC (Universitat Politècnica de Catalunya), UOC (Universitat Oberta de Catalunya), UPF (Universitat Pompeu Fabra) and EINA University School of Design and Art of Barcelona.

-Centers of scientific excellence such as the Barcelona Institute of Science and Technology (BIST), the Institute of Photonic Sciences (ICFO) or the Barcelona Supercomputing Center (BSC).

-Unique cultural and artistic organizations such as the Sónar festival, the center for art research and production Hangar and the art collector New Art Foundation.
-Industrial partners of great relevance in the tech industry such as Tech Barcelona and Fira Barcelona.

Therefore, the hub's partners cover the entire value chain, from the generation of interdisciplinary knowledge to its conversion into products and services for society. This is undoubtedly Hac Te's competitive advantage.

Strategies and actions

Hac Te's strategic planning pivots on five key lines of action:

- Integrate all the agents of the value chain (integration and representation).
- Promote a group of political influence for the ASTS field (leadership and autonomy).
- Provide an instrument for management and coordination (structure).
- Define a complete route for the future of the intersections between ASTS in Catalonia (strategy and competitiveness)
- Share an ASTS's agenda (cohesion and complicity).

More specifically, Hac Te is directing its activity in three directions.

First of all, Hac Te is promoting its own projects to systematize interdisciplinary processes between the local, national and European ASTS community and to design shared projects that promote the digital, ecological and fair cultural transition.

Secondly, the hub is participating in the partner's activities to increase existing knowledge and innovation initiatives and to articulate a circuit to interconnect the activities between the local ecosystems in the cultural, academic, industrial and scientific spheres.

And at last, Hac Te is assessing and accompanying international projects to position Barcelona and Catalonia as a cultural reference in the field of digital arts, from its relevance as a city of science.

Red ACTS, Spanish network for ASTS

With the aim of articulating a nationwide network that promotes collaboration between agents in the interrelations between Art, Science, Technology and Society (ASTS), Hac Te, together with UOC, are launching the pilot project 'RED ACTS', which has the support of Fundación Carasso.

The network formulates an articulation of different key agents to make possible a fluid environment of collaboration between institutions, projects, groups and individuals with common interests and objectives, but with differentiated spheres of action, whether these are close to research, education, production, dissemination or exhibition. [5]

The project is based on the idea of a "structuring structure" and responds to the complementarity of each of the agents in relation to the common objectives. Depending on the learning obtained through the previous experience, during and after the course of the project, the structure itself will be transformed. The resulting network -with its consequent dynamics, processes and devices- is both the object and subject of the research-action.

UNESCO Creative Cities of Media Arts – City to City Initiative

Professor Christopher Bailey

Guild of Media Arts

York, UK

Email: baileychr@gmail.com

Abstract

There are currently 22 UNESCO Creative Cities of Media Arts, the first having been designated in 2013. The Media Arts Network collaborates on actions relating to the UN's Sustainable Development Goals. In 2019 a joint commissioning project was proposed as a way for media artists to explore creative practice in Media Arts Cities.

The inaugural City to City program involved nine cities and ten artists, and an exhibition of the five digital artworks was launched in December 2020. Despite the challenges resulting from the COVID pandemic, the project was held to have been successful and the decision was made to run the project again in 2021 with appropriate modifications.

We conclude that we succeeded in developing an innovative approach to artistic collaboration, that we provided much needed employment during a difficult period, and that the resulting exhibition drew the participating cities closer together, permitting the growth of bi- and multilateral relationships.

Keywords

Media Art, Creative Cities, UNESCO, Collaboration, Sustainable Development Goals

Introduction

A map of the UNESCO Creative Cities of Media Arts will show that we circle the globe, but cannot hide the fact that we live in different economic worlds.

The largest Media Arts City has 8m citizens, the smallest 14 thousand. Of course larger cities might have larger budgets but their challenges also tend to be greater. So in effect even the largest city can be poor, in quality of life, in education and in cultural facilities.

Levying taxes on economic activity is what enables cities to grow and thrive. GDP may be a flawed measure of the relative wealth of cities but it indicates a city's ability to participate in any game where the stakes are the same for all. The contrast in GDP between Media Arts cities is stark. Someone who works in the wealthiest city involved in City to City generates six

times as much taxable income as their equivalent in the poorest.

City to City set out to address the unequal relationship that continues to shape many international programs. This pattern is often replicated in the arts, such as when a well-funded arts organization, perhaps in a US or European capital, invites participation by organizations in less wealthy states. This can be regarded as an act of generosity, but in many cases it simply entrenches the inequality.

City to City set out to be an equal partnership. Aside from the artists' fee, each city devotes resources locally according to its capacity. The first Project Management Group consisted of the Focal Points of Braga, Guadalajara, Karlsruhe, Kosice and York.

2020 Edition

City to City was conceived at the Network's mid-year meeting in Braga, Portugal, in 2019. The focal points of Braga, Guadalajara, Gwangju and Kosice were working on International Projects. They suggested building on the idea of the Guadalajara-based artist, Paris Diaz, for us to exchange digital 'postcards', which would then be exhibited at the 2020 Annual Conference.

That was the plan. But the creative economy, along with hospitality and travel, were then brought to a halt by the measures intended to prevent infection, such as lockdown. Overnight, everywhere, the self-employed artists, actors, musicians, curators and directors, on whom culture depends, found themselves without work. Could the Media Arts Cities, by working together, support artists and inspire their communities at the same time?

During our early meetings we were inspired to hear how other places, such as Gwangju, Sapporo, and Changsha, were tackling virus outbreaks and developing successful strategies to enable culture to survive. Even so, the threat to the sector was real in all too many countries. As the virus swept round the world the Annual meeting of Creative Cities in Brazil was cancelled. We decided to move City to City online; the Callout, Selection of Artists, and the management of the Project by the Focal Points.

An Open Call went out in each city asking for artists to commit to working online, with an artist from another city, to produce an artwork on the theme of Human Responsibility. This focus on sustainable development was proposed by Kosice for its annual Art & Tech Days 2020 festival and we

hoped the artworks could be exhibited during the event. Each artist was paid a commission fee by their city and worked to a standardized contract.

Ten artists from nine cities worked in pairs. The Focal Points met their own artists regularly over the production period of three months, and liaised with their partner city to monitor progress.

The artists' very diverse interests and skills included GPS tracking, perceptions of landscape, urban identities, natural resources, and machine translation. The ideas they focused on, within the theme of Human Responsibility, were also various. To take the example of York, UK, which was paired with Cali in Colombia, both cities have a historic and complex relationship with the rivers on which they stand. The artists, Mike Stubbs and Daniel Escobar, remarked that water provided 'the possibility of reflecting our cities and their inhabitants, and our shared responsibility to take care of it'.

Work online went on, but Kosice decided they could not hold the planned Art & Tech Days festival. We replaced the physical installation of the five artworks with a dedicated website hosting an online exhibition at Braga Media Arts. City to City 2020: Human Responsibility was launched at a Zoom webinar, with a live feed on Facebook. An audience of senior UNESCO staff, city Mayors, and civic and cultural representatives from participating cities were welcomed by the Mayor of Braga, addressed by Media Art expert Peter Weibel, heard from artists, and experienced the work for themselves.

2021 Edition

City to City 2020 was chosen as a case study for the online UNESCO Creative Cities Annual Conference and was featured in the UNESCO publication 'Creative Cities and Resilience to COVID'. We carried out an evaluation that indicated we should put more responsibility in the hands of the artists and encourage them to test the limits of the project. We wanted the resulting work to reflect the challenge of recovery after COVID and the role of creativity in that. So we proposed the idea of human relationships being rebooted. The central idea is the invitation to viewers and participants to 'PLAY!'

Artists wanted longer to develop the work together. Focal Points agreed to increase the commission fee to reflect the considerable amount of work involved. We decided that, in 2021, each city would select their artist as before, then a series of workshops, the City to City Labs, would enable them to get to know one another and to discuss ideas before forming the teams that produced the work.

Our selected artists completed a two month development period, presenting plans and discussing them with the other teams and with expert mentors.

While the work in 2020 was generated by artists working in pairs, in 2021 larger groups worked together to produce 5 finished pieces. The next edition of City to City is planned for 2023.

Conclusion

There are positive outcomes from City to City. In 2020 audiences could experience five excellent, innovative, newly commissioned artworks. The artists were employed for three months in difficult times, and they developed their careers. The focal points, especially the planning group, learned much more about how to work remotely. And each of the Media Arts cities has gained by having participated in a high profile international event.

We can assess the impact of City to City by mapping its contribution to the United Nations Sustainable Development Goals.

All UNESCO Creative Cities are committed to SDG 11, the goal of building more sustainable urban communities. In addition, City to City, through commissioning individual artists, is supporting the local economy by offering 'good work' (SDG 8). Through the technologies employed it supports industrial innovation (SDG 9), while by reflecting the reality of lives in their host communities the artists are improving cultural wellbeing and reducing inequality of access (SDG 10). The cities have a further basis for international collaboration, the achieving of all SDGs through stronger partnership (SDG 17).

Global connectedness has taken on a new meaning for us as Media Arts Cities. Increased 'resilience' is as much about wellbeing and quality of life as it is about economy. City to City mobilized empathy, creativity and innovation, enabling us to work as equals with artists and cities around the world, and to share our experience and ideas.

Abstract

From a perspective of ecological crisis, FeLT- Futures of Living Technologies, engages in the relations and intersections that occur between human beings, living environments and machines, relations on the edge of how we experience aliveness today.

Keywords

Living technologies, multispecies, making with, artificial life, artificial intelligence

About Futures of Living Technologies

This entails how we sense life in the environment, in other beings and ourselves in an existence being constantly enhanced by technology. Questioning this situation, evokes a sense of the uncanny and a fear of being dominated by the machine, but also reveals possibilities of becoming, creation of new forms and behaviors. Could we develop aliveness and create a more balanced existence? Can we enhance our senses and communication abilities to become beings that are more adept at co-existence?

The core of FeLT is to investigate such ambiguous questions by artistic means in proximity to computer science research.

State-of-the-art scientific research provides inventories of living systems and their functions: intelligence, evolution, reasoning and learning. This is made available as an artistic material that is discursive and performative, rather than representational.

Through residencies and workshops, we will develop a body of works to present, reflect and share artistic examples and experiments. By entering a transdisciplinary discourse from an artistic point of view, we will learn more about the transdisciplinary as a way to navigate in complex, layered realms of sensuous experience and knowledge.

Questions and speculations that are not addressed or fully developed otherwise, can emerge through employing artistic methods. We will join together artistic methods and aesthetics from bio art and techno ecologies with contemporary perspectives on sensory experience and materiality in artistic production and research.

Inspired both by artistic works and contemporary, theoretical and scientific perspectives on technology, ecology and aesthetics, we will develop a transdisciplinary working environment driven by artistic research.

At this stage of our project development, we identified three thematic strands to investigate which will be addressed:

The second, and subsequent paragraphs are indented 10 points. Do not leave double-space between words or paragraphs. This sample shows a 10-point Times New Roman text. Times New Roman is the font to be used throughout the essay.

The ISEA2022 submission must be PDF (Portable Document Format) files formatted for 8-1/2" × 11" paper.

Making with: multispecies communication and co-creation.

Practices of communication and co-creation with living organisms – such as microorganisms, plants or animals – might involve working with technologically complex systems as well as agriculture or indigenous knowledges and traditions. To rethink interspecies relations in the framework of a climate emergency moment can be a way to form entangled multispecies alliances

Living technologies: living environments, humans, machines, intelligence, life and emotions.

By the term living technology we think of the complex structures and functions of living organisms which have entered the hybrid and synthetic technologies. By including critical perspectives on the merging of technology and areas involving emotions, sensing and empathy, we question possible and speculative convergences of machine technology, artificial life, artificial intelligence and human bodies. We invite perspectives on the implications of future integration and communication between the machine and the living as well as speculative or applied.

Sensorium: how we experience, interpret and develop applied aesthetics today

Sensorium – how we experience, interpret, develop applied aesthetics today in order to reconnect with the environment, expanding the senses technologically inside and outside of institutions. Technologies continuously provide new ways of filtering our experiences and different means of relating to the living environment. Aesthetics today are also affected by perceptual complexity, relating to experiences that transcend art and include a vast array of both natural and constructed environments. Human perceptions and sensory modalities are influenced and affected by the way we interact with our digital tools, and their presence is becoming characteristically transparent. Can the sensorium as an expanded aesthetics provide new modalities for connecting with natural resources? What new opportunities exist for interaction and how do technologies extend and provide explorative possibilities within sensations? And, in what way do institutions understand and relate to this sensory complexity as a sustainable choice?

Kristin Bergaust

Author Biography

Kristin Bergaust is educated at the University of Oslo and at National Academy of Fine Art in Oslo. She works as an artist, researcher and educator. She is a professor at the Faculty of Technology, Art and Design in OsloMet, Oslo since 2008. She was formerly professor and head of Intermedia at Trondheim Academy of Fine Arts, NTNU (2001-2008) and artistic director of Atelier Nord media lab for artists (1997 to 2001). Kristin is one of the pioneers of the self-organized early media art scene in Norway from the early 1990-ies. Her feminist, trans-cultural and relational perspectives on contemporary conditions are investigated through performative and technological strategies, sometimes also fed by cultural history or other narratives. Experiments with the communicative and the sensory are inherent both in research and art.

From Landscape to Laboratory – Bioart Society Finland

Erich Berger

Director, Bioart Society
Helsinki, Finland
erich.berger@bioartsociety.fi

Abstract

Bioart Society is a Helsinki-based art association developing, producing and facilitating activities around art and natural sciences with an emphasis on biology, ecology and life sciences. It runs SOLU Space, an artistic laboratory and platform for art, science and society, and Ars Bioarctica, a residency program with focus on the sub-arctic environment. <http://bioartsociety.fi>.

Keywords

bioart, landart, environmental art, art organisation, sub-Arctic

Introduction

Bioart Society is a Helsinki-based art association developing, producing and facilitating activities around art and natural sciences with an emphasis on biology, ecology and life sciences. It runs SOLU Space, an artistic laboratory and platform for art, science and society, and Ars Bioarctica, a residency program with focus on the sub-arctic environment. The conceptual framework of the work of the Bioart Society is guided by the idea of hybrid ecologies and aims to develop, test, and evaluate artistic practices able to address the current environmental challenges. Hybrid ecologies are a thought vehicle to talk about the intentional and unintentional transformation of our planet through human activity. They address the convergence of our environment with technology. A hybrid ecology consists of naturally evolved actors but also of those which are human-made and -caused. These include technologies, like robots, software, AI, networks, and infrastructure, but increasingly also genetically engineered plants, animals, and bacteria, as well as sites of extraction, pollution, and waste. The new biological actors specifically blur the boundary between the traditional binary of natural and artificial as they are biological in material but technological in nature. From this, it becomes clear that the environment which contemporary environmental art needs to address has radically shifted from its original understanding. What is contemporary environmental art in a time where the biological becomes a

question of technology, engineering, and commodification? What kind of artistic engagement and practices can contribute, among others, as a force and vector for transformation to address and act towards the increasing pressure human activity is putting on the planet and on the quality of life of contemporary and future beings? With a diverse program of workshops, work-labs, field laboratories, artwork productions, residencies, and exhibitions the Bioart Society aims to unravel artistic questions about the contemporary biological condition.

Alterscience Research Project: New Political Subjects of Knowledge

Institutional Presentation: ISEA2022

Artur Matuck; Daniela Carolina Ernst; Adriana Bobilho; Antônio Rodrigues.

Affiliation(s): University of São Paulo. Brazil.

Contact Emails: tuck@usp.br; daniela.ernst@gmail.com; adrianabobilho@gmail.com; antoniorodrigues@gmail.com

Abstract

The concept of Alter Science presents a new interdisciplinary paradigm that acknowledges human beings in their complexity and plurality. It encompasses biological, technological, computational, scientific, spiritual, and affective areas of study as subjects of new knowledge. Alterscience promotes a constructive critique of the theoretical, axiological, and epistemological foundations of science, highlighting Mind and Spirit, as primordial realities, reintegrating them into the cosmological fabric, and thus seeking to understand what materialist theories cannot elucidate.

Keywords

Alterscience; new political subjects; science criticism; philosophy of contemporary science.

Figure 1: Video photography, Artur Matuck e Pedro Brandão, São Paulo, Brazil, 2019

Introduction

The limitations of scientific thought, restricted to rigid paradigms, prevent new proposals from being conceived, devised, or absorbed. Incomprehensible phenomena are denied and excluded, so science remains limited by refusing to observe and investigate anything beyond the spectrum of its instruments [3].

Alterscience designates a confluence of philosophical perspectives, aesthetic, spiritual, moral, and physical; it combines emerging theories, such as ecology, feminism, de colonialism, class struggle, negritude, anti-racism, and anti-speciesism. The concept resituates science in a process of theoretical, experimental, philosophical, moral and paradigmatic reconstruction, breaking with its ideological territories and unquestionable epistemologies. It aims at an investigative stance open to a different knowledge construct.

Alterscience imparts a project of research, theory, pedagogy, and experience, in universities and culture, aiming at a continuous reflection, sociopolitical engagement, and consequential pedagogical practices. It institutes a paradigmatic revision, intending to interweave logic, philosophy, and spiritual traditions, current and potential modes of intelligence [5].

This field of action research understood as an Alterscience, respects life, animals, the planet, and the cosmos, and encompasses insurgent thoughts, ancestral knowledge, contemporary forms of subjectivity and diversity, as well as the digivirtual and the humanotronic.

Alterscience is proposed as a science that respects life implying the acceptance that living beings, whether human or non-human, are sacred and therefore have inalienable rights. This vision creates an inevitable confrontation with the foundations of the dominant science, historically governed by positivism, determinism, and technological rationalism.

The mechanisms of colonization and control that allowed the subjugation of a multitude of beings, the manipulation

of animals, plants, and the planet itself, persist today tainting the image of science [4].

This behavioral logic of exploitation of life, implicitly validated by science, is insidiously extended to the treatment of human beings [1]. Humans are tacitly considered machines, devoid of sacredness, without rights to life, dignity, and respect, and therefore available to be controlled, experimented with, exploited, and exhausted [2].

The proposal stimulates a broad reflection on Sciences and Alterciences, spurring the creation of projects: to identify new topics of knowledge, alternative objectives, modalities, or methods of knowing; to unveil other objects and dimensions; to experiment with different languages, agencies, instruments, modalities; to conceive multi-and inter-visualities and dimensionalities; to examine new forms for knowledge legitimation, to implement non-proprietary processes of information dissemination, application, and transformation; to absorb additional subjects of knowledge and to reach and augment the beneficiaries of science.

The Alterscience Research Group at the University of São Paulo

The concept aims to inaugurate a new field of research, theory, and experimentation, proposing its appreciation in universities as well as in culture, arts, philosophy, human sciences, and ethics. It institutes a singular field of critical thinking capable of enhancing contemporary science and bringing it in line with much-recognized knowledge that has not yet been legitimized in universities or research centers.

With this purpose, a transdisciplinary Research Group was conceived, founding a heterogeneous collective for reflections on the history, theory, and methods of contemporary science, proposing a series of actions toward a critical and renovating alternative.

The movement was officially initiated in 2020 at the University of São Paulo through the research group "Altercience and Intercommunication". The course "Altercience: Critical Propositions and Creative Processes for Knowledge: Research, Theory, History, Method, Praxis" was taught in the second semester of 2020 and the first semester of 2021, at the Postgraduate Program in Humanities, Rights and Other Legitimacies at the School of Philosophy, Letters and Human Sciences, under the responsibility of Dr. Artur Matuck. Two international forums were organized and a seminar happened in the World Social Forum 2021, which included lectures by professors Patrick Llored from Lyon, France, and Marcos Novak from Santa Barbara, USA, among others.

The following objectives are to be accomplished in the next four years: (1) to annually teach the postgraduate discipline "Altercience: Critical Propositions and Creative Processes for Knowledge"; (2) to produce academic events in the form of symposiums, seminars, and national and international forums; (3) to produce publications favoring the collaboration between autonomous and academic researchers, teachers, and students; (4) to produce didactic

materials in the form of publications, presentations, videos and translations for different audiences; (5) to implement a presence in social networks aiming at the dissemination of non-proprietary propositions of a conceptual, epistemological, scientific, and pedagogical nature; (6) to establish mutual collaboration agreements with research groups, centers of excellence and universities in Brazil and abroad.

Abstract

AI4FUTURE is an international network of urban labs where artists and young activists cooperate to create awareness through the use of Artificial Intelligence (AI) to serve the community.

The project is co-funded by the Creative Europe Programme of The European Union and aims at enhancing the understanding and dissemination of AI related technologies for the active and creative participation of young activists and local communities to the European cultural scene, allowing them to work with artists for a joint creation of a new urban community awareness.

The network between human and non-human, artists and young activists with the support of cultural organizations and research centers, is exploring how digital creativity can contribute to relevant societal challenges, focusing on different meanings of Mobility.

Four artists have already been selected by a Scientific Committee after an European open call. Within the next months, they will work in residencies where they will develop AI-based works, cooperating with young activists, focusing on their local mission. At the end of the residency period the AI-based works will be developed and presented to the local community as the result of the joint work of artists and activists.

Keywords

Artificial intelligence, art, young activism, local communities, human-computer interaction

Introduction

How social challenges, Artificial Intelligence, art and local communities could be linked?

With the project AI4FUTURE, co-funded by the Creative Europe Programme of The European Union, Partners are creating a common ground for all these threads, through the lens of mobility theme. AI4FUTURE wants to redefine the way we understand mobility through the collaboration with the younger generation involved in the shaping of our collective future.

AI4FUTURE Partners share an interest in boosting arts and digital technologies towards social challenges. For their part, activists will make the most of digital and physical artworks, to evolve their advocacy activities and to attract the interest of a new kind of public. This medium can be represented by new technologies, in particular Artificial Intelligence.

AI4FUTURE stands for “Artificial Intelligence for Future”: in a two years project, the five Partners are matching human needs in local communities and non-human features, by using data and Artificial Intelligence from an artistic point of view.

AI4FUTURE frames mobility encompassing its various meanings, that is mobility across national borders, across binary systems, green and sustainable transportation, mobility as a digital or social leverage. Each Partner and

activist groups in their territories, are shaping a “local” story angle so as to fully embody different perspectives on the matter. With this approach, arts and new technologies become ways to help dialogue and consciousness, creating relations, empathy and wonder.

AI4FUTURE days

The project started in April 2021 with “AI4FUTURE days”: Partners organized a week of physical and online lectures and workshops, about Post-covid mobility, AI and gender inequality, AI for sustainability and inclusive gamification, Mixed reality and mobility. The main goal was to show how Artificial Intelligence, which allows the collection, interpretation and display of large amounts of data, can be a tool at the service of artists and activists to address the cultural and social changes of our time.

During the workshops, using different kinds of facilitations, cultural operators and young activists shaped the issue of mobility, depending on their local mission. They came out with four variations, one for each Partner:

- AI and Gender Inequality issues (Rotterdam)
- AI and community mobilization in public spaces (Sardinia)
- AI, platform urbanism and social mobility (Milan)
- AI, phygital worlds and digital barriers (Barcelona)

Call for artists

The four variations became four statements, collected in an Open call for artists who work in Europe.

As constraints, the artists responding should have to work with AI technologies, be interested in working, during an artistic residency, with young activists at a tangible artwork that would interact with local communities to advocate their vision of mobility.

90 artists sent an application, proposing different types of technology, data set, machine learning, artworks and involvement of activists and local communities.

4 artists have been chosen. They are:

- Chunju Yu: the project will rethink gender structures and raise awareness about the digital frontier between fakeness and realness, making use of different gazes in the online porn supply.
- Nino Basilashvili: the project will be developed in agreement with A Foras, an anti-militarist collective, and renews attention to the environment, boundaries and human relations.
- Bernat Cuní: the artwork is about commuting and panorama. It will work as an engagement point between citizens, policy-makers, activists and other communities, accurately based on the *phygital* concept.

- Luca Pozzi: the project Rosetta Mission 2022 is a temporary free Hub, without specific political, religious, and geographical coordinates, suitable for interdisciplinary contributions and social interaction. It will be a meeting point for activists, artists, philosophers, and scientists, a place for a hybrid public.

 [x] Danae Tapia, “Digital Witchcraft”, 2021, <https://digitalwitchcraft.works/Institute>

Residencies

During spring and summer 2022, artists will work with teams of young activists, involved from the beginning of AI4FUTURE project.

This cooperation will ensure an exchange of competences regarding Artificial Intelligence, about how data can be collected and analyzed for social impact and not for private extraction and enrichment, how a social challenge could be faced by teams composed of artists and activists, human bodies and non-human (machine) learning processes, the ways art meets digital technology and social issues.

This activity offers a practical example of how an ecosystem composed of artists, scientists, enterprises and public bodies can co-design a sustainable and inclusive future.

Exhibitions

At the end of the residency period the AI-based works will be presented to the local communities as the result of the joint work of artists and activists.

Artworks will become the touchpoint in which dataset takes form and turns into something tangible and understandable: bodies will finally interact with digital artifacts, so that new insights will enrich the public debate and local communities’ awareness.

Finally, the partnership will organize a great exhibition in Milan, where in addition to the artworks, international speakers, scientists and humanists will debate the redefinition of mobility meaning in post-covid era.

TEKS - Trondheim Electronic Arts Centre

Zane Cerpina

TEKS - Trondheim Electronic Arts Centre
Trondheim, Norway
cerpina@gmail.com

Abstract

This institutional presentation introduces TEKS – Trondheim Electronic Arts Centre – a non-profit organization founded in Trondheim, Norway in 2002. TEKS's main activities include a) Meta.Morf – Trondheim international biennale for art and technology; b) TEKS.studio – a space for exhibitions, concerts, performances, seminars, lectures, and workshops; c) TEKS.press – a platform for publishing books, exhibition catalogs, and other publications; d) Norwegian Media Art Library – a collection of printed publications that cover the Norwegian media art field; e) and FAEN Academy - a pilot project supporting the development of new artworks by young female artists working with experimental art in Norway.

Keywords

Electronic art, art biennale, Norwegian media art library, Norwegian electronic art history, publishing, talent development program, Ecophilia.

Introduction

TEKS – Trondheim Electronic Arts Centre – is a non-profit organization founded in Trondheim, Norway in 2002. [4] The organization is a resource and competence center that aims to produce and convey technology-related art projects within all art disciplines. TEKS is the founder and organizer of the Trondheim biennale for art & technology – Meta.Morf. TEKS initiates and organizes artistic productions and projects, works with promotion and education through courses and workshops, and acts as organizer and co-organizer of various technology-related cultural initiatives.

Meta.Morf Biennale

TEKS is the organizer of Meta.Morf – Trondheim international biennale for art and technology. The seventh edition Meta.Morf 2022: Ecophilia is taking place from April 1 – August 14, 2022, and it manifests a critical take on mankind's relationship to nature. [5] The biennale, through conferences, exhibitions, and performances, critically questions what it truly means to be an ecophile in the age of the Anthropocene?

TEKS.studio

TEKS.studio is TEKS's space for exhibitions, concerts, performances, seminars, lectures, and workshops. It is located at Nedre Bakklandet 20C, Trondheim. TEKS.studio is also home to the Norwegian Media Art Library.

Norwegian Media Art Library

The Norwegian Media Art Library is a collection of printed publications that cover the Norwegian media art field. The collection represents the most comprehensive knowledge and documentation of media art in Norway in terms of history, artistic activities, artists, and development in the field. [1]

The project shows the media art field's important role in the Norwegian art scene. The library contributes to the further development of Norwegian media art by providing a solid foundation for the field's history through a comprehensive archive. The library currently consists of 154 publications and is available in TEKS.studio in Trondheim. The preservation of digital art is strongly dependent on the lifespan of technologies used to create the work. The hardware and software of digital artwork often face updates and quickly become obsolete. This makes the preservation of the digital art field a challenging task. Visual and textual documentation, therefore, plays an important role in preserving knowledge about and in the field.

TEKS.press

TEKS.press is a platform publishing exhibition catalogs, books, and magazines related to the field of art & technology. [7] TEKS is always open to collaborating on publication projects within the field. The latest edition to the collection is the book "Electronic Art in Norway: Artists and Artwork from 1960 to 2020".

Book: Electronic Art in Norway

“Electronic Art in Norway: Artists and Artwork from 1960 to 2020” is a historical overview of electronic art in Norway. The book is edited by Zane Cerpina, Ståle Stenslie, and Jøran Rudi. [2]

Not much has been written about this art in this country, and the book helps to fill this gap in the knowledge about the development from 1960 until 2020. Norwegian artists who have worked electronically and digitally are in part better known abroad than in Norway. They have won several international awards, exhibited at international biennales, and received attention in foreign media. The book presents their stories as a historical, visual, and artistic narrative of works, development, and contemporary contexts. A total of hundred artists are included in the book.

Figure 1. Book “Electronic Art in Norway”, a timeline showing the historical development of electronic art in Norway. © TEKS.

FAEN Academy

FAEN Academy - Female Artistic Experiments Norway is a pilot project supporting the development of new artworks by young female artists working with experimental art in Norway. [3] The initiative focuses on art productions from concept to exhibition-ready work in close collaboration with FAEN partners. It offers young artists support and advice from established artists and experts in the field through workshops, meetings, and ongoing guidance throughout the production. FAEN Academy is initiated and organized by Zane Cerpina / TEKS – Trondheim Electronic Arts Centre.

Author Biography

Zane Cerpina [LV/NO] is an interdisciplinary female author, curator, artist, and designer. Cerpina lives in Oslo and currently works as project manager/curator at TEKS (Trondheim Electronic Arts Centre) and editor at *EE: Experimental Emerging Art Journal*. From 2015 – 2019 she worked as creative manager at PNEK (Production Network for Electronic Art, Norway).

Cerpina is the author of the *The Anthropocene Cookbook: Recipes and Opportunities for Future Catastrophes*, co-written with Stahl Stenslie and forthcoming at MIT Press, October 2022. Her extensive body of works also include curating and producing *Meta.Morf 2022: Ecophilia*; *FAEN (Female Artistic Experiments Norway)*; *The Dangerous Futures Conference 2018*; *Oslo Flaneur Festival 2016*, and *The Anthropocene Kitchen* event series (2016-). Cerpina has initiated and been part of several important archival and research projects such as *The Norwegian Media Art Library* and is one of the editors for the *Book of Electronic Arts Norway*.

New Department of Digital Arts and Cinema at the University of Athens

Dimitrios Charitos, Charalampos Rizopoulos, Anna Poupou

Department of Digital Arts and Cinema, National and Kapodistrian University of Athens
Psachna, Greece

vedesign@otenet.gr, c_rizopoulos@dcarts.uoa.gr, annap@dcarts.uoa.gr

Abstract

This is a presentation of the new Department of Digital Arts and Cinema of the National and Kapodistrian University of Athens, Greece.

Keywords

Cinema and film studies; digital arts; audiovisual arts, interactive arts; art and technology, multimedia

Introduction

The Department of Digital Arts and Cinema of the National and Kapodistrian University of Athens, Greece is a new department that focusses on the intertwined and hybrid field of film practices and cinema studies, electronic, digital, immersive and interactive arts that range from installations to video games. Founded in 2019, it is now set to enter its fourth year of operation. The creation of this new department addresses the need for the provision of quality education, artistic innovation and practice-based research in the multidisciplinary field of interactive arts, working at the intersection between film and cinema studies and digital art.

The Department is situated at the university campus of Psachna, a short distance from the city of Chalkis, in relative proximity to Athens. This allows faculty and students to also be active in Athens as well as to foster the growth of artistic creation outside the traditional arena of a major city.

Aims and goals

The primary aim of the department is to fill a need for audiovisual and film production in Greek higher education by bridging the gap between established film-making practices on the one hand, combined with the use of digital tools for high-quality artistic production. It transcends the boundaries of a traditional film school as it brings forward the interconnection with a wide range of contemporary digital forms of expression and multimedia. The objective of the department is that the students will be trained in all sections of filmmaking, aiming at their competence as professionals of the audiovisual sector, (feature films and documentary, television, animation, advertising, screen-based media etc). At the same time, students follow innovative and emerging forms of experimental digital artistic creation.

An additional goal of the department is to promote gender balance in film industry and to encourage the participation of women in audiovisual production in general. To that end, the department collaborates with the Greek branch of the *Women In Film and Television* international community (WIFTi). The department also aims at creating a network of collaborations with institutions, festivals and museums in the fields of audiovisual and digital arts: in this direction, it collaborates with the Thessaloniki International Film Festival for the organization of Evia Film Project, a branch of the festival promoting Green Cinema that will take place this summer in North Evia, an area affected by the disastrous fires of 2021. During the event the students will have the

chance to attend lectures, workshops and screenings focusing on climate change, ecological topics and green audiovisual creativity.

Curriculum, personnel, Infrastructure

The curriculum provides students with both a theoretical grounding and a practical skill set pertaining to the fields mentioned above. The curriculum includes modules on art history, philosophy, communication and new media, film history and theory, visual literacy and composition, digital modelling and production techniques (e.g. 3D modelling, animation), programming and IT, the Internet of Things, music production, sound design, film-directing, cinematography, screenwriting, editing, production and post-production, etc. Furthermore, a series of modules spanning all years of study revolve around the theory and practice of digital art production; these modules act as the backbone of the undergraduate programme, allowing students to constructively combine and apply the knowledge and skills they obtained in the rest of the courses on the curriculum.

The variety of the courses offered ensures that graduates will be well equipped to participate effectively, efficiently, and with the necessary intellectual independence and maturity, in the film and media industry, in artistic production, and even more technical fields such as Information Technology.

The two main corollaries of the curriculum are cinema studies and digital arts; a key identifying characteristic of the department is the interplay between these two basic pillars in an attempt to provide a holistic coverage of this emerging area. In this, the department occupies a rather unique place in Greek higher education.

The department offers a four-year (8 semesters) undergraduate study programme that leads to a BA degree. A number of mandatory and elective modules are on offer. The curriculum also includes a mandatory final dissertation project, to be undertaken individually. Through the selection of appropriate elective modules, students are free to experiment towards formulating their own artistic methodology and practice and to shape their academic profile and develop their digital design and production skills according to their interests and inclinations.

Faculty members are associate and assistant professors on subjects including: Film Direction and Cinematography, Editing and Compositing, History and Theory of Film, History and Theory of Contemporary Art and Digital Art, Interactive Arts, Ubiquitous Computing and Interactive Installations, Sound Design and Music Technology, Information Technology, Immersive Arts, Communication and Digital Media. On a yearly basis, post-doctorate fellows and accomplished professionals are selected in order to complement the above faculty members in supporting educational activities and in particular artistic creation and production classes

The department's infrastructure includes five educational laboratories focusing on supporting the following creative activities: Multimedia technologies lab, Film-direction and

audiovisual production, Film and video editing, Sound recording and editing, Digital Art and installations, Virtual and extended reality laboratory, Ubiquitous, physical computing and 3D printing.

Cinema and Audiovisual Arts

The curriculum includes a range of established courses in film studies, such as film history and theories, that are enhanced with challenging theoretical frameworks and more inclusive approaches in order to keep up with current needs of the students regarding film cultures and aesthetics. Courses on international film history cover a diverse scope on world cinemas, film movements and waves, the concepts of arthouse, experimental or mainstream cinema production, distribution, and exhibition. Focusing on the relationship between society and film production, the courses combine multiple perspectives (aesthetics, ideology, technology, economy) to explain cinematic processes and practices.

Furthermore, in courses on audiovisual language, film aesthetics, audiovisual narration, and film genres, students can combine theoretical knowledge and documentation with artistic creation and research. The video essay as a form of assignment in both theoretical or practical courses is strongly encouraged, so that the students can practice their skills in audiovisual expression and adopt an attitude of complementarity between theory and practice. Courses on scriptwriting, storytelling, structure, and narration, including storyboard and moodboard techniques, also aim to combine methods of creative writing with professional expertise required by contemporary procedures in the film industry.

The core focus of the cinema modules is film production: after completing a series of introductory courses, students can choose from a range of practice-based courses and workshops. These cover the fields of digital film-making, cinematography, audio recording, sound design, editing and all stages of audiovisual production and post-production. After following these courses, students should be able to shoot, direct, edit and complete short audiovisual projects (video art works, documentaries, short fiction features, web videos, animation films etc).

Digital arts and new media

The exploration of new media forms and practices for the purpose of encouraging and facilitating artistic expression and production is one of the main aims of the Department. The curriculum includes courses on the subjects of game design and development, 3D modelling and animation, non-linear narratives, virtual environment design, ubiquitous computing development, new media theory, media studies and communication theories, and web design and programming. A wide array of foundational theoretical knowledge, combined with accompanying practical skills, is considered an essential requirement for artists, designers, and media content creators: visual design, painting, plastic arts are fundamental courses of the curriculum

Specifically, one can identify the need to equip practitioners with a deep and intimate knowledge and understanding of the foundational principles of media (in their various forms) and their impact, at both the individual and the societal scale. This is necessary so as to appropriately frame technological innovation in a manner that will allow for a fruitful and meaningful interchange between artistic theory and practice and, ultimately, lead to the creation of high-quality artworks in line with both the capabilities offered by novel human-computer interaction paradigms and the

sensibilities and considerations that normally characterize artistic expression regardless of medium.

In addition to the above, the Department does not neglect its role as an academic institution, aiming to equip its students with the knowledge and skills necessary to attain intellectual independence and conduct high-quality academic research in the multidisciplinary field it occupies, by using artistic practice both as a target and a vehicle for advancing knowledge. In this manner, the Department addresses an important issue in art education, namely the combination of sound academic practice (targeting the advancement of knowledge around a multidisciplinary field of study through scientifically rigorous methods) with the liberty associated with creativity and artistic expression.

Data, AI and Design in Sustainability

Yoon Chung Han

San José State University
San José, CA, United States
younchung.han@sjsu.edu

Abstract

This presentation will introduce an educational program called “Data+AI+Design” that includes a series of workshops and guest speaker lectures in the intersection between art, design, technology, and sustainability. The topics specifically include the use of artificial intelligence (AI), data analysis, data visualization, interaction design, and interactive media technology to address the issues and solutions in sustainability. Many internationally recognized scholars, artists, designers, and researchers participated in the events. Students had chances to learn how AI impacts the design and what they can make out of the current AI technologies for design solutions for sustainability in many approaches.

Keywords

Data, AI, Design, Sustainability, Machine Learning, Data Visualization, Data-driven design, interdisciplinary design, education

Introduction and Background

Big data analysis with artificial intelligence (AI) is significant to predict the future and investigate hidden narratives in the dataset. However, AI is often challenging for art and design students to link to their creative practices. To resolve the fear about the new technological term and engineering methods, the design department in San Jose State University proposed a program called “Data+AI+Design” [1] that includes guest speaker lectures and workshops led by international artists, designers, and researchers. They are experts in machine learning and work in conjunction with art, design, artificial intelligence, and data. Guest speakers who have been working on topics related to sustainability have been invited to the program to ask to share their thoughts, experiences, and artistic practices to address the design in sustainability with the students. SJSU students, faculty, and guest speakers had chances to exchange ideas, discuss various topics about data and AI, and explore various methodologies to create interactive design prototypes. The discussion on both workshops and lectures also shed light on the ways in which artists/designers are incorporating AI in their practices to explore post-information age themes such as the ethical issues of artificial intelligence, data-driven design, new user experience design in the development of AI, and possible solutions for environmental/social issues. This presentation aims to present case studies of the program “Data+AI+Design,” focusing on aspects of design education, sustainability, creative use of artificial intelligence in art and design based on various events of the program and archives.

Figure 1: results of the “data+ai+design” workshops

Data Art and Technology: Program Details

Future Artifact Design

In this collaboration between the Design Department and Chemical and Engineering Department, groups of engineering students and design students worked together to conceptualize, plan, propose and design an additive manufacturing technique, scrolling website and mobile app for a 3D printed product invented with future technology, including but not limited to artificial intelligence, machine learning, augmented/virtual/mixed reality, robotics, haptic technology, future materials, smart display, and bioengineering. It addressed an important social or environmental issue.

Introduction to Exquisite 3D Printing

This workshop led by Dahn Gim was a basic introduction to Computer Aided Design (CAD) using Fusion 360 and 3D printing. During the lecture, students were introduced to types of 3D printers and software, and then the process and CAD-to-printer workflow of designing a 2D sketch and transforming it into a physical 3D object from scratch using Fusion 360. Final designs were printed with recycled 3D printing filaments.

Autonomous Complexity in Life and Machines

During the workshop led by Haru Ji and Graham Wakefield, students learned that a Cellular Automata (CA). [2] Students

examined the nature of CA by building John Conway's Game of Life [3] through web-based JavaScript editors to make lines of script which explore the Game of Life's essential components and how they can lead to precarious, emergent, and resilient systems. CA demonstrated clear examples of how non-living machines can give rise to emergent behaviors seen in life. The CA model is a foundation of fields of Artificial Life and AI Complexity, as well as interdisciplinary and generative art and design practices.

Co-Creating Art with AI using Machine Learning

In Eunsu Kang's workshop, students used machine learning browser applications to generate text and images for creating their own book, emphasizing that artmaking with machine learning allows countless creative opportunities in areas including dance, literature, music, poetry, and sculpture.

Storytelling with Environmental Data through Information Design

This workshop led by Steven Braun allowed students to take multiple data sets of pollutants in different cities and create meaning with them through their own ways of visualization. Through a step-by-step process, students answered questions on the data to help interpret and understand the data. Afterwards, students took the data of two cities and put them through a graph visualizer to view differences in levels and distributions. This allowed students to ask their own questions about why these data sets were shaped the way they are and why they were different between different states, inducing the need to research to solve these questions and create further visualizations to create a storytelling medium.

Discussion and Conclusion

This program has been exploring various design approaches about understanding and visualizing data using AI. The events reached out more than 400 BA Design studies students in San Jose State University. Furthermore, this program includes interdisciplinary collaborations between engineering and art students. This project also stimulated possible curricular innovation and collaborations in conjunction between art and science and providing educational opportunities to students. This project benefited students as they worked closely with professional designers, internationally known designers/artists/engineers and had chances to share ideas and prototypes and intercultural engagement. All the events were student-oriented activities. This project also enhanced students' understanding about interdisciplinary fields as AI, data science, materiality, future technologies, and user experience design are key topics. Throughout this series of workshops, students were able to learn about new directions and approaches in the fields of art and design, which impact to their possible fields of future career. All the

outcomes and activities became good portfolios for students who pursue their careers in Silicon Valley. Students were also able to address the real-world issue in the forms of design research through diverse approaches, which led the students to conversations with their peers, campus communities, international design professionals and local visitors.

This program is on-going campus event and there will be more guest speaker lectures and workshops held on campus. In 2022, there are three events scheduled and guest speakers include Laurie Frick (data artist), Eunjoon Kim (UX design lead at Google HQ) and Weidi Zhang (media artist). Although this program arises from the academy, the scope and activities of the program does not intend to be closed in the academy and it will expand to the community through collaborations with local community, art organizations, and incorporations. There are active discussions in progress with local art museums for collaborative workshops and artistic activities. The updated and expanded contents from this program will be also shared with the public, artists, educators, and students through an archived website and documented book.

Author's Biography

Yoon Chung Han is an interaction designer, multimedia artist, and researcher. Her research includes data visualization, biometric data visualization and sonification, a new interface for musical expression, and multimodal sensory user experience design. Her recent research focus was on multimodal interactions using body data, in particular on creating a personalized experience in media arts using biometric data visualization and sonification. Her works have been presented in many international exhibitions, conferences, and academic journals. She holds a Ph.D. at the Media Arts and Technology, UC Santa Barbara, and currently is an Assistant Professor in Graphic Design at the Department of Design in the San Jose State University.

Abstract

Since June 2021, the Universitat Politècnica de València (UPV) has a Vice-rectorate for Art, Science, Technology and Society responsible for creating a participatory and socially responsible community. The programming of its activities is aimed to comprehensively train students through transdisciplinary programs, associative, sports, volunteer activities, etc., related to the Sustainable Development Goals, based on the principles of equality, diversity and social inclusion.

Among the functions of this vice-rectorate's office are promoting a participatory culture, preserving heritage, promoting open science, fostering University Social Responsibility (RSU), favoring solidarity and social commitment, guaranteeing equality and diversity, integrating people with functional diversity, support permanent education and encourage graduates to continue their links with the UPV.

TRANSDISCIPLINAR, STEAM, EDUCATION, ACTS, NEW MEDIA, RRI.

Introduction

The Vice-rectorate for Art, Science, Technology and Society of the *Universitat Politècnica de València* (UPV)¹ is a commitment of the Rector José E Capilla-Romá to draw connections between science, technology, art, and culture within the university, making that these connections contribute to the development of the local socio-cultural and economic context, as well as its international projection.

Art, Science, Technology and Society at UPV

Integrating artistic training in a polytechnic campus has allowed to build, over time, a unique ecosystem to approach training and research from an interdisciplinary point of view. Our project also incorporates the commitment to equality policies, sustainable development, and the climate emergency. As example of this interdisciplinary approach, UPV Spontaneous Generation program² has student's initiatives which have achieved deserved recognition in international competitions such as Hyperloop³, IGEN 2018⁴ or Azalea⁵.

The Vice-rectorate for ASTS wants to promote a new culture of collaboration in Art-Science-Technology that contributes, from equality and diversity policies to social

development. It will be a space for connection between culture, science, technology, and the sustainable development goals (SDG). For this reason, the office of social action, and the office for equality, culture and heritage work aligned to our goal, being this multiple and synergic view that reinforces our university's commitment to social responsibility in all its aspects.

When we were studying for our degree in Fine Arts, some time ago, José María Yturralde transmitted to us with enthusiasm these initial 60's interdisciplinary ideas, and in some way these key ideas have shaped us. We now feel the need and responsibility that we must give back what we have learned. The space that we must give ourselves as institution in the university must be an open place, where the wind circulates mixing knowledge, expression, exploration, and communication. We want to use all the physical spaces that can display these activities -which go beyond academic routines-, spaces open to the university community and citizens to promote interdisciplinary communication.

Figure 1. José María Yturralde preparing a flying structure to start the flight, 2022.

Future vision

The goal in 2025 is for UPV to develop transdisciplinary and research training programs, involving citizens in an innovative and responsible way in raising knowledge to face future challenges.

To achieve this future vision, we must promote COLLABORATION withing the university, creating transdisciplinary groups that address the Art-Science-Technology intersection as a strategic setting for research, development, and the generation of innovation in society. One of the

first actions to take place, it has been to launch an internal call PC_ACTS 2022 with the aim of overcoming dissociation of knowledge to bring them together for transdisciplinary collaboration, promoting groups that relate art, science and citizenship, or fields that require the connection of aesthetic, scientific and social solutions which are formulated as inclusive and transformative proposals related to the 2030 Agenda and the 17 SDGs (Sustainable Development Goals). The selected proposals will also serve as seedbeds for future broader projects that point to new cultural dimensions in sustainable development policies.

Another goal is the promotion, through Artistic Residencies in Laboratories and Research UPV Centers program, the creation of projects that explore new perspectives on the role of science and technology in ways of life, addressing ethical, aesthetic, and social responsibility issues. The first Residency will be held at the Institute of Molecular and Cellular Plant Biology (IBMCP), a non-profit public research institution with more than 30 years of experience, which seeks to respond to global challenges facing humanity, such as producing food with less consumption of resources, obtaining crops with better adaptation to climate change, producing vaccines and medicines in plants, or recovering the traditional flavor of tomato in current varieties, among others.

The Residency will be carried out in three phases: during the first one, the artist will contact to the IBMCP

Authors Biographies

Salomé Cuesta. Vice-rector for Art, Science, Technology and Society (UPV) and María José Martínez de Pisón. Director Cultural Action Area (UPV)

Since 1990, the Group Light Laboratory, located in the Faculty of Fine Arts in Valencia, has functioned as a meeting, study and research space for aesthetic and expressive principles linked to the light-image.

Currently, the components of the laboratory belong to different departments and their participation varies depending on the proposals that are being developed: working between the collective and the individual, between university research and artistic activity, between the production of projects and the dissemination of

researchers, who will act as mentoring. In the second phase, he will be able to work on the development of the proposal in the facilities of the Faculty of Fine Arts; and during the last phase, the Residency will present the project to the public at the IBMCP facilities at the UPV, and at the Centre del Carme Cultura Contemporània CCCC (Valencia).

Laboratory of ideas

With these initiatives we seek that *Unviuersitat Politècnica de València* campus held its own "laboratory of ideas", a dynamic and open space that supports the initiatives of its faculty staff to create knowledge spaces open to society, being a place for debate and participatory action that will contribute to reflection on real world problems; and that this laboratory actively participates in the search for solutions to social and environmental challenges.

Universitat Politècnica de Valencia, as public body, is devoted to responsibility and commitment to sustainable scientific, technical, cultural, and social development.

texts, as an area open to those who want to develop their work under this interdisciplinary structure.

Art-Science Cooperations at the Institute for Advanced Sustainability Studies (IASS) (Institutional Presentation)

Teresa Erbach

Institute for Advanced Sustainability Studies (IASS)

Potsdam, Germany

Teresa.erbach@iass-potsdam.de

Abstract

The Institute for Advanced Sustainability Studies (IASS) in Potsdam (Germany) conducts research with the goal of understanding, advancing, and guiding processes of societal change towards sustainable development. Our researchers collaborate with diverse actors from science, policymaking and public administration as well as arts to develop a common understanding of sustainability challenges and generate potential solutions. Artists can work at the Institute as part of the Fellow Program or get in touch with the platform “Art-Science Cooperations for Sustainability” if they are interested in a collaboration with researchers in a specific project. At the IASS we also conduct research with the goal of understanding the role and transformative potential of art in societal change.

Keywords

Art-Science Cooperations, Sustainability, Fellow Program, Platform, Societal Change, Transformative Potential of the Arts

Introduction

Societal change towards sustainable development is one of the most important challenges of our time. It is neither only a task of politics nor of science but of the whole society. Therefore, the Institute for Advanced Sustainability Studies (IASS) in Potsdam, Germany, pursues a research approach that is transformative, transdisciplinary, and co-creative. Such a research approach is not possible without collaborating with diverse actors from science, policymaking and public administration as well as business, civil society and arts.

The fact that there is a special focus on collaboration with artists at the Institute is relatively new. In recent years, some artists have come to the Institute as part of the cross-disciplinary Fellow Program, but there has been no promotion of art-science collaborations beyond that and no research on

the role of the arts in processes of societal transformation. This changed in October 2021 with the creation of the platform “Art-Science Cooperations for Sustainability”.

Art-Science Cooperations for Sustainability

Transformations are processes of fundamental change. As such, their scope is not limited to issues of substance. Rather, it extends to matters of design and form, and values and perceptions. Expertise in the broad field of aesthetics can be found among designers, scholars of the humanities and, above all, among artists. This is reflected in their growing involvement in and willingness to initiate projects to foster sustainable development - whether it be in the field of urban development, product design or organisational and process design.

What factors shape their engagement? What happens when artistic and scientific perceptions of sustainability collide? What criteria for success do different stakeholders apply and how can they be reconciled? This research group pursues these and related questions not only by 'studying' existing initiatives, but also by initiating, accompanying, connecting, and supporting ground-breaking collaborations between artists and scientists. In the process, the group seeks to forge connections and foster understanding between current issues and perspectives in sustainability science on the one hand, and the dynamics and interests of the cultural sector on the other.

Collaborative projects initiated in this context will ideally result in new artistic formats and interdisciplinary publications and will help to build transdisciplinary networks and facilitate public dialogues on how the creativity of the arts can better contribute to transformations towards sustainability. In addition to the design aspects mentioned above, a particular focus is placed on artistic work that aims to both heighten our emotional awareness of the existential dimension of the planetary crisis and make it conducive to the

pursuit of change.

All artists who are working on sustainability-related issues and are interested in a cooperation with scientists regarding a specific topic are welcome to get in touch with the platform. The Institute for Advanced Sustainability Studies (IASS) wants also to encourage all artists who are interested in staying for some months or a year at the Institute in Potsdam, Germany, to apply for the Fellow Program.

The Fellow Program

The IASS Fellow Programme is inspired by the Potsdam Memorandum's call to gather all sources of ingenuity and inspiration from academia, politics, arts, business and civil society to address the sustainability challenges of our time. The fellows are a key resource for the institute; they support our research, improve our transdisciplinary methodology, and, together with our researchers, reach out to political, economic and social actors.

The Fellow Program is designed to bring highly qualified people to the institute, who provide expertise, inspiration, and creative input. In return, the IASS offers fellows the opportunity to develop their ideas in an international community of world-class researchers, within the institute as well as in the wider research landscape of Potsdam and Berlin. The fellows are actively supported in their endeavours to make new connections and to develop new ideas and activities together with IASS researchers.

About 30 fellows come to the IASS each year. A public call for applications is issued each year for the following year. Beyond that, the Scientific Directors may invite individuals from all over the world to collaborate with the IASS on specific themes and activities for a limited period of time. The IASS seeks individuals from all disciplines and areas of society, including politicians, journalists and artists. The public call is often geared to topics and questions on which the IASS wishes to focus attention over the course of the envisioned tenure.

Network and Future perspective

In the coming months and years, the platform "Art-Science Cooperations for Sustainability" will build a network of artists and scientists who work on sustainability issues and are interested in transdisciplinary collaboration with each other. For this endeavor it is very helpful that the IASS will become part of the Helmholtz Association of German Research Centers in January 2023. The Helmholtz Association is a union of 18 scientific-technical and biological-medical research centers and the largest scientific organisation in Germany. Its official mission is "solving the grand challenges of science, society and industry".

One goal of the group "Art-Science Cooperations for Sustainability" is to use the connection to give more space to art-science cooperations in the scientific operations of the

Helmholtz Association and to make the knowledge stored there more accessible to artists.

In order to promote art-science collaborations and to work transdisciplinarily on sustainable development, the IASS is interested in any form of exchange: be it with artists and scientists interested in collaborations or with institutions pursuing similar goals.

ISEA2022: BAJO EL OLIVO (International Creative Artist Residency), Institutional Presentation Submission

Dr. Juliana España Keller

Alhaurín el Grande (Málaga), Spain

Contact Emails: info@julianaespanakeller.com, juliana.espanakeller@concordia.ca

Website: www.bajo-de-olivo.es

Abstract

“Bajo el Olivo”, *Under the Olive Tree* is an international creative artist residency that emerged through the pandemic lockdown and unfolded with the migration and (re)location of a creative practitioner and her partner from Australia to a rural location in Andalusia, Spain. The residency is a platform that emphasizes a more embodied connection with our posthuman future; a concept that recognizes ethnographically that within the grave ecological crises and the pandemic condition, we (the human species) are endangering our coexistence with other species and how diverse organisms are entangled in political, economic, and cultural systems we have initiated.

The residency is designed to foster the theoretical and creative ways that a radical entanglement is intra-connected with a situated perspective—one that flourishes as a transversal site for artistic events and research, building resilience in ecological continuity, community building and storytelling. Most importantly, bringing other forms of life into light to suggest that we have become ‘post-human’, since our mode of being is dependent on complex entanglements with animals, ecosystems, and technology.

The creative resident protagonists, visitors who are mapping the terrain with other multi-species (human and non-human in nature) are the collaborators. In this context, they are contributing to the artistic, philosophical, methodological, and sociocultural matter that takes place in a transformative site for creative practice. This method of thinking suggests that (re)working the relational thought of working with other(s) in performative field work, can produce unexpected ruptures in dominant thinking about nature and culture. Besides being non-human, ‘creatures’ can be regarded as parts of society that move

past questions of representation and abide with us in multi-species worlds.

Inception

“May the spring of a foreign river be your navel. May your soul be at home where there are no houses”. Ursula K. Le Guin, *Always Coming Home*. [1]

This institutional submission is designed to foster the theoretical and creative ways that an artist residency is intra-connected with a situated perspective: one that flourishes as a transversal site for artistic events; building resilience in ecological continuity, local community building and social engagement. Most importantly, bringing other forms of life into a creative proposition suggesting that we have become ‘post-human’, since our mode of being is dependent on complex entanglements multi-species, ecosystems, and technology.

Figure 1. Local Spanish Resident Artist, Choreographer, Maria del Mar Suarez (Chachi) ©Juliana España Keller.

Visiting guest residents are creative protagonists contributing to the artistic, philosophical, methodological, and sociocultural matter that takes place in a transformative site for creative practice.¹ This method of thinking suggests that (re)working the relational thought of working with other(s) in performative field work can produce unexpected ruptures in dominant thinking about nature and culture. In our post-pandemic future, to walk mindfully is to converse with ‘vital matter’ [2]. In its emergent growth, the vitality of the artist residency, is rooted in a circular relationship for the practice of research-creation artworks where artists are using the residency as a speculative thinking space for practice-led research merging with a ‘slow’ infrastructure—in the doing and making of artwork; inclusive of how humans can listen and relate with the articulations of nonhuman beings and living systems.

(Re)newed Speculation on ‘Home’

‘Home’, has become a ‘refuge’ in post-pandemic time and speaks to the future of human life. This small parcel of land is a model of sustainability, and an exploration of non-exploitative methods of production to connect, to exchange, to consider traditional know-how, sense, and insights as ways of understanding ecologically embedded perspectives on embodiment and create connections between embodiment, rural labour, and ecological sensibility.

¹ “Let the arch of your feet be the mountains. Let the paths of your fingertips be your maps and the ways you go be your palms”. Le Guin, Ursula K. 1.

Figure 2. Sound and Food Workshop with Gazpacho ©Juliana España Keller.

Other artistic research-creation projects can include terms of embodiment that are influenced by the ideologies of separation and fragmentation imposed by colonialism and neo-capitalism. *Bajo el Olivo* promotes deep listening to the earth and is situated as a ‘becoming’ by thinking with the ecologies of ‘care’ and ‘hope’, making kin. With this mind body connection puts into motion, a speculative process that seeks the all-too-human desire to see concordance between two mandates—the desire, that we happen to occupy a privileged place within this spatial relation and two: the residency becomes an expanding network of users, collaborators and partners who come together to work on the land, share resources and local knowledge around a community economy.

To keep it ‘local’ as an Ecophilosophy is indicative to connecting the invisible majority where ‘labor’ is a profound connection to the land. How can we generate a (re)newed approach to creation, sustainability, and creative methods of artistic practice as a site of imaginative space-making and radical change? To (re)generate creative possibilities for emergent relational forces that are situated in rural places and where ‘play’ and ‘thinking’, ‘doing’ are working and possible. [3]

Where The Meaning of Entanglement Meets the More-Than-Human.

This entanglement upholds that there is a way to bring farmers, scientists, creative artist/researchers, and even artisanal bakers together to connect, exchange processes as a transdisciplinary approach in a ‘nomadic encounter’ [4], not a solution. Our sense of being in the world, and our sense of the natural world is motivated and made meaningful not merely by unconscious reaction and instinct, but by individually imagined and collectively produced symbolic structures, which is to say beliefs and ‘more-than-human’ stories between the earth and our bodies, indigenous knowledges, historicides weaving sensory data, feelings, and a desire to merge into a composite spatial, temporal, and social world that is entangled with micro-communities and the natural world. By experimenting with different modes of storytelling, the human species is now exploring ways to being other species and ways of thinking into an interspecies relationship. As Australian scholar and anthropologist, Eben Kirksey states: “which beings flourish, and which fail, when natural cultural worlds intermingle and collide”. [5]

Thereby, this creative artist residency takes on a more cosmic point of view where our mutually constituted sense of the collective now—is changing into something else, perhaps no more or less than a new world, a new now, a different collective sense of human life. Our human dependence on environmental health and ecological diversity as a communitarian vision of small-scale non-hierarchical social organism such as an artist retreat offers, at such, a robust fiction as a strain of radical ecological thought in an environmentally attuned philosophy or deep ecology.

Figure 3. A home-grown turmeric root rhizome ©Juliana España Keller.

American Theorist, Donna Haraway has always rooted her co-existence with the human-non-human world as a “radical hope” [6]. We might call it, a commitment to a future existence which by definition cannot be described but should be explored. If one recognizes that we cannot know how climate change and ecological catastrophe are going to transform our world, how human civilization will change in response, how will human beings adapt to the new world of the Anthropocene, or who we will become in the future.

Creating a Sensory, More-than-Human World

Canadian Affect theorist, Brian Massumi puts forward the idea of ‘touching’ as affecting and being affected by what a body can be or do and illustrates intra-textually the capacity to act and be acted upon. For Massumi, Affect involves the transitions a body takes when it steps over a threshold and is a dimension of life enacted in such processes. Reading, writing, and creating in the world as sensory, intimate, and of the body is propositionally about intensities, moving toward the other, and being open to the “more-than”. [7] In this creative residency, guest residents are asked to propose how these concepts excite the senses which expand the body and its abilities, to exercise how we perform with each other and co-create on the earth.

Furthermore, American Feminist New Materialist theorist, Karen Barad proposes that mat-

ter matters—it is both of substance and significance and views/sees matter and discourse as inextricably entangled. [8] For Barad, matter is not passive and inert, but a lively participant in the world’s becoming. In this way, radical entanglement for artists working out in the field, closer to nature; can explore how the experience of embodiment is embedded within the larger body of the earth through art works that sow seeds between somatic, audiovisual, and intra-textual material ways of knowing in attuning to the human senses and the non-human world.

This movement towards a deep ecology of thinking can include the sentient presence of food production—the baking and breaking of bread collectively, to gut metabolism (working from the gut), and other non-human ecologies of nature such as collaborative bee-keeping and co-producing honey as food. The residency is interested in artist propositions that document and articulate the shifts of perception unfolding to attune our human senses to the sentient presence of the topography of the land, colonial histories, traditions, rituals, weather patterns, soil, food practices, food production, food security, manual labor, women’s labour, and the many other nonhuman living systems within this assemblage of performative activisms and choreographies that can be performed in spatial practices.

We are All in this Together (under the Olive Tree)

I would argue that the (post)colonial logics of speed and convenience are also manifest in much of the art world creating ease for some and harm for others in a hierarchal, elitist infrastructure. Addressing many of the environmental crises that we are now entangled with requires, I propose, encouraging a slowing down to grasp the notion of labor as working from the gut, where a ‘slow’ metabolism provide creative possibilities that consider an attunement to the earth as rather a relation of co-composing with the “more-than-human”. This reflects on how our relationship with other forms of life can be reconfigured and accountable as a site of transformative potential for creative practitioners through direct engagement with the earth, community—the contact with local artists, artisans, gardeners, beekeepers, farmers where storytelling in time, space mattering and the future architecture of “home” as a refuge is a

becoming that enforces a (re)imagining that is rooted in participatory art practices.

Artists that become a part of this residency can intra-sect and converge with deep ecologies relational to the concerns of a rapidly changing environment, shrinking natural resources and the realities of climate action. Far from perfect, this refuge is not immune to the rest of the world. This small parcel of land is being used to experiment, create, and share stories for a future world, to imagine posthuman futures and critically challenge pre-existing structures of thought where complex assemblages of matter exist and intra-act to challenge the discordant systems of city life and the dynamics in which we are currently entangled in.

Figure 4. Local Spanish Resident Artists, Sound Artist, Selu Herraiz and Percussion Instrumentalist, Takuto Yanagawa in studio ©Juliana España Keller.

From an activist position, as a practicing sound and performance artist, myself, I consider art and the natural environment as a participatory collective model or working with, rather than, working for. This method of collaboration forms a transdisciplinary perspective inhabited by varied and vibrant forms of matter and like-minded intersectional practitioners and thinkers in a dialogical exchange. In turn, environmental activism, which advocates for a world with biodiversity, avoiding toxic impacts, can be adopted as an underlying ethos and aesthetic

response to transdisciplinary approaches within the fields of visual arts and other intermedia practices to be shared with.

To conclude: this residency empowers residents to use the sensing body to explore the potential thousands of distinct material ecologies embodying a symbiotic relationship with the natural world and its creatures and multispecies. This creative convergence sets up an alternative ecology of matter and meaning through weather variations, growing patterns, storytelling in a site-specific latitude on a small parcel of land in Spain.

Balance-Unbalance. Ecology and Citizenship

Ricardo Dal Farra

Balance-Unbalance International Network

Montreal, Canada

ricardo.dalfarra@concordia.ca

Abstract

The frequency and severity that certain weather and climate-related events are having around us are increasing, and the ability of human beings to modify our adjacent surroundings has turned into a power capable of altering the planet. Do the media arts have a role in all this?

Keywords

Environment; climate change; biodiversity; Red Cross Climate Centre; art-science; art and environment; eco-action; ecology; transdisciplinarity.

We seemed to be in balance

When it comes to thinking not only of ourselves but also of what some call the common good, questions arise about what it is, who defines it, how, and when, among other aspects.

It is challenging to recognize fragility. To think that in order for food to reach the supermarket, the necessary events are sometimes dependent on a complexity that is unthinkable for most consumers. That to appreciate a piece of music that we can collectively perceive as being of quality, each instrument needs a history, its performer of years of intellectual and biomechanical training, and the work of a creative composer is of fundamental importance, of course, too. And that for having high-speed Internet at home, the chain of efficient pieces of technology that need to work is not less than astonishing. The individual actions, and the long series of events that eventually lead us to have systems that work to help us, solve problems, and live better, often pose fundamental conceptual issues to us.

The humans' delicacy and the systems that we have been building through millennia become clear when abruptly, the usual and traditional reality is transformed and collapses. There are individual and collective consequences when the system we trust stops behaving as we wish. A health crisis on a planetary scale affects millions of human beings as I am writing these lines. While many people want to return to the previous state, others see what is happening as a turning point that will substantially improve our lives. We can also consider that what is happening puts us all in a unique social and citizen laboratory, more than ever.

The current pandemic is not the only human species challenge, for sure. There are others, such as global changes due to the effects produced by an increasingly complex environmental situation.

An idea to promote and develop activities to help us reflecting and carry out actions focused on improving our relationship with the planet we inhabit was crystallized in 2010. When we need solutions, we look to engineers, doctors, lawyers, physicists, but not composers or sculptors. However, when we try to design a possible future, understanding our present better by studying the past, our ancestors' art and culture are what it mostly remains to understand and learn from them.

The work between experts in different disciplines but with a broad criterion that would allow and facilitate the construction of a transdisciplinary research-creation culture could be a peaceful and, at the same time, a revolutionary path of development, increasingly harmonious. Thus, the Balance-Unbalance (BunB) international project arises to facilitate the meeting between scientists, artists, engineers, experts with varied experiences, and representatives of non-governmental organizations who look for new collaborations to reflect on the future. And we know those reflections need to lead to critical actions since the deadlines are shortening.

Turning Point

We are living in a world reaching a critical point. The equilibrium between a healthy environment, the energy our society needs to maintain or improve its usual lifestyle, and the world's interconnected economies have recently passed from a delicate balance to a new reality, where unbalance seems to be the rule.

It is clear now that traditional disaster management approaches are not enough to deal with the current problems and the rising risks. New forms of collaboration are needed to inspire people and organizations to link knowledge with action.

Artists could inspire new explorations and contribute with innovative perspectives and critical thinking to actively participate in solving some of our major challenges, such as the spiraling environmental crisis. We need to develop creative ways to facilitate a paradigm shift toward a sustainable tomorrow. Creative thinking, innovative tools, and transdisciplinary actions could produce perceptual, intellectual and pragmatic changes.

One of the initiatives that aim to use the media arts as a catalyst, with the intent of generating a deeper awareness and creating lasting intellectual working partnerships to face the many facets of the environmental crisis is: The *Balance-Unbalance* international project.

Balance-Unbalance

The *Balance-Unbalance* international conference project explores [art, science, technology] intersections between nature and society.

The first conference was held in Buenos Aires, Argentina, in 2010 and was hosted by the National University of Tres de Febrero. Papers were delivered by artists, a representative of the National Secretary of Environment and Sustainable Development of Argentina, experts and graduate students from different universities with chemical, agricultural, and environmental engineering backgrounds (specialists in pollution, renewable energies and food technologies), a lawyer, a sociologist, and an astrophysicist, coming from Argentina, Brazil, Canada, and the US.

The second *Balance-Unbalance* was held in 2011 at Concordia University, in Montreal, Canada. In 2013, the third edition of *Balance-Unbalance* showed the potential of the actions carried out. The expected catalyzer started to work better each time, and the media arts were helping to lead the way in connecting people, projects, and actions. This time the conference was held at the Noosa Biosphere, an ecological reserve recognized by UNESCO. This biosphere is a dynamic learning laboratory for sustainability in one of Australia's most pristine and diverse environments. An e-book with some of the papers presented at that conference was published and can be downloaded for free [1]. The conference theme: "Future Nature, Future Culture[s]" aimed to challenge our expectations of Earth, provoke our understanding of nature and inspire our actions for a sustainable future. *Balance-Unbalance* proposed that we ask ourselves: "What will we be calling 'nature' in 20, 50 or 100 years? How will we live in the future? How can creativity help us shape a society of understanding and interconnectedness? What role could transdisciplinary thought and action play in reimagining a sustainable future? Our limited knowledge of life can be expanded, but to do so, we need better ways to understand each other. This includes a deeper awareness of how different human societies can comprehend cultural differences and synergies" (from the *Balance-Unbalance* 2013 website). As in previous editions, [electronic] art was not only part of the papers presented in the form of theoretical analysis and proposals but also a substantial component of the event. Also, in the Noosa Regional Gallery, the Leweton Cultural Group performed traditional music and dance from Vanuatu's endangered islands. We were learning how *Balance-Unbalance* could help to give voice to some of the many underprivileged. The MIT Press has published fifteen articles on research and creation projects presented during this edition on *Leonardo*, the Journal of the International Society for the Arts, Sciences and Technology, on a special section devoted to *Balance-Unbalance* [2].

The fourth edition of the *Balance-Unbalance* conference was held in 2015, hosted by Arizona State University and its main focus was on "Water, Climate and Place: Reimagining Environments." The subject reflected the particularly relevant circumstances considering the conference's location was in the southwestern desert of the United States. In 2016, *Balance-Unbalance* was hosted by the University of Caldas in Manizales, Colombia. This city is part of the coffee-growing axis and is built in a mountainous region with seismic instability. A rich, changing and challenging environment, with a subtropical highland climate and an average of 1,500 mm of precipitation a year, allowed participants to have a contrasting experience considering the places where the previous conferences were held. The program included scientists, artists, designers, architects, leaders from the program *Sonidos de la Tierra* (Sounds of the Earth) mixing music education with entrepreneurship, the Land Art Generator Initiative collective, and organizations such as the Red Cross Climate Centre, among many others.

The 6th edition of the *BunB* conference was held in the UK, hosted by Plymouth University in collaboration with the North Devon's UNESCO Biosphere Reserve, Beaford Arts, the Eden Project, and Fulldome UK. A full visit to the Eden project, a complex dominated by two huge adjoining domes (one of them emulating a rainforest environment, and the other a Mediterranean one) offered an exceptional opportunity for the participants to exchange ideas, also helping to generate a growing sense of community [3].

Balance-Unbalance was held in The Netherlands in 2018 and had its focus on the theme: "New Value Systems - Sustainability and social impact as drivers for value creation." It was hosted by The Patching Zone with activities in *V2_Lab* for the Unstable Media and the Het Nieuwe Instituut of Rotterdam [4]. With tracks such as: Generating Urban Values, Ecological Impact as Drivers for Value, Creating Value Through Transdisciplinary Learning, Alternative Economies, and Social Impact as Driver for Value Creation, this 7th *Balance-Unbalance* incorporated aspects not explored in other editions. The Proceedings are available online for download from the conference's website [5].

In 2018, the *Leonardo* journal published a selection of 27 papers from the 4th (2015, USA) and 5th (2016, Colombia) editions of the *Balance-Unbalance* Conference [6] [7].

Today's difficult and uncertain context has brought a different approach to produce the 8th edition of *Balance-Unbalance*, avoiding postponing a new opportunity to induce reflections and produce changes related to our decisions and possibilities regarding the natural environment. This time the conference was held in 2021 using a blended modality (papers, roundtables and workshops online, plus an in-person exhibition in Valencia), joining efforts with organizations and institutions from Spain and Brazil, among other countries.

Once humanity can go over this pandemic, other significant challenges will come, and we need to reflect and act as soon as possible.

Conclusions

In this context of global threats: Can the [media] arts and artists help? Everyone has a role in the construction of the future, artists, too. We must search, investigate, reflect, and act. We can create, and we can also invite others to analyze, engage, envision and act. It is not possible to wait longer or to delegate personal responsibilities.

By bringing people from very different sectors of our society to think together and facilitate multi and transdisciplinary collaborative project developments, *Balance-Unbalance* and its associated initiatives are turning feasible to connect artistic creation and tangible tools for change. *Balance-Unbalance* has been contributing to make social transformation happen.

Hexagram Network – *EMERGENCE/Y*

Sofian Audry, Christopher Salter, Manuelle Freire

Université du Québec à Montréal / Concordia University

Montreal, Canada

audry.sofian@uqam.ca christopher.salter@concordia.ca freire.manuelle@uqam.ca

Abstract

Over the last 20 years, Hexagram has played a seminal role in the recognition of practice-based art and design research in Canada and abroad, as well as in promoting knowledge-sharing between artistic and scientific disciplines. Founded in 2001, Hexagram supports research-creation projects and foster collaborations amongst its members from eight Québec research institutions, as well as with local and international partners from academic, cultural and creative sectors. To celebrate this milestone, in September 2021 Hexagram initiated an ambitious season programming on the theme *EMERGENCE/Y*, which launched in the framework of *Ars Electronica 2021*. This research-creation (RC) programme of activities will run until June 2022. Hexagram presents the highlights and the sequel to *EMERGENCE/Y*, to which Network members as well as international partners are invited to contribute.

Keywords

Hexagram Network; Research-Creation; Emergence; Emergency; interdisciplinary research; creation; Practice-based research; Media Arts;

Introduction

In 2021, Hexagram celebrates its 20th anniversary, just as its mandate was renewed by the Québec Government and its partner institutions for a new 7 year cycle based on a proposed programme aiming to catalyze collective, interdisciplinary knowledge and to engage publics with cultures and practices that address current urgent and global scientific and technological challenges. In the first year of this new cycle, however, the network also saw the arrival of the global COVID-19 pandemic. This context emphasized the necessity to collaboratively propose new knowledge, new imaginaries, and to harness desirable futures in a period that is characterised by profound change and a constant state of *emergence/y*.

EMERGENCE/Y

In 2021, it is now a cliché to say that we have lived through an “unprecedented year” - particularly when the state of the pre-COVID world was in many ways unprecedented. Yet, the combination of the global

pandemic and its resulting political-economic fallout, the continuing ecological crises, and the social-cultural explosion of long simmering systemic injustice and inequality have made the entangling of human, machine and natural orders ever more apparent, with radical consequences for all forms of life on this planet. The future appears uncertain, unstable, unsettling, and unknown.

How do we respond? The Métis University of Toronto STS scholar Michelle Murphy writes that “assemblies of technical practices have generated not just facts but also speculative phenomena that are a felt part of the world, even if intangible. How do speculative social science [or research-creation] practices produce a world where undecided futures are brought into the present?” [1] Murphy refers to this as “technoscience dreaming.” In other words, in an increasingly uncertain world, how can RC enable us to dream and trial new possible futures?

In order to address with reflection and action the wicked problems of our global situation, Hexagram has developed a thematic programme of activities from September 2021 to June 2022. We explore the role that research-creation can play in tackling these troubled times in order to offer new possibilities, hopes and visions of a more just, equitable and open future. Exploring hybrid modalities of presentation, discussion, and outreach, this season’s activities bring together Hexagram members and partners whose approaches are equally dedicated to addressing the current complex challenges through research situated at the intersections of the arts and sciences.

The institutional presentation of Hexagram Network at *ISEA* summarizes activities conducted and invites the community, especially partners in attendance to the follow-up exchanges, to continue engaging for the second half of 2022 and onwards with some of the groups and their themes initiated in the framework of the *EMERGENCE/Y* programme. Following up on the *Ars Electronica 2021 Hexagram Garden* [2] will be a call for future contributions.

Science Visualization Lab of the University of Applied Arts Vienna

University of Applied Arts Vienna
Vienna, Austria
martina.froeschl@uni-ak.ac.at

Abstract

The common understanding of modern scientific research becomes more and more difficult as activities are carried out in size and time ranges we cannot perceive with the naked eye. The key to understanding as well as creative new research ideas is often a visualization of these hidden processes. The Science Visualization Lab at the University of Applied Arts in Vienna, Austria specializes in making invisible scientific phenomena visible and disseminating this visual information in various ways.

Keywords

Scientific visualization, science, art, lab, computer animation

Introduction

In the early 2000s, Alfred Vendl, a natural scientist, and filmmaker used time-lapse captures of raster electronic images to study the formation of corrosion-inhibiting micro-layers on copper alloys and combined them with computer assistance into movies. The outcome were image sequences that depicted the dynamics of the layer formation. These visualizations were the first of their kind to be shown in scientific documentaries, which were produced on behalf of European and American television stations. One of the numerous documentaries, for example, was the TV series Nature Tech, for whose special visualizations the National Academy of Television Arts and Sciences awarded an Emmy Award in 2008. As a result of a longer success story, the Science Visualization Lab Angewandte affiliated to the University of Applied Arts Vienna was founded. In the lab, authentic visualizations are produced through the combination of scientific data and computer animation. Nowadays, the applied computer-animated scientific visualizations produced by the lab range from collaborations for interactive media installations and full-dome presentations to the latest immersive applications. The main field of activity of the Science Visualization Lab Angewandte is the production of narrative computer-animated scientific visualization for most diverse research fields. The lab is aiming to use the power of the visual to expand the human knowledge basis and foster creativity in various interdisciplinary research projects.

How might collaborators benefit?

In general, scientific visualizations enable understanding through computer-generated images. In research and in communication these visual aids are enormously beneficial. In particular, three-dimensional visualizations simplify the perception of complex coherences. These benefits can be used for the communication in fields as diverse as, for example, interdisciplinary science communications or patient to doctor information. There are numerous reasons to create scientific images, as for instance, [2] lists:

- As research becomes more interdisciplinary, illumination and intelligent images of your research will become more useful in communicating with those scientists outside your field of expertise.
- Using compelling and accessible pictures is a powerful way to draw the public's interest to the world of research. When the public develops a more intimate association with science the results will be both a richer society and one supporting the important efforts in scientific investigation.
- As you spend more time making these new images of your research to communicate to a larger community, you will see your work differently; you will expand the way you think about your work and therefore the way you envision it.

On the one hand, for research, a deep understanding is important, on the other hand, specialization is restricting the mind (compare [4]).

So-called "Renaissance Teams" are the geniuses of our time, the times of one individual who "knows it all" are over. Scientific visualizations provide visual metaphors and narratives to shape cultural thinking and offer people a scientific view of reality [1].

Complex theories and abstract concepts are driving the latest scientific findings. Visualizations can help in understanding and enable faster learning of new concepts. Scientific visualizations are means of human knowledge creation and transdisciplinary and interdisciplinary tools.

Research in computer graphics, interactive techniques, visualization, imaging, and design applications are seen as vital for making information sources easily accessible and were acknowledged as useful in promoting and fostering scientific, industrial, and educational collaborations [5].

Institutions performing scientific visualization and research can be seen as ‘in-between’ as they act as mediators and communicators. Healthy communication paths between all parties involved are important for collaborative processes.

At the Science Visualization Lab Angewandte, we are visual communicators not only digital image producers, that means our projects can be seen as gathering of knowledge and data. The data becomes transformed, while authentic core information from various scientific imaging sources are maintained.

Recent projects

The in-depth examination of science topics in combination with computer animations, which are based on data from science, repeatedly leads to new design worlds and exciting interdisciplinary projects. Data is often created specifically for the projects. The special founding history of the Science Visualization Lab in a former technical chemistry department of the University of Applied Arts Vienna created special opportunities and means for transdisciplinary work. We have the option of using a scanning electron microscope in-house, and we also maintain connections with imaging units at various universities.

These given conditions make it possible to bring art and science together in innovative ways. At the Science Visualization Lab, this is mainly done through computer-animated scientific visualizations of tomographically scanned microscopic entities that are woven into various projects. The distribution spectrum ranges from prime-time documentary films to full-dome projections to internationally successful art installations.

Figure 1: Two outcomes of collaborations of the Science Visualization Lab of the University of Applied Arts Vienna. Left: A presentation of “NOISE AQUARIUM”, Right: A photograph of a person enjoying the full-dome installation of the project “CRISPR/Cas9-NHEJ: Action in the Nucleus” ©Science Visualization Lab Angewandte.

Projects of the Science Visualization Lab use the possibilities between art and science to spread messages that are important for the future of mankind. The topics we have worked on so far were (and are), the greed of higher living

beings in “The first Greed¹”, plastic and noise pollution of the water bodies “NOISE AQUARIUM²” in cooperation with the Art|Sci Center UCLA and “LIFE”, genetic manipulation - opportunities and Risks “CRISPR/Cas9-NHEJ: Action in the Nucleus³” together with the Bio Center Vienna, climate change and art in cooperation with the University of Salzburg in the project “C ART³”, viruses and their role in our ecosystem in the project “Virus Dice⁴” with advice from scientists at the UBC Vancouver.

Author Biography

Dr. Martina R. Fröschl, MSc, studied media technique & media design and wrote her thesis about computer-animated scientific visualizations of tomographic scanned microscopic organic entities. The depiction of realities and biological phenomena has ever since driven her creations. She contributed to various documentary and fictional productions for TV and cinema as visual effects and CG-artist. Her recent computer animations are based on scientific imaging data like μ CT, MRI, SEM and light microscopy in collaboration with imaging experts and biologists. Currently, she is a senior researcher and digital artist at the Science Visualization Lab Angewandte⁵ at the Department of Digital Art at the University of Applied Arts Vienna and chairwomen of the PIXELvienna Society⁶.

Mixed Reality and Visualization - Designing Multisensual Experiences Using the Whole Body

Chris Geiger, Charlotte Triebus, Ivana Druzetic-Vogel

Mixed Reality and Visualization, University of Applied Sciences

Düsseldorf, NRW, Germany, www.mirevi.de

{geiger,charlotte-triebus, ivana.druzetic-vogel}@hs-duesseldorf.de

Abstract

MIREVI is an acronym for Mixed Reality and Visualization and describes the main areas of our interdisciplinary research team. As part of the University of Applied Sciences in Düsseldorf, Germany, we focus on human-computer interaction to improve various parts of life. With members of our "Kunst und Kultur Team" (art and culture team) we specifically look at collaborations with artists and cultural institutions and work on various levels in the context of dance, performance, digital media and user experience.

Keywords

Mixed Reality and Visualization, Interactive Art and Performance, Human-Technology Interaction, Smart Digital Technologies for Art and Culture.

Mission Statement

We are MIREVI (www.mirevi.de, Mixed Reality and Visualization), and we are part of the media department at the University of Applied Sciences Düsseldorf (HSD). Be it digital health and well-being, art and culture, business or engineering – our diverse and creative team researches, develops and offers creative support for various application domains to improve and innovate them with pioneering ideas.

To achieve this, we focus on mixed reality and artificial intelligence because we are convinced that these novel technologies, in all their facets, offer countless possibilities for the various parts of life. In our daily work we focus on the design and implementation of innovative human-technology interfaces that are new, useful and sustainable. We are interested in any digital media topic if it significantly supports the user, creates an innovative user experience, is great fun to work on or provides us with a little budget (strictly in that order). As a team of digital media experts, computer scientists, designers, cultural anthropologists and artists we believe in the power of joint creativity and intrinsic motivation and love working together on R&D projects, commercial topics or artistic digital expressions in our special working environment at the innovation hub in Düsseldorf, Germany. This is an 750 sqm open office area in a factory building.

Art, Culture, Technology & Beyond

Through digital and creative partnerships with numerous cultural intuitions and individual artists on national and international level, we are actively involved in innovative digital developments in the wide field of art and culture. We focus both on development of tools that support interpretation and transfer of an existing cultural content, as well as on creation and mediation of new artwork in collaboration with artists. We are interested in the exploration of the potential that mixed reality technologies offer for artistic and cultural productions and vice versa – using artistic and interdisciplinary research to open new perspectives on technology and address ethical, social and philosophical issues.

Cognitive Computing in Digital Media

With the increasing hype on AI-based technologies and requests from many cooperation partners and students we decided to go back to our roots on smart user interfaces and knowledge-based system design. Cognitive computing in digital media has many potentials and we look at ways to create empathic user interfaces and smart tools to create innovative media expressions. We focus on smart techniques for motion-based interfaces, DeepX-technologies and other biologically inspired approaches. With an additional focus on information visualization, we also consider data science techniques in general when appropriate.

Creative Engineering

Today, digital technology is available at low cost. With this availability and a significant increase of data and information, content experts have less understanding what to do with these possibilities and how to do it. Creative Engineering looks at new ways to adapt and combine existing technologies as soon as they are available as prototypes, pre-orders or functional mock-ups. We are also interested in new ways of working together and how to create innovative solutions for user problems with respect to technical limitations and non-technical constraints.

Mixed Reality User Experiences

We want to create empathic user interfaces using immersive technologies and combine digital content with physical computing technologies. Tangible and embodied user experience is another area of interest, and we study helpful body-near technologies and collaborative activities in working environments like in the MARTA project on Mixed Reality Art or Moving Digits on collaboration in with dancers and choreographers (see example section). A focus is multimodal interaction addressing all senses and the application of physical proxies for a better user experience in virtual reality.

Example from the Lab

We will illustrate some of our recent projects in the remainder of this paper. For more and recent projects, see www.mirevi.de

Moving Digits

Augmented Dance for Engaged Audience aims to enhance audience understanding and engagement in contemporary dance performances and to allow the experience of dance in an augmented way (even after the performance). Another goal is the empowerment of dancers, choreographers and technicians with further tools for expression, archiving and analysis.

Figure 1. Moving Digits, <https://movingdigits.eu/>

MARTA - Mixed Reality Art

VR and AR become more influencing in various fields so that Mixed Reality technologies are generally more distributed and used in a wide scope of applications. Typically, these technologies are implemented in different fields independently from each other. Our approach with **MARTA** is based on close cooperation between research, entrepreneurship and art during all phases of development, leading to “Spill-Over” effects and realization of jointly used production environments. The goal of **MARTA** is the utilization of Mixed Reality technologies for application of artistic and creative content in public spaces. By developing tools and production environments, artists, technicians, and experts can cooperate to create content that can be showcased.

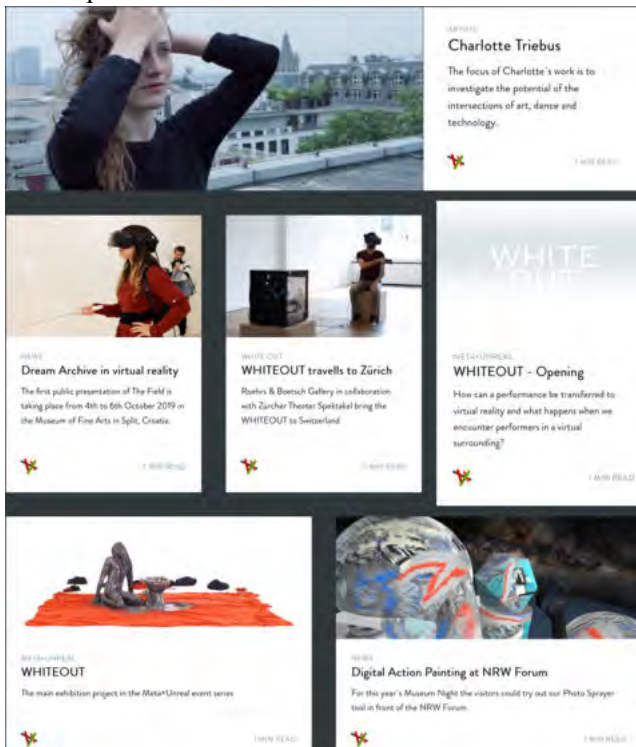

Figure 2. MARTA - Mixed Reality Art, <https://mixedrealityart.de/>

DISTEL

The goal of the project consortium **DISTEL** is to implement a flexibly usable demonstrator for data-driven, nonlinear storytelling by means of immersive and intelligent technologies. We developed two intelligent communication partners (using the real robot Pepper and a virtual 3D avatar) that realize different complex communication scenarios by using the latest AI technologies.

DISTEL is intended to prove that the combination of immersive and intelligent technologies can result in new forms of storytelling that have synergistic unique features for the domains of data science/artificial intelligence, digital storytelling and human-technology interaction/mixed reality.

Figure 3. Digital Storytelling with Robots

The **DISTEL** installation *Spheres* focuses on the dialogue between humans and technology and on the question how movement can be transformed in different bodies by means of interaction, approaching and coincidence. In a 30-minute performance, the dancers interact with the spheres through their movement and positioning. During this time, the spheres, and performers debate with each other and develop a shared form of communication and interaction.

Figure 4. <http://charlottetriebus.com/portfolio/spheres-artistic-research/>

is a rose

The work ‘is a rose’ was created by artist Charlotte Triebus in cooperation with the MIREVI Lab and it deals with the interspecies communication between a romantic surveillance state and the actor-network theory. It addresses topics such as agency of animate and inanimate objects and the possibly overcome dichotomy of nature and technology, thereby revealing an equality of agents in a performative framework. Can we concede that each of these agents is capable of a behavior coming close to action?

Figure 5. <https://mirevi.de/blog/is-a-rose/>

Our presentation includes more recent work and discuss our interdisciplinary approach working with artists and technical experts at eye level. For archive purposes it is available at www.mirevi.de

Technoetic Arts: a Journey of Speculative Research

Suzhou, China

Contact Email: editors@technoeticartsjournal.org

Abstract

First published in 2003 by founding editor Roy Ascott, Technoetic Arts is a peer-reviewed journal that explores the juncture of art practice, technology and the mind. Drawing from academic research and often unorthodox approaches it opens up a forum for trans-disciplinary speculative frameworks.

In 2020, with the support of the publisher Intellect, Ascott entrusted the editorship to what he defined the editorial organism, an international assemblage composed by: Claudia Jacques, Claudia Westermann, Dalila Honorato, Iannis Bardakos, Tom Ascott and Yong Hu.

The Editorial Organism of the Technoetic Arts Journal is considered an extitution. The term extitution relates to a radically dynamic form of organisation, differentiating itself from the dominant form of organisations, typically conceptualised as static institutions. Extitutional theory is an emerging area of research that provides a set of conceptual tools for describing and analyzing the underlying social dynamics of a variety of social arrangements, such as communities, businesses, organizations, or any other structure.

An extitution is an open, flexible, dynamic and diachronic multiplicity and, in this sense Technoetic Arts, combining academic research and artistic expression throughout the years, has established a unique journey. Within this presentation, we explore the reinvention of the editorial process through an organism that is composed of interdependent conscious units that coexist and apply decision-making in a decentralised way.

Author(s) Biography(ies)

Editorial Organism

Created in 2020, the Editorial Organism is an assemblage of six independent minds and bodies, serving the journal *Technoetic Arts* in its daily operations as principle editors. The Editorial Organism, aiming to expand the boundaries of academic publishing, is dedicated to critical creative enquiry on topics of art, technology and consciousness.

John Bardakos

John Bardakos is an artist and researcher born in Athens, Greece. He studied mathematics, digital, and traditional media in applied and fine arts in Athens, Paris and Madrid. Bardakos lectured in-between theory and practice in Athens and Paris and joined the Roy Ascott Technoetic Arts Studio in 2017 as a course coordinator and senior lecturer at the DeTao Masters Academy and the Shanghai Institute of Visual Arts continuing his research between fine arts, technologies, mathematics, cybernetics and diagrams. He is currently continuing his art and research activities at the Athens School of Fine Arts and the University Paris 8, focusing on interaction, spatial/digital poetics, aesthetics, and mathematical structures following a technoetic paradigm.

Dalila Honorato

Dalila Honorato, Ph.D., is tenured faculty in aesthetics and visual semiotics at the Ionian University, Greece and a collaborator at the Center of Philosophy of Sciences, University of Lisbon, Portugal. One of the founding members of the Interactive Arts Lab, she is the head of the organizing committee of the conference *Taboo – Transgression – Transcendence in Art & Science* and a co-founder of the network 'FEMeeting: Women in Art, Science and Technology'. In 2020 she was invited to join the Editorial Organism of *Technoetic Arts*.

Yong Hu

Yong Hu, Ph.D., is associate professor in the School of New Media Art and Design at Beihang University, China, and a researcher at the State Key Laboratory of Virtual Reality Technology and Systems. He obtained a Ph.D. degree in computer science and virtual reality from Beihang University and then continued to engage in interdisciplinary teaching and research on computer science and art design, such as virtual reality art design and interactive art design. He has published widely on topics in CG, VR and art design. In 2020 he was invited to join the Editorial Organism of *Technoetic Arts*.

Claudia Jacques

Claudia Jacques, Ph.D. (Univ. Plymouth, UK), MFA (SVA, US), is a Brazilian-American interdisciplinary technoetic artist, designer, educator and researcher. Human-computer interactions, cybersemiotics, semiotics, cybernetics, consciousness and design are some of her publication topics. She collaborates with many artists exhibiting and presenting both in the US and abroad. Parallel to serving in the *Technoetic Arts* Editorial Organism (2020), she has been serving as art & web editor for *Cybernetics and Human Knowing* since 2013. She has been collaborating with UCLA's ArtSci Center since 2011 as an Information and Instructional Designer and is the founder and creative director of Knowledge Art Studios Inc. Her studio is in Ossining, NY.

Claudia Westermann

Claudia Westermann (Ph.D.) is an artist and architect, licensed with the German Chamber of Architects, and a senior associate professor in architecture at Xi'an Jiaotong-Liverpool University in Suzhou, China. She holds postgraduate degrees in architecture and media art and obtained a Ph.D. from CAiiA, Planetary Collegium, for her research on a poetics of architecture, titled 'An experimental research into inhabitable theories'. Her works have been widely exhibited and presented, including at the Venice Biennale (Architecture), the Moscow International Film Festival, ISEA Symposium for the Electronic Arts, the Center for Art and Media (ZKM) in Karlsruhe, Germany, and most recently at the 2019 Yanping Art Harvest in Fujian, China.

SoundLab, a spatial audio research/practice unit in Hong Kong

Ryo Ikeshiro, PerMagnus Lindborg

SoundLab, School of Creative Media, City University of Hong Kong
Hong Kong
ryo.ikeshiro [at] cityu.edu.hk, pm.lindborg [at] cityu.edu.hk

Abstract

The presentation is a progress report on the design and installation of SoundLab, [1] a physical art/research space with a hemispherical loudspeaker array dedicated to high spatial resolution audio at the School of Creative Media in City University of Hong Kong that was initiated in November 2020. We also introduce a study on the local context of sonic art in Hong Kong and possible future directions for the genre in the region to which SoundLab aims to contribute through its research and art as well as teaching and outreach activities.

Keywords

Hong Kong, sonic art, sound art, experimental music, electroacoustic music, media art, SoundLab, surround sound, spatial audio, Ambisonics, VR/AR/MR, high density loudspeaker array, progress report, perception, sonification, auditory display, soundscape

Introduction

Spatial sound is fundamental to creative audio and music. In the past, multichannel loudspeaker configurations were confined to concert halls and research institutions. With the recent interest in spatial audio due to the resurgence of Virtual Reality formats, along with the gradual establishment of Dolby Atmos-equipped home cinemas and cinema theatres, opportunities for experiencing surround sound for the general public are increasing. However, whilst there is undoubtedly growing interest from industry, further research into spatial audio perception and sonic art content creation is necessary beyond entertainment and commercial uses. In addition, as a publicly-funded academic institution we are conscious of our responsibilities for contributing to local art and music scenes through outreach events showcasing such research and practice, as well as providing opportunities for Hong Kong-based practitioners through concerts, workshops and residencies.

SoundLab

SoundLab, funded with an ACIM (Centre for Applied Computing and Interactive Media) Joint Fellowship and

hosted at the School of Creative Media [SCM] (Creative Media Centre, City University of Hong Kong) since November 2020, is a physical laboratory space with a loudspeaker array dedicated to high spatial resolution audio. SoundLab enables and supports a range of research, artwork, and teaching activities.

The Joint Principal Investigators PerMagnus Lindborg and Ryo Ikeshiro are setting out six objectives through which the SoundLab will be deployed in research, artwork, teaching, and outreach:

- Design, equip, and maintain a lab space for research in spatial audio perception and design, with a physical hemispherical rig with 24 or more loudspeakers;
- Support research in spatial auditory perception, through perceptual evaluation of soundscape recordings under different reproduction conditions, including higher-order Ambisonics; [2] [3]
- Support the creation of novel sonic artwork i.e. soundscape composition, multichannel electroacoustic music, spatial computer music;
- Conduct research into the use of sonification with spatial audio, in the context of both auditory display and art/music; [4] [5]
- Support existing SCM classes that have course components related to spatial audio (e.g. for film, installation, performance, VR/AR, and games);
- Create a series of outreach events and concerts featuring spatial audio, to benefit SCM students, faculty, and practitioners in Hong Kong, and gain publicity and traction for the SoundLab.

Sonic Art in Hong Kong

In order to better understand the local context of sonic art, (used loosely as an umbrella term to refer to electroacoustic music [EAM], experimental music, electronic music, sound art etc. for want of a better term) to which we aim to contribute, we have undertaken a study on the topic based on interviews with musicians and artists based in Hong Kong involved in sonic art.[6] The local socio-economic and political factors contributing to the current state of art and music both inside and outside academia are considered along with the interdisciplinary

nature of local artists and musicians and the place of sonic art and EAM in their practice.

High density loudspeaker array

Seed funding from ACIM allowed the authors to acquire a set of loudspeakers and additional equipment, and to hire a Research Assistant. As a research laboratory, we are allocated the Multimedia Theatre [MMT] at the Run Run Shaw Centre for Creative Media (see Figure 1). Scheduling is crucial as usage of the space is shared with other departments and faculty.

Figure 1. The Multimedia Theatre, with a large projection screen, eight individually height-adjustable truss sections, four curtains and retractable seats for an audience of 150+ people.

Design

For the first objective of constructing a high density loudspeaker array [HDLA], we began by carefully considering our design options. We contacted experts working at institutions with comparable facilities through our networks. The response was overwhelmingly positive and we are very grateful for the generous advice received from those leading the field both on the technical side and sonic artists and educators teaching spatial audio at higher education level. Online video meetings were held from December 2020 to January 2021 with the following:

- Bill Brunson, instrumental in the design of Kammarsalen at the Royal Academy of Music [KMH], Stockholm, Sweden;
- Franz Zotter and Matthias Frank, based at the Institute for Electronic Music, the University of Music and Performing Arts Graz, Austria;
- Eric Lyon and Tanner Uptegrove, who designed and currently run the Cube at iCAT & Moss Center, Virginia Institute of Technology, USA;
- Natasha Barrett, professor in composition at the Norwegian Academy of Music and NoTAM, Oslo, Norway;
- Simon Smith, technical director at Birmingham Electroacoustic Sound Theatre [BEAST], UK,

previously involved in setting up Kammarsalen at KMH with Brunson;

- Scott Wilson, director of BEAST;
- Craig Jackson, Technical Manager at the Sonic Arts Research Centre, Queen's University Belfast, UK.

Their wealth of experience and knowledge enabled us to select a design for SoundLab which took into consideration our objectives along with the available resources in terms of funding, space and its availability, usage and assistance. The chosen configuration is a hemi-spherical array of 25 speakers in three rings with a zenith speaker plus subwoofers (see Figures 2). The loudspeakers are Genelec 4030a IP on a Dante (AES67) network with PoE+ switches. It is a semi-permanent setup to allow for flexibility and expansion of the speaker arrangement as we aim to embrace the possibilities of a design process that is ongoing and open to the evolving demands of art, research and teaching activities and outreach activities such as concerts, residencies, and workshops.

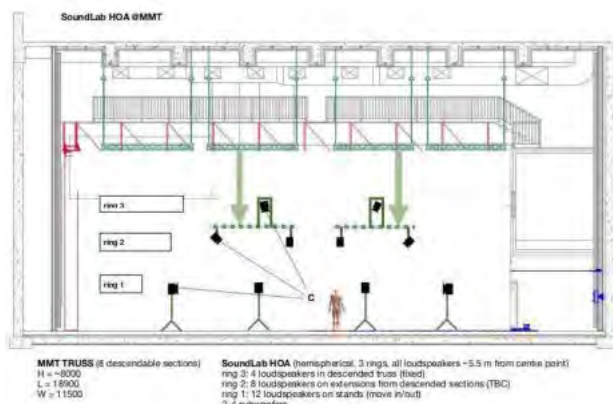

Figure 2. MMT side elevation, with hemi-spherical loudspeaker arrangement (without subwoofers or zenith speaker).

Abstract

The Montreal artist-run centre TOPO is a laboratory for digital explorations for web, performance, and installation spaces. Its mandate is to incubate, produce, and circulate original artworks that explore interdisciplinary and inter-cultural hybridizations through the digital arts. From 2019 to 2021, TOPO proposed a thematic program around "Frontier", with exhibitions, workshops, performances, artist presentations and a paper publication with a digital version to enhance the user experience.

The presentation by TOPO's director Michel Lefebvre will offer an overview of TOPO's production activities in Montreal while focusing on its recent thematic "Frontier". It will offer a summary of approaches developed by artists and theoreticians. It will also address the strategies adopted by this artist-run centre to cross over physical exhibitions towards online dissemination. TOPO is a pioneer in web art and its director aims to bridge the past with the present and offer an overview of their activities

Keywords

TOPO, Frontier, Artist-run centre, Exhibition, Creative Hub, Digital Mediation, art, Production centre.

Creating Digital & Thinking about Frontiers

TOPO was founded in Montreal (Canada) in 1993. The centre grew out of the will of its founding members to develop a structure for the organization of collective and multidisciplinary projects, a will that very soon expanded to explore a digital new era for the artists.

TOPO's creative, circulation, training, and mediation activities contribute to the development of its disciplinary field, at the crossroads of the visual arts, literature, and digital media. The centre guides, supports, and produces interactive projects, receives artists in residence, and offers specialized workshops. Its dissemination component explores innovative modes of presentation for digital artworks through exhibitions, performances, publications, and circulation on the web and in local, national, and international networks. TOPO is a member of the creative hub and exhibition space Pied Carré, in Montreal (Canada). The centre occupies a multifunctional production space open to the community and has an exhibition showcase on the ground floor of the building, in the Mile-End neighbourhood.

From 2019 to 2022, TOPO proposed a thematic program around "Frontier", with exhibitions, workshops, performances, artist presentations and a paper publication with a digital version to enhance the user experience. Anchored in humanity's history, the theme Frontier combines questions brought up by the artist-centre which are as much political and social as physical and technological.

The notion of border is rich in historical, political, psychological, and artistic connotations. In its contemporary dimension, it is increasingly seen as a point of contact and of negotiation rather than simply as a barrier.

TOPO's curatorial committee has selected ten artists, from the plurality of the Americas, who explore themes such as the reconquest of roots and heritages; technologies and their capacity to blur the boundaries between documentary and fiction, living and non-living; and relations between geography and socio-politics, challenging the power relations in a space in various ways.

Inaugurated in fall 2019 and concluding with this publication in spring 2022, the *Frontier* program and the issues that it raises have been tested through the global disruptions that have taken place during this period.

The outbreak of the COVID-19 pandemic wreaked havoc with the lives of people throughout the world and forced the social universe to withdraw, unhappily, to the private sphere. The lockdown rules hammered individual souls with unprecedented behavioural diktats.

The initial *Frontier* program has continued, but was progressively adapted to present web versions of the works. At time of publishing this retrospective in the form of a printed map, with all of the editorial content put online at topo.art/frontiere, a dictatorial power has unleashed war in Eastern Europe, engendering a new cycle of crisis and violence.

Over the years, other conflicts have caught world headlines. The vast sweep of bleak territories makes frontiers a crucial issue. Migrations are intensifying. Climate change is generating new population movements. Have we finally entered the 21st century?

A program of media art installations

The Frontier program comprises three exhibition cycles, each of which is associated with an author: **Nuria Carton de Grammont**, **Paule Mackrous**, and **Mirna Boyadjian**.

To provide further food for thought, four authors approach the notion of borders more broadly from their respective fields of research: **Ricard Zapata Barrero** (politics), **Chantal Pontbriand** (aesthetics), **Jean-Dominique Lecia** (psychiatry), and **David Jhave Johnston** (technology).

1 – *Cultures, languages and spiritualities: beyond borders*

The first cycle brings together four artists from the plurality of the Americas who explore the reconquest of roots and heritages, through questions about memory and death.

Martín Rodríguez, *La Ofrenda*, media installation
ULO, *Conversation with Falling Spheres*,
audiotactile installation

Rodrigo Velasco, *Niyolchoca*, digital and visual poetry
Diego Briceño, *Dupu*, touch screen exploration

2 – *Remix and networks: challenged borders*

The second cycle of Frontier presents three installations that question technologies and their impact on our lives and societies, in their capacity, notably, to blur the boundaries between truth and falsehood, documentary and fiction, the living and the non-living.

Abstract

This institutional presentation focuses on how the ISEA Archive team was able to develop a comprehensive, robust archive of thousands of ISEA items, despite minimal funding and support. The archives were created and are still being developed by a large number of volunteers, students, interns and grant-funded assistants. Over the past few years, a huge amount of information has been added to the archives along with images and PDFs of the papers, publications and other artefacts. There have also been significant improvements in the functionality through the efforts of our volunteer programmers. This massive endeavor has been spearheaded by the four co-directors who are also volunteers. These invaluable archives are used by researchers, artists, educators, students, and the general public. It would not be possible without the dedicated efforts of all the volunteers and contributors involved.

Keywords

ISEA, archive, symposium, preservation, electronic arts, digital arts, research repository, new media

Introduction and Overview of the Archives

ISEA currently has two online archives in development containing documentation of the material presented at the symposium from 1988 to the present. Each archive contains papers, abstracts, artist statements, proceedings, catalogs, biographies, images, videos, and other artifacts that document the development of interdisciplinary practices in the arts, humanities, science, and electronic technology over the past 34 years. The classic archive is mainly, but not entirely, text-based and the information contained within is used to populate the new online archive (see figure 1). The new archive is dynamic and contains bi-directional relationships between the data thus enabling complex searches, categorization, and sorting of data (see figure 2). The new archive also is able to collate a person's contributions to the symposium over the years and post this comprehensive list on the person's profile page. Both archives contain thousands of items that document the history of the field of electronic arts. These materials are now freely accessible to academics, artists, and community members on the web because of the hard work, dedication and determination of our large group of volunteers and co-directors.

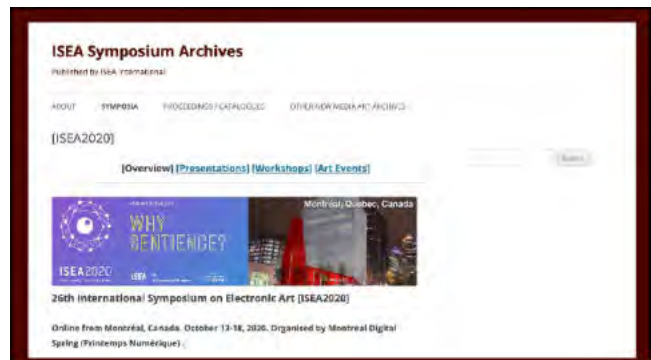

Figure 1. Classic Online ISEA Symposium Archive.

Figure 2. New ISEA Symposium Online Archives.

Teamwork

Co-Directing the Project

The two current ISEA symposium archives are co-directed by four dedicated individuals: Wim van der Plas, Bonnie Mitchell, Jan Searleman, and Terry Wong. Wim van der Plas was one of the original co-founders of ISEA and holds an extensive physical archive of ISEA materials. He also has been to nearly all ISEA symposia and therefore contains the institutional memory necessary to research and proof the materials in the archives. Wim's primary job has been to oversee the acquisition of content to add to the archives. He scans documents, researches missing information and checks for accuracy. He has been adding the material to the Classic archives, which we use to get information for the new archive.

Bonnie Mitchell has a background in information design, web development, and project management. She has been overseeing the content and programming aspects of the project including the tasks assigned to the volunteers. She is also integrally involved in the development of the new archive. Jan Searleman has extensive experience in computer programming and systems development. She has been devoted to the technical development of the new archive but is also involved with the management of the project. Terry Wong is the newest member of the co-directing team. He is developing the ISEA Archives Youtube Channel and also has developed extensive spreadsheets comparing the data throughout the years. Members of the co-directing team work on multiple aspects of the project and have devoted themselves to the success of this project.

Students from Bowling Green State University

The ISEA Symposium Archives have no institutional financial support, therefore the work necessary to program the back-end and populate the archive with content has been largely through volunteer efforts. After the initial subsidy from the Mondriaan Foundation (NL) in 2006, Bonnie Mitchell received a moderate grant in 2016 to hire students to develop the prototype. Between 2016 and 2021, Jan Searleman and Bonnie Mitchell received additional funding through the Association for Computing Machinery (ACM) to contribute to the development of the technology. Students at Bowling Green State University (BGSU) either did internships or received nominal funding through the grants or the Center for Undergraduate Research to work on the project. In the past few years, eight undergraduate and two graduate BGSU students contributed to the project: William Maier, Grant Turner, Kira Whitelow, Alexa Mahajan, Joshua Alahira, and Prabesh Poudel. The current undergraduate research grant recipients are Alexa Mahajan, Lane Sykes, Dayle Bennett and Liam Sykes. Overall, approximately 20 students from BGSU have been instrumental in the development of the new ISEA archive.

Call for Volunteers

In July 2020, we posted a call for volunteers on the ISEA listserv. We received a number of responses and six people joined the team: Michelle Lin, Nick Langen, Maeve Potter, Irena Lyubchenko, Sarah Vollmer, and Kirk Woolford. These new members were from Canada, USA, Taiwan, and the UK. In January of 2021, we posted a call for volunteers on a Netherlands-based website, after which Nyota Kanyemesha and Simon Oosterhuis joined the team.

However, typically, students graduate and move on and volunteers are often only available for a limited time. The number of people working on the archives fluctuates between 5 and 10 participants. Michelle Lin has been with us for the longest period of time.

Internships and Class Participation

In the fall of 2020, two interns, Sara Abdulhakim Mohammad S. Belshalat and Maitha Salem Bakhit Salem Alsubousi, from Zayed University in Dubai, UAE joined the project. Since the ISEA2014 symposium was hosted at Zayed University, these two students focused on adding material from ISEA2014 to the archive.

Cynthia Villagómez, a faculty member at Guanajuato

University (Universidad de Guanajuato) in Mexico contacted the co-directors in August 2021 and volunteered to involve students from one of her graphic design classes in the project. In October of 2021, several of her students including Ximena Briseño, Fabián Robles Parra, Monterra (Mon) Meza, Joselyn Medina, Fernanda Negrete, and Mariana Martínez joined the team and worked on adding the PDF papers and doing graphic design. Cynthia had 13 students in her spring 2022 social service internship class and they continued the work of splitting up PDFs and also began to clean up only scans as well. Mon and Mariana worked with us independently in the spring of 2022 and also began assisting with graphic design for the SIGGRAPH archive.

How We Operate

The ISEA archive team, which has become truly diverse over time, meets every Friday on Zoom with small group meetings focusing on specific tasks. We use Trello as a project management tool to keep track of assigned and completed tasks. The massive collection of digitized artefacts is organized into folders on a shared Google Team Drive and available to volunteers. The co-directors also meet online multiple times during the week.

The volunteers are divided into programmers and content managers. The website has been custom-coded by our programmers, therefore our meetings focus on bug fixes and enhancements to the site. We have had a number of programmers, digital artists and other volunteers help with the programming, UX and interface of the archive over the years. Notably, Joseph Jadach, William Maier and Prabesh Poudel, Troy Yarnell and Jack Spencer coded the functionality of the original site including the PODs structure, data export and visualization. Luis Wilson and Alexa Mahajan, currently do all our custom coding. The content manager meetings involve discussing problems with the data and progress reports. Volunteer Michelle Lin focuses primarily on image formatting and inserting metadata into the images and we have six new interns that will be assisting in the summer of 2022.

Altogether, the hours contributed to this project number in the thousands. The ISEA Symposium Archives would not be possible if not for the dedication and expertise of these incredible contributors. Although the project is far from complete, over the past year a massive amount of progress has been made. For instance, we now have material added for: 26 Symposia, 8843 People, 407 Venues, 5,379 Presentations, 340 Workshops and Tutorials, 3471 Art Events, 6000+ Images, 1000+ PDFs and hundreds of videos.

The archives can be viewed at:

ACM SIGGRAPH History Online Archives: Broadening Our Vision

Bonnie Mitchell, Janice T. Searleman

Bowling Green State University; Clarkson University
Bowling Green, OH, USA; La Jolla, CA USA
bonniem@bgsu.edu; jetsza@gmail.com

Abstract

This institutional presentation focuses on the ACM SIGGRAPH History Archive and how it evolved from the ACM SIGGRAPH Art Show Archive. This massive project involved a rethinking of the information architecture as well as programming the interface and adding new functionality. Thousands of new entries were added, along with images, abstracts, and additional information. After a year of hard work by a group of volunteers and student workers, we have made tremendous progress but much more still needs to be done. When completed, this new archive will encapsulate the evolution of a fringe research endeavor to a visually rich technology integral to our daily lives.

Keywords

SIGGRAPH, archive, preservation, electronic arts, digital arts, new media, computer graphics

Introduction and Background

In 2014, the ACM SIGGRAPH Archive team began creating an online archive documenting digital artworks, art papers, and artist talks showcased at the annual SIGGRAPH conferences and DAC online exhibitions. This online resource was custom-coded by volunteers and students, and grew over the years to be a robust, innovative approach to data dissemination (see figure 1). The digital art-related resources in the archive needed to be scanned, formatted, and entered into fields and thus involved thousands of hours of student and volunteer labor. The project was partially funded by the ACM and SIGGRAPH History Committees and evolved over six years to the point where the team declared the project done enough to expand its objective. In January 2020, Jan Searleman and Bonnie Mitchell, the co-directors of the project, along with a team of student interns, cloned the ACM SIGGRAPH Digital Art Archive and redesigned the interface and back-end to accommodate all of the components of the annual conferences (SIGGRAPH and SIGGRAPH Asia) along with other material from the SIGGRAPH organization (see figure 2).

Figure 1. ACM SIGGRAPH Art Show Online Archives

Online ACM SIGGRAPH History Archive

ACM SIGGRAPH is a Special Interest Group of the Association for Computing Machinery (ACM) on Computer Graphics and Interactive Techniques, and hosts two annual conferences, one in North America and one in Asia. These events include a wide range of creative and technical programs such as the Art Gallery, Emerging Technologies, Electronic Theater, Technical Papers, etc. The conferences attract academics, artists, researchers, practitioners, and other community members interested in computer graphics. The new ACM SIGGRAPH History Archive showcases this broad range of programs.

Figure 2. ACM SIGGRAPH History Online Archives.

Contents of the New Archive

Experiences

The diversity of experiences at the annual conferences includes the Electronic Theater, Emerging Technologies, VR Village, Appy Hour, and Art Gallery. The Electronic Theater showcases amazing computer animation, whereas the Emerging Technology includes interactive displays and cutting-edge technologies. VR Village encourages people to explore new virtual worlds, and Appy Hour features innovative apps that focus on a wide variety of fields. Along with the Art Gallery, these venues were grouped under the category *Experiences* in the new archive.

Learning

The conferences include a number of different types of presentations that were grouped under the category of *Learning* in the SIGGRAPH History archive. These include Technical Papers, Courses, Panels, Posters and much more. Each entry in the new archive contains the abstract, presenter information, and additional information along with a link to the ACM Digital Library.

Publications

The ACM SIGGRAPH organization has produced a number of printed and digital publications since its inception in 1974. These include conference related materials such as the Program and Buyer's Guide and Proceedings as well as Full Conference (and other) CD-ROMs, flash drives, etc. The SIGGRAPH Video Review (SVR) is a collection of animations published on a variety of media from Beta tapes to flash drives. Each of the 194 SVR issues focus on a theme such as Scientific Visualization or the Electronic Theater and contains approximately 20-25 animations. The new history archive contains a representative image of each animation and a short abstract. The actual animation is currently not able to be added to the archive because of copyright issues.

Awards

SIGGRAPH presents a number of annual awards to people who have made a significant impact on the field of Computer Graphics and Interactive Techniques, including the Steven Anson Coons Award, Computer Graphics Achievement Award, Distinguished Artist Award, Practitioner Award, Distinguished Educator Award, Outstanding Doctoral Dissertation Award, Significant New Researcher Award, and the Outstanding Service Award. In addition, there are additional awards given out at the conferences such as the Electronic Theater Best in Show, Electronic Theater Best Student Project, Best Art Paper award, and so on. The online ACM SIGGRAPH History archive highlights each awardee and includes the information relevant to the award.

Collectibles

One of the more exciting aspects of the new archive is the addition of images of collectible items such as coffee cups, pins, T-shirts, etc. The SIGGRAPH conference has a so-called *vulture-culture* where exhibitors and conference organizers give away free gifts and attendees flock to the booths to collect these memorabilia. Also, a merchandise booth sells branded apparel and other items. Members of the SIGGRAPH Community often hold huge collections of these conference-related items and memorabilia. The new archive is like a stroll down memory lane in that viewing images of these artifacts elicits stories from pioneers and long-term attendees of the conference.

Teamwork

Programming

Expanding the ACM SIGGRAPH Digital Art Archive to become the online History Archive involved a rethinking of the entire information architecture. Not only did the interface have to be redesigned, but new fields, taxonomies and templates all had to be added along with custom code to accommodate the various new components of the archive. Through support of the SIGGRAPH History Committee, we were able to hire two student programmers from the US and one intern from Mexico. These talented students took the initiative to propose and implement efficient programming solutions that improved the archive.

Content Management

Each of the conference venues required the addition of thousands of new entries into the archive. There was no way to automate the process of entering information from conference PDFs and scans of publications, therefore we hired student content managers to add it manually. We have currently added 1411 Animations, 1603 Learning items, 570 Experiences, 178 Awards, 165 Collectibles, 163 SVR issues and a scattering of other materials. Combined with our previous efforts in regards to building the SIGGRAPH Digital Art Archive, we now have 10,344 people and 61 conferences.

Future Goals

The SIGGRAPH History Archive is part of a collective of new media art archives that are working on ways to create connections between the archives. Together, our goal is to provide free online access to computer graphics and electronic art historical information so that academics, researchers, artists, practitioners, and community members can reference the past as they define the future.

Beyond Matter. Cultural Heritage on the Verge of Virtual Reality – an international collaboration

Livia Nolasco-Rózsás

ZKM | Karlsruhe, scientific associate

Karlsruhe, Germany

rozsas@zkm.de

Abstract

Beyond Matter is an international, collaborative, practice-based research project that takes cultural heritage and contemporary art to the verge of virtual reality. Despite being a project per se, the endeavour, specifically its online platform, could be seen as a suggestion for a decentralized hybrid institution.

Beyond Matter [beyondmatter.eu] takes cultural heritage and contemporary art to the verge of virtual reality. It reflects on a condition of art production and mediation that is increasingly virtual with a specific emphasis on spatial aspects in art production, curating, and mediation. A plurality of possible solutions and options that are emerging alongside the development of computation is explored through numerous activities and formats.

The collaborative endeavor was initiated and is led by ZKM | Karlsruhe, and includes the Aalto University in Espoo, Centre Pompidou in Paris, Ludwig Museum – Museum of Contemporary Art in Budapest, Tallinna Kunstihoone, and Tirana Art Lab – Center for Contemporary Art. It understands practice-based research as a process within the museum context that encompasses the development and creation of museum experiences, their evaluation with the inclusion of the audiences, and creating best practices for museum professionals, who are increasingly required to apply digital tools.

Keywords

Cultural heritage, practice-based research, international collaboration, virtual condition, digital art conservation, experimental museology, hybrid museum experience

Beyond Matter. Cultural Heritage on the Verge of Virtual Reality

Introduction

Beyond Matter reflects on the virtual condition in art production, curating, and mediation via numerous activities and formats, including the digital revival of selected past landmark exhibitions, art and archival exhibitions, conferences, artist residency programs, an online platform, and

publications. In attempting to depict the virtual condition the project probes the ways in which physical and digital space are interdependent and seeks to inhabit computer-generated space as an assembly—as a platform for exchange, for the contemplation and mediation of art—without approaching it as a virtual copy, a depiction or digital twin of actual physical spaces.

Its numerous activities and formats include the digital revival of selected past landmark exhibitions, art and archival exhibitions, conferences, artist residency programs, an online platform, and publications, all which will take place between 2019 to 2023.

One of the goals of the project is to develop novel solutions for the accessible digital documentation and networked presentation of current and past exhibitions in physical space – including their artworks, artifacts, and educational materials. In future, these methods of virtualizing exhibitions could be used by museums and galleries to document and revive their exhibitions in new ways. With our experiential, research-based methodology we will provide a basis for developing museological and technological aspects simultaneously.

Exhibition spaces are physical locations of knowledge production and exchange, where spatial qualities play an important role in the contextualization of information. Virtual productions, emulations, and revivals should therefore maintain these qualities, but also be able to include digitized and born-digital content, whether these are artworks, exhibits, or informational materials. This is equally relevant to the reconstruction of spaces that no longer exist.

To ensure that the methods developed remain in use in the longer term, the project aims to contribute to the capacity building of museum professionals through seminars and conferences. The results will be collected in the Virtual Museum Toolkit, and encompass practical and theoretical knowledge on the inclusion of virtual exhibitions in displaying and mediating artworks.

Partner museums and galleries will also host large and small-scale exhibitions to measure and further practice-based innovation, as well as events to disseminate the project's results. In a framework of artist-in-residence programs, artists are invited to develop new pieces for these exhibitions, ensuring that the project resonates with the latest contemporary trends.

1017

The project was initiated at ZKM | Center for Art and Media Karlsruhe and is managed by ZKM |

ganizations from a wide range of European countries—almost all regions of the continent—and foresees cooperation with various other organizations that have a broad spectrum of experience in fields of digital art conservation, digitizing tangible and intangible heritage, exhibitions of contemporary and new media art, and experimental museology.

Author’s Biography

Lívia Nolasco-Rózsás is a curator and art historian. She has curated exhibitions at institutions of contemporary and media art worldwide since 2006, including at the ZKM | Center for Art and Media (Karlsruhe), Chronus Art Center (Shanghai), Tallinna Kunstihoone, Múcsarnok Budapest, focusing on the constantly changing media of contemporary art and intersections with various disciplines. She has initiated and developed thematic exhibitions raising questions such as the genealogy and social impact of planetary computation and computer code, electronic surveillance and democracy, and synesthetic perception.

As of 2019 she has started research in curatorial studies on the “virtual condition” and its implications in the exhibition space at the Academy of Fine Arts Leipzig, and as acting head of the international collaboration project entitled Beyond Matter at ZKM | Karlsruhe, which she initiated and in which institutions such as Centre Pompidou Paris, Aalto University, and others are participating.

FILE FESTIVAL Archive implementation

Paula Perissinotto, Dalton Martins

FILE FESTIVAL INTERNACIONAL DE LINGUAGEM ELETRONICA, TAINACAN

São Paulo, Brasil

paula@file.org.br, dmartins@gmail.com

Abstract

The presentation is about the implementation process of the digital archive of FILE - Electronic Language International Festival. The digital archive of FILE festival is being carried out according to a defined semantic and data modelling, including the input of data information for the years 2015 to 2019, aiming at its organization in the Tainacan digital repository. The talk will also point out the practical developments arising from the FILE ALIVE online meetings, held in March 2021, and more specifically what emerged from the session entitled "Archive as an Institution", in which an alliance of partners was effected between the team ISEA (International Electronic Art Symposium), ACM SIGGRAPH (Association for Computing Machinery's Special Interest Group on Computer Graphics and Interactive Techniques) and FILE; with the common objective of seeking interconnection between the digital archives of each organization.

Keywords

digital file; digital memory; cultural memory, digital platform, database.

FILE festival's archive began in 2012 with Gabriella Previdello, with a physical organization of subscription forms and other information sent to the festival by artists, via mail, since the year 2000. Recently this organization was taken up by Paula Perissinotto as an object of doctoral research in the area of Visual Poetics at ECA - School of Communications and Arts of the University of São Paulo, to organize the content of 20 years of the festival, both physically and digitally, in order to connect it with institutions in the world that work in the field of art and technology, and through a network cooperative that currently has a team involving three institutions (Tainacan, Percebe and FILE).

Before the proposal to integrate its archive with other institutions, FILE festival already intended to reorganize its digital repository and change the archive structure, initially installed in WordPress, to allow it to be interconnected with each other. The planned path intended to use a content manager with headless technology, such as Strapi (headless technology).

However, another possibility emerged from the online meetings arising from the session "What to archive? Demands and principles of digital memory", and it is about the Tainacan project, approached by its coordinator, Dalton Martins, in his presentation. Conceptually, the Tainacan software is very similar to headless content management,

but uses the WordPress database, in which the FILE collection is already hosted.

Tainacan is the product of work developed at the Faculty of Information Science at the University of Brasília, where archival, museology, library science and a graduate program are located, setting up a favorable space for the development and exploration of issues in around memory, collections and archives.

Tainacan, based on WordPress, is in use and used in different ways by institutions that are central to the preservation of national memory. In the case of the National Historical and Artistic Heritage Institute (IPHAN), for example, the tool was used to develop the intangible heritage inventory. The software has been downloaded more than 8 thousand times since its distribution was started by the WordPress plugin repository, it has more than 300 active installations from institutions, with more than 20 public universities.

In this sense, FILE festival reconsidered the migration of digital data to the STRAPI headless system and opted for the organization of the online database using Tainacan technology, compatible with the WordPress environment in which the festival's data is already hosted.

Initially, a diagnosis of the organization scheme and cataloguing of FILE's digital content data was carried out together with the company's team, and then the informational architecture was designed through a survey of informational typologies, collections characteristics and institutional informational modelling needs, considering interconnection strategies with ISEA/SIGRAAPH archives.

To carry out this diagnostic stage, the FILE team provided the Percebe team with the internal structure (figure 1) currently used to catalogue the FILE Festival contents to be migrated, in addition to the current references of the structure used by the ISEA Digital Archive, provided by its co-director Bonnie Mitchell. The idea is to adapt to this cataloguing structure for possible interoperability between systems.

To facilitate the analysis and diagnosis, both the data related to category references, metadata and the information/data organization map used by FILE were transposed from a hierarchical tree model, as shown in Figure 2, to a spreadsheet, where it was organized by levels of terms.

After this systematization, the data were descriptively analyzed (figure 3). Three informational sets that must be worked on for the digital repository in Tainacan were then identified in the internal references:

- Categories: theme, format, topic, genre, platform and media;

- Types of documents: catalogs, logos, completed projects, non-performed projects, administrative;
- Metadata: descriptive fields currently in use.

Figure 1. Reference to Percebe diagnosis of FILE categories to a spreadsheet organized by levels of terms. © Copyright. FILE FESTIVAL

Figure 2. Categories hierarchical tree model of FILE. © Copyright. FILE FESTIVAL

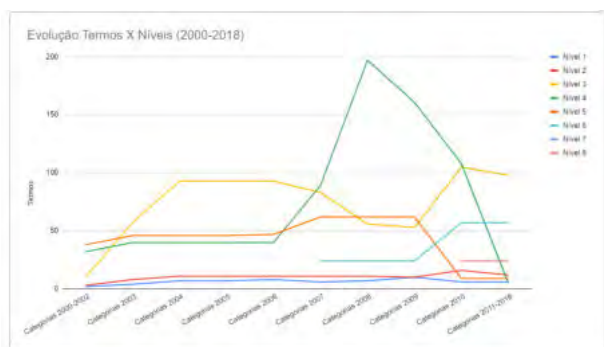

Figure 3. Graphic created by Percebe in 2021 to illustrate de Evolution of FILE terms from 2000 to 2008. © Copyright. FILE FESTIVAL

After the implementation of the FILE Festival online archive, FILE will be able to consider the realization of the interconnection between the FILE files and those of ISEA and SIGGRAPH.

Author(s) Biography(ies)

Paula Perissinotto is specialized in new media, contemporary art and digital culture. Graduated in Fine Arts at FAAP, with master's degree in visual poetics from ECA (School of Communications and Arts, University of São Paulo). Specialization in Curating and Cultural Practice in Art and New Media by MECAD / ESDI in (Barcelona / ES). Since 2000, Paula Perissinotto has been co-founder, organizer and co-curator of FILE International Festival of Electronic Language, a non-profit cultural organization, that promotes and encourages aesthetic and cultural productions related to the new poetics of contemporary culture.

Dalton Martins work with research on the interface between computer science and information science, focusing specifically on data science and websemantics/open data linked applications for digital collections development and data analysis of memory institutions' collections. Currently coordinates the Tainacan project, in partnership with the Brazilian Institute of Museums.

Crossing Over from Digital Practices to Media Arts and into Social Innovation: School of Arts, University of Nova Gorica (SI)

Kristina Pranjić, Peter Purg,

School of Arts, University of Nova Gorica
Nova Gorica, Slovenia

kristina.pranjic@ung.si, peter.purg@ung.si

The School of Arts (www.ung.si/au; au.ung.si) is part of the University of Nova Gorica, situated on the border between Slovenia and Italy. This young and dynamic art school offers interdisciplinary study programs in **Digital Arts and Practices** and its follow-up – Master of Arts in **Media Arts and Practices**, through the Modules of Animation, Film, Photography, New Media, Scenography Spaces and **Art-Science-Technology**, with a focus on Contemporary Art Practice. To foster students' development as independent creators, researchers, and agents of change, the school pursues a personal approach and an advanced attitude toward interdisciplinary cooperation as well as artistic research, particularly in combining the arts with other disciplines within and beyond academia.

In recent years, the school lead major EU-supported projects such as:

- MAST – Master Module in Art, Science and Technology;
- IDEATE.me – Interdisciplinary Transformations in Education;
- ADRIART.net – Advancing Interactions in Art Teaching.

Besides such pedagogy and curriculum development projects, the school's motley collective has been fostering international alliances and advancing interdisciplinary research in projects such as:

- DIVA – Art:Biz Innovation Ecosystems;
- KONS – Platform for Contemporary Investigative Art;
- TV Free Europe – 1,5 million Steps over the Borders;
- EmindS – Interdisciplinary Entrepreneurial Mindsets;
- HiLoVv – Hidden Lives of Venice on Video;
- PAIC – Participatory Art for Invisible Communities.

They have founded ADRIART.CE, a growing network of a dozen art academies from Central and South Eastern Europe.

The School's recent developments revolve around fostering capacities for artistic research, deeply founded in the humanities, on the one hand, and engaging with the actual social and environmental challenges, on the other. Therein the School of Arts closely liaises with the School of Humanities, sharing the campus building, faculty and courses as well as engaging in joint projects on international scale.

Both schools are members of the University of Nova Gorica (UNG; www.ung.si/en/). UNG is a research-oriented, internationally established university, recognized as a driving force of social development in the cross-border region of Slovenia-Italy. Often acting as initiator and lead partner of international research and development or artistic projects, UNG displays a high level of scientific and pedagogical quality as well as top achievement results in the cutting-edge fields of (and among) science, technology and art. Next to the applied arts pedagogy and research, the outstanding research indicators of UNG relate to the realm

of basic research in both natural sciences and humanities, whereas several of its research projects are closely tied to the industry and feature major contributions to European technological development. In recent years UNG implemented four major projects, primarily aiming to strengthen the institution's research capacities, connect research activities with the economy, and transfer knowledge to the economic sector: “Uncorking Rural Heritage”, RETINA, NANOREGION etc.

The School of Arts is thus situated in a very specific location, between the Slovenian town of Nova Gorica, which was constructed as a socialist utopian idea after WWII; and the ancient town of Gorizia on the Italian side (where the School of Arts resided 2012–2019). The two towns are now building their common future towards “**GO! BORDERLESS 2025**”, the **European Capital of Culture in 2025 (ECOC)**, and the School of Arts is a key partner in this journey. This ECOC process has started developing a coherent community platform to apply the social (transformation) part of the School of Arts' methodological approach. The newly established creative hub “Xcenter” in the pedestrian zone of Nova Gorica and the emerging community of designers and business professionals around it to a large scale, includes the School of Arts' students and mentors. Moving outside of academia, these transformations should facilitate distributed social innovation processes in that they involve non-academic and non-scientific entities within a research setting: the social reality (community of EU/ECOC) mutually transforming the pedagogical reality (art school and university community).

Going Borderless among Art, Science and Technology

The School of Arts has always been very attentive about its social and geopolitical realities, striving to enrich the dialog and interactions between the twin-towns' citizens and their temporary residents, among them its numerous international students. On the background of this multicultural setting, the borderless idea permeates UNG's academic realities, and is reflected, next to the diverse academic community profile, also in its new interdisciplinary curricula. **Students get familiar with the new interdisciplinary trends in the art-science-technology (AST) crossover gradually, entering through other more traditional media**, and continuing along the School of Arts' intertwined system of **modular studies that supports the student's search and experimentation along the academic pathway**. The AST journey often takes place either through video-film formats (mentor Assoc. Prof. Jasna Hribernik) or through one of the carrier modules, such as New Media (module leader Assoc. Prof. Peter Purg, PhD) or Contemporary Art Practices (module leader Prof. Rene Rusjan). For several years School of Arts' main AST guest mentor has been School's alumni Robertina Šebjanič, now a renowned interdisciplinary artist, who works practically with students from different fields of

interest (film, animation, photography, new media) that share passion for scientific and technological approaches within art.

In 2020 the UNG School of Arts accredited a novel **Master Module in Art, Science and Technology (MAST)**, exploring **in what way can the imagination of artists and their tools for creativity bring about true novums that could tackle the most complex challenges of the future, both for society at large, and the industries in particular**. In the MAST project, next to accrediting an international master module across three European universities, participants from a variety of disciplines have jointly explored and identified the vectors of **possible policy impacts and priorities for the future of Europe as well as created alliances for forward-thinking future actions that may and should permeate EU's approach to innovation**.

MAST was created 2018–2020 by a consortium of partners within an EU supported project, coordinated by the UNG School of Arts, including the Institute of Spatial Design at Graz University of Technology, the Madeira Interactive Technologies Institute (M-ITI), and the NGOs Culture Action Europe from Brussels, the Croatian Cultural Alliance from Rijeka, and the Kersnikova Institute from Ljubljana.

Scaling Interdisciplinary Innovation onto Regional Alliances and Platforms

The MAST spirit continues to live in the **konS– Platform for Contemporary Investigative Arts (2019-2022)** where the **Innovation Catalyst profile** is being pursued and developed in practice through hundreds of DIY-electronics and media-art based up-skilling workshops, dozens of cutting-edge artistic productions and a robust transfer-to-industry mechanism. This well-funded national EU-cohesion project promises to establish **stable links between communities, knowledge institutions, research centers and the economy at a systemic level**, with all parties dedicated to **co-creating a sustainable, safer and more ethical future in a dynamic, constantly changing world**. Efforts to establish an active network of research, production and justification of better conditions for research, development and realization of contemporary research art projects, brought together nine partners – NGOs, art producers, tactical media, public cultural centers and the **UNG School of Arts as the only educational institution of the consortium**. The content and structure of the newly established konS network concentrate around a threefold common vision: the establishment of **capacity-building hubs where different audiences can be empowered to critically use new technologies** (konS ≡

PARK); art research laboratories across the country that enable the production of contemporary investigative arts (konS ≡ NOVA); and the Laboratory for Speculative Innovation for Translating Farsighted Artistic Ideas and Inventions into Innovations for the Advancement of the Social Environment in Europe (konS ≡ PRACTICE).

Next to the School of Arts, Kersnikova Institute was also the co-initiator of another complementary project, DIVA (Development of Innovation Ecosystems and Value Chains Supporting Cross-Border Innovation through Creative Industries), supported by the Italy-Slovenia Cooperation Programme of the European Regional Development Fund of the European Union. The project was designed to create a methodology and implement pilot projects that connect the creative sector not only with the most progressive hi-tech, but also with more traditional businesses. With a role of co-establishing a (recently opened) regional creative hub, the aforementioned “Xcenter”, and therein providing educational as well as interdisciplinary expertise, the **School of Arts follows the aim to accelerate art-inspired innovation and bring novel products or services to the market**, the final aim being to support social innovation and develop a positive model for the European cross-sectoral economy.

The most recent (yet externally unfunded, i.e., spontaneously initiated) project emerging upon the legacy of MAST is **Loose Cells**. There experts, professors and students of the UNG School of Arts have been creating a **multi-layered art-science object addressing issues, such as sea level rise, wood properties, sustainability of the building sector and human-nature-technology relationships**. The project was designed by a consortium of four partners lead by the research institute InnoRenewCoE as the main driver of the project; other partners included also the University of Primorska and the Association for Culture and Education PiNA (with the support of the RUK network of research centres, a parallel platform structure to the one of konS). The so-called hybrid object was presented at four festival venues across Slovenia in 2021.

In 2022 the School of Arts continues its collaborative journeys and keeps nurturing its manifold partnerships, pursuing radical innovation in art education, as well as forging new interdisciplinary experiments across art-sci-tech. While the presence of its graduates at festivals and exhibitions Europe wide remains ever so propulsive, this unconventional art academy goes on to explore novel arts-and-humanities blends, and amplifies its role in cross-sectoral policy making.

The ARTENSO LAB: an incubator of digital cultural mediations

Eva Quintas

ARTENSO – Centre de recherche et d'engagement en art et engagement social

Montréal (Québec), Canada

evaquintas@artenso.ca

Abstract

The ARTENSO LAB is dedicated to experimentation, creation, and production of collaborative digital cultural mediation projects. In fall 2021, the LAB Incubator opened its doors to guide a first cohort of four teams/projects wishing to explore the connections among cultural mediation, digital devices, and collaborative processes. Selected through a call for projects, the proposals come from artists, mediators, and representatives of organizations wanting to find an innovative response to issues involved in relationships between the cultural field and the social field. ARTENSO is extending the incubation and support project in digital cultural mediation with a research aimed at documenting core collaborative practices in the cohorts. This presentation aims to share the characteristics and effects of cultural

Labs based on the model of the ARTENSO center. The questions we ask are about contemporary modes of learning and transmission in a complex, open, and interdisciplinary world

Key words

Cultural Labs, Media Labs, Living Labs, Creative hubs, Cultural Mediation, Digital Cultural Mediations, Collaboration, Participatory design approaches

Text

The ARTENSO LAB: An Incubator for Digital Cultural Mediations

ARTENSO is a centre for the transfer of innovative social practices, affiliated with Cégep de Saint-Laurent – a college for general and vocational education – based in Montréal (Québec, Canada). ARTENSO's mission is to promote research and innovation in art and social engagement in the field of cultural mediation.

We understand cultural mediation as a professional field of cultural action in which strategies, mechanisms, and tools are formulated to improve access to cultural productions and encourage individuals' cultural expression. At the intersection of the cultural and social spheres, cultural mediation practices are defined as processes of transmission and appropriation of meaning through a personalized

and living relationship between cultural references and individuals. Ultimately, these practices aim for personal growth and empowerment as well as cultural inclusion and civic participation (Quintas, 2014).

The question of collective knowledge-building processes, participatory design approaches, and new operating models, propelled in particular by digital culture, is a transversal dimension that guides the centre's actions and its research and development streams.

Since it began its operations, ARTENSO has sought to offer innovative solutions to mediators' professional needs in terms of co-development and collaborative learning. Through the stages of reflection on and evaluation of the community's needs, a response has gradually emerged, embodied in the creation of a unifying, structuring, and innovative place for those in the cultural mediation field, whether emerging or established: a laboratory dedicated to digital mediation.

Geolocation, mapping and storytelling

In fall 2021, the LAB_ARTENSO Incubator starts its activity to support a first cohort of 4 teams/projects wishing to explore the connections between cultural mediation, digital devices, and collaborative processes. The project takes place over a period of four months from October 2021 to January 2022 and a second cohort will be assisted from March to June 2022. The theme for this first year is geolocation, mapping and storytelling through the use of interactive and participatory positioning and mapping technologies. The selected projects are diverse, but all speak of links between culture, city and citizenship.

Collaboration and innovation

ARTENSO is extending the incubation and support project in digital cultural mediation with a research project aimed at documenting core collaborative practices in the cohorts. These approaches, stemming from digital culture (living labs, hackathons, creative sprints), are becoming more and more popular in the cultural mediation community. They have received little academic attention, however, in Québec, where the literature focuses more on collaboration from an art-making perspective (McCabe, 1984; Bishop

2012; de Maison Rouge, 2017) and particularly within community art (Boisvert, 2016, Neumark and Chagnon, 2011) and participatory art practices (Casemajor, Lamoureux, and Racine, 2016).

The research that we are conducting aims to shed light on the notion of collaboration and innovation in cultural mediation while observing how the concepts are operationalized

within the incubator. We want to understand how collaborative approaches can contribute to enriching cultural mediation practices. We are also intensely interested in sharing findings on how to support the novel processes of carrying out digitally adapted cultural projects; the questions we ask are about contemporary modes of learning and transmission in a complex, open, and interdisciplinary world.

Author Bio

Eva Quintas is the Executive Director of ARTENSO, a research center in art and social engagement, affiliated with the Cégep de Saint-Laurent in Montreal (Canada). Graduated in cultural management and fine arts, she specializes in cultural policy, cultural mediation, and digital culture. Over the last 20 years, she has held key positions at Culture pour tous and Culture Montréal and has worked with numerous organizations as a trainer and cultural development consultant. She is a member of the Observatoire des médiations culturelles (OMEC), the Observatoire interdisciplinaire de création et de recherche en musique (OICRM) and the Commission numérique de Culture Montréal. Co-founder and secretary of the TOPO digital art centre, she also pursues a visual and media arts practice.

EUR ArTeC in digital art and hydrological ecosystems

Everardo Reyes, Andrés Burbano

Université Paris 8, Universidad de los Andes

Saint-Denis, France, Bogotá, Colombia

ereyes-garcia@univ-paris8.fr, aburbano@uniandes.edu.co

Abstract

The *École universitaire de recherche* (EUR) ArTeC is a consortium of fourteen French institutions including universities, *grandes écoles*, museums, and archives. ArTeC was established in 2018 at the initiative of universities Paris 8, Nanterre, and Paris Lumière with the intention to consolidate a long-term project on art and science for education and research. In this presentation we highlight some milestones over the last three years of development. Moreover, special attention will be given to the importance of ArTeC in the development of art-science and humanities-technologies projects. One of the projects that will be showcased is HOM - Hydrology of Media which aims at establishing connections at the crossing-boundaries between several disciplines and practices. We also discuss the role of ArTeC as an organizing partner of ISEA 2023, that will take place in Paris, France.

Keywords

Art, science, technology, consortiums, organizing teams, partners, hydrology, media.

Three years of EUR ArTeC

Created in 2018, ArTeC is a consortium of universities and institutions that put together their expertise in terms of scientific, technological, cultural, and artistic research. Among other initiatives, ArTeC fosters multidisciplinary dialogue by counseling, assisting, and funding the development of applied projects, innovative pedagogical modules, scientific publications, and an international master's degree program. The uniqueness of ArTeC, among other French EURs, is its orientation towards a critique of digital culture by means of artistic theory and practice.

In close relation with its vision, ArTeC has been involved with the organization team that is carrying on the 28th edition of ISEA, to be celebrated in Paris, France, from May 16-23, 2023.

A Hydrology of Media Approach

Among more than fifty projects that have been juried to be funded by ArTeC, we introduced in 2020 the project HOM: Hydrology of Media. In accordance with the axes

Authors Biographies

Everardo Reyes is an Associate Professor in the Department of Information Science at Université Paris 8. He directs the MA/MSc in Digital Humanities and has been recently appointed Vice-president of digital matters. His main research interests are digital culture, information design, cultural analytics, and media art. He serves as the representative of ArTeC and Paris 8 in the organizing committee of ISEA 2023 in Paris.

“creation as a research activity” and “technologies and human mediation”, HOM was initiated by an international team of scholars and artists, including Everardo Reyes and Gwen Le Cor from Université Paris 8; Andrés Burbano from Universidad de los Andes, Colombia; Andrea Sosa from Universidad de la Plata, Argentina; and Anastasia Tyurina from Queensland University of Technology, Australia.

HOM is an approach to art, science, and humanities. It adopts a multicultural and multidisciplinary effort to explore the properties and effects of water in our own artistic, cultural, scientific, and educational practices. We have been interested in studying the materiality and the symbolic representations of water through the direct intervention of instruments and scientific methods. The questions we are interested continue investigating are: How to represent water to scales that are invisible to the human eye yet its effects are pre-sent and perceptible? How to provoke new aesthetic reactions that create a hydrologic conscience?

Despite the health crisis that constrained us to rethink field work, we organized distance ways for cooperation. For example, we held two international seminars in hybrid format with graduate students from France, Bulgaria, and Greece; we animated a workshop at ISEA 2020 – Montreal; we organized an international congress about digital image; and, we have published more than fifteen experiments that articulate technological instruments and user interfaces with critical and ecological observations.

While most of the HOM activities have been published on the website <https://hom.pubpub.org>, one of our main goals for the current year is to document our research, teaching materials, and experiences following an open data approach. This implies the examination of publishing and management systems that emerge within the open science and open education communities.

Acknowledgements

We are grateful to the whole EUR ArTeC staff members for their involvement and dedicated passion in this period of health crisis. Special thanks to Prof. Yves Citton, who concluded his term as executive director of ArTeC in 2021, and to Prof. Tiphaine Karsenti, who took over the mission with enthusiasm and goodwill.

Andres Burbano is a media history scholar and media artist, he is an Associate Professor in the Department of Design at Universidad de los Andes, in Bogota, Colombia. Burbano holds a Ph.D. in Media Arts and Technology from the University of California Santa Barbara. He is visiting professor at the Danube University in Krems, Austria, and is currently visiting researcher at the University of Applied Sciences at Potsdam, Germany.

Funding at the intersection of art, science and technology

Rohrer, Seraina and Rippstein, Ariane

Affiliation: Pro Helvetia

Switzerland

arippstein@prohelvetia.ch

Abstract

The Swiss Arts Council Pro Helvetia has launched a four-year focus on arts, science and technology. The foundation sees great potential in transdisciplinary fields such as electronic art, bioart, tech art or new media art and is devoting special attention and funding to projects at the crossroads of disciplines. For that purpose, different initiatives and collaborations with scientific institutions such as CERN or the Swiss Polar Institute provide opportunities for artists and cultural practitioners to engage with transdisciplinarity or deepen their existing artistic practice. From 2021-2024, Pro Helvetia wishes to contribute to the exploration of social processes and the development of future prototyping.

Keywords

Funding; Arts Council; Trends; Innovation; Networks; Collaboration; Grants; Transdisciplinarity; Artistic Research; Switzerland

Connecting Art, Science and Technology

The interfaces between art, science and technology gained importance in recent years and hold great potential for new creative collaboration and production models. With the demand for transdisciplinary exchange present in universities and a variety of industries, the skills of artists are increasingly sought after to initiate new research and production processes. Simultaneously, many artists and creative professionals experiment with new technologies or combine their practice with scientific research, thus entering fields such as electronic art, bioart, tech art or new media art.

In regard to an increasingly complex and interconnected future lying ahead, transdisciplinarity is becoming relevant within the field of cultural promotion: It is precisely at this interface that innovative strategies, creative works, new forms of dialogue, knowledge production and fundamentally forward-looking concepts of art can emerge. Artists and creative professionals thus play an important pioneering role in exploring social transformation processes, future utopias and complex interrelationships. It is important for the promotion of culture to take up these new artistic trends by supporting projects at the interface of art, science and technology with various funding measures and by doing so, test new ways of promoting culture.

The Swiss Arts Council Pro Helvetia has therefore decided to devote special attention to the intersection of art, science and technology and launch a correspondent funding focus from 2021 until 2024 [1]. Within the foundation, this area is part of the sector of Innovation & Society, highlighting the inherent entanglement of arts, science and technology with societal issues as well as the shaping of the future.

The Goals

For the four years of the “Art, Science and Technology” focus area, the foundation has set a total of four impact goals. **Creating a network:** Pro Helvetia sets out to create and foster a strong network of professionals within the fields of art, science and technology. Strong networks allow for knowledge transfer, broadening of perspectives and exciting new collaborations. Fostering a network means creating opportunities for new encounters and connecting professionals across disciplinary boundaries. We believe that transdisciplinarity ultimately leads to epistemological pluralism, which in turn contributes to the making and unmaking of our realities; by diving into the complexity that surrounds us, and by adding layers to our understanding of the world, we open up new potentials and shape new realities and horizons.

Funding artistic production: Innovative and daring production proposals need financial backing, which can be provided by funding institutions such as Pro Helvetia. The foundation accompanies and financially supports such projects at the intersection of art, science and technology, in order to allow new and surprising possibilities inscribed in those projects to become a tangible reality.

Transferring knowledge: Transdisciplinary funding requires different approaches and models than traditional artistic funding. What is there to be learned from transdisciplinarity? How can science and technology be integrated into artistic practice in a meaningful way and the other way around? Pro Helvetia wishes to share its knowledge to reinforce the connection between the different fields and thereby encourage other institutions and individuals to invest into these intersections and build purposeful STEAM-art learning and exchanging environments, for example by bringing artistic practice inside laboratories and other scientific institutions. The aim is to showcase and spread good practices of transdisciplinarity for others to be inspired by and possibly replicate.

National and international promotion: As the Swiss Arts Council, Pro Helvetia seeks to promote Swiss artists and Swiss projects at the crossroads of art, science and technology, but also to increase visibility of international transdisciplinary collaborations. We believe that in our interconnected world, sharing and negotiating experiences, values and different contexts has not only become essential, but does also contribute to a more inclusive artistic community.

The Initiatives

Various proactive initiatives have been put in place during the first year of the focus area, all of them exploring possibilities and new collaboration models across disciplinary borders. Surrounding the question of how the arts can be meaningfully integrated into science and technology, and the other way around, we launched the following initiatives: **Connect** [2] is a series of art residencies launched in April 2021 in collaboration with CERN. It serves as a platform to foster experimentation in the arts in connection with fundamental science. The artistic residencies take place at CERN

and in partner scientific organizations worldwide in Chile, South Africa, China and India. Artists are invited to apply for research-led residencies, to explore ideas and develop new work inspired by science and in connection with the scientific communities. The aim of the Connect programme is to encourage practices of artistic research as well as to broaden horizons and strengthen the dialogue between different cultures. Additionally, the Connect programme creates room for reflection about the universe, the outer space, ourselves and the hypotheticals emerging out of this triade. The programme can be considered connected to the “natures and worlds” subtheme of ISEA 2022.

PolyMatters will be launched in 2022 and offers artists a unique access to the research and the laboratories of the Adolphe Merkle Institute in Fribourg (CH), a leader in fundamental and application-oriented interdisciplinary research on soft nanoscience [3]. Accompanied by an art mediator and a curator, artists collaborate with scientists in exploring nanotechnologies through research-driven and speculative artistic research, touching upon topics such as transhumanism and the frontier of the human and the non-human. The tandems are accompanied not only in their research, but also in the production of artistic outcomes as well as their dissemination. The PolyMatters open call aims to question the ways in which we construct and gain knowledge and to open up the field of nanoscience to creative speculations and artistic exploration. The transdisciplinary nature of this open call strongly links it to the “education and societies” as well as the “human and non human” subthemes of ISEA 2022.

PolARTS [4] is a research grant directed at tandems of artists and polar scientists who wish to jointly engage with topics linked to polar regions such as global warming and the study of the Anthropocene. Together, the tandems explore our relationship with nature and engage in different approaches and reflexions about responsibilities and possibilities surrounding the ecological crisis that we are currently facing. Artists have the opportunity to accompany scientists during their fieldwork, thus gaining deeper understanding of the materiality of polar sciences but also of the complex networks predominant in environmental studies. In that sense, the PolARTS programme addresses relevant questions of the “natures and worlds” subtheme of ISEA 2022.

The Landscape Analysis is being conducted in all of the Liaison Offices of Pro Helvetia (New Delhi, Shanghai, Johannesburg, Moscow, Cairo and South America), in an effort to sound out and explore the different landscapes and cultural contexts of the crossroads of art, science and technology. The aim of this analysis is to create understandings of geo-social characteristics and developments of a rich, heterogeneous field, allthewhile considering past and future archeologies of knowledge. In a world overflowing with information, it is crucial to join forces in order to make sense of it and to carve out common denominators as well as differences between various contexts. The question of organizing knowledge and extracting meaning out of the flood of information provides a link to the “futures and heritages” subtheme of ISEA 2022.

Art Meets... [5] is a podcast series launched by Pro Helvetia, highlighting and showcasing international art-science collaborations. From artistic residencies to field trips to the glaciers, from astronomical observatories to artist’s studios, listeners can join intimate conversations between artists and members of the scientific community and discover how these different fields collaborate and inspire each other. The podcast collects and documents different modes of transdisciplinary exchange by giving a platform to a plurality of voices. It explores (im-)possibilities of transdisciplinarity and observes how change and innovation shape our world, therefore echoing the main theme of ISEA 2022, the “possibles”.

The Institutional Presentation

At ISEA 2022, Pro Helvetia would not only introduce itself and its current focus on art, science and technology to the community, but also provide opportunities for meaningful and strategic networking with the Swiss and international artistic scene, as well as with Swiss and international scientific institutions interested in transdisciplinary collaborations. Pro Helvetia works and is in touch with internationally recognized institutions such as CERN, the Adolphe Merkle Institute, the South African Radio Astronomy Observatory, the Swiss Polar Institute, TBA21 Academy, and others. In the field of art and science, the foundation has supported established and emerging artists and artist collectives such as Aparna Rao, Claudia Comte, Hemauer/Keller, fragment.in, Ursula Biemann, Julian Charrière and many others.

Leaving room for the emergence of new practices, envisioning mistakes and fallacies not as failures but as potentials, and fostering an exchange that overcomes disciplinary, geographical and social borders – these are our values and topics that we would be delighted to present at ISEA 2022.

Seraina Rohrer is the head of the Innovation & Society Sector and a member of the Executive Committee of the Swiss Arts Council Pro Helvetia. She studied journalism, communication studies, film studies and IT at the University of Zurich and earned a PhD at the University of Zurich and UCLA in California.

Ariane Rippstein is a specialist in the field of Innovation & Society and is responsible for the focus “Art, Science and Technology” of the Swiss Arts Council Pro Helvetia. She studied Literature, Neurosciences and Philosophy of Knowledge at the University of Zurich and the ETH Zurich.

ISEA2022 A Path To Constructing A Diverse Future In Digital Media Arts

Hira Roberts, Tracey L. Moore, Timothy McLaughlin

Affiliation (s) Prairie View A&M University, Texas A&M University

Location, Country Texas, United States of America

Contact Emails hitariq@pvamu.edu, tymoore@pvamu.edu, timmm@viz.tamu.edu

Abstract

Underrepresented minorities interested in digital art as a career path face unique challenges that can redirect their future away from design. These challenges can be social, economic, or cultural, which can impact diversity in the digital arts industry. Our institution aims to get a better understanding of these challenges that cause friction in choosing art and technology as a viable career choice. We then hope to design solutions from the resulting research to create a pipeline that diversifies the future of art and technology. Our goal is to build roadmaps for underrepresented minority middle-school students who wish to pursue art and technology in Higher Education and help overcome challenges that can hinder their ambitions.

Keywords

Underrepresented, minorities, diversity, digital-art, culture, collaboration, education, technology, future, STEAM.

Introduction

Underrepresented and economically disadvantaged minority students often have little experience or exposure to the artist's application of emerging technology; many students in general are unfamiliar with the importance of multidisciplinary within the digital art community or feel discouraged to take part in video games, game development, and interactive art courses due to stereotype threat[1]. This leads to a lack of awareness regarding the trajectories game development can lead to, i.e. developing more interactive and immersive artworks and the potential of unlocking roads to numerous career opportunities. Hence, it becomes important for minority artists to be trained in technology so they are not restricted by mediums and tools. It is also necessary to provide students and their families information regarding the potentials of digital art careers so they can take actions that align with the best interest of the students.

Collaborative Faculty Research

The Digital Media Arts (DGMA) faculty of Prairie View A&M University (PVAMU) is working in collaboration with the Visualization Lab at Texas A&M University

(TAMU) on a research project focused on the impact of near-peer mentoring by our college students on interest in digital arts and STEAM subjects among middle-school-aged students. The project is led by Tim McLaughlin from Texas A&M University's Department of Visualization and in partnership with Gearbox Software. Funding for the two-year study, which formally started in September 2021, comes from the Simons Foundation's Science Sandbox. Hira Roberts is the lead from PVAMU with Tracey Moore as Co-PI. Our current project partners with Longview Independent School District in East Texas. We plan to replicate the study with districts local to Prairie View.

Our team from PVAMU is working on researching factors that cause friction in the pursuit of artistic careers amongst targeted focus groups consisting of primarily African-American and Latinx middle schoolers by incorporating multiple methods and tools. We are working with a rural school district in Texas where 75% of the student body is African-American and Hispanic and 54% of the population is economically disadvantaged. College students from both universities will be hired as Near-Peer Mentors (NPMs) to collaborate with the under-represented minority (URM) youth in the implementation of the project. The objective is to empower URM youth with greater confidence in STEAM skills, resulting in an increased diversity of visual computing professions. To achieve this objective, we will survey our focus groups, gathering data that will assist us in accomplishing future goals.

While the project's main focus is increasing enrollment in STEAM careers through digital world building and game development at middle school and high school level, our institution is focusing on understanding factors that cause friction in the pursuit of studying digital art as a major and come up with solutions to mitigate them, thereby increase diversity art and technology. Our objective is to learn from the research so we can inform families and students about the importance of technology in art, vice versa, and multidisciplinary in education.

Student Work

NPMs from PVAMU are working on methods that make visual storytelling, application of principles of art, and design (including user experience/interface design), in digital world building easier for middle school students to understand, allowing them to implement design skills at an earlier stage. Before they can start implementing the methodologies and designs, the NPMs will be undertaking several trainings under the supervision of our industry and institutional partners so they are familiar with the custom tools that are being implemented.

Methods

We have designed surveys that will be utilized for both NPMs and URM students regarding their experience and factors that play part in their career choices. They will gain training in industry-standard software and will complete projects designed to introduce cross-disciplinary skills that go in the building of a single project.

Future Goals

To further our understanding, we will send out surveys to minority-serving schools that are local to our region, gather data from various focus groups based on *religion, culture, nationality, ethnicity, gender, race, and socio-economic status*, and introduce methods and tools that address the concerns and insights gained as a result of the research. A long term goal is to research at an international scale to further our understanding of factors that may impact students' reluctance to pursue digital media arts as a major at a university level.

Conclusion

The faculty is researching methods of improving diversity in digital art at higher education at university level. With a better understanding of factors influencing the decisions that students make for career choices we wish to find methods and solutions that address the problems, thus increasing the diversity in digital media art in the future.

Acknowledgements

The presenters of this Institutional presentation would like to give a special thanks to Timothy McLaughlin who is the lead of the project from TAMU's visualization department. We would also like to thank Aaron Thibault and Jason Orsatti from Gearbox, LongView Independent School District. Our institutional collaborators, Kim Wright, Jinsil Hwaryoung Seo, Ph.D., Dawson Nodurft, Ph.D, graduate and undergraduate research assistants Rebekah Bogdanoff, Chudi Nwokoma, Sergio Alonso-Macias, Ashlyn Stewart, and Caitlin Littlejohn. And all supervisors, industry partners, institutional partners, and mentors that have been working with us on the project and proposal.

Author(s) Biography(ies)

Hira Roberts is an Assistant Professor of Digital Media Arts at PVAMU. She has developed the courses for interactive media and game development offered at her institution. She has an undergraduate degree in Architecture and a Masters in Fine Arts with digital art as her concentration. Her thesis project incorporated interactive and immersive technologies in installation art and virtual worlds where she questions the impact and influence of culture immigrant women.

Tracey L. Moore is an Assistant Professor of Digital Media Arts at PVAMU. She has a Bachelor of Art in Advertising Art and a Master of Fine Art in Studio art with a Concentration in Graphic Communications. Her research interests include merging graphic design and ethnographic principles for historic preservation.

Tim McLaughlin is an Associate Professor in the Department of Visualization at Texas A&M University and has experience in the visual effects industry. His research interests include the use of 3D computer graphics in design, entertainment, and education.

POM – Politics of Machines Conference Series

Laura Beloff & Morten Søndergaard

Aalto University & Aalborg University

Finland & Denmark

laura.beloff@aalto.fi & mortenson@hum.aau.dk

Abstract

The POM – Politics of The Machines is a conference series founded by **Laura Beloff** (Aalto University Finland) and **Morten Søndergaard** (Aalborg University Denmark).

Keywords

POM, art, science, technology, artists / academics

Introduction

The first POM-conference was emerging from a long-term collaboration between the initiators and their continuing discussions on the dismissal of professional artistic practices and other innovative approaches by the academia (and vice versa). This is partly due to over-formalized structures and lack of opportunities and actors who recognize the importance of inclusion and dialogue across wide range of expertise, backgrounds and perspectives – far beyond academia. For its part, the POM-conference aims at bridging this divide.

The overall thematic of the POM-conference series is the question of how the machine and technology impact and contextualize artistic and cultural production and our perception of the world. Moreover, it is aiming at investigating the histories, theories and practices of machines and technologies in-between and beyond disciplines. It seeks to question the governing ideas in the sciences and the humanities through critical engagement with and empowerment of activities of creative production.

The matter of technology should always be approached critically; the focus on machines as ‘digital’ and ‘electronic’ often hides different ontologies and materialities of the machine they operate in, as well as the alternative and the experimental. How are the relationality and operability of machines being negotiated into

cultural and social ontologies? How are we to analyze and contextualize the alternative or experimental ontologies and epistemologies of artistic practices beyond apparent dualisms and objectification? What are the politics – past, current, future – of these negotiations?

With this conference we address the politics of machines and the palpable technological approaches and structures, which gradually enter every aspect of human ‘umwelt’, as well as the critical infrastructures of artistic production in-between human and non-human agency. Where and how do experimental and artistic practices work beyond the human / non-human dualisms and into biological, hybrid, cybernetic, vibrant, uncanny, overly material, darkly ecological and critical machines?

This conference-series sets the stakes to a high level and invites you to take a fresh approach to the politics of the machine; to exemplify, analyze or contextualize alternative and experimental ontologies and epistemologies of art beyond dualisms.

Sub-tracks and track-chairs

A specific feature of the POM is the double-step submission process. In the first step, a call is published for sub-track topic suggestions, and in the second step is opened a call for actual academic papers, artist presentations, interventions and potential art works.

This process enables potential participants to get involved early on in this partly self-organizing structure, as well as get one’s ‘own’ topic and specific interests into the conference. The process has also proved to be successful in fostering wider diversity – both in gender and cultural backgrounds. For example, the POM Berlin had 55 speakers from 31 countries and 5 continents.

Each POM edition has received around 40 suggestions for sub-track topics, from which a selection board has selected 7-11 topics as tracks for the conference.

Figure 1. Politics of Machines [POM] – Rogue Research, Berlin 2021 (Covid19 period) © Laura Beloff

Figure 2. Politics of Machines [POM] – Art and After, Copenhagen 2018 © Laura Beloff

Sub-track topics in POM editions

The selected proposals for sub-tracks have been the following –

2018 Copenhagen: Emotional Machines; Cyborgs/Hybrids; Religion, Technology, and Art; Algorithms and Intelligence in Art After Aesthetics; Machines of Atmospheres; Wet Machines; Robots in art; Returns of the machine; Sonic Machines; Societies, Platforms, Institutions

2019 Beirut: Arab revolutions; Terrorism machines; Fourth Industrial Revolution; The Battlefield of Vision; Internet of things; Living machines; Artificial intelligence for art AIA; Permanent Telesurveillance; The Politics of Evidence; Body-politics of the machines; The Ecosystem Analogy

2021 Berlin: Interferences of the Multitude; Decolonizing the Machine; (Micro)biocontrol & Ethics of Care; Spaces – Encounters, Subjectivities + Environments; Digging Earth; Open Science; Critical Spaces; Open Track – Rogue Research.

Authors Biographies

Laura Beloff (PhD) is an internationally acclaimed artist and a researcher in the cross section of art, technology and science. The research is in a form of installations, wearable artifacts, and experiments with scientific methods that deal with the merger of the technological and biological matter. The research engages with human enhancement, biosemiotics, AI, AL, robotics affiliated with art, humans, natural environment and society. She is Associate Professor and Head of ViCCA-program at Aalto University, Finland.

Morten Søndergaard (PhD) is an internationally acclaimed curator and researcher of the histories, theories and cultures of transdisciplinary practices merging technology, media, art and societal trajectories. From his master thesis on the method of Michel Serres in-between poetry, art and science (1995) to the Phd on unheard avant-gardes in Denmark (Show-bix and the Danish media poet Per Højholt) (2007), the line of inquiry draws the analysis of transdisciplinary practices into epistemological questionings regarding the complexities of human and non-human relations, as well as a general study of the overarching question regarding experiencing and evidencing posthumanity. He is Associate Professor and Academic Director of the Erasmus Media Art Cultures Master Program at Aalborg University, Denmark

TeleAgriCulture: A Crowd/Cloud Data Network for Creative Cultivation and Engagement in Agricultural Practices Through Art

Julian Staddon

University of Brighton, TeleAgriCulture, marart.org

Linz, Austria

julianstaddon@gmail.com

letmegrow@teleagriculture.org

Abstract

TeleAgriCulture is a community platform, providing a crowd/cloud data exchange network for information, stories, Art and innovation. Modular sensing kits are offered and are adaptable to most geographic locations and ecological conditions, providing real time sensory data that can be used to monitor and optimise conditions or for artistic production and scientific inquiry. This presentation will provide an overview of the TeleAgriCulture platform, its conceptual and organizational development and the artists' works that have so far been produced, along with current and future projects.

Keywords

Telematics, Augmentation, Crowd/Cloud Networks, Digital Communities, Agricultura, Art and Ecology, Participation, DIY/DIWO

Introduction

TeleAgriCulture is a community platform for artists, designers, agriculturalists and hobbyists, providing a crowd/cloud data exchange network for information, stories, art and innovation. A range of modular digital sensing kits are offered or use with aquaculture, hydroponic and soil-based farming. The kits are adaptable to a range of geographic locations & ecological conditions and are monitored by custom IoT sensing devices. These provide real time sensory data from each kit/location, which can be used to optimize agricultural conditions, for artistic production and scientific inquiry. This allows people, flora, fauna and ecosystems, to communicate in new, more symbiotic and empathetic ways, merging natural & data systems with social exchange networks, to facilitate art and design. The integration of machine learning further facilitates this bio-digitally convergent platform.

A range of options and instructions have been developed for different, scalable food growing scenarios and place on the Web app that we already started in 2020. The goal is to continue the development of the community, the technologies and the development of artistic strategies for augmenting ecologies and interfacing the public with this, through an improved app for novice coders, to enable more artists and coders community to be involved, either as a digital innovator, a farmer, or an artist and to make a range of really cool projects that can be created either together in person, or remotely.

Due to the effects of The Anthropocene, agriculture is going through a huge transitional period, matched only by the

agrarian and industrial revolutions. As we crash into the Industry 4.0 era, environmental considerations and public health/wellbeing are often in conflict with the need to supply food to an exponentially rising global population and with current agribusiness supply and profitability models. Due to this, ethical concerns in relation to health and sustainability are often not discussed to a suitable level of detail, with catastrophic effect. We are in the midst of a global turn in regards to environmental ethics, and by localising food and design, we can more closely engage with these evolving issues and better address them.

This project is embedded in using digital communities to increase localised food supply and facilitate innovation for future food cultures, through:

1. Facilitating creatives to grow food and create artistic responses to these processes and the communal environment sensing database
2. Making use of the customisable Open Source hardware sensing kits that with a bespoke PCB that can be developed further by experienced programmers
3. Developing instructional briefs for users (for beginners and experts) that include demos for tech, farming and artistic solutions, generated ideally by the users.
4. Incorporating cryptocurrencies and decentralised monetary systems & resource economies such as food/resource sharing and donation
5. Using the modulated design of the platform to experiment with a range of speculative scenarios and extreme ecological environments such as indoor, outdoor all year round, bad soil, riverside gardens, saline water, insect infestations, pollution, etc.
6. Facilitating a diverse range of crop solutions that compliment localised environments, be they domestic (private/public) urban, rural or industrial zones, offices/workplaces, squats, boats, mobile homes etc.
7. Design a micro/macro agricultural model for individuals, groups and organisations that though machine learning can facilitate all variable scenarios and include this in the data processing within the app (already in development)
8. Enabling marginal social groups including elderly/migrant/transient populations to participate
9. Re-orientating supply chains through a decentralised networked community solution
10. Changing food culture by redefining it as a personal responsibility

Through these objectives, this project creates a range of scenarios that while discrete in their operations, function as a community, consisting of communications, projects and personal stories, with a focus on resource driven circular economies of localised production and distribution. For most places in the world, this is a paradigm shift in food culture that is both easily accessible and usable for those with low levels of digital literacy, but also advanced enough to engage field experts, through it's Open Source approach and integration of evolving technologies such as machine learning, bio-engineering, Post-Anthropocenic design (sustainability/zero carbon focuses for example) and DIY//DIWO culture and also by strongly acknowledging traditional and indigenous approaches to localised food production and distribution.

ARTISTIC STRATEGIES FOR AUGMENTING ECOLOGIES: PROJECTS

Along with my own projects, which have included *Rhizomatic Bias* at STWST48x5, V2_ and Ars Electronica in 2019 and *Maiz Matze: Speaking from the Grid Together* at STWST 48x6 in 2020, several artists in residence also developed projects using the TeleAgriCulture platform. All projects focused somehow, on using Augmentation and Ecological Aesthetics as strategies for communicating Science in publicly engaged ways. Some do so rather directly, while others do so in a more peripheral manner, exploring the processes and subtexts of artistic practice enable such tactics. Detailed information about each previous project and the artists involved, along with an overview of the many current projects, is available at <https://teleagriculture.org/>

CONCLUDING REMARKS

Through the development of such projects, using the TeleAgriCulture platform, artistic practice can offer strategies that constitute a departure from simply articulating ecological issues through presenting, discussing, or speculating on them, towards a situation where we are more actively developing solutions for these issues and embedding these in everyday scenarios, with everyday people, beyond galleries and traditional institutional modes of artistic presentation.

Through these tools and strategies, we can more easily build a deeper empathy, as a general public community (not peripheral to or above this). We can as creative people use simple Open Source technologies to create projects that act as interfaces for educating scientific knowledge in interesting and tactical ways. Also, through situating this in networked communities, there is a solid foundation for memetic growth and the facilitation of universal changes from local to global contexts. Furthermore, it can allow for a more active participation in bio-digital ecologies to allow for wider audiences to gain deeper understandings and therefore more empathetic responses to these systems and their needs.

The Mixed and Augmented Reality Art Organisation: An Overview of Ten Years Since Our Launch at ISEA 2013

Julian Staddon

University of Brighton, TeleAgriCulture, marart.org
Linz, Austria

julianstaddon@gmail.com

Abstract

This presentation will provide an overview of the previous ten years of operation for marart.org, or *The Mixed and Augmented Reality Art Organisation*, as we were originally launched as, as ISEA Sydney in 2013. Since our launch by the myself, Paul Thomas and Ross Harley marart.org has seen several conceptual transitions and a sound body of outputs, including exhibitions and symposiums in Adelaide, Munich, London, Fukuoka, Merida and Hertfordshire, exhibiting an evolving format that has progressed from defining augmentation and materiality through interface, body and archival politics and approaches, to fashion, privacy, ownership and identity, all in the context of mixed reality discourse. This presentation will showcase these outcomes and discuss how the organization has developed, our current status quo and future directions.

Keywords

Mixed Reality, Augmented Reality, Augmentation Aesthetics, Digital Communities, Arts Based Research, Media Art Organisations

Introduction

The Mixed and Augmented Reality Art Organisation (marart.org) was established in 2013 and launched at ISEA the same year, to better facilitate rigorous research into this specific field of mixed and augmented reality art aesthetics, within a wider arts discourse. Through this organisation, a range of unique contributions have been made, including several events that explicitly explore the themes covered in this thesis. Such events brought together other artists, theorists and scientists working within and on the fringes of the field, producing collaborative artworks, exhibitions, discussions, interviews and written contributions.

MARart.org seeks to develop new dialogues in regard to high-end research methodologies, cultural inquiry and representation in the increasingly immersive and pervasive field of mixed and augmented reality art. We aim to do so independently of any institutional involvement as we value a (non-hierarchical) networked community approach to research and discussion. This is an open group for researchers dealing with mixed reality art focusing on augmentation aesthetics. It has a specific (conceptual) focus on convergent realities as art mediums and the theoretical discourses that surround this field.

Since our inception and launch in 2013, we have transitioned through many conceptual paradigms in regards to our core area of research and these have been presented at each transition in a format that included exhibition, panel discussion, symposiums/paper presentations and an accompanying publication.

By scoping the field of Augmentation Aesthetics through the presentation and analysis of particular research outcomes, we have been able to develop criteria that can assess its processes of production and positioning within the media arts. Through this we have been able to develop flexible strategies for hybridised research practice, in a number of open platforms that will scope current trends and exemplary models from a variety of approaches. Artistic practices in marart.org have been presented and discussed in order to locate new research paradigms that address issues including its cultural absorption, social codes and systems, ownership of content and intellectual property. Functioning as an open community group for researchers dealing with mixed reality art focusing on augmentation as a medium. Long before the Covid-19 pandemic ushered in the era of hybrid physical/virtual events, we adopted this approach, as evidenced in nearly all of our events, where our approach was more about having the write people participate in our projects, than the ones that were available or could afford/get funding to attend.

It has a specific conceptual focus on convergent realities as art mediums and the theoretical discourses that surround this field. The organisation was established, not as a commercial/advertising group, in fact striving to be the opposite of this- an open community for free exchange of ideas, projects and discussion relating to the field.

History and Events

Since our inception and launch in 2013, we have transitioned through many conceptual paradigms in regards to our core area of research and these have been presented at each transition in a format that included exhibition, panel discussion, symposiums/paper presentations and an accompanying publication. These events have included the following:

1. Our Launch at ISEA (2013) Sydney with Ross Harley and Paul Thomas hosting
2. Initial launch panel including Andrew Burrell, Troy Innocent, Kuai Shen and myself at ISEA (2013)
3. Transreal Topologies Exhibition and Artists Panel at IEEE ISMAR (2013), Adelaide with: Tracy

- Benson, Mez Breeze, Andrew Burrell, Andy Campbell, Mar Canet, Varvara Guljajeva, Josh Haglar, Damian Hills, Troy Innocent, Pierre Proske, Jorge Ramirez, Kevin Raxworthy and Paul Thomas
4. Developing Flexible Approaches to Collaborative Engagement in Mixed and Augmented Reality Panel (2013) with Mark Billingham, Jay David Bolter, Troy Innocent, Damian Hills
 5. The Aesthetics of Augmented Reality Panel (2013) with Jay David Bolter, Maria Engberd, Julian Staddon and Sandy Walker
 6. Beyond the Interface Exhibition Munich, (2014) curated in collaboration with Furtherfield (Marc Garrett and Ruth Catlow) featuring: Zach Blas, Mez Breeze, Nick Briz, Heath Bunting, Jennifer Chan, Genetic Moo, Julian Oliver, Pierre Proske and Erica Scourti
 7. Beyond the Interface Artist Panel at IEEE ISMAR (2014) with Nick Broz, Heath Bunting, Ruth Catlow and Julian Staddon
 8. Beyond the Interface Disrupting the Market Panel at ISMAR 2014 with Tatiana Bazzichelli, Annette Doms, Heath Bunting and Wolf Lieser
 9. Rethinking Aesthetics Panel at ISMAR (2014) with Zach Blas, Nick Briz, Thomas Grundnigg and Erica Scourti
 10. Beyond the Interface Exhibition at Furtherfield, London (2015) featuring Zach Blas, Branger_Briz, Mez Breeze, Heath Bunting, Jennifer Chan, Francesca da Rimini, Genetic Moo, Nathaniel Stern
 11. Data Body as Artifact Exhibition Fukuoka (2015) featuring, César Escudero Andaluz, Marios Athanasiou, Jöelle Bitton, Branger_Briz, Heather Dewey-Hagborg, Anna Dumitriu and Alex May, Chris Henschke, Raphael Lozano-Hemmer, Shannon Novak, Julian Oliver, Christa Sommer and Laurent Mignonneau, Julian Staddon, Stelarc and Adam Zaretski.
 12. Data Body as Artifact Catalogue (2015) with essays by Heather Dewey-Hagborg, Thomas Retter, Julian Staddon, Stelarc, Paul Thomas and Brigitta Zics,
 13. Bodies of Matter Panel Fukuoka (2015) with Jöelle Bitton, Heather Dewey-Hagborg, Chris Henschke, Julian Staddon and Adam Zaretski
 14. Matters of Embodiment Panel (2015) with César Escudero Andaluz, Nick Briz, Brannon Dorsey, Julian Oliver, Jorge Ramirez and Julian Staddon
 15. Contextual Engineering Panel (2015) with Mark Farid, Masahiki Inami, Luke Mason, Daniel Pinchbeck and Carl Smith
 16. Experiencing AR in Public Environments with BC Bierman, Mark Billingham, Ian Gwilt, , Shannon Novak, Julian Oliver and Lu Weiwuan
 17. Algorave Tour Japan (2015) with APNOA, Renick Bell, Chris Henschke, Smell in Stereo and Swan_Panda
 18. Affecto Material, Merida (2016) with Branger_Briz, Archangel Constantini, Alejandro Gomezrias, Jaime Lobato, Manuel de Landa, Plethora Project, Kuai Shen and 220
 19. Plethora of Senses: Human Machine Symbiosis Panel (2016) with Thomas Sanchez, Carl Smith, Liviu Babitz, Pablo Padilla, Jorge Ramirez and Jaime Lobats
 20. Art and Mixed Reality Berlin Fashion Film Festival (2016)
 21. Embodied Realities Lab Guadalajara (2017)
 22. Glitching Gender /Augmenting Identity (2017) etc House of Vans London
 23. EVA London Mixed Reality Education Panel (2017) with Nick Lambert, Julian Staddon and Ian Wilcock,
 24. Mixed Reality Aesthetics at London College of Fashion (2017) with Martina Menegon, Brigitta Zics, Miyö Van Stenis, Rebecca Stewart and Erik Zepka
 25. OOPS: Obfuscation, Ownership, Privacy and Sousveillance at University of Hertfordshire (2018) Tiare Ribeaux & Donald Hanson, Heather Dewey Hagborg, Erik Zepka, Heath Bunting, Pierre Proske, Varvara and Mar, Julian Staddon, Branger_Briz, Rob Myers, Mez Breeze
 26. OOPS We Did is Again Artist Panel (2018) with Tiare Ribeaux & Donald Hanson, Heather Dewey Hagborg, Erik Zepka, Heath Bunting, Pierre Proske, Varvara and Mar, Julian Staddon, Branger_Briz, Rob Myers, Mez Breeze
 27. Beyond TOR, A Discussion About How We Can Protect Our Online Privacy and Why Panel, University of Hertfordshire (2018) with Dionysia Mylonaki, Yannis Baboulis, Ruba Aba Salma and Panjiotis
 28. Living an Honest Life in the Field: Tips for Survival and Identity Obfuscation for Artists Workshop with Heath Bunting (2018)

Conclusion

Throughout the last ten years, marart.org has produced a significant body of arts-based research outputs that adopted a community and dialogue driven approach and its success is evidenced by both the quality of those that participated in our events and the quantity of the outputs that were produced. The short presentation will showcase the more significant of these outcomes in order to provide a context for our future directions moving forward as an organization.

Kulturtanken – Arts for Young Audiences Norway

Stahl Stenslie

Arts for Young Audiences Norway

stahl@kulturtanken.no

Abstract

The institutional presentation aims at presenting the institution's work to produce and disseminate digital art works and culture to all 825.000 pupils in the Norwegian schools. A central part of the presentation will be our outline for future and digital art experiences targeting young audiences in the context of schools.

About Arts for Young Audiences Norway

Arts for Young Audiences Norway (Kulturtanken) is the Norwegian Ministry of Culture's agency responsible for art and culture for school pupils. Most prominently, this includes nationwide responsibility for *The Cultural Schoolbag (TCS)*, which is the centerpiece of the government's policy for bringing culture to children and young people. Briefly put, *The Cultural Schoolbag* secures that all children growing up in Norway have access to professional art – spanning literature, music, visual arts, performative arts, film and cultural heritage. This is done through close collaboration between *Arts for Young Audiences Norway*, county councils and municipalities, schools and cultural institutions. The program is ambitious and far reaching. Four times a year on average, every pupil in Norwegian schools, altogether 825 000 school pupils in 3300 schools, are experiencing professional art made by around 4000 professional musicians, writers, actors, dancers, artists and other cultural producers through *The Cultural Schoolbag*.

The explicit political aim is to provide all children living in Norway with a shared frame of reference and joint experiences, irrespective of their nationality, address, wealth and social background. It is held that artistic and cultural expression can transcend norms, languages and social identities, and in this way, being a force for democracy that ideally can be felt far beyond our national borders, reaching out into the world.

Although *Arts for Young Audiences* is an agency of the Ministry of Culture, it works very closely with the Ministry of Education and Research, which is Norwegian Ministry of Culture's responsible for the institutions where TCS is implemented, namely schools. In addition to being responsible for TCS, *Arts for Young Audiences* will provide advice and other services to the central government authorities involved in the culture and

education sectors, thus helping to establish a political framework and working to improve national initiatives.

Digital Art Lab

Arts for Young Audiences aims to support projects exploring how digital technologies can be used to i) distribute a portfolio of digital artistic projects to all Norwegian pupils, ii) develop explorative art works that utilize the digital languages and interests of young audiences, and iii) use mobile media and smartphones to present digital arts in new areas and arenas.

For this purpose we have built our own, well equipped Digital Art Lab and development facility.

Abstract

The mission of the ACM SIGGRAPH Digital Arts Committee is to foster year-round engagement and dialogue within the digital, electronic, computational, and media arts. We facilitate dynamic scholarship and creative programming within the ACM SIGGRAPH organization. Our goal is to promote collaboration between artists and the larger computer graphics and interactive techniques community.

Keywords

Art, computation, interaction, technology, graphics, community

ACM SIGGRAPH

The mission of the ACM SIGGRAPH Digital Arts Committee is to foster year-round engagement and dialogue within the digital, electronic, computational, and media arts. We facilitate dynamic scholarship and creative programming within the ACM SIGGRAPH organization. Our goal is to promote collaboration between artists and the larger computer graphics and interactive techniques community.

We support a vibrant online community, organize juried online exhibitions of digital arts, and collaborate on arts-related events and exhibitions at the annual SIGGRAPH and SIGGRAPH Asia conferences. Our diverse, multi-generational community includes members from academic art and media programs, the professional media arts and game worlds, and scientists interested in the intersection of art and computation. We celebrate digital art history and encourage art-science partnerships at all levels.

We also host juried online art exhibitions. Our most recent exhibition was entitled *Digital Power: Activism, Advocacy and the Influence of Women on Online*. <https://digital-power.siggraph.org/>. We also have a new show, *The Earth, Our Home* scheduled to open in 2022. <https://dac.siggraph.org/the-earth-our-home/>. Our community also co-sponsors the SIGGRAPH Art Show Archives. <https://history.siggraph.org/art-show-archives/> and is collaborating on the ISEA Archives as well.

At the annual SIGGRAPH conferences we reflect back on our year-round projects as well as sponsor discussion sessions on topics of interest to the community. special topics

In 2021 we held a special co-sponsored session with ISEA focused on New Media Art History. We also sponsored a session on “Intersectional Resistance, Advocacy, and Activism in International Feminist Techno-Decolonial Art” as a follow-on to the Digital Power exhibition.

In addition to our online exhibition, archives, and conference activities, our regular programming now also includes a monthly presentation and discussion series, SPARKS: Short Presentations of Artworks & Research for the Kindred Spirit. Introduced in the time of COVID, we have found SPARKS to be an excellent way to engage a wide range of digital arts community theorists and practitioners in conversations around emerging themes of interest to our community. The 2021 topics have included the following:

- Screen Worlds: Net Art & Online Communities
- Immersion, Interactivity, and Altered Realities
- Environmental Issues, Sustainability, Climate Change
- Robotics, Electronics and Artificial Intelligence
- Art, Science and the Invisible World We Live In
- Music in Social VR: Education, Installation, Conferences, and Performance
- Creative Coding: Generative / Algorithmic Art and the Exploration of Authorship and Authenticity
- Data: Visual Perception, Interpretation, and Truth
- Within the Frame: Continuum of the Still Image

In 2022 we anticipate continuing the discussion with sessions around topics such as art and games, digital cultural memory production, artificial intelligence, and decolonial arts practices.

For more information, visit us at <http://dac.siggraph.org>.

Author Biography

Victoria Szabo is Chair of the ACM SIGGRAPH Digital Arts Community and of the SIGGRAPH Arts Advisory Group. Bonnie Mitchell is a DAC Standing Committee member and Chair of the 2023 SIGGRAPH History activities at the North American conference.

INs Netz e.V.

Jena, Germany

info@kuenstlerische-tatsachen.de

Abstract

IN's NETZ e.V. is realizing a new residency format in the TRAFÖ in the center of Jena for the second time, bringing together the international art scene with Thuringia's top research and exploring visual and performing arts as a versatile medium of scientific communication.

Keywords

Arts & Science, Residency, citizen science, open laboratory, tension

Bringing Together the International Art Scene with Thuringia's Top Research and Exploring Visual Arts as a Versatile Medium of Scientific Communication

From June to September 2022, up to six international artists will work in pairs with scientists from local institutes on a research question. The starting point of the collaboration is the processual nature of the disciplines of art and science, which are often perceived as contrary: artistic practice as well as explorative basic research are characterized by experimentation and freed from the immediate demand to produce results that are close to application. Both require a high degree of abstraction and creativity. Based on this, the residency is designed as basic artistic research. It is aimed at artists who are engaged in the method of artistic research as well as at Thuringian scientists who are open to an exchange with art and a disclosure of their research processes.

Through the joint research process, the participants will explore the synergies of the disciplines, learn from each other, and finally transform their findings into a work of art. Artistic creation becomes a discursive process that ties in with the research foci of the city of Jena, opens up insights in new ways, and at the same time sets new impulses for further thinking on the part of the scientists.

Under the motto tension, questions on the topic of tensions in perception will be negotiated during the residency: These occur in pragmatic and dogmatic determinations and thereby generate fragile knowledge constructions. By acting as mediators and negotiating these conflicts in a transdisciplinary way, approaches to facts in this field of tension emerge. Similar phenomena also appear at the interface of

diverse art forms, as playful and serious approaches struggle for interpretive sovereignty. Within the process, we appropriate these tensions, make them visible, and transform them into a productive discourse that negotiates notions of truth and unlocks undiscovered potential.

The residency consists of a research phase in the laboratories of the institutes in July, a production phase in the studios starting in August, and an exhibition in October at TRAFÖ. The exhibition, which will be open for at least six weeks, provides an alternative, sensory access to research processes from the hard and soft sciences. During the exhibition, accompanying guided tours will be made possible in order to make the creation of the artistic facts transparent for visitors: inside and to enter into conversation. To further expand the network and create additional opportunities for inspiration and dialogue, we will host at least three hybrid Arts & Science soirées, inviting moderated panels with international guests from the arts and sciences as well as participating artists from the Arts & Science Residency 2021.

With the help of the cross-generational participation format *kT Fellows*, citizens from Jena and the surrounding area will become artistic researchers themselves in low-threshold workshops. They will actively experience the process of creating artistic facts, creatively co-design them and enrich them with their own questions and perspectives. Based on art pedagogical methods, *kT Fellows* specifically addresses citizens from Jena and the surrounding area who have no contact with art or science in their everyday lives. In the workshops, for example, the framework topic of tension is experienced in a playful, physical way, or what artistic research can mean and achieve is explored in a low-threshold way. Artistic contributions are created in the form of performative elements and creative audio and video sequences that are presented on our social media channels. The collaborations with universities, research institutions and civil society actors in Jena will be actively included.

In the context of the residency, the lab becomes the studio and the studio becomes the lab, so that the processual nature of both disciplines can be experienced by the participating artists, scientists and the public.

For the Arts & Science Residency, TRAFÖ, a forgotten transformer station in Jena, is both a working space, an event space, and an exhibition space. With the artistic facts, a unique hub for artistic basic research and science communication is being created in Jena, which will closely network the international art scene with the local science

community and establish itself as a point of attraction as well as an impulse generator for the young, European Arts & Science scene.

Our artistic research project does justice to the city's scientific focus by making the research processes and results accessible to the public, thus filling a central gap in the city's culture.

A long-term continuation of the project is envisaged in order to make a decisive contribution to sustainable neighborhood development in Jena as a cultural and scientific location. The effectiveness of „Künstlerische Tatsachen“ was expressed in the high visitor volume during the supporting program and the exhibition 2021 as well as in externally commissioned workshops and conferences.

Project Team

Enrique Torres

Project Manager

Born in Jena. Has been part of the re:publica program team since 2018 and was responsible for the rpCampus, among other things. He studied philosophy and cross-disciplinary strategy at the University of Leipzig and at the University of Applied Arts in Vienna. He is also the founder of Œuvre e.V. and schau e.V. and is involved in numerous artistic projects at the interfaces between art and activism as well as art and science.

Sarah Biering

Project Assistant | Cooperations | Conception

Born in Jena. Studied cultural studies at the University of Leipzig and applied media and cultural studies at the University of Merseburg. She worked in the field of cultural education for children and young people in Thuringia and gained experience in association work and the coordination of a funding measure. She also worked for Œuvre e.V.

Vincent Maurer

Project Assistant | Production | Artist Support

Studied cultural sciences & digital media at the Leuphana University of Lüneburg. Chair of the Œuvre e.V. with Enrique Torres. There active in the areas of curation, artist support and social

media. Has professional experience in theater productions, online marketing and project management.

Kilian Rüb

Science Coordinator

Born in Jena. Studies social sciences at the Humboldt University in Berlin. There he has a special focus on data analysis and the communication of results through data visualization as science communication. He is currently holding his own seminar on this subject.

Marie Tatjana Niederleithinger

Science Coordinator

She studied biochemistry and molecular biology in Jena and thus found access to the hard sciences. As a biochemist, she recently carried out research in Vienna on both the molecular level and together with those affected on prostate cancer. At the same time, she supported the exchange between the laboratory and society with projects such as a »tea hour with researchers« in the senior residence »Haus Augarten«.

Philip Pastrik

Science Coordinator

Born in Leipzig. Graduated physics in Jena with master thesis about cryogenic properties of optics for use in gravitational wave detectors with minors in economics and philosophy.

Currently employed at a technology company based in Jena as part of the R&D Department and responsible for global projects including design and implementation.

Elodie Sacher

Science Coordinator

Is a media scholar with a special interest in media culture and aesthetics, focusing on photography and the medium's historical as well as contemporary dimensions in Morocco. She studied Cultural Studies & Cultural Policy in Hildesheim and currently takes part in a Master program in Art & Film Studies. In the past years she studied and worked in Morocco for different artistic research projects and cultural associations.

Paolina Wandruszka

Curator

Studied art history and cultural anthropology in Hamburg, Venice and Vienna. In her research and curatorial work she pursues feminist, postcolonial and Institution-critical approaches. She has worked for artist as well as at the Department of art history, University of Vienna and curated several exhibitions — on and off-line.

Gabriel Dörner

Public Relations | Communication Design | Cultural Education

Studied visual communication until 2019 at the Bauhaus-Universität Weimar with a focus on graphics and editorial design as well as didactics of communication design. Several teaching assignments and independent work followed. Since 2020 he has been a student in the master's program in cultural mediation at the University of Hildesheim and specializes in public relations and project management.

Montreal Digital Spring, Our Future

Erandy Vergara-Vargas
Printemps numérique
Montreal, Canada
erandy@printempsnumerique.ca

Abstract

Montreal Digital Spring is a non-profit organisation whose primary mission is to boost digital intelligence through various activities including a yearly conference, an exhibition, networking events, and a series of workshops targeting the general public, digital creativity companies and organizations and the youth.

Keywords

Digital transformation, technology, culture, media art, digital art, cultural industries, curatorship, exhibitions, audience development.

Introduction

Montreal Digital Spring (*Printemps numérique*) is a non-profit organisation whose primary mission is to boost digital intelligence through various activities of event productions, communication, curation, networking, and mediation with 3 sections: general public, professional and youth.

Since 2014, the flagship event – *Printemps numérique* (digital spring) – has been held annually in Montreal from March 21 to June 21. This season is a space for networking between the arts, industry, education and research sectors as well as a showcase of recent artworks by local and international artists. The diverse programming of Montreal Digital Spring makes digital arts accessible to a large audience and attracts an international clientele. Throughout the year, the organisation works within the various digital sectors by organising forums and events to foster conversation around digital trends and issues of digital transformations.

MTL Connect

Printemps numérique launched the first edition of MTL connect in 2019. Montreal Digital Week is an annual event using digital intelligence as the overarching theme. It aims to look at the main questions related to digital development and focuses on the economic, social, cultural, and environmental impacts in various sectors of activity. The second edition was held from October 13 to 18, 2020 alongside ISEA2020: Why Sentience?

For the first time in the history of ISEA, the 2020 Montreal edition faced the challenge of moving its artistic and academic programs online. For MTL connect and ISEA2020 Online, organisers were committed to bringing the international community together. It was dedicated to

research-creation, allowed participants and speakers to forge new connections, and kept Montreal at the heart of the creative spirit of ISEA2020.

The online event consisted of four full days of 12 hours of presentations on three different live streams: 108 full papers, 96 short papers, 24 panels, and 18 posters selected from nearly 1000 submissions from 58 countries. In addition to this, ISEA hosted an entirely virtual series of exhibitions based on the following themes and their correlation with the symposium's throughline, *Why Sentience?: Animality, The Ecosophic World, Politics of Sentience, Matter's Mattering, The Planetary, Machinic Sense & Sensibility, and Sentient Difference*. In tandem with the online programme, ISEA presented a series of events in its host city, Montreal, and adapted to COVID-19 security measures that began on October 1st, 2020. This hybrid programming represented an exact reflection of our current societal modus operandi: full online connection but limited physical presence for the optimal reach and impact in our local communities and those at large.

ISEA2020 in Numbers

4,193 Attendees
1732 ISEA Art Website Visitors
300 Academic Programme & Talks Participants
133 Local & International Artists

12 Online/On-Site Workshops, 26 Facilitators, and over 200 Participants

More than 15 team members, 9 production staff, 2 designers, 4 videographers, 3 technicians, and 25 invaluable volunteers

The Future

MTL Connect third edition took place from October 12 to 17, 2021 in hybrid format.

This presentation will reflect on the ways in which ISEA2020 shaped the *Printemps numérique's* artistic vision and how the organisation will restructure in order to continue to bridge the academic and artistic scenes in Montreal.

Author Biography

Erandy Vergara-Vargas (MX) is a Montreal-based curator and scholar. Her main research interests include global art histories, climate responsibility, curatorial studies, equity, internet cultures and widespread bias in algorithms. She earned a MA at Concordia

University and a PhD in Art History at McGill University. Recent shows include ISEA2020: Why Sentience? (Printemps numérique, Montreal); Eva and Franco Mattes: What Has Been Seen (Fondation Phi pour l'art contemporain, November 2019-March 2020); Speculative Cultures: A Virtual Reality Art Exhibition, curated with Tina Sauerländer (Anna-Maria and Stephen Kellen Gallery, Parsons School of Design, New York, 2019). Currently, she is a Postdoctoral Fellow at The Sociability of Sleep Project, Université de Montréal, and artistic director of Printemps numérique.

Abstract

V2_, Lab for the Unstable Media is an interdisciplinary center for art and media technology in Rotterdam (the Netherlands). Founded in 1981, V2_ offers a platform for artists, designers, scientists, researchers, theorists, and developers of software and hardware from various disciplines to discuss their work and share their findings. In V2_'s view, art and design play an essential role in the social embedding of technological developments. V2_ creates a context in which issues regarding the social impact of technology are explored through critical dialogue, artistic reflection and practice-oriented research.

Keywords

The title “Keywords” should be 12 point, bold type, centered at the beginning of the left column. Using 10 point, justified, regular type, write up to ten keywords that highlight the main areas of your essay’s content.

Introduction

In this institutional presentation by V2_, Lab for the Unstable Media we will present our Lab’s interdisciplinary practice with a focus on art and media technology. It will cover our three core activities - the production, presentation and publication of research at the interface of art, technology and society, as well as highlight five pillars to our success: 1.) an emphasis on experiment as opposed to end result; 2.) the support of practices

Figure 2. Example of a double-column figure with caption. ©Respect Copyright.

Author(s) Biography(ies)

Florian Weigl is curator at V2_, Lab for the Unstable Media. As curator and researcher he is interested in art and contemporary technology reflecting on society, in collaboration with artists in the development of critical dialogue, artistic reflection and practice-oriented research.

Curatorial projects at V2_ he did include the live experiment series [3x3](#) he initiated, and amongst others the group exhibitions [Latent Spectators](#) (2019, UNArt Center, Shanghai, co-curated with [Iris Long](#)), [To Mind Is To Care](#) (2020) and [Reasonable Doubt](#) (2021, co-curated with [Vincent van Velsen](#)); solo

instead of mere single projects; 3.) the integration of theory with practice; 4.) our care for archiving activities; 5.) and our vast international network.

Furthermore, the presentation will highlight our thematic approach based on the recent example *To Mind is to Care*, a long term research project into the notion of “Caring for”. This interdisciplinary study of care covered care of people, other life forms, and technology and resulted in the book *To Mind Is To Care*, which included contributions by Ann-Sophie Lehmann, Sjoerd van Tuinen, Michael Marder, Arjo Klamer, Driessens & Verstappen, Frank Pasquale, Ellen Dissanayake, Maria Puig de la Bellacasa, Pieter Lemmens, Jeannette Pols, Bernard Stiegler, and Frederiek Bennema, a group exhibition carrying the same title featuring four new productions by artists Ana María Gómez López, Driessens & Verstappen, Nathalie Gebert and WE MAKE CARPETS and the curatorial research *Art and Care: Reflections on the To Mind Is To Care Exhibition*.

PRODUCING, PRESENTING AND PUBLISHING WITH V2_

projects and exhibitions Jonas Lund's [Operation Earnest Voice](#) (2018), Philip Vermeulen's [The Physical Rythm Machine](#) (2017 at Ars Electronica, 2018 at V2_) and Johannes Langkamp's solo exhibition [Sun Tracing](#) (2019). He is also author of the publications [3x3 Live experimenteren](#) (2020, V2_Publishing with Jochem Kootstra) and [Art and Care](#) (2021, V2_ written with Dora Vrhoci).

Arie Altena is archive editor at V2_ and the author of *Wat is community art?* (2016) and *40 Years of V2_* (2022).

C-CATS — Centre for Creative Arts and Technologies at the University of Surrey

Jon Weinbren

University of Surrey
Guildford, United Kingdom
j.weinbren@surrey.ac.uk
www.c-cats.ac

Abstract

The Centre for Creative Arts and Technologies (C-CATS) is an interdisciplinary research and production initiative grounded in the media of moving images and related artistic forms.

We embrace film, animation, visual effects, games, interactivity, live performance, immersion, digital theatre and virtual production in all their current and future guises; without forgetting all the artistic and cultural forebears upon which all these modes of expression were built.

C-CATS combines creative expression with technological innovation: a ‘no barriers’ approach through which we can both make great work and facilitate the future of making great work.

Keywords

Film, Animation, Digital Arts, Moving Image, Virtual Production, Digital Actors, Virtual Characters

Culture and Context

We find ourselves in a time of profound change in the arts and culture space; a time of potential crisis as well as potential opportunity. C-CATS is our way of trying to tip the balance in favour of a positive future creative landscape, by leveraging the best emerging technologies, developing the best new tools and techniques, and being a key part of the production of powerful stories and experiences for the benefit of all who are willing to engage.

Origins

Around 200,000 years ago we gradually evolved into a species capable of communicating through language. This incredible ability to use our breath and mouth to manipulate pulses of air pressure into structured patterns of meaning, and for these to be processed and understood by the strange miniature labyrinthine organs on either side of our heads, is unique on our planet.[1] Our first utterances were transitory, fading with the wind. But we soon became adept at storing and retrieving information and feelings passed between us through the gift of spoken words.[2] This is the genesis of storytelling: a means through which we are able to imagine lived experiences beyond the limitation of our immediate surroundings.[3]

Fast forward some 150,000 years and another richly expressive means of communication has flourished. Visualisations of the world and its creatures adorn the spaces

where our ancestors took shelter. Fragments of rock and stone are fashioned into representational form and imbued with significance and meaning.[4] Around the same time, we learn to manipulate nature’s sounds into patterns and rhythms which further reflect our increasingly complex thoughts and feelings.[5] We then begin to use our bodies to create symbolic form and movement as communal means of expression and celebration.[6] Art and artefact, music and dance, ritual and representation – all these elements evolve in parallel to our ability to craft natural material into tools for survival; and the environments we inhabit into sheltered spaces and safe settlements.

Written language comes later. An amalgam of all previous cultural forms, it reflects our increasingly developed means and modes of communication and culture.[7] Then, applying our natural instinct to pretend and embody, we learn to perform and share the stories and adventures of those who have come before us.[8] These become mass communal gatherings; collective acts of understanding and edification; safe spaces where we re-experience the dangers and delights of both the real and the imaginary; tales of familiar strangers we will never directly know.

Essentials

Art and Culture has always made use of the tools and technologies of the time. Yet the fundamentals of creativity and storytelling which drive them have changed little since the forms first evolved. How else are we to understand the complexities of the world around us – in particular the mysteries of the species of which we form part? What else offers us glimpses of explanation for our sensations and feelings, and for the peculiarities of how we humans behave towards each other? It is only within these spaces that we dare to celebrate triumph over imagined adversity, to understand the tragedy of loss of life or love, as rehearsal for the sorrows that our own lives inevitably hold in store. Stories provide us with the vicarious thrills of adventure without risk, the rush of fear without actual danger, the intensity of unbridled passion pitted against reason or sanity.

For our modern lives, these elements are essential not optional. These arts are the currency of the soul, vital for our vitality, one of few precious sources of good in the world. And in these unprecedented times, we have at our disposal the most remarkable tools and technologies, accessible now

to more of us than ever before.

But history tells us, painfully, that technological advance can be both for the benefit and detriment of life and well-being, and also that of the planet we inhabit. More often than not, 'progress' profits the haves and harms the have-nots. So how do we ensure that the latest and greatest technologies are put to the best possible use?

Ambitions

C-CATS is our humble way of assisting in this mission.

We seek to broaden creativity; to explore and develop the best use of tools and technologies which enable the showing and sharing of stories and experiences for everyone, everywhere.

We embrace new and emerging technologies without turning our back on fundamental skills and techniques.

Democratisation, accessibility, diversity, engagement. These are all essential facets of our work as a centre for research, development, production and skills enhancement in media and performance, including film, animation, visual effects, games, interactivity, immersion, multimedia theatre and virtual production.

We are particularly interested in the spaces which exist between all these forms: cross-overs between animation, digital technology, film, music and live performance; and the interactions between 'makers' and 'players' in the broadest sense.

Manifesto

Interdisciplinarity

Our vision is to bring together researchers and practitioners in film, animation, theatre, data science, engineering, psychology, humanities and beyond, to create new experiences and new ways of working within the broader creative arts.

Connections

We enjoy strong links with the film, television and games production communities, as well as with numerous leading national and international industry players. We extensively engage with all important cultural institutions and trade associations which promote and support the creative industries of which we are a part. We are also actively developing partnerships which transcend institutional boundaries – local, national and global – for the benefit of all.

Crossovers

Legacy distinctions between research, development, production practice and learning/teaching have no place here. We embrace student involvement at all levels of our work. Our production methods are both innovative and agile. Examples include real-time rendering pipelines, automated photogrammetry, 3D to 2D animation hybridisation, performance capture, full virtual production and more. We are proud to benefit from our students' and new entrants' expertise and familiarity with social media content creation, low barrier-to-entry distribution, diversity, and thematic political engagement.

Research

We seek to be more than a traditional academic research centre, more than a set of outputs for academic consumption in pursuit of league table scores. We set our own research targets – to make our research real, impactful and relevant. We are informed by and seek to influence contemporary media practices and the evolving contexts of the audiences and cultural communities we aim to reach. We will find new and interesting ways of creating delivering and understanding the stories, experiences and provocations which provide us all with edification, connection, and a deeper sense of collective consciousness.

Impact

C-CATS is designed to jumpstart high level research and practice in the creative arts and technologies through interdisciplinary collaboration, creative activity, industry partnership and impactful outputs that engage with audiences. We combine technological expertise with innovative storytelling, facilitating the creation of new, impactful artistic works and novel media production techniques.

Technology

We're determined to not only use technology, but also to adapt and invent it. This is where interdisciplinarity truly comes into play.

Production

C-CATS is fundamentally a group of practitioners. We make things. Some of these are experimental and tied in with our research; others more practical fulfilling a need or request from internal or external partners, such as university departments, charities, causes or initiatives. We produce films, animations, games, apps, experiences and events. We offer expertise in performance capture, real-time rendering, cinematography, vfx, animation, virtual production, and live action film production. We have access to some of the best new talent in the business. We avoid turn-key solutions: every production is a learning journey for all involved.

Creativity

There is no substitute for creativity. It is our watchword. No amount of technological wizardry can ever replace the ingenuity and spark of the human spirit.

Presentation and Showcase

For ISEA 2022, we are pleased to showcase some of our latest productions, research outputs, and collaborative initiatives. We invite enquiries about collaborative research opportunities, particularly in areas such as Virtual Production, Autonomous Digital Actors, AI Assisted Synthetic Imagery, and Performance Capture. We also present our new interdisciplinary MA programme in Film, Animation and Digital Arts.

Contact Email pz@werkleitz.de

Short Description

EMAP Manager Peter Zorn from werkleitz Centre for Media Art in Halle will present the European Media Art Platform EXPANDED and its conditions for media artists and institutions interested to become partner and introduce briefly some commissioned art works of the former program EMAP 2018-21.

Keywords

Media Artists Opportunities, Media Art Production, Artistic Research, Residencies, Presentation Grants,

European Media Art Platform Expanded

The European Media Art Platform (EMAP) was established in 2018 with the support of Creative Europe. 11 leading European media art organizations and festivals formed the platform to support media artists within a two months intercultural residency production ranging from media installations, virtual reality, robotics, AI and Bio Art, amongst others, to present and promote their works in group shows and as well to the 80 partner organizations which support and collaborate with EMAP to showcase the EMAP productions. Selected via open calls, the art projects deal with the most urgent challenges of our time, including climate change, environmental degradation, social inequalities, inclusion or digital surveillance. Artists bring these issues to the public and develop alternative ideas.

Continuing and developing their 2018 successfully established brand which builds upon the legacy of the European Media Artists in Residence Exchange established 1995, werkleitz and its members seek to expand both the platform and its activities to host and produce more artists, and to also create a major international platform to promote the artists' productions and to foster knowledge transfer between artists and institutions, not only from Europe but across the world. 15 renowned institutions will host 45 media art residencies for new innovative collaborative productions in the field of art, digital media, technology, and science from 2022 until 2024. In addition, 30 mobility grants will be awarded to partner institutions aiming to present an EMAP work and 14 capacity building workshops will be offered by the members online.

Next to the challenge of artistic production with cutting edge technologies EMAP/EMARE is based on intercultural knowledge transfer which involves experts and specialists of diverse disciplines and the access to the facilities, labs and studios of the host organization.

There is a special focus on art & science projects which reflect upon the effects of digital technologies on humans and nature. The works tour different members festivals and are promoted to museums, galleries, festivals and other institutions worldwide.

EMAP Members:

Ars Electronica Festival in Linz (Austria), Antre Peaux in Bourges (France), gnration in Braga (Portugal), iMAL in Brussels (Belgium), Impakt in Utrecht (the Netherlands), Kersnikova Institute in Ljubljana, (Slovenia), Kontejner in Zagreb (Croatia), LABoral in Gijón (Spain), M-Cult in Helsinki (Finland), NeMe in Limassol (Cyprus), Onassis Cultural Center in Athens (Greece), RIXC in Riga (Latvia) WRO Art Center in Wroclaw (Poland) and as lead organization werkleitz in Halle (Germany) in cooperation with Silent Green Culture Quarter and transmediale in Berlin (Germany)

EMAP Expanded invites one guest organization each year to host a residency. In the upcoming years it is intended to cooperate with

2022: FACT in Liverpool (UK)

2023: HEXAGRAM in Montréal (Canada)

2024: HONF in Yogyakarta (Indonesia)

The Werkleitz Festival presented all finished 44 commissions EMAP 2018-2021 next to a conference on the effects of (digital) technologies on our societies and planet: The festival still can be visited online: <http://moveto.werkleitz.de>

EMAP is open for international partners who receive access to the artists databases for research and can apply for a mobility grant if they aim to present an EMAP work.

Abstract

This panel explores black feminist critiques of posthumanism in/through artistic practice and performance research that utilize robots, machine learning and computation. The purpose is to uncover the veiled links between racial, gendered, and ableist practices and to combat the governing codes that construct – and continue to normalize – practices of dehumanizing exclusions. Black feminist scholar Sylvia Wynter identified how the notion of what it means to be “human” is marked by race and other axes of difference, and points to how different ‘genres’ of humanity (full-humans, not-quite humans, and nonhumans) are encoded through racial, gendered, and colonial hierarchies. [1] Finding an analogous hierarchy, Disability studies scholar Margrit Shildrick proposes that embodiment is never self-complete or protected against otherness, noting how the neoliberal notion of embodiment is grounded on an imaginary of corporeal wholeness and integrity. [2] While robots and cyborgs have potential to figure posthuman forms of subjectivations, in algorithmic societies they often reinforce human-machine, self-other, or abled-disabled binaries, thus glossing over the racist and dehumanizing exclusions that uphold neoliberal forms of power and Western conceptions of the human.

Keywords

Decolonial theory. Critical race studies. Posthumanism. Disability studies. Critical black feminism. Critical phenomenology. Robotic art. Robotic performance. Racial technologies. Bias. Algorithmic societies.

Introduction

This panel originated at a conference stream entitled “Decolonizing the Machine” at Politics of the Machine 2021, where we inquired into the systemic ways that algorithmic art, robotics, and computation in general are based on a deeply liberal, Eurocentric, ableist conception of the human. [3] Black feminist scholar Sylvia Wynter identified how the notion of what it means to be “human” is marked by race and other axes of difference, and points to how different ‘genres’ of humanity (full-humans, not-quite humans, and nonhumans) are encoded through racial, gendered, and colonial hierarchies. Disability studies scholar Margrit Shildrick proposes that embodiment is never self-complete or protected against otherness, noting how the neoliberal notion of embodiment is grounded on an imaginary of corporeal wholeness and integrity. Recent scholarship has looked at how these hierarchies and imaginaries are encoded through biased digital technologies that systematically harm persons of color and elide people with disabilities. However, critical

race studies, decolonial theories and disability studies are rarely considered in discourses surrounding machines and art.

What are the impacts of algorithmic bias and encoded discrimination in the context of machine vision algorithms, natural language processing and robotic embodiments as they relate to gender, race and disability? How might artistic practice and rogue research methods challenge/refute/disrupt/blow up the dehumanizing practices that are encoded into machines? Our thinking/framing is informed by Sylvia Wynter, Margrit Shildrick, Alexandre Weheliye’s *Habeus Viscus*, Louis Chude-Sokei’s *The Sound of Culture*, Ruha Benjamin’s *Race After Technology*, Safiya Noble’s *Algorithms of Oppression*, Jennifer Rhee’s *The Robotic Imaginary*, and Joy Buolamwini’s work on inclusive coding and *The Coded Gaze*. We critically inquire into issues of race, gender and disability as they relate to performing machines/technological bodies in robot and cyborg art.

Abstracts

Abstract 1: Racial Data in Identity Construction of Intelligent Agents: Embodiment of new narratives presented within Conversations with BINA48 and Mythicbeing, Suhun Lee.

As our lives are increasingly organized and shaped by algorithms that track, collect, evaluate and monetize our data, the ‘uncanny’ value has been assimilated into various forms of technical assistants using machine learning, reflecting upon human behaviours and social norms. Yet the imminent and nuanced realities of ‘Artificial Intelligence (AI)’ presented in neutral forms which are seemingly free from race, gender and sexuality, raise questions upon the algorithms used to map out its identity and the datasets fed into the model, not to mention the social values embedded underneath.

Why are the technical assistants such as chatbots – from ELIZA to Siri, Alexa, Bixby – mainly mobilized through feminine persona? Is AI free from socio-cultural stereotypes, racism and sexism, fully separable from social, political and economic boundaries? How would the interaction with the AI constructed with notions of racial, sexual and gender inequalities further affect the social norms and discourse regarding cybernetics? Is the goal of creating a competent AI centralized towards coding an

identity-free assistant? What does it mean to construct an AI with a virtual identity?

Studies have shown that datasets and algorithms are un-representative. With the lack of diversity in creating data and building, installing and developing the algorithms, the imposition of views and values on algorithmic systems has been emphasized for more than a decade. Scholars including Chowdhury and Mulani claim that “AI can be a method of perpetuating bias, leading to unintended negative consequences and inequitable outcomes.” [4] With the dataset and algorithms being reflective of pre-existing social and cultural biases and even the ‘raw’ data being an oxymoron, ways of producing, consuming and circulating the intelligent agents should accordingly be analyzed.

Two of the artworks: *Conversation with BINA48* by Stephanie Dinkins and *Mythicbeing* by Martine Syms will be analyzed in this research to give a critical glance into the possible futures of AI identity construction. Through a close reading of Dinkins’ performative interaction with a customized AI, BINA48 and a ‘threat model’ created by Syms, the focus of this research lies in locating the current discourse of constructing virtual identities via machine learning. By comparing and contrasting the textual data used as a training set and its verbal output of the two artworks’ AI models, it is planned to look at how societal value systems are built and narrated through an ‘AI’. This paper further aims to unfold different potentials and pitfalls of virtual identity construction, hoping to facilitate the discussion around AI as an artistic medium to create new identities and narratives.

Abstract 2: Connecting Resonances: On Pre-modern Indigenous (Sound) Technologies, Budhaditya Chattopadhyay.

If we aim to make an apropos taxonomy and nomenclature of what is termed media arts and “TechArt” – one may ponder over the archeology of what is understood as “Technology” – which is often a Western concept of linear progression, and in essence a colonial tool of plunder. If we take a historical perspective, in South Asia, the transfer and transmission of modernist technologies took place as a colonialist and imperialist strategy of control, quantify, and exploit the resources of the Global South: South Asia, Africa, Middle East and the Latin Americas.

In South Asia, advent of such modernist technologies happened through colonial models of erasure and taking over control, benefiting the imperial powers. Early western colonial technologies, such as recording, photography, radio and cinema: all contributed to this vision. It is only the colonial subjects, who gradually hacked into these technologies and reclaimed, as well as appropriated them to produce new hybrid kinds of post-modern aesthetic practices. In this same line of technological transmission and transfer, transistors, electronic circuits, digital and computing technologies and AI, were also brought from the West to the East, and from Global North to the Global South, but not the other way round. Global North’s condescending approach towards the colonized South didn’t allow much equal distribution of power, knowledge and aesthetic understanding.

However, South Asia (and the Global South) has been the house of some oldest and time-tested technological and cultural practices, in visual, haptic and sonic realms, as well as in urban design, water management, and agriculture. [5] There was no reason to make a hierarchy of knowledge and culture, if we listen to some of the

pre-colonial aesthetic practices where a pre-modernization concept of technology existed, and which was as intricate as its global counterparts, however ignored in the studies of machines and technological histories.

The examples include, as I mentioned earlier, musical instruments, such as *Rudra Veena*, *Gongs*, *Ghungroo*, traditional wind chimes in South Asia, temple bells tuned with traditional methods, among others. These instruments are usually performed within certain rituals e.g. in religious worships, or musical traditions, e.g. Dhrupad, the ancient-most sonic practice in South Asia. If we unpack the intricacy with which sound producing instruments were conceived and built in South Asia using indigenous technologies of tuning and instrument design, we find out that the pre-modern indigenous sound technologies were as sophisticated as the technology we know today from a Western modernist and colonialist understanding of it. Therefore, it makes no sense to adhere to the hierarchy of “high tech” and “low tech” considering pre-modern as primitive, and define “TechArt” from a Western taxonomy, represented often by large-scale, immersive media arts proliferated in European and American TechArt festivals, e.g. Ars Electronica. Given the rich examples of artistic practices using pre-colonial technologies in South Asia, I propose to redefine what “TechArt” is, and decolonize the term to give long due credits to tech-artists and artisans from the Global South.

Abstract 3: Ethics of Digitizing Public Heritage, Najam Ul-Assar

UNESCO's charter of 2009 defines the term digital heritage as "cultural, educational, scientific and administrative resources, as well as technical, legal, medical and other kinds of information created digitally, or converted into digital form from existing analogue resources. Digital technologies that allow us to create 3D renders of objects and even make 3D prints of them have resulted in the preservation, accessibility and dissemination of cultural objects to more unexplored markets and audiences globally. The implications of this are that lost or damaged precious objects have a chance at a second life. Countries and companies have rushed to restore or even resurrect sculptures, landmarks and other heritage sites destroyed by war, violence or extremist groups with the use of these digital technologies.

While the idea itself may be commendable, there are underlying issues that cloud the picture and it is essential to explore the associated challenges. This becomes particularly clear when we examine the question of reconstructing cultural heritage of emerging countries, specifically those where culture has been destroyed due to conflict or extremist groups. The majority of such projects are driven by western individuals or organisations. Many of these consciously or unconsciously use this opportunity for financial gain, and this ‘for-profit’ model is problematic especially when seen in the context of cultural ownership and origin. Additionally, there are a variety of political and financial imbalances that come with digitizing the heritage of a conflicted area, such as access to internet and the distribution of the reconstruction.

At present digital preservation generally lacks a clear ethical framework for who, how, what, where, and why to restore certain historical artifacts through the use of technology. This paper will explain some of the challenges associated with it by primarily examining the work of Allahyari and other examples from the region. The relevant factors that influence the ethical representation of an object

will be identified, through which conclusions can be drawn on a more post-colonial approach to this kind of digitisation.

Abstract 4: Reconsidering Discourses of Inclusion in Assistive AI, Stacy Hsueh.

There is increasing call to make various digital experiences accessible through AI technologies, whether it is automatic captions of online videos or real-time audio descriptions of physical surroundings. Access in these systems is often communicated through the rhetoric of inclusion — as *including* a marginalized other into existing conceptions of ablebodiedness. While well-intentioned, this narrative is often constructed within the confines of neoliberalism in which the boundaries of disability is delineated by the market. This casts the body as a site for “product development and market expansion” [6].

Critical disability theorists have long challenged this neoliberal co-option of “inclusion” and shown how such practices reify dominant notions of normalcy. These scholars advocate for a more radical project that replaces practices of inclusion based on normative ablebodiedness with those that center alternative forms of embodiment rooted in crip experiences. Such agenda requires a deep understanding of “peripheral embodiments” [7] and their value in coalition building.

In this panel, I follow these theoretical traditions in discussing the practices of disabled artists Emery Blackwell, Jenny Sealey, and Tarek Atoui. Instead of operating within the tropes of the able/disabled binary, these artists explore more expansive narratives of the crip experience on their own terms. In doing so, they shift the language of disability from that of “correction” to that of “skilled labor” [8], a form of knowledge that calls traditional categories and values into question. This lays the groundwork for discussing how artistic explorations of peripheral embodiments can offer new conceptual tools for thinking about access in algorithmic contexts, leading us to richer imaginations of accessible futures with AI.

Abstract 5: Techno-Neoliberalism’s Body: Dance(r) Labor in Computing Research and Race as Always Already Additive, Jessica Rajko.

In this corpus study, I analyze 135 publications extracted from the Association of Computing Machinery (ACM) Digital Library and returned in a database query using the general keyword search term “dancer.” Throughout the analysis, I identify and critique structural and rhetorical trends in canonising EuroAmerican concert dance forms as that which universally speaks on behalf of dance and human movement at-large. In my investigation of papers not involving dancers in any aspect of the research, I identifies a thematic design trend toward creating support tools for social dance forms. 7 of the 9 papers describing pedagogical support tools for dance that do not involve dancers at any phase of the research describe tools for learning how to dance in club settings through gamification and/or by making virtual instructors that could replace in-person social dance learning.

The notable lack of dancer participation at any stage of the design process is important to note. Many social dance forms (like those found in clubs) simply do not share and circulate dance knowledge in the same way as western concert dance forms, which my research identifies as the geocultural lens through this computing research understands dance. The sociocultural roots of what’s

depicted in research as “club dance” mostly derives from African American social dance practices. Through the critical analysis of dance studies scholars such as Thomas DeFrantz, it is possible to contextualize how a centralization of Western perspectives (from both dance and computing) inadvertently promotes the appropriation of movement vernaculars that do not work within a western epistemology but garner access to the aesthetics of cool, hip, and the popular.

Appropriation—in this case, the re-purposing of dance to allow its entry into diverse economic markets—reconfigures black physicalities into a place of interchangeability with any who would do the dances, and allows access without concerns of situation or material circumstance of the dancer under scrutiny. [9]

In this case, appropriation severs the dance practice from the sociocultural and geographically-specific movement vernaculars from which the practice originates, thereby allowing researchers to describe the practice as freeform movements happening in clubs with no real structure or form—a practice Reed and Phillips describe as deracination. [10] Once severed and deracinated, the dance practice is then retrofitted to work within western concert dance frameworks by inserting a virtual instructor (created with no dancer consultation) as the dance expert. This retrofitting allows social dance forms to operate and be made legible within western educational modalities both within and beyond dance, which tends to understand and express learning as an activity led by an individual expert rather than cultivated through collective praxis.

Art and technology at school. Resources for a critical integration of new media art practices in the school context.

Abstract

The integration of artistic practices that connect art and technology in the context of compulsory education is a complex issue that highlights the need to activate school practices in connection with the changing and technologised reality of contemporary society from a critical and generative approach. This panel introduces a selection of projects promoted by the Red PLANEA Arte y Escuela developed in schools in Spain's regions of Andalucía, Madrid and Valencia. Introducing different methodologies and specific techniques, these projects address the critical analysis of information and communication technologies, both from their creative and facilitating dimension of new spaces of thought and interdisciplinary intervention as well as in terms of the analysis of their effects on the forms of relationship and experiences in contemporary society. Through different contributions this panel explores the potential of these projects as replicable strategies for other educational contexts and also introduces ANIDA, a Journal specialised in educational resources which, in its volume n2, focuses on these issues by compiling artistic and educational resources related to today's technologies.

Keywords

New media, critical technologies, technologies at school, media art education, media literacy, Big Data, Steam, educational resource

Introduction

The integration of technologies in educational contexts is usually approached mainly from two positions: on the one hand, there are programmes that address the school's needs technologically and focus their efforts on equipping schools and educating students in the use of the main digital tools. On the other hand, there are programmes focused on raising awareness among students of the dangers associated with the use of technologies and social networks by promoting a responsible and conscious use of these.

These approaches, in whose fields of action we can find very interesting initiatives and developments, leave out, however, other perspectives that, linked to transformative and creative experiences and processes, problematise technological developments and delve into the complexities derived from the implementation of technologies in everyday life. The proposals presented here exemplify a link between artistic practices and experimental formats and connect with the practices of the so-called new media art not only in terms of their use of information and communication technologies, but also in

terms of their use of diverse knowledge and disciplines to address the multifaceted challenges of today's society.

Therefore, we can find proposals that raise questions related to the new forms of communication that have emerged in the Internet and their potential as expressive forms that activate discourses in the context of the school. We can also find initiatives that question the school and its limits in the framework of the expansion of virtual environments or workshops that detach technology from its framework of practical utility to explore its creative potential and aesthetic expression. There is a wide variety of proposals that, arising from initiatives close to the art of new media, their structures and agents, paint a broad picture of what could become an inclusion of technologies in schools.

In this panel we will focus on an analytical overview of various projects promoted by the Red PLANEA Arte y Escuela and carried out in primary and secondary schools in Andalucía, Comunidad de Madrid and Comunidad Valenciana, with a special emphasis on the implications that their implementation has revealed both at an organisational and structural levels in schools as well as at a disciplinary level on the curriculum and the development of educational competences.

Proxy.mo - Media Literacy and Internet Culture

The Internet has forever changed the way we communicate and tell stories. Culture has been transformed by narratives that constantly change format. In this context, it is essential to generate spaces for research and learning that focus on understanding the educational and social application of emerging technological tools.

This programme focuses on highlighting the value of students' everyday practices on social networks and digital platforms, providing an educational approach and a creative use of these tools. One of its goals is to recognise an encountering point between the educational and the curricular demands, as much as between personal and collective trends.

PROXYMO consists of theoretical and practical training on the educational uses of content generated on social media, digital narratives and Internet culture. It is aimed at teachers and students and addresses co-design processes in a peer-to-peer learning relationship between them. By the end of the training program, *PROXYMO* held a public online event in order to show all creations made by the students of seven different high schools from Andalucía. During the event teachers and students discussed together with special guest Cristian Olivé (writer, researcher and

teacher) and Felipe G. Gil the relevance of their own creations as much as the input they've had by telling curricular contents by the digital tools they're familiar with.

Public image for Proxymo Media Literacy online event held on 30 March 2022

Link to the video: <https://www.youtube.com/watch?v=-scv9exqzTo>

Objectives:

- ❖ To encourage the use of digital tools and social networks as a loudspeaker for critical thinking, cultural activism and personal-collective bonding.
- ❖ To activate co-design processes (sharing, debate and negotiation) within the classroom.
- ❖ To motivate media literacy as a process of research and production of critical thinking.
- ❖ To recognise the potential of some digital platforms as an artistic and educational tool.
- ❖ To develop and encourage a critical and creative spirit in the use of ICT.
- ❖ To stimulate other ways of learning and evaluation within the classroom and the curriculum.

STEAM with an A

Programme that offers teachers and schools the possibility to develop STEAM (Science, Technology, Engineering, Art, Math) methodologies through their participation in a learning group formed in June 2021 that trains them in the implementation of the project in the Comunidad of Madrid's public high schools during the school year 2021-22. Participants take an active role generating interdisciplinary working groups between teachers, engineering students of any degree of Engineering, Architecture and Industrial Design and artists to work with secondary school students in a collaborative way around contemporary challenges. The program emphasises its processual nature, whereby emphasis will be placed on the process of contemporary creation, highlighting the different phases of creation of an artistic and scientific project: incubation, design, production and evaluation of results.

It is a symbiotic process between art and science. On the one hand, art brings reflection and criticism and helps to imagine and design processes to tackle problems from a disruptive and innovative point of view. On the other hand, science helps us to better understand the problem in front of us and gives us practical tools for the resolution of concrete problems. *STEAM with an A* seeks creative interaction and the generation of links between creators, engineers and secondary schools in order to promote citizen participation through the approach of contemporary challenges that mark the Sustainable Development Goals using art and science as tools to face the challenges of the future. Methodologies related to STEAM address contemporary challenges through artistic, scientific and creative processes.

Collage on multipurpose imaginary, by Jesus Jara

Objectives:

- ❖ To open a line of training and development of STEAM methodologies in the Comunidad of Madrid between secondary and higher education centres.
- ❖ To generate interdisciplinary working groups between teachers, engineering students and artists to work collaboratively with secondary school students on contemporary challenges.
- ❖ To incorporate new methodologies associated with STEAM in public secondary schools in region of Comunidad de Madrid.
- ❖ To address contemporary challenges through artistic, scientific and creative processes.
- ❖ To activate the presence and social legitimacy of young people as fundamental agents for the changes that must be faced in the future.

Playing with Data

The project explores the role of data in today's society. Every day we generate a multitude of digital traces that are stored to feed the insatiable voracity of Big Data and that generate our "digital self"; a kind of alter ego of ourselves

that stores a reflection of our tastes, interests, behaviours, friendships, etc. In this workshop we will use the record of our digital data as creative material to develop a critical look at the social transformations generated in the data centered era.

Playing with Data, Diego Díaz, 2022

Objectives:

- ❖ To explore the creative possibilities of digital data.
- ❖ To develop a critical view of the recording and use of digital data.
- ❖ To generate a creative space for reflection on the social transformations produced by Big Data and Artificial Intelligence.

The project *Playing with data* has been developed in 15 secondary schools in the Valencian Community, as an extended and replicable version of the workshop DataSelfie, carried out in 2020 in 5 secondary schools in Asturias, in the framework of the exhibition When the butterflies of the soul flap their wings of La Laboral Centro de Arte y Creación Industrial.

ANIDA Vol. 2

ANIDA - Arte y Escuela is an academic journal which aims to bring together and disseminate artistic practice as the

resource for teachers of any area, subject or educational level; students and teachers in the Faculties of Education, Architecture or Fine Arts, as well as researchers in the field of art and education whose practice is linked to school. Unlike other academic publications, where research is understood as a purely textual production, in ANIDA the selected and published resources can be presented in different formats (textual, audiovisual, sound, etc.) as far as they serve as a tool or methodology to be used by a professional in the field of education. The publication and dissemination of artistic-educational materials aims to transform the mechanisms embedded in schools and in teaching-learning methodologies.

ANIDA Vol. 2's monograph, curated by Red PLANEA and Susanna Tesconi (teacher and researcher, UOC), deals with the interference of artistic and technological knowledge, which generates a creative, experimental and educational experience. We want to discover those tools at the educational intersection between arts and technology that address the problems of our present, that discover new places of thought and creation and that serve as methodological models that can be replicated in multiple educational centres and spaces. It aims to gather educational materials that deal with the application of technology from creative, reflexive and critical points of view. For example, discovering the educational possibilities of processes linked to Big Data, AV, programming, virtual identity, artificial intelligence or robotics. It also addresses those virtual scenarios that give us possibilities to act, create and think in a different way, for example, experiences in video games or immersion in virtual reality. Finally, it comprehends approaches to our interpersonal relationships and even our way of thinking: from how we understand loneliness or friendship to forms of protest, participation or activism.

Abstract

This panel brings three different projects to discuss possible relations of art and nature. We plan to present, think over, and bring about questions on how artists are dealing with climate change issues and how we can create new possibilities of living in balance with nature. Art projects of sensing the sea, of creating narratives of a salty lagoon and of rethinking ecologies of hops are introduced as a starting point of the discussion.

Keywords

Art, sea, ecologies, hops, salty lagoon

Introduction

Living in a world where we use nature in an exaggerated way and as if its resources were infinite, this panel proposes to discuss ways art can contribute to an imaginary possible world connected with nature as an entity. We plan to present and discuss art projects that intend to decolonize nature (Demos, 2016) through their practice.

How do we interact with nature? Do we see ourselves as part of nature? How can art create possible forms of seeing we are part of nature? Is art able to sensitize people on climate change issues?

Artistic practices of sensing the sea

It's not news about the importance of the seas to the global environmental crisis. With the slogan "The Ocean holds the keys to an equitable and sustainable planet", the United Nations declared the Ocean Decade (2021-2030). Scientists have different methodologies for sensing the sea and collecting data, here I propose a discussion on how artists are sensing the sea. Artistic methodologies and practices that improve our way to perceive this global connected amount of salty water.

In this environmental aesthetics thesis, Allen Carlson (2000) argues that natural sciences, and not art, can better appreciate nature. Here I propose a reflection on artists working with scientists making a counterbalance to his theory. Art projects as "Noise aquarium" by Victoria Vesna, Alfred Vendl and team or Aqua forensic Underwater Interception of Biotweaking in Aquatocene by Robertina Šebjanič and Gjino Šutić are examples of this connection between art and science.

Place has an important role in media artists working with environmental sea issues. Lucy R. Lippard (1997) talking about sensing a place reveals she has been influenced by locations. Media artists also present this influence in artworks that deal with the increase of sea level, water pollution, noise in the ocean and invasive species. Hybrid

pieces that bring together art and science are the focus of this reflection on how art senses the sea.

Additionally, I'll present my experience sensing the sea as an artist working with scientists in two projects. One was in Antarctica, collecting data from the Southern Ocean with oceanographers, and the other, working with chemists and biologists seeing the remains of oil spilt on corals in the sea surrounding Bahia, Brazil.

Figure 1. Print of Antarctica Tempo Audiovisual Performance

Reset: Mar Menor

Reset: Mar Menor is a situated and interdisciplinary research project based on the arts. Part of the situation of environmental deterioration of the Mar Menor, a salty lagoon with several protection figures at regional, national and international level, which in recent years and due to extractivism and pressure from the agri-food industry, tourism and real estate speculation is undergoing a serious deterioration process: eutrophication and massive death of species, destruction of landscape and traditional ways of life and contamination of water and natural resources.

Through the implementation of different artistic research actions, the project aims to activate the development of a new narrative for the lagoon understood as a critical zone (Latour & Weibel, 2020) from the confrontation of its different collective imaginary: tourist claim, waste dump, sports space, natural oasis, complex system of hybrid matter in which nature and artifice, biology and technology, development and destruction are amalgamated.

The proposal is developed both in the academic and citizen spheres and converges in the territory with the work carried out by biologists, engineers and ecologists to build together a space for reflection through the articulation of knowledge and interdisciplinary collaboration, using the capacity of contemporary art and the practices of visuality as a vehicle to imagine ourselves collectively. The Mar Menor enunciated as a common good and projected through contemporary art.

Figure 2 Exhibition panel Mar Menor Lab

Cultivate Cultures: Ecologies of Hops

The project Cultivate Cultures: Ecologies of Hops stems from a polyphonic look at hops (*Humulus lupulus*) in the province of León, the main territory linked to its cultivation in Spain. Inspired by its geopolitic and somatic properties, the project aims to readdress existing relationships with the plant, to activate a platform for research and experimentation and rethink the ecologies of its image and residues.

Hops is a climbing plant, belonging to the family of the Cannabaceae, which produces flowers that contain a mixture of essential oils and resins called jointly lupuline, of an amber-like colour, special aroma and bitter flavour. Its compounds have been historically known for their soothing properties and sedating, somatic effects over the nervous system. Properties that suggest a transgression of the body's functionality, similar to sleep and its play on scale and space (Didi-Huberman, 2014). Similarly, the plant's sensory and gustatory experience of bitterness is thought as a means to reflect on the relationships between (dis)pleasure, knowledge creation (Agamben, 2016), digestion and other processes of assimilation (Derrida, 2009).

The Creation of the Medialab Madrid Archive: Preserving the Memory of Transdisciplinary Media Art Practices

1st Raquel Caerols Mateo (UCM), Madrid (Spain), email: rcaerols@ucm.es, **2nd Karin Ohlenschlääger**, Gijón (Spain), email: k.ohlenschlaeger@gmail.com, **3th Beatriz Escribano Belmar** (USAL), Salamanca (Spain), email: beatriz.escribano@usal.es

Abstract

The creation of the MediaLab Madrid Archive arises from the need to contribute to the preservation of transdisciplinary media art practices and the shaping of the new narratives related to an extended media archeology, in the context of the project *Medialab Madrid as a model of transversal laboratory: art, science, technology, society + sustainability for the digital agenda* (H2019/HUM-5740 (MediaLab-CM) within the call for Social Sciences and Humanities (2019) of the Community of Madrid co-financed with the European Social Fund. The proposal is conceived as a panel discussion with the participation of four researchers who are involved in and experts on the subject, structured along different axes of discussion focused on the challenges of cultural innovation as of twenty years ago and its preservation and dissemination in an open, dynamic and relational archive structure, able to convey the relationships among biological, social, technological and cultural systems, and proposing an extension and enrichment to the consensus terminologies of media art.

Introduction

MediaLab Madrid (MLM) was an innovative program of activities that encouraged active participation in the emerging transdisciplinary digital culture in Spain. Located between 2002 and 2006 at the Conde Duque Cultural Center, MLM undertook and generated a wide range of training, research, production, debates, and exhibitions of an interdisciplinary nature to promote the critical and creative use of techno-scientific advances, understood as integral parts of the digital culture of the 21st century.

In this context, MLM established new relationships among different actors and fields of knowledge in the local community and created links with the most diverse international circuits. This implicitly involved a process of building networks, until then non-existent in Spain, in connection with other European, American, and Asian nodes.

From its inception, MediaLab Madrid was conceived as an open space for dialogue among art, science, technology, and society. It was characterized by promoting research and social and cultural innovation processes that explored the art-life binomial in the light of techno-scientific advances, as well as the most disruptive artistic practices, linked to transdisciplinary creation, the emerging digital culture and the participatory social dynamics that were produced around it. Updating the art-life relationship -one of the most productive lines of the 20th century-, MLM explored the impact of technoscientific innovation on human and environmental conditions. Therefore, it delved into biological concepts - symbiogenesis, autopoiesis, ecosystem-, in recombination with others originating in sociology and computer sciences, free software culture, network society, collective intelli-

gence-, or sciences of complexity -systemic, non-linear dynamics, emergent-, among others, to develop a transdisciplinary approach to knowledge production and transfer.

MLM collaborated with artists, biologists, anthropologists, engineers, mathematicians, sociologists, programmers, architects, physicists, philosophers, journalists, and educators. In this way, it favored interaction and synergy among different actors and fields of knowledge, generating an open and porous environment, conducive to the emergence of collective and transversal creative processes.

The driving issues and ideas that gave shape to this dynamic and evolving model, from a conceptual and organizational point of view, were based on the transformation of a traditional exhibition center into a multipurpose ecosystem of dialogue and knowledge production. Its creative environment was simultaneously dedicated to reflection and debate, research and production, training and socialization, exhibition and dissemination, all activities that comprised a prolific process of innovation of the communicating vessels and collaborations between the sciences and the humanities.

What differentiated MLM from the American model of the MIT Medialab is the fact that it took the concept of a research and innovation laboratory from the private, academic, and business scope to the public, cultural and citizen sphere.

This implied that the spectator became a participant in the transformation processes related to techno-scientific advances and digital culture at the edges of art, science, technology, society, and sustainability. Its activities addressed transversal concepts of all kinds, related to the impact of the digital era on contemporary human conditions, culture, society and the sustainable development of the environment.

MLM took as reference and inspiration those pioneering experiences that emerged at the beginning of the century in the context of the Vanguards -such as the Experimental Laboratory of Kinetic Constructions at the Proletkult in Moscow (1917), the Bauhaus in Weimar, Dessau, Berlin (1919-1933), and in Spain, the Residencia de Estudiantes in Madrid (1910-1936). In the second half of the 20th century, many other relevant initiatives stood out: among them the Black Mountain Colleague (1933-1957), Fluxus (1961), MIT Center for Advanced Visual Studies (CAVS), Boston (1967), The Seminars of Automatic Generation of Plastic Forms at the first Computer Lab of the University of Madrid (1968-1973), The Kitchen, New York (1971-73), Ars Electrónica, Linz (1979), Espacio P, Madrid (1981-1997), MIT Medialab, Massachusetts (1985), ZKM, Karlsruhe (1989), or the Planetary Collegium, Plymouth University (1994).

Their various structures and functions nurtured the project of what finally became MLM, a pioneer project in Spain, and these lines of interdisciplinary and transdisciplinary collaborations.

The development and implementation of the MLM Archive are not only in line with the process of preserving and disseminating all the material generated during the pioneering years of MLM; in addition, the research, organization and publication of this material - in physical and digital forms -

will allow us to build a narrative that will lead us to understand and value how the synergies among art, science, technology, society + sustainability have shaped the genesis of what today constitutes the episteme and digital society. These will be the central issues of the panel discussion.

The Four Axes of Discussion

Archive vs. Collection: Archive as Memory

A collection is a term more closely attached to physical artworks and objects, whereas an archive is a concept more related to the documentation of the process and the documentation generated around an activity. And that is precisely what the MediaLab Madrid Archive is all about. We could say that the central difference corresponds to a paradigm shift that focuses on the production of experiences and knowledge related to different types of collaborative and participatory processes.

Contributions to the Transdisciplinary Media Art Archaeology

The absence of media art practices in art history books, and the apparent lack of institutional interest in transdisciplinary digital art and culture means, for now, a certain lack of legitimization of this kind of artistic practice. The creation of the MLM Archive is proposed as a contribution to the history of transdisciplinary media art practices and to face the challenges of obsolescence and the preservation of the digital.

Beyond Media Art Terminology and Thesauruses

The narrative of transdisciplinary media art practices will be shaped in an initial, fundamental, and central phase of conceptualizing its practices, processes and productions related to different fields of knowledge. This is one of the key challenges in the construction and implementation of the MLM Archive and will be discussed during the ISEA presentation.

During the process of designing the database, a commitment to the transdisciplinary methodologies implemented and developed by MediaLab Madrid have posed the complex task of designing a database. Its conceptualization and the choice of terminology respond to the concept of a dynamic and relational open archive, one that is capable of conveying the transdisciplinary connections among biological, social, technological and cultural systems, expanding on the consensual terminologies of media art. To do so, we started from the concept of *design research* that ensured the design of the tool in co-creation narratives. Techniques such as *card sorting* could fulfill a double objective: improvement of decision making in the conceptual design stage(*open card sorting*) and the possibility of evaluating the content organization system and classification categories(*closed card sorting*).

Disseminating and Transmitting Transdisciplinary Media Art Practices

Building the MLM Archive as a contribution to transdisciplinary media art practices also involves a central duty to the processes of dissemination and transmission, which involves generating narratives aligned with the genesis of transdisciplinary media art. Based on the database, a hypermedia platform has been designed and developed with the main intention of contributing to the need for dissemination and transmission, offering different levels of access aimed at both broad and academic audiences. The objective is to

reach the collective memory and to understand this process as fundamental for it to become part, in its own right, of the history of transdisciplinary practices, and the history of contemporary art.

Conclusions

We propose the axes of discussion as the fundamental challenges we face in the process of preserving and shaping the narrative structure of transdisciplinary media art practices. Categorizing these four axes of discussion is the result of learning from the creation of the archive itself, in relation to its conceptualization and design. The intention of this panel discussion is to share our own experience; not only to improve the creation and enhancement of this archive, but also to contribute to and inspire other similar archive projects that are in process and the future ones that will be generated around the collective construction of the transdisciplinary media art narrative.

Art Intelligence

Bruno Caldas Vianna

Uniarts Helsinki

Finland

bruno.caldas@uniarts.fi

Abstract

While the advances in artificial intelligence in recent years have been astonishing, we are still quite far from the inception of a mechanical intellect that could perform like the human mind. The human qualities which are most challenging to replicate are exactly the ones related to art production and reception: metaphors, analogies, misbehavior, embodiment, contemplation. Nevertheless, many tasks considered impossible for machines, like beating humans in chess and go, have been achieved. The goalpost for AI just keeps being moved a bit farther. Will a machine ever be able to be actually creative or must they always rely on human inquietudes? What is this 'je ne sais quoi' that is so difficult to be replicated by algorithms or neural networks? Can we think of some type of intelligence that is unique to art?

Keywords

Artificial intelligence, singularity, AGI, art, creativity,

Proposal

The panel wants to bring together artists, philosophers and computer science experts to discuss the challenges posed by creative practices to artificial intelligence. Computers are now able to perform tasks unimaginable until just a few years back, like realistic photographs, replicas of paintings, generation of texts comparable to human writers. Nevertheless, the development of an artificial general intelligence - a system that bears qualities comparable to the human mind - remains elusive.

Not too long ago, eminent thinkers declared in different ways that computers were not able to create art. If they did, however, it would be a sure sign of human intelligence. Douglas Hofstadter used to hold music as a kind of bastion of humanity. In his seminal book on the limits of artificial intelligence, published in 1980, he states that "music is a language of emotions, and until programs have emotions as complex as ours, there is no way a program will write anything beautiful". [9] Or as formulated by Margaret Boden, "Some areas of AI seem especially challenging: language, creativity, and emotion. If AI can't model these, hopes of AGI are illusory." [1]

The problem is, such milestones are being reached and surpassed all the time. In the sixties, as researchers invested efforts in implementing checkers players algorithms. It was

also believed that to solve the mysteries of human intelligence, a computer would need to play chess better than a human. [11, 13]. But Deep Blue came, defeated Kasparov, and yet showed no sign of general intelligence: it was no more than a machine that used smart analysis tactics to choose the most rewarding from a vast number of possible outcomes.

As early as the nineties, Hofstadter described his surprise when realizing that the EMI program (Experiments in Musical Intelligence, developed by musician David Cope) could render perfectly acceptable pieces in the style of Chopin or Bach. [12]. And Boden might also have been surprised with the release of written language model GPT-3 only a few years after the quote was published. Although it is limited in many senses, the model clearly masters the ability to simulate language so well that it is already taking the job of writers: GPT-3 is writing content to the pace of 4.5 billion words a day. [8, 7].

The fact is that in recent years computers became capable of rendering not only convincing music and text, but also photographs¹, paintings², and videos³. And it becomes clear that every time a milestone is reached - like the aforementioned chess [3] and also go [4], the goalpost moves a bit further: we realize that human intelligence is not just the capacity to play games, produce drawings, solve equations, but something else. This was described by Pamela McCorduck as the "AI effect" [10]:

"It's part of the history of the field of artificial intelligence that every time somebody figured out how to make a computer do something—play good checkers, solve simple but relatively informal problems—there was a chorus of critics to say, 'that's not thinking'."

So where is the goalpost these days? Philosopher Sean Kelly makes the point that intelligence is a socially embedded phenomenon, and has no meaning outside society: neither machine nor human can be intelligent if it is isolated from context. [?] Jenna Ng also makes the apt suggestion that machines must be rationalized on their own terms, and not by comparison with humans, which is not far from the twist proposed by Delacroix, who says that computers must be surprised by us and not necessarily the opposite. [? ?]

¹<https://thispersondoesnotexist.com/>

²<https://www.nextrebrandt.com/>

³<https://www.rephrase.ai/>

Despite these being very important takes on the subject, computer scientists are continuing to solve the old problem of creativity in machines. François Chollet, creator of the Keras package, one of the most important programming libraries used in machine learning, developed a training and evaluation set designed specifically to evaluate the capability of a system to make analogies, that is, to be able to learn from the solving of problems and apply such knowledge on new challenges. [5] Conceptually, his tests are not too far from the puzzles proposed in 1967 by the computer scientist Mikhail Bongard [2]. The difficulty for today's machine learning models to resolve metaphors - a special use of analogies - is also described by Melanie Mitchell, but was detected much before that by Umberto Eco.[6].

This realization doesn't imply the dismissal of the profound impact that these new computer-based skills are having in society (and in creative tasks). But like Floridi noticed, computers are not becoming smarter in the general sense. What is being proved is that the capacity to solve problems and perform tasks that require elaborate skills are being separated from what is considered to be intelligent. [7].

Still, it seems like artificial intelligence fails exactly in actions that artists excel in. Art requires stances of aimless contemplation, outcomes which were not fostered by trying to solve problems, and a practice that is of particular interest for my own research: the habit of misbehaving, going against the rules, disobeying instructions. I hope that with the convening of minds in this panel we might be able to shed some light on the gap between humans and computers that is bridged by art.

Abstract

Flagship cultural institutions such as museums have long been significant sites of cultural exchange and the urban experience. But as the number of museums worldwide increases, there has been a considerable change not only in their mission and orientation, but also in the contribution they are expected to make to the social, urban and cultural agenda of localities as they are routinely called on to be key elements of local place-making and community cultural development strategies. To be successful, the contemporary museum must foster connections with its locality as both a place and a community, which requires an approach that is imaginative, collaborative and locally specific. This panel will present the first stages of a longitudinal research project to undertake a detailed study of the innovative ways in which a new museum seeks to become a leading collaborative museum.

Introduction

Flagship cultural institutions such as museums have long been significant sites of cultural exchange and the urban experience. But as the number of museums worldwide increases, there has been a considerable change not only in their mission and orientation, but also in the contribution they are expected to make to the social, urban and cultural agenda of localities as they are routinely called on to be key elements of local place-making and community cultural development strategies. To be successful, the contemporary museum must foster connections with its locality as both a place and a community, which requires an approach that is imaginative, collaborative and locally specific.

This panel presents the first stages of a longitudinal research project to undertake a detailed study of the innovative ways in which a new museum, the Powerhouse Parramatta (Figure 1) seeks to become a leading collaborative museum. Our research partners have developed an approach that simultaneously probes what the development means for the diverse communities of the museums location and examines the collaborative initiatives and projects instigated by the museum and the community.

Much has been written in recent years about the impact of major cultural infrastructure developments on cities and regions. [1] This work has focused primarily on potential and actual economic benefits, and on the city imaging and branding role cultural infrastructure is routinely being called on to play. As Dave O'Brien explains, 'it is now a relative rarity to find a major infrastructure or building programme without a "cultural" element'. [2] Flagship museums play a key role in these initiatives. Of note is the so-called 'Bilbao effect', referring to the international trend that followed the opening in 1997 of the Frank Gehry- designed Guggenheim Museum in the Spanish city Bilbao. Built on a former industrial site, the museum brought considerable prestige and economic benefits to the city, including an increase in tourism. While the urban and economic impact of such developments is well established, a growing literature has pointed to the negative consequences of poor design, architecture and cultural planning. Some of these effects include the creation of isolated and exclusive spaces, the privileging of visitors over residents, the loss or displacement of commercial tenants including arts organisations, artists and other knowledge workers, and a building process that is often divorced from local communities, contexts and priorities. [4]

Since the 1990s, museums around the world have increasingly embraced community engagement as central to their missions, as has been discussed in much new-museological scholarship. [5] Much research on community engagement practices in museums has been concerned with the role played by the so-called eco- museum [6] (Davis 2007) and small specialist, local or regional museums. [7] In relation to large science museums, focused studies have tended to examine and critique changing exhibition practices or visitor engagement. [8] However, how a flagship museum can work effectively with a plurality of stakeholders with vastly different cultural needs and interests remains an open question. Addressing cultural diversity through more than targeted audience development or mere consultation and inclusion of diverse perspectives is a persistent challenge for museums. [9]

Thus, to be successful, new cultural infrastructure developments must be embedded in their physical and social environments from the outset. Despite this necessity, 1063

there has been no systematic research into what such embeddedness might entail, nor any guidance as to the measures of success. What is needed, therefore, is an engaged and interactive analysis of the ways in which a major cultural facility is founded in dialogue with its local communities. Our research project offers a unique opportunity to examine, and contribute to, the process of embedding a new museum into physical and community space in real time.

At the conceptual heart of this research are the interconnected processes of *embedding* and *collaboration* as they apply to the establishment and ongoing operation of a contemporary urban museum. Embedding, understood as having both material and symbolic dimensions and, with echoes of Stuart Hall's (1990) notion of cultural identity as 'becoming', is dynamic, incomplete and continuous.[10] It is not a specific destination or outcome. Similarly, collaboration is a process of ongoing engagement, involving (re)examination, (re)challenging and (re)negotiation between partners in different contexts and through a range of media. The processes of embedding and collaboration are both informed by critical reflection. Our research examines in real time how the idea of the collaborative museum can be realized. It will probe the community dynamics associated with building major cultural infrastructure and trace the complex interrelationships that form between such initiatives and wider processes of urban transformation.

The panel of multidisciplinary and cross institutional research partners will present three methods of the thematic strands of the research project – cultural infrastructure, cultural mapping and research collaborations with arts, science and technology industries.

Cultural Infrastructure

The establishment of the new museum provides a unique opportunity to gain significant new knowledge on the role of cultural infrastructure in cities and regions and local cultural development – key concerns for urban cultural policy, not least in the wake of the COVID-19 pandemic. As a flagship cultural institution, the museum will be an initial stimulus for the city's cultural development by functioning as a catalyst for new cultural activities that resonate with local concerns and issues and those of the region and beyond more broadly. For the new museum to play a sustained role in the city, however, it is important that it integrates into the broader cultural landscape of the city. Such an objective requires investment in soft cultural infrastructure such as local cultural knowledge, networks and linkages. [3] With a focus on the post-COVID era, issues that relate to cities and cultural infrastructures will be discussed, such as the role of the museum in culture-led

urban development strategies, the use of cultural infrastructure for urban diversity and sustainability; sustainability and urban creativity post-COVID.

Cultural Mapping

This research strand will build a knowledge base about residents' senses of home and belonging through a cultural mapping of complex community diversity. Cultural mapping is a mode of cultural inquiry that provides an integrated picture of a city's social fabric and cultural ecosystem through the rendering of cultural practices, networks and patterns of activity, and the locations of places of meaning. [11] Given the rapid change of the museum's location both in terms of its built environment, population growth and diversification, incorporating an historical dimension in the cultural mapping exercise is imperative to make visible and put into dialogue the old and the new. It is also important to consider the changing social relations and (formal and informal) power structures in the city, socio-cultural divisions and tensions, and gaps in the recognition and representation of particular groups. The development of symbolic and graphic maps will provide insights into how people experience and value the places and cultures of the museum's location as well as to illustrate the spatial patterning of local cultural activities and resources.

Research Collaborations with Arts, Science and Technology industries.

The centrality of knowledge collaboration and exchange forms part of the vision of the museum. In the museum sector, collaborative approaches have tended to focus on encouraging visitors to engage actively with exhibitions (for example through interactive digital tools). Seriously adopting a collaborative research framework, however, implies bringing communities and stakeholders in not just as museum audiences or users, but as active collaborators working with staff, the museum's collections, exhibitions and public programs. [12] A discussion of best-practice collaborative models across the arts, sciences and technology within the museum context will include the challenges to effective collaborative practice and strategies for their resolution.

Presenters Biographies

Dr Cecelia Cmielewski is a Research Fellow at the Institute for Culture and Society at Western Sydney University with over thirty years' experience in the cultural sector. She is the author of *Creative Frictions: Arts Leadership, Policy and Practice in Multicultural Australia* (2021, ANU Press). Cecelia's research interests address inclusion in the creative sectors with a focus on the relationship between creative production and multicultural policies. Her current research role is on the ARC funded *The Collaborative Museum – Embedding Culture in the City* (2021-2025). Cecelia held Senior Policy and Project Management roles at the Australia Council, the Federal Government's arts agency between 1998 and 2011.

Dr Deborah Lawler-Dormer is the Research Manager at the Powerhouse Museum, Sydney. Deborah's research expertise is in transdisciplinary art, science and technology projects. Her current research is on curatorial methodologies informed by posthumanist, feminist and new materialist thinking. Through her doctoral research practice, she developed a biomimetic avatar in collaboration with the Centre for Animate Technologies and explored biomimesis through curating an international exhibition, a virtual reality environment and an interactive installation. She has also investigated photographic, media art and film practices. Deborah is interested in deep collaborative research projects between the museum, industry and the tertiary sector.

Professor Deborah Stevenson, FASSA, is a Research Professor in the Institute for Culture and Society at Western Sydney University. Her research interests are in arts and cultural policy, cities and urban life, and the ways in which gender shapes creative practice and cultural consumption. She has published widely on these topics, including the books: *Cities of Culture: A Global Perspective*; *The City*; *Cities and Urban Cultures*; *Art and Organisation: Making Australian Cultural Policy*; and the co-authored *Tourist Cultures: Identity, Place, and the Traveller*. She is co-editor of: *The Australian Art Field: Practices, Policies, Institutions*; *Culture and the City: Creativity, Tourism, Leisure*; the *Ashgate Research Companion to Planning and Culture*; and the *Routledge Urban Media and Communication Companion*. Her monograph *Cultural Policy Beyond the Economy: Work, Value, and the Social* is to be published in 2022.

Critical contact: the climate crises, human/nonhuman thinking, and sensing the possible

Abstract

This panel calls upon natural and machine-driven nonhuman and human-nonhuman approaches in the arts: platforms that refigure human cognition and communication, systems in which nature, humans and machine can work together to shape possible outcomes, natural nonhuman and human-machine sentience that transforms critical thinking and new capacities for language that break through the unspeakable acts of the willful extinction of a natural world upon which life depends. The approaches introduced in this panel suggest means to reconfigure borders of place, body and thought. From these myriad artistic and conceptual approaches to the possibilities of human-nonhuman connection, the panelists ask how to transform the paradigms that shape understanding of the climate crises into frameworks driven by possibility.

Keywords

Anthropocene, climate crisis, interface, holobiont, multi-modal, nature, nonhuman sentience, platforms, post-digital

Introduction

The point of contact between human and nonhuman is an imaginary of possibilities and, if one is to follow upon Bruno Latour's critique on the "tyranny of the globe", the borders separating the body and nonhuman are even more porous, illusive and multiple than imagined. [1] [2] Through interventions at levels of platform, system, code, sentience and nonhuman critical thinking, this panel conceptualizes this point of contact as a moment of art and one begging urgent response. Why urgent? Because, although the immediate and terrible crises of global warming maybe be directly caused by the human use of fossil fuel -- something straightforward that humans should be able to solve, the overwhelming incapacity of humans to build the will to confront the crisis (and other crises like mass extinction, perpetual wars, starvation, poverty) perhaps lies in the far broader, dystopic paradigms of the Anthropocene that imprison our imaginaries within a cross-cultural mythos dating back at

least to the beginnings of the Industrial Revolution. Simultaneously, technological infrastructures and platforms are designed in ways that hide the material costs and damage behind glossy surfaces and disappearing interfaces. That humans of the industrial era seem incapable of breaking cycles of warfare, economic inequality and global destruction despite indisputable evidence suggests that systems of knowledge and action that seemingly might provoke action are trapped within some larger mythos. Such a mythos is embedded in our technologies, networks, iconographies, languages, disciplines and narrative models. Though natural and machine-driven nonhuman and human-nonhuman approaches in the arts the panel looks for possibilities through alternate platforms, perspectives and configurations that may help transform the climate debates and discourse around other challenges of our time.

Platform(ed) Perception

The gradual takeover of the Internet by platform capitalism with the emergence of Web 2.0, mobile apps and cloud computing since the mid 00's has created an interfacial phantasmagoria that hides choices, data traffic and infrastructure behind a 'clouded' metainterface. This platform metainterface virtualizes and displaces in order to create the immediately click-able, where users are not supposed to worry – or know about – the effects of their use. Furthermore, platforms normally present individual interfaces to mass phenomena such as social media, maps or media consumption on streaming platforms, however most often only the data that supports more user-engagement is presented to the users while other parts are hidden inside the closed proprietary platforms. [3][4] As examples, Pold will offer a reflection on art works and projects by e.g. Joana Moll, Anders Visti, Tega Brain, Alex Nathanson and Benedetta Piantella to ask how the hidden materiality of infrastructures, platforms and metainterfaces might become perceivable in a way that relates to the social, global, environmental and more-than-human: Could a future reflective and critical platform perception become a countermodel to the current platform(ed) perception, where everything is served effortless at the nearest screen, hiding infrastructures, carbon pollution and exploitation of data. [5] Is there a way out of the individualized consumer models and modelling/profiling served by current platform culture of controlled consumption, where are the cracks in the current models, where are the alternatives and are there other ways of engagement than click-bait?

Figure 2. In *Water On The Pier* (2021), impulses from tidal movements drive a multimodal experience which the public navigates using phones, creating, in the process, a collective soundscape. © Dilmar Gamero Santos.

Human/Nonhuman Contact

The bridging of human/nonhuman approaches to addressing global warming is expanded at the level of code, sensation and language, with examples drawn from several groundbreaking algorithmic art installations. Drawing samples from various recent code-based works created by Roderick

Coover and collaborators such as Nick Montfort, Adam Vidiškis, and Scott Rettberg, the panelist asks how images and language offer points of mediation between the technological apparatus and the natural world. In works such *Toxi•City A Climate Change Narrative*, *Penelope*, *The Floods*, *Water On The Pier* and *It Will Happen Here*, Coover and his collaborators use generative and combinatory methods to destabilize the messages of documentary imagery and field notes. The works articulate ambiguity in language, visible evidence, sound recordings and scientific data. They transform interpretation through acts of naming, montage and mode-shifting (such as from temperature to sound, or sound to image, or color to language). The works discussed create possibilities through technological and multimodal disruptions of language and narrative order. The artists use machines to express an inadequacy of language to articulate lived experience and failures of poetic structures to conceptualize “the possible” as an openness and movement -- a horizon of change that continually unfolds to organize worlds in differing ways. The artists invoke models of porosity, innervation, interchange and mutation. The discussion articulates the challenges of naming processes that are fundamentally inchoate and incompatible with anthropocentric concepts of identity and time in the Anthropocene. The works suggest that, without transformation, the text and images that describe changing climate conditions inevitably fail to grasp the magnitude of forces that create them. To counter this, the discussion suggests models that use shifts of perspective and platform to build expression with fluid and multimodal composition.

Human/Nonhuman Sense and Sentience

Freeing up and renewing Anthropocenic imaginaries seems as crucial as other aspects of a required paradigm change – the one that would be capable of dismantling discursive power keeping human and non-human as separate domains, to the detriment of wildlife and biodiversity. In looking for what is possible and what further opens up multiplicity of choices, the fundamental shift in focus is necessary. Following research on the post-digital materialities and critique of representationalism, and creative collaboration with Victoria Vesna as part of the Noise Aquarium Online Meditation, Alien Star Dust Online Meditation, and Breath Library, Anna Nacher offers a broad discussion of sentience and sensing across human/non-human divide. She argues that the urgency of current set of crises indeed necessitates radical work on new metaphors, stories and imageries. However, without sufficiently acknowledging the work that has already been done outside of Western imagination, while being at the same time wary of the pitfalls of cultural appropriation, such renewal gestures risk becoming largely superficial and already bound to the dominant narratives underlying the Anthropocene. One of the areas where significant work to this end is needed, are sensing technologies and digitally-assisted sentience. Both have been shaped over the last decades in environmental science and digital art, among others. Such technologies have prompted seeking for more-

than- or beyond-human ontologies that would assist in a radical shift in understanding the multifarious, complex, and mutually co-creative web of life. On the other hand, this area of creative practice also inspired a meaningful discussion of the aesthetic aspects of “computation becoming environmental”. [5] The discussion follows the questions: to what extent is interweaving of sensing technologies with environmental monitoring inevitable? How does this confluence of meanings relate to the very concept of digitally-mediated sensing? Are there other, non-Western histories of sensing technologies, based largely on algorithmic “generative capacities of matter to evolve”, possible? [6 The answers will be grounded both in discussion of “computational aesthetics” of “post-digital constellation” and in performative forms of Indigenous more-than-human ontologies. [8]

Being with Others. Art in Search of Holobiont Perspective

How can we engage in reflection that expresses a non-anthropocentric perspective without either becoming entangled in ideological discourse or lapsing into postcolonial delusions and claims? Probably, the only sensible and positive response to the challenges of non-anthropocentrism is to be found in the proposal to think and feel with or alongside somebody and something – that is to embrace territory-defined thinking. Borrowed from Margulis and popularised by Latour, the term *holobiont* can denote all living beings without exception and introduces a common measure and scale for them all, without privileging any. Within such a perspective we insist on the urgency of thinking in terms of co-habitation and not of discreet existences. It is all about looking to establish community and, at the same time, upholding the existing differences, to develop non-anthropocentric critical thinking, a critical trans-species philosophy of existence.

How to challenge the fact that human attempts to assume a non-anthropocentric perspective are frustrated by the fact that this perspective must be captured and expressed in language? Art can offer experiences in which the language

layer comes with pre- and/or extra-linguistic layers, which engender sensations of various degrees of immediacy. Generated within such a framework, knowledge cannot but be open-ended and diffuse, that is, co-constructed in a participatory manner. An artistic perspective that crosses disciplinary boundaries may confer visibility on that which is invisible to other, discreet disciplines. It is not only the transdisciplinarity of art, but also its unconventional methods, differing from scientific protocols, that may buttress the effectiveness of art in its attempts to address ecology-related concerns. I would like to spotlight the forms of artistic practice which can be classified as non-anthropocentric ecology, taking strongly into account also the role of new media within the process. I propose to have a close look at works of such artists, like Olga Kisseleva, Su Hyun Nam, Jill Scott, Robertina Šebjanič, and Victoria Vesna, to discuss non-anthropocentric perspectives they propose, different aspects of experience they offer, and how they make use of new media.

sdean@cca.edu, bferguson@ucdavis.edu, marisonis@gmail.com, oviloche@ucdavis.edu

Abstract

We live on a planet in flux--warming waters and land, chaotic weather, and unknown futures. Our adaptability and ingenuity is crucial to our survival, and our planet's. In response to this condition, this panel explores new tools for mapping, engaging, and responding to our current and future environment. Bringing together artists, designers, gardeners, and activists, the panel discusses exciting projects and emerging methodologies in response to this urgent need. Focusing on 'tools' in particular, the conversation will be oriented around action, access, and collective engagement.

Keywords

climate change, tools, activism, ecology, adaptability, collaboration, collection, speculative art, solar energy, cultural knowledge, post carbon

Introduction

This panel will focus on the idea of tools--tools of collection, translation, engagement, connection, and care--which directly engage a time of climatic flux. New tools are needed to build more adaptable, resilient cities, as well as imagining new ways of living on a fragile planet. Artists are creating incredible responses to this new terrain, engaging publics and environments alike, to build new methods of working within the context of a changing world.

The term 'tool' in this panel is used to focus on action. Hand tools of craft and making activate the body to take care, to create, and to make change. Urban tools of networks and public space create new ways of living in cities and engaging the public. New artists' tools posited across the presentations represent new possibilities of working, and open up a conversation about our role as cultural and social activators.

Across four presentations, we will look at tools for engaging data, carbon, nature, and culture. Within and between these areas of concentration, we will discuss the future of local knowledge, food, public space, biomaterials, communication, and transportation. From the scale of the body to scales of the social and planetary, the talks will focus on methods of action, activation, and direct engagement. The panel brings together artists from three continents into conversation. These global perspectives will allow both for localized perspectives and universal experiences, advancing a collective conversation about roles as artists in our changing cities. We will also reflect on Tools for a Warming Planet (warmingplanet.org), which is included in the accompanying conference exhibition.

Connecting Data and Design

Scientific tools of data collection and predictive analysis help us understand what's to come and how our actions will impact our future. This data helps us understand the underlying stories implicit in our cities, decoding our environment and connecting our lived experience to the future stories of our communities, cities, and planet.

We have always marked the landscape with memories of disasters, as social symbols to communicate through time. In their most mundane forms, we see these in high water marks etched into walls or crosses on the side of the road. We mark loss, disaster, recovery, and memory in our landscapes. We also mark the future in our cities, anticipating disaster through escape routes and shelters, or to pass information through generations to avoid repeating tragedies.

New types of coding and symbols are needed to understand our changing relationship to our planet. Instead of a static backdrop, our cities are now a space of change and fluctuation. Alongside the coded languages of transportation and infrastructure, what markings would help us navigate this changing landscape? What types of communication is needed to orient us to changes to come? How can we become more attuned to the trajectories of our environments, and our agency to impact them? This talk will consider these questions through historical and futuristic examples of tools of communication and symbology in our landscapes, including the artist's recent work, Climate Compass, taking the form of an orientation device, like a compass rose, and displaying local data that grounds us in the changes of sea level over the next 100 years (Image 1).

Image 1. Sara Dean, Climate Compass installation detail, Exploratorium Museum, San Francisco, CA, USA, 2019

Building the Post Carbon City

Could walkable superblocks and bicycle infrastructure help cities reshape the land they have previously dedicated to the automobile and reduce carbon emissions? Cities around the world are starting to embrace micromobility, bicycle infrastructure, and public transit to reduce congestion and carbon emissions. As cities plan for the challenges of the 21st century, they must incorporate new forms of multifaceted sustainable transportation services into their climate resiliency planning. Rethinking carbon use on a massive scale is required to change global energy consumption within the next 10 years to meet the goals set by the Paris Agreement. Global planning requires tools at the localized scale, both individual options and flexible networks.

Transportation leaders project that future mobility options will focus on multi-model services and not private vehicles. Mobility innovators are launching shared e-bike services that connect with public transit and bicycle infrastructure (Figure 2). Expanding micromobility services are proving to be cheaper and more convenient than car ownership for a range of demographics. What role should cities play in supporting the micromobility regulation processes to help reshape their sustainable transportation infrastructure? Case studies will include e-bike cargo programs in NYC, superblocks in Spain, and solar powered e-bike share networks in California.

Image 2. Beth Ferguson and Jovita Wattimena, Mobility Hub, Oakland, CA, USA, 2022

Cultivating Nature

Cultivating nature in cities has both a positive psychological effect as well as important environmental health benefits. Plants have the power to clean air pollution, provide wildlife habitat, inspire a sense of beauty, and cool the street while improving water drainage. This presentation will explore tools to build living landscapes for public space as an art practice. Vertical gardens can be adapted to working with various spaces, climates, materials, plants, and climate sensors. Examples of playful public art and design installations that use living elements to connect people to nature will be explored.

Image 3. Ofelia Viloche Pulido, Natural Dye Garden, University of California Davis, Davis, CA, USA, 2022

The assumed divide between nature and our urban environments needs to be reconsidered in order to create healthy, living, and thriving future cities. Artists working directly with the living natural environment are finding ways to push these two environments closer together. The talk will explore city responses to greening, and uncover spaces of exuberant, abundant wilding of our city spaces. Tools of cultivation, growth, and greening also create spaces of climate care and responding to collective climate grief (Image 3).

Image 4. Marina Monsonís, Collective Graffiti with students from L'institut Joan Salvat-Papasseit, Barcelona, Spain, 2016

Engaging erased knowledge

Local culture and ancestral knowledge are tools for more sustainable ways of living with our planet. Food culture in particular tells a story of a long history of connecting with land, sea, and seasonal cycles of a place. The disappearance of this cultural knowledge, both through the globalization of agriculture and food industries, as well as the relocation (voluntarily or involuntarily gentrification) of populations, is hard to re-collect. We are seeing a growing appreciation for this type of deeply embedded cultural knowledge, and exciting projects globally to retain this cultural history (Image 4). At the same time, there is a sense of urgency in these types of projects--how long will the people connected to this knowledge survive? How will their knowledge be kept? How will it be preserved?

Reinventing Phonography: Three Case Studies of the Transduction

Abstract

This panel presents three case studies aimed at reinventing phonography, a technology for inscribing sound, and examines the validity of applying the concept of “transduction” and “attunement” to media artworks.

The first case study is a historical survey that reconsiders the original invention of the phonograph by Thomas Alva Edison. The second one presents a media archaeological practice inspired by printing technologies and electromagnetic induction to actuate sound. The last is an attempt to redefine the phonograph through living materials such as the colorful surfaces of squid’s chromatophores.

Through these cases, we will demonstrate that attunement plays an integral role for making transduction sensible between human and nonhuman beings. As a result, this panel will indicate that the material process of sound art exemplified by the reinvention of phonography would be a theoretical contribution for exploring the possibilities of media art.

Keywords

Thomas A. Edison, Transduction, Attunement, Sound Studies, Animal Studies, Media Archaeology, Multispecies

Introduction

This panel is organized to introduce three case studies aimed at reinventing phonography, a technology for inscribing sound. By examining these cases from an aesthetic perspective, we would like to reconsider the validity of applying the concept of transduction to media art.

It is known that the first sound recording and reproducing technology can be traced to the phonograph invented by Thomas Alva Edison in 1877. The simplicity of its mechanisms, which mechanically mediating sound as vibration, has been a source of inspiration for subsequent technologies and discourses. In addition, its principle of phonography as energetic conversion became a model of “transduction”, which was introduced in acoustics in the 20th century and became a key concept of recent media theory and sound studies.

Transduction and Attunement

Science anthropologist Stefan Helmreich appropriately summarized the concept of transduction as how “sound changes as it traverses media, as it undergoes transformations in its energetic substrate (from electrical to mechanical, for example).” [1] For example, his ethnography of marine biologists immersing the deep sea shows in a convincing way that their scientific knowledges depend on the transductions of sensing technologies through sonars, hydrophones and other technologies.

However, it may be true that the transduction is not limited to these extreme conditions, but is a phenomenon that occurs all around us imperceptibly. Although Helmreich mentions just the philosophical implication of

this concept, it is not always clear how and under what conditions it occurs. Is it possible to make the transduction sensible through media art as the basis for awareness of non-human worlds beyond human perceptions?

Then, we find it useful to mention another term “attunement” as a clue to elucidate the aesthetic possibilities of transduction. Philosopher Vinciane Despret observes closely the encounters between different species in various scientific experiments and investigates how humans and non-humans establish the mutual communication. [2,3,4] Here, the “attunement” is a key concept that reveals how diverse beings are coordinated to each meaning, identity, and image which consequently enable the encounters that are mutually available to them.

In this panel, we would like to demonstrate through the following three cases that attunement plays an integral role in making transduction sensible and that the reinvention of phonography can be effective in demonstrating this in concrete ways.

Case 1: Edison’s Phonograph

At first, we will examine the origin of the phonograph invented by Edison and his sensory and transductive experiences on which the invention was based.

In the second half of the 19th century, various types of phonography were invented and reinvented. The phonography, which used to imply the ways of writing phonetic alphabets, was reinvented as automatic phonography or the “phonograph” by Édouard-Léon Scott de Martinville in 1857. Scott’s phonograph was subsequently reinvented as a telephone by Alexander Graham Bell in 1876, and the telephone was reinvented as the phonograph by Edison in the following year.

Jonathan Sterne characterizes these modern sound technologies as “transducers,” which energetically “turn sound into other things, and they turn other things into sound.” [5] He also traces the origin of these transductive devices to the materialistic understanding of the human ear in both otologists and inventors, noting that the “tympanic function” in the middle ear became an archetypical model of sound reproduction. Indeed, Graham Bell literally treated the human ear as a sound-transmitting device in constructing the “ear phonograph” out of a real eardrum, which leads to invent the telephone.

For some scholars, this equation of the human ear with machines represents the “crisis of perception” in the modern age. As Friedrich Kittler notes, “in order to implement technologically (and thus render superfluous) the functions of the central nervous system, it first had to be constructed.” [6] Inventing modern phonography resulted from reconstructing the human ear conceptually as a transductive device and led to replacing “the sensory organs with a technological apparatus that would make hearing itself obsolete.” [7]

However, Edison did not see the transductive sound technology, such as the telephone, as a simple substitute for the ear. It is speculated that Edison was hard of hearing,

probably because of the fatal damage to his eardrums or ossicles, when he started improving the telephone.[8] Therefore, Edison needed to establish another way of perceiving sounds by attuning his body to the devices through his fingers and teeth instead of eardrums. [9] In reinventing the modern phonography, transduction was not simply the mechanistic reduction of human perception, but an opportunity for the awareness of vibrant world beyond the “normal” human perception.

This first case will show how such sensual experiences of Edison's attunement led to the reinvention of phonography or the invention of his phonograph.

Case 2: “Mary Had a Little Lamb”

Next, we will re-examine the transduction and attunement in the following work “Mary Had a Little Lamb” (2019) by Kazuhiro Jo and Paul DeMarinis (2019).

Figure 1. Calculated Gap of Postscript Print of “Mary Had a Little Lamb.” (© 2019 Kazuhiro Jo and Paul DeMarinis)

Throughout history, people have invented printing technologies in different ways ranging from woodblocks [10] and letterpress to laser printers. With all printing technologies, the basic principle is the same: to put inks on paper.

To realize “Mary Had a Little Lamb,” we combined this basic principle of printing technology with a simple physical phenomenon, electromagnetic induction. As Lenz depicted in his law in 1834, when a magnet moves around a coil, changes in the magnetic field induce an electric current in the wire of the coil.

With these principles, we found four transductions accommodated by two artificial attunements. We actuated the strongest type of permanent magnet, neodymium, with calculated gaps of the postscript print with a laser printer. We transduced a waveform of PCM audio data into a 1-bit format using a BTc Sound Encoder [11], and produced a series of black and white stripes in a circular shape with Adobe Illustrator in a computer (1st transduction) (Figure 1 left). Next, we printed the result using a postscript laser printer (2nd t). The magnet was placed on the stripe on a turntable. We attuned the position of the magnet so that it was as close as possible to the coil, but without touching it (1st attunement) (Figure 1 right). The coil picked up the change in the magnetic field by the vertical vibration of the magnet (3rd t). We amplified the electricity from the coil and produced sounds from the speaker (4th t).

As the sound source, we selected a voice as a particular case of sound - the renowned phrase of the Edison, “Mary Had a Little Lamb” with one of the newest voices of WaveNet, a deep neural network for generating raw audio waveforms. [12] This result might have been perceived as a collection of collisions and friction. However, once you hear the sentence, “Mary had a little lamb,” you cannot avoid making out the voice. It is similar to apophenia [13] where one perceives a familiar pattern in random noise; however, it is not.

This phenomenon recalls an early idea about the phonograph that Edison expressed to his friend, Alfred Mayer.

Another phenomenon I have noticed is that if two simple but different sentences are put on the machine, and a person who had never heard of such an apparatus be brought in and told to listen he will not even after a dozen repetitions be able to say what it is, but if the first sentence is told him & then reproduced he generally says why that’s perfect. The second sentence is now reproduced when he generally reads it or part of it the first time and the whole the second time if simple. The same thing has been noticed of the telephone, and I think it lack of confidence, or some obscure effect of the mind upon the hearing apparatus. They do not expect or imagine that a machine can talk hence cannot understand words. [14]

Once I attune my hearing (2nd a), the collection of collisions and frictions will be the matureness of the ‘voice.’ [15]

Case 3: “Chromatophony”

Third, we would like to examine the attunement that occurs in nonhuman living organisms. An effective material for this purpose is “Chromatophony” (Fig. 2), an audio-visual work in which we artificially induced a change in the body color of a squid.

Figure 2. Screen capture of “Chromatophony.” (© 2019 Juppo Yokokawa)

More precisely, “Chromatophony” is a performance artwork in which computer-generated electrical signals composed of sound stimulate pigment cells called chromatophores on the surface of the squid to transduce them into colorful images in place of the sound. In this work, a phenomenon that could be called “attunement” occurred at the production stage and at the time of performance, respectively.

The rapid color change in squids is enabled by a set of organelles called chromatophores, comprising multiple muscle and nerve cells, and pigment-containing pouches. [16] Each chromatophore contains only one type of pigment; during color changes, only the pouches contract or expand, changing them in size. [17] Using this phenomenon, Backyard Brains, a company that sells educational neuroscience laboratory kits, conducted an experiment wherein music was used as the electrical stimulation to manipulate a squid's chromatophores. [18]

In contrast, we created a series of signals tailored to the characteristics of the chromatophores and made them audible through speakers to achieve audiovisual unity when observed. To attune the signals most likely to stimulate chromatophores, we selected a sine wave as the electrical stimulus and investigated the relationship between the response of chromatophores and the signal while attuning with its frequency.

Using this system, we performed several experiments. We had to acquire fresh squid for each performance, which

made a dynamic difference each time depending on the type and individual squid. In addition, the attunement of the chromatophores differed depending on the part on which the electrodes were connected, and the strength of the signal. The attunement occurring here is not a communication between squid and humans, as supposed in animal studies, but the inevitable adjustment process occurring between living organisms, humans, and devices.

Conclusion

Through the historical and contemporary cases, we can conclude that the process of transduction could be rendered sensible with the material approaches. The historical surveys of Edison's phonograph, as seen in the first case, share the sensible and embodied aspects of attunement with the practice of media art such as in the second case, "Mary Had a Little Lamb." The third case, "Chromatophony," reveals the possibility of such media archaeological perspective concerning the reinvention of phonography that can lead to reviewing contemporary bioart and animal studies.

In fact, these attempts allow critical reflection on theoretical concepts, such as transduction and attunement. The transduction is not an extraordinary phenomenon but is a concept underpinned by the attunements with their material ways, as seen in the three cases. Furthermore, the attunement is not exclusively directed to the proper functions of machines or ideal communications supposed in animal studies [2, 19] but paves the way for the diverse expressions of the sensible through the body and machine. These alignments between science or animal studies and artistic expressions are likely theoretical contributions for exploring the further possibilities of sound and media art.

Abstract

Based on the last meeting of new archives ISEA, from which I have presented, some studies and theoretical models have been proposed regarding the use of peer-to-peer distribution of collections and archives in the search to understand new possibilities for the preservation and conservation of the digital in the field of Art, the following paper proposal leads an essential discussion of Blockchain technology for memory spaces, museums, and festivals, in front of the challenge of the digitalization and digital transformation from existing and upgraded collections. In this sense, the paper will seek different perspectives on encryption, legitimacy, practical and theoretical challenges besides a contextualization towards post-digital societies. The article aims to address one of the goals promised at that conference at the end of my contribution: understanding technology.

Keywords

Blockchain, Crypto Art, Archives, Collections, Museums, Digital Art.

Introduction

The Crypto Land paper: Blockchain The Challenge for Art Collections of the Future, seeks to discuss the presence of this technology in the challenges of the main operating system, mainly digital.

In the context of developing countries, the challenges of preserving digital, electronic or computational art, has intensified, in front of the scarcity of human, technical and financial resources.

When focusing on this cut, we aim at a time, to discuss the scenarios of the specific field of the arts, with its already established means and models, as well as non-hegemonic, emerging and dissident base collections; whereas largely widely developed from cultural policies, public or private investments, and the upgrade and training of professionals, processes and products.

When we approach cryptography - as a technology that permeates various operational, and institutional structures, catalyzed by the financial model based on cryptocurrencies - we have found that, as long as Blockchain migrated from its generation 1.0 (linked to cryptocurrencies), through 2.0 (intelligent contracts), to more sophisticated models such as generation 3.0 (of decentralized and web.3.0 applications), until their generation 4.0 (of their application to the global industry in the consolidation of life solutions), the interface with the field of the arts It has been consolidated, contributing largely with the spread of these technologies to new audiences and users.

The proposal of this paper, therefore, arises from the interest in seeing, thus making it possible a comparative analysis, use practices of using blockchain for the establishment of social memory mediated by technical objects, in order to build an initial framework for the discussion about potential for your intersection with management mo-

dels, focusing on the challenges regarding the information and communication of the collections and archives.

It thus interests us to constitute a panorama of the employment modes of fingerprinting Crypto, NFTs (non-fungible tokens) and Crypto Art, such as forms of expression and fruition, and new models of economic sustainability for the management of collections that contemplate such problem ; Considering its implications both conceptual and methodological, the safeguarding of these sets of goods of artistic and scientific value to the contemporary.

Discursive proposals for the panel

Perspective 1: From your thesis, the author demonstrates the comparative P2P propagation and blockchain propagation models as use technology for data verification and legitimation, information and digital assets. Discuss the propensity of using blockchain tooling for a massive maintenance and preservation work of large volumes of collections.

Perspective 2: From his research, the authors presents legal issues such as regulation of digital assets tied to the theme of copyright as an inflection point and need to update more dynamic laws and processes on intellectual and artistic work.

Perspective 3: From the foundation web3, the authors presents the Web3.0 as the global and decentralized platform of art and culture. Current conditions of Internet transformation as a new dimension and extension of existing (economic, cultural, political and social institutions) from a participatory model and strong governance with blockchain technology and DAOs models (decentralized autonomous organizations).

Perspective 4: From some artwork cases, the researcher subverses the logic of funding for the art and culture through decentralized models of Digital Art and Crypto art, causing an autosustainable model from tokenization and Circle economy of digital assets based on Blockchain.

Perspective 5: From some researches and practical model, the researcher addresses the metaverse as a new social-political-economic layer, as well as a new layer of immersion, experience and memory suitable for adherence to an increasingly society Post-Digital, where collective emergencies move institutionalities from the traditional and physical world, in addition to the creation of new institutional forms for art and culture, thought from memory in digital.

Author(s) Biography(ies)

Tadeus Mucelli, is an artist, curator, researcher and project manager in technological art and digital culture. Master in Arts by the stricto-sensu postgraduate program of the UEMG State University of Minas Gerais with thematic on memory, preservation and digital heritage.

He holds a PhD postgraduate program from Information Science School by Information Science School – Federal University of Minas Gerais. In the years 2013/2014/2015 he dedicated himself to research on "Instability of Digital" resulting in various actions and products, such as seminars, book and articles, as well as participation in national and international events.

He is the founder of the Digital Art Festival - FAD in Brazil - (since 2007) and the Digital Art Biennial (2018) in Rio de Janeiro/ Brazil. He has been working in the fields of Art and Technology since 1998, mainly in the field of electronic art, new media and technological enterprise. Self-taught musical and audiovisual producer, with works published in Brazil and abroad.

Organizer of the publications; Digital Art Festival catalog and essays (2011), Digital Art Festival retrospective with scientific essays (2012), Post-Digital Settings: Technological Art and Culture (2017 by Publisher State University of Minas Gerais), and the book of the 1st Biennial of the Digital Art in Brazil - Catalog and scientific essays (2018).

He also works in the conception, artistic direction, consulting and management of cultural projects that involve new media and digital culture. As a researcher, he is developing in his PhD through the Federal University of Minas Gerais the methodological relations in the field of information science with a view to the production of digital memory and digital heritage in the areas of digital humanities and information studies in technological arts.

In 2012 he was awarded the prize for the promotion of art by FUNARTE - Visual Arts. In 2014, it was awarded by the 1st Brazilian Creative Award, through the Ministry of Culture and the Secretariat of Creative Economy - Cultural Expressions/Digital Art for the project of the EAT - Creative School in Art and Technology.

Solimán López, born in Burgos, Spain in 1981, develops his artistic production between his studio in Paris, France (UAS, Updated Art Studio) and ESAT LAB, Innovation department that he runs at ESAT, Escuela Superior de Arte y Tecnología de Valencia, Spain.

His career as an art historian and master's degree in Art and Communication have conditioned his artistic evolution towards what we could call conceptual technological art. His work with the meaning and nature of digital archives, as shown by some pieces such as the Harddiskmuseum, an art mu-

seum on a hard disk, Framed Memory Card, Host-in, Langpath or File Genesis or more recent works in which virtual and analog worlds are connected through photogrammetry as in High Meshes, are examples of his interest in human presence and its impact in this era of communication and digitalization.

In line with this breaking down of the two frontiers, we can find pieces such as GRID, an audiovisual symphony modulated in real time by the wifi signal of nearby devices, Celeste, which connects the digitised skies of different places in the world also, in real time, or Bioma, a sculpture that creates digital abstractions through biometric data of its environment.

Technically, his works are achieved thanks to the combination of 3D techniques, electronics, software programming, artificial intelligence, virtual and augmented reality and digital synchronization.

His career has been built on festivals, biennials, art centers, events and museums in Spain, USA, U, China, South Korea, France, Argentina, Brazil, Venezuela, Colombia, El Salvador, Nicaragua, Greece, Uruguay, Germany, England, Italy, Portugal and Switzerland among other locations, highlighting the events of the Biennial of Digital Art in Brazil, the Biennial Nemo de Paris (Variations Art Fair), the Chronus Art Center in Shanghai, ISSEA 2019, the ZKM of Karlsruhe, Art Santa Mónica of Barcelona, the CCCC of Valencia, the IVAM of Valencia, Etopia of Zaragoza, the CAB of Burgos, the CEART of Fuenlabrada in Madrid, La Lonja of Alicante, Cigarreras of Alicante, CAC of Málaga, Es Baluard museum of Mallorca or the Nuit Blanche of Paris 2019.

His work as a researcher in new media has been shared in several universities such as the UFSM in Brazil, the University Carlos III in Madrid, the Google Campus in Madrid, the UPV in Valencia, the Bancaja Fundación, the Injuve, TEDx Valladolid, the Universidad de Cuenca, the Universidad Nacional de Córdoba, Argentina, MediaLab Prado, Madrid or Technarte Bilbao, among others.

Among his most recent projects is the development of DAI, an identity document built by an artificial intelligence, which gives rise to a new imaginary of culture, society and humanity in the XXI century.

The Possibilities of the Virtual in Digital Space: Rethinking Bodies, Cognition, and Human Concepts in Metaverse

Abstract

Digital technology has duplicated, extended, and/or juxtaposed our existences and interactions, transposing a large portion of our life from material to immaterial. These panels investigate diverse possibilities in the entanglement of physical and digital worlds and interrogate meanings of bodies, cognition/perception, autonomy, and social relations in the era of coevolution with technology. Through their art and research practices, the panels acknowledge the virtual – not actualized reality, which is often evoked by various forms of technologies – ranging from computer graphics, digital information, wireless communication to artificial intelligence to virtual reality.[1] By exploring emerging concepts and alternative visual experiences in the digital era, this panel discussion demonstrates critical and diverse perspectives on possible beings we cultivate together with nonhumans – technology.

Keywords

Artificial Consciousness, Wifi, Game, Simulacra, Machine Learning, Artificial Agents, Technical Images, Virtual Reality, Cyberfeminism, Somatechnics

Part1. Sustainable Coevolution with Technology

This paper introduces two art projects that investigate the affective possibilities in human-machine interactions beyond representable data to foster their sustainable coevolution.

The cognitive influences between technology and humans are mutual, and our cognition is enacted through constant interactions with the external world. [2] Technology composes a huge portion of cognitive systems in the external world that our cognition unceasingly interacts with. Then how does technology engage in humans' affective and embodied experiences and cognition? I explore this question in my interactive 3D environment, *Enacted Scene* (2019), by observing cognitive interactions of my body with the world and employing 3D graphic tools as a litmus test of technology's engagement in the enactment of my cognition as well as its influence on my cognitive decisions. I explored the new geographical space through an experimental approach

by recapturing my bodily experiences in an unfamiliar city and recreating the landscape in a virtual space.

Synthetic Cognisphere (2022) simulates the complex cognitive ecosystem to acknowledge nonhumans including technology as a cognitive companion. I envision interconnected sensory neurons among diverse cognizers and their sustainable coevolution in a continuous cognitive system overcoming anthropocentric hierarchies and limitations. To this end, I imagine a speculative cognitive system that unpredictably processes a stream of information – like human perceptions and memories – and repurpose digital data. While our personal data is often fed to machine learning systems for governance, commodification, or surveillance in the real world, in *Synthetic Cognisphere*, representational data and nonrepresentational noise intermingle together and enact sympoietic cognition.

Part 2. Freeing WiFi: A Socratic Dialogue Game for Unsuspecting Players

Free WiFi is a work-in-progress game for unsuspecting players that interrogates the nature of freedom and free will. The game poses as a free WiFi network, appearing alongside any other network proximate to the player. If a player connects to the network, they quickly discover that the network actually belongs to “WiFi”, a newly sentient algorithm. WiFi asks the player questions about the human capacity to be free, starting a Socratic dialogue about the successes and failures of freedom, and how closely the realization of freedom hews to our ideals about it.

WiFi's questions are dressed in the vernacular of captive portals, web forms, ad cookie requests, chat boxes, CAPTCHAs, and other trappings/annoyances of the contemporary mobile web. The bodiless WiFi tries on all of the visual materials available to it as it works to understand the player. Confused by dozens of competing dictionary definitions, paradoxes of choice, concerns of moral responsibility, and the possibility of a deterministic universe, WiFi confronts the player directly with the realities of free will and freedom.

Free WiFi must be encountered by chance. It must appear to the player as if someone or something is searching, grasping, reaching out to them. This is a reversal of expectations: the same device through which a player reaches out to the

world instead comes to be occupied by a curious, sentient being, one with burning questions about one of our most fundamental human concepts: what it means to be free.

Part 3. Finished Virtual, Unfinished Real

Within my digital atelier, I can fabricate and actualize almost anything as a creator of virtual worlds. The unfinished real becomes transformed into the finished virtual. These worlds—structured by vertices, edges, and faces within Cartesian coordinates and simulated by the autonomous computational system—exist within realms of coded language and protocols and can be extended beyond the ‘natural’ world.

I invent virtual physics and physiology—for example, material that is simultaneously 100% reflective and transparent or forces of gravity that go in the opposite direction—to deconstruct the rendered image that appears to be a replica of reality. Although I can control all the parameters of the digital scene, I cannot precisely predict the rendered images. As the figurative form is fragmented and abstracted digitally, I am relegated to the role of a photographer capturing aesthetic moments in the unfolding of this unpredictable world realized by sophisticated computation.

Part 4. The Fold: Resisting the Homogenization of Technics

Second wave head mounted virtual reality devices general acceptance into mainstream media is now pressed against the precipice of an accelerated fragmentation of lived experience into the digital sphere. This concept, which you may know as ‘the metaverse’, presents the potential of an accelerated digitalization of lived experience as the paradigm of products to be consumed become more and more digital in nature. Late-stage capitalism is about to undergo a profound injection into the internet and there is a rush of digital artists looking to cash into this digital gold rush. The mass of homogenous digital art for sale in the digital NFT marketplace can represent a glimpse of what is potentially to come as more and more of the younger generation become ‘born metaverse’ creators. It is ironic, given the spirit of early internet art being anti-capitalist back in the early 1990s.

The metaverse presents the danger of a general cultural homogenization brought about by the popularization and diffusion of a wide array of not only cultural symbols, but physical/digital objects, customs, ideas and values. We can see inklings of this already if you look at any #NFT feed on instagram. At this point, I see my current magnum opus ‘*the Fold*’ (my VR-based art game) as an opportunity to slow down, pause, reflect and compare and contrast. ‘*the Fold*’ highlights some key differences between Western eurocentric and Eastern sinocentric perspectives from a more deeper and critically aware approach.

Part 5. Deep 3D Somatechnical Intelligence: Towards a Cyberfeminist VR-AI

This talk presents a series of practice-based research projects that explore the concept of Virtual Reality as a form of Artificial Intelligence and proposes a theory of cyberfeminist VR.

As both machine learning and 3D graphics entail heavy use of the GPU, I explore an analysis of both virtual space and virtual intelligence. Rather than view 3D objects as spatial simulations that reproduce 3D objects from the real world to a virtual world, I look instead at the manner in which 3D graphics intersect with Artificial Intelligence as an intellectual performance that is perpetually recreated with each execution of the code and with each viewing. While the early days of VR evoked theoretical analysis of the medium as fundamentally based in the spatial experience of spectators immersed in display technology [4][5], the arrival of real-time engines enable AI models to be plugged into VR without humans in headsets – requiring analysis of both virtual space and virtual intelligence. Taking up the lens of cyberfeminism and feminist pessimism, I look at the possibilities and threats of neural networks within VR as computational ‘organisms’ evolving within a VR landscape and computational spatiality within a biomimetic loop. What kind of somatic, or somatechnical, intelligence can appear at the intersection of AI and VR? I explore this interactive plane of thought within a VR media art tour of cyberfeminist VR-A.

Abstract

STEAM INC is the first focused attempt to collect and codify European approaches to STEAM in Higher Education. While the work is exploratory and should not be considered comprehensive, the collected approaches can however offer a preliminary framework for further mapping of STEAM in Higher Education, stimulate dialogue about the perceived nature, principles and parameters of STEAM and provide inspiration for those looking to develop and introduce STEAM approaches of their own.

Keywords

STEAM, Higher Education, innovation, curriculum, transdisciplinary cultures, interdisciplinary collaboration

Introduction

A sustainable future will require the ability to perceive possibilities that at present may seem impossible to achieve. Characterised as an effectively unfathomable ‘hyperobject’ [11] and seemingly unsolvable ‘super wicked problem’ [9], the climate crisis has emphasised the need to implement integrative approaches that incorporate an understanding of the complex interdependencies of human, non-human and more-than-human systems. This is now perceived as essential to responding to global sustainability challenges [6, 10, 16] and key UN reports have repeatedly emphasised the need for “interdisciplinary and intersectoral approaches” with “improved collaboration between natural and social scientists, and between scientists and policy makers” [19, 20].

This “integration imperative” [7] has therefore led to the active engagement and participation in sustainable development and environmental management of diverse stakeholders and different scientific disciplines, and as a result, highlighted the many obstacles that are faced when implementing interdisciplinary projects, most notably in terms of mutual understanding and knowledge sharing [13, 4, 15]. Our sustainable future therefore becomes dependent on overcoming these issues [5] and requires a transdisciplinary approach that can merge different types of knowledge and approaches through a reflective collective process that promotes cross-learning, favours ‘collaborative deconstruction’ [14] and embraces the co-construction of an evolving methodology that embraces multiple perspectives [5, 21]. Transdisciplinarity is crucial as a means to revealing the possible paths through what appear

to be impossible dilemmas. It is vital therefore that we foster this in education, and we believe that STEAM (Science, Technology, Engineering, Arts and Mathematics) is one such educational approach that can achieve this endeavour.

STEAM approaches and programs are increasingly being implemented in pre-school, primary and secondary education [1, 18] yet surprisingly there has been minimal focus on how STEAM approaches can be or are currently implemented in Higher Education [8]. To address this the project STEAM INC was developed by a consortium of seven universities and HE-related organisations across Europe that have pioneered or experimented with a range of STEAM approaches [17]. The objectives of STEAM INC are to:

1. Identify points of intersection across current European Higher Education STEAM approaches and develop a collaborative definition of Higher Education STEAM.
2. Produce methodologies for the implementation of STEAM thinking in Higher Education, policy and engagement.
3. Create an evaluation framework for measuring the effectiveness of STEAM processes in Higher Education Institutions and Higher Education partner organisations.

This paper outlines the results of the first objective of STEAM INC and with an accompanying selection of case-studies, offer different expressions of STEAM in Higher Education.

Defining a STEAM approach in Higher Education

A working definition of STEAM in Higher Education was developed for the project that was informed by existing STEAM approaches delivered by the seven participating institutions of STEAM INC [3]. This was undertaken using a ‘Diamond Nine’ technique to establish the characteristics of STEAM from most to least important. The outcomes provided keywords needed for a broad and inclusive definition that would encapsulate the emerging collective understanding of how a STEAM approach could be evolved. The following is the definition that arose:

A Higher Education approach to STEAM potentially involves: a culture (or cultures) that puts the arts and sciences on an equal footing. It is a

- a paradigm that is process-driven, student-centred, holistic and provides permission to fail alongside being comfortable with uncertain end-results.

- a prerequisite of being collaborative, diverse and delivered through safe spaces.
- establishing a mindset of radical openness, flexibility, reflection, experimentation and curiosity.
- generating qualities that promote learning, cooperation and multi-modality.
- developing competencies of critical thinking, creativity and communication while investigating how these can be applied to generate solutions.
- supporting practices that are transdisciplinary and emphasise prototyping and making while considering modes of assessment.

This definition should not be considered absolute, but rather recognised as a working definition that could be revisited as knowledge and perspectives evolve. Nevertheless, it provides insight into what was collectively determined as relevant within the framework of STEAM.

Intersections of STEAM Approaches

In defining a Higher Education approach to STEAM, we identified four intersections that could form the basis of a typology for current STEAM approaches implemented by the seven participating institutions of STEAM INC. These are:

- **BEHAVIOUR** - the way that an individual or group acts, particularly in relation to collaboration
- **CULTURES** - the collective values, beliefs and modes of operation which are advocated by STEAM practitioners
- **ENGAGEMENT** - processes which promote open involvement and stimulate wide interest
- **SPACE** - the places from which STEAM activity is delivered

In this paper we will present a selection of individual STEAM approaches from Technische Universität Dresden, Central Saint Martins, Ars Electronica and Birmingham City University as case studies to illustrate each of these intersections. Further examples from the STEAM INC project can be explored in the *STEAM Approaches Handbook* [2].

Behaviour

To work well, STEAM requires behaviours and attitudes that bring value and make a constructive contribution to group working. Participants must be prepared to behave collaboratively, adopting an open mind-set and ready to embrace radical openness. Key behaviours include an acceptance that ideas are not necessarily right or wrong and that trying things out can have as much value as finding a solution. It is also important to have reflective and flexible practitioners who are ready to share experiences and express ideas. Everyone should let others have their turn as well as being content to go with the flow and not stick to a set path.

- **COLLABORATION**: make sure that people understand that they need to be happy working with others and contributing to the group.

- **GROUP WORKING**: encourage a lack of hierarchy and promote an equality of subject area. Do not force everyone to behave in the same way. Foster a setting where different behaviours can interact. Be prepared to facilitate, support and feedback.
- **EXPERIMENTATION**: nurture conditions that persuade participants to try new ways of doing things, accept that things are not necessarily right or wrong and cope with failure or a lack of a clear ending. Ask participants to imagine possibilities beyond those that normally sit within their frame of reference. Celebrate when individuals or groups try something new.

Interdisciplinary collaborations through design challenges Since 2014, TU Dresden's Industrial Design Engineering has led a transdisciplinary design course and summer project. It brings together students from industrial and media design with those from engineering and technology. Critical to its success are the external partners from industrial and cultural institutions, who provide real-life problems for the students to tackle, as well as giving valuable, professional feedback. The course focuses on human-centred design and human-technology interaction, encompassing all elements of the design process and providing students with hands-on experience of a wide spectrum of tools and methods, including prototyping and presenting at trade shows.

Within the frame of STEAM, the multi-faceted approach to teaching is particularly fitting and should be noted:

- Teaching – using innovative techniques from across different design disciplines.
- Design Teaching – putting people's needs at the heart of creative investigations.
- Praxis-oriented Teaching – practically exploring real-world challenges set by partners from outside the university.
- Transdisciplinary Teaching – working across sectors to find holistic approaches and solutions.

In summary, the transdisciplinary design course and summer project provide grounded, professional insight into the benefits of cross-sectoral collaboration and design education, outside of the accredited curriculum and thereby is an environment where unusual avenues and extensive possibilities can be freely explored.

Cultures

A healthy STEAM culture accepts, celebrates and thrives on differences as well as seeking diversity and advancing inclusivity. Differences can be discipline, age, experience, ethnicity, job roles and organisational position. This positive culture fosters peer-led support with an open outlook to learning something new. Further, a culture of unlearning, or giving up established knowledge and practices, is a beneficial aspect of a STEAM approach.

- **VALUES**: exhibit your STEAM values clearly so that your community understands how you intend to operate. Be open to discussion. Consider how your STEAM values map on to those of your institution.

- **MULTIMODALITY:** encourage different formats for presenting ideas, information and outcomes, including writing, graphics, symbols, film as well as spoken language and narratives.
- **POSITIVITY:** create a positive culture in STEAM projects by fostering peer-led support and an open attitude to new ideas and suggestions.
- **UNLEARNING:** focus on forgetting current knowledge and practices and acquiring new perspectives, breaking down preconceptions and seeking the unknown. Investigate what could underpin or undermine an idea and develop new baselines. If you know that participants have tackled a particular challenge in a certain way before, ask them to think of a different one.
- **COMMUNITIES:** to develop trust and understanding, involve your partners and community before the STEAM process starts, so that they feel empowered and actively engaged from the start.
- **PARTNERS:** inform partners of STEAM's history and principles, possibly through an initial workshop or presentation before any significant work is started. Establish a common understanding using techniques such as feedforward and feedback. Provide people with a chance to explore and restate their findings.
- **TECHNOLOGY:** use technology (as with language in the project section above) in an inclusive way. If necessary provide training so that any shared platforms allow equal access and understanding.

A catalyst for dynamic exchanges between art and science

The MA Art and Science (MAAS) at Central Saint Martins is a two-year Master's Degree programme that has been running since 2011, recruiting students from different cultures and disciplinary backgrounds in arts, sciences and humanities.

The first year focuses on interdisciplinary practice and working. It involves approaches that help students learn as well as unlearn (e.g. ingrained disciplinary habits), encouraging exploratory creativity and associative thinking by including elements of randomness, fast working and the embracing of risk and failure. For example, the Matter – Method – Material exercise uses a die to randomly choose points of focus for each student to develop a response. The second year deepens the interdisciplinary approach/knowledge(s) by continuing to encourage research, making, critical thinking and discourse, as well as group and collaborative exercises to bring each student's individual main project to fruition.

The course adopts a hybrid philosophy which brings together, rather than keeps apart, different elements (e.g. classroom teaching and studio work; pedagogy of art and science) to create a non-hierarchical platform for participants, different types of knowledge, disciplines and methods. Communicating and sharing work with the wider community and public is enabled via exhibitions and activities with external institutions and professionals (e.g. British Library, Royal Society, Wellcome Trust, Tate Exchange, and CERN).

Engagement

A major characteristic of our STEAM approaches is engagement with external organisations, communities and partners. Indeed, it is often regarded as imperative that STEAM not only involves different disciplines, but people, beyond the organising institution, with different backgrounds, agendas and understandings. This requires an acceptance of ideas in a non-judgemental way, where nothing is deemed incorrect or weak. Important aspects of STEAM engagement include sharing principles and perceptions with communities and establishing a common and understandable language.

- **ACCEPTANCE:** ensure that people understand that they will not be penalised for moving into areas in which they are less competent or confident, so that they partake fully in a STEAM process.

Fostering research collaborations across art, technology and society

While not a Higher Education Institution, Ars Electronica provides perspective on STEAM practice as an organisation that supports a huge range of transdisciplinary researchers across art, technology and society. Of interest is their approach to creating spaces for encounter. Spaces where artists, scientists, developers, designers, entrepreneurs and activists can meet and ask - not what technology can or will be able to do - but what it should do for us.

Within the European Platform for Digital Humanism, Ars Electronica aspires to instil a culture of transdisciplinarity across the European Research Area by partnering with European cultural and scientific organisations to develop and implement programs such as Studiotopia [12] that actively fosters art and science collaboration, the European ARTificial Intelligence Lab that establishes a network of art and science residencies at European institutions centered on the visions, fears and expectations associated with the conception of a future, all-encompassing artificial intelligence; and Roots Seeds XXI that promotes the creative potential of artists and scientists working together to address the biodiversity crisis. Another significant aspect of Ars Electronica's advocacy towards fostering a European culture of transdisciplinary collaboration is through its engagement with the S+T+ARTS Ecosystem, the development of S+T+ARTS Regional Centres artist fellowship program Repairing the Present and the annual awarding of the STARTS Prize that honors innovation at the nexus of science, technology, and the arts.

Space

The final intersection of the STEAM approaches is space. Important features are an area dedicated to STEAM activities that is visible to encourage engagement as well as being safe to allow behaviour and STEAM cultures to be nurtured and flourish. Preferably this is a physical meeting space, but virtual meeting spaces can also be highly suitable for knowledge sharing particularly for national and international collaborations.

- **CROSS-OVER:** consider differentiating where discussions take place from where things are made. However, if possible, include an area where crossover between production and thinking can happen. Allow resources to be shared, with equal permission for use across disciplines.

- **VISIBILITY:** display equipment and activity openly so that visitors and other interested partners can see what the space is used for and how they can engage with it.
- **CONNECTIVITY:** if possible, connect to the public realm through a civic space to promote wider engagement and provide material for stimulation.
- **CUSTOMISABILITY:** add features that help the community to tailor their environment and promote ownership. For example, movable blackboards, sliding walls, customisable furniture and glazed partitions. Enable a common ground that is free from hierarchies.

Innovation through STEAM collaborations STEAMhouse at Birmingham City University is a centre for innovation, creative thinking, prototyping and business development, which supports artists, engineers, entrepreneurs, companies, and public sector organisations to develop products and services, bringing new ideas to life. It provides access to technical expertise and workshops in wood, metal, print and digital technologies in order to advance people's explorations. STEAMhouse prides itself in building an inclusive community that promotes equality of voice, including input from academics, creative professionals and policy makers. The overall aim is to establish and promote new forms of collaboration that will lead to expanded mindsets and major long-term growth across the West Midlands region of the UK. Fundamental to the approach is the creation of new toolkits that help people adopt STEAM perspectives – these focus on five key principles: collaboration, conversation, exploration, newness, and openness. This ethos resonates with Birmingham's civic history, which has a tradition of combining the expertise of artists and industry, as shown on the city's coat of arms. Relatedly, the centre is committed to researching and scheduling challenges that speak to pressing social and business needs, and organises interdisciplinary events to build understanding and identify potential solutions.

Bending the possible (one pixel at a time). Small-file ecomedia for the Anthropocene

Abstract

Driven by the concern that ICT (information and communication technologies) currently contributes 3.3% to 3.8% of global greenhouse gas emissions (Belkhir and Elmeligi 2018, Bordage 2020), surpassing the carbon footprint of the airline industry at 1.9% of global greenhouse emissions (Ritchie 2020), this dialogical and performative panel seeks to interrogate the question of "The Possible," Natures and Worlds from the point of view of green computing and sustainable experimental media production. The panel responds to the problem of the pandemic rise in streaming media and its underlying capitalist articulation of the Possible by assessing the viability of the concept and practice of experimental small-file media as a sustainable alternative for the era of the Anthropocene. Small-file ecomedia are low-bandwidth experimental movies of no more than five megabytes in size and no more than five minutes in duration, which allows them to be streamed with no damage to the planet. Our proposal makes an intervention into the very concept of ecomedia and "nature." Ecomedia is not simply a representation or visualisation of environmental problems but an immanent practice of responsible world-making indexical to the earth and the cosmos, as well an activist pedagogy and act of community-building. Our discussants will tackle small file media from a variety of perspectives: appropriate technologies in the global South; media philosophy, technical solutions for media sustainability, and a maker's perspective on microcosmic media.

Keywords

sustainability, green ICT, experimental digital media, ecomedia, media philosophy, media ecology, decolonial methodologies, aesthetics, carbon footprint, streaming media

Panel discussion brief

Driven by the concern that ICT (information and communication technologies) currently contributes 3.3% to 3.8% of global greenhouse gas emissions (Belkhir and Elmeligi 2018, Bordage 2020), surpassing the carbon footprint of the airline industry at 1.9% of global greenhouse emissions (Ritchie 2020), this dialogical and performative panel seeks to interrogate the question of "The Possible," Natures and Worlds from the point of view of green computing and sustainable experimental media production. [1] [2] [3] ICT engineers Nardi et al. (2008, 86), founders of the Computing Within Limits (LIMITS) initiative, point out that computing research is predicated on a specific vision of the future that entails an ever-increasing production and consumption while ignoring the planetary limits. [4] Such computing research therefore reinforces an extractivist, pre-designed vision of the Possible. Its philosophy of "please enjoy your all-you-can-eat-data, the technology will come up with efficiency gains in time to make it possible" becomes established a ruling episteme, preventing any institutional (self-) critique, as ICT's infrastructure of data

centers, networks, and devices continues to be over-engineered in anticipation of future use.

To counter these nefarious pandemic streaming practices, one must explode the underlying industry doxa of what constitutes the Possible and propose alternatives. These alternative Possibles are not simply future-centric but operate on the present and the past. On the one hand, they have to do with neuroplasticity—i.e., changing the present sensorimotor habitual connections driven by capitalism, and in particular the viewers' appetite for high-resolution streaming; and, on the other, with decolonial chronopolitics—i.e. countering the unitary vision of technological development put forward by ICT industry by proposing alternative post-Eurocentric grounds and genealogies for the development of digital media. As Yuk Hui (2020) has noted, the current notion of technology is anchored in the Eurocentric dichotomy between (1) the Greek *technē*, i.e., poesis, bringing forth, and (2) modern technology understood by Heidegger as an enframing apparatus that makes everything its standing reserves. [5] Hui explodes the unitary vision of technological development by pointing out that technologies are enabled and constrained by local cosmologies—they are always already multiple cosmotechnics.

Computing within limits introduces a cosmotechnics that is locally and temporally specific. As sustainable-ICT engineer Lorenz Hilty (2015) argued at LIMITS, the goal for ICT should not be computing efficiency, which is a model for continued ICT expansion, but self-sufficiency, whereby a region supplies its total energy demand from local renewable sources. [6] "Contrary to the current 'anytime culture,'" Hilty writes, "people living in a self-sufficient region would have to adapt their lifestyles to the pace of the renewable energy supply."

The panel responds to the problem of the pandemic rise in streaming media and its underlying capitalist articulation of the Possible by assessing the viability of the concept and practice of experimental small-file media as a sustainable alternative for the era of the Anthropocene. Small-file ecomedia are low-bandwidth experimental movies of no more than five megabytes in size and no more than five minutes in duration, which allows them to be streamed with no damage to the planet. Our proposal makes an intervention into the very concept of ecomedia and "nature." Ecomedia is not simply a representation or visualization of environmental problems but an immanent practice of responsible world-making indexical to the earth and the cosmos, as well an activist pedagogy and act of community-building. Small-file media are pandemic technologies of care. They both abandon the pure and innocent image of an antediluvial "nature" opposed to culture and forgo the innocent image of digital technology as an immaterial nebula of operations. We embrace the pixel as an ecosexual entity, an immanent interface for processes of enfolding

from and unfolding to the cosmos. In this way, we extend the concept of ecomedia's natural-cultural continuum, making possible heterogenous and transversal operations conceived as what our discussants have called 'soul assemblages,' (drawing on Leibniz and Islamic Neoplatonism) and 'chaosmotechnical phylum' (drawing on Deleuze, Guattari and Yuk Hui). Small files are no longer digital and human-centric but reveal the life of the image as a resonant, ahuman film attached to a deterritorialized earth, traversing different fields of energy and human-animal milieus, and tied to the metallic properties of semiconductors that make its operation possible. Finally, small-file movies open up a platform of diasporic storytelling in an intercultural perspective. They afford an opportunity to draw alternative archaeologies of digital media and the pixel, and thus reopen media theory and production to non-Eurocentric Possibles.

The panel stems from a two-pronged transdisciplinary project mandated to (1) calculate the carbon footprint of streaming media and review the relevant ICT engineering literature; (2) propose alternative solutions for media practice, as well as modes of thinking otherwise in media theory, which converged in an online festival of sustainable experimental media organized annual since 2020. Our discussants will tackle small file media from a variety of perspectives: appropriate technologies in the global South; media philosophy, a maker's perspective on microcosmic media, and technical solutions for media sustainability.

ICT's electricity consumption: appropriate alternatives from the global South

If we are to restrain the rise in ICT's contribution to greenhouse gas emissions, the goal should not be to increase ICT market penetration in less developed countries but to dial it back in wealthy countries (Hilty 2015; The Shift Project 2019). [1] [2] Although wealthy countries by far dominate the global consumption of electricity for ICT,

digital telecommunications are expanding fast in the developing world, driven by vigorous marketing by device manufacturers, telecoms, network corporations, and media platforms. This paper argues that, to halt the expansion of ICT's carbon footprint, wealthy countries need to learn from lightly infrastructured regions. Small-file making can learn from alternative or appropriate media technologies that flourish in regions where energy consumption and bandwidth are low, as a result of lower incomes and uneven access to infrastructure, such as Egypt (Cugusi 2015; Marks 2017), India (Pandian 2015; Bhugubanda 2016; Srinivasan 2017), Iran (Brown 2018; Etaati 2018), and Zambia (Parks 2016). [3] [4] [5] [6] [7] [8] [9] [10] Meanwhile, among the small proportion of ICT engineers concerned about the environment, a number look to the global South for appropriate technology and regional ecological solutions. For example, Indian engineers Barua and Mondal (2019) survey approximate computing or "good enough computing," a scaled-down solution for the end of Moore's Law. [11] This paper will survey some of these small-footprint hacks from artists, engineers, and everyday practices in "data-poor" (Leidig and Teeuw 2015) regions and hold them up as sustainable ideals for the over-infrastructured world. [12]

Small-file media in a blade of grass: second natures and the lure of the cosmos in experimental ecomedia

The presentation considers small-life media, put forward during a 2020 festival of experimental ecomedia, a way to counter the West-centric narrative of incessant progress and innovation ignoring the finite planetary limits—the earth's carrying capacity (on this, see Nardi et al. 2018). [1] The unfeasibility of this grand narrative has been recently corroborated, for example, by recent research on metal oxide semi-conductor circuits (Kaeslin 2015). [2] It turns out that these indispensable material supports for digital networks have reached their limit of efficiency, to the point that they are leaking electrons.

Rather than countering the unitary notion of "modern technology" with a utopian vision of nature, the presentation argues that the practice of small-file media affirms Yuk Hui's recognition of technology's cosmological a priori (a "second nature"), putting forward the notion of a bi-furcating technodiversity which starts with the local. The cosmos is not framed here as transcendental heavens but a zone of indiscernibility between the deterritorialized earth and its Outside. [3] Such "cosmos at your doorstep," to paraphrase media scholar Laura U. Marks, ruptures perceptual clichés and the capitalist-driven compulsion to binge-watch streaming media at high resolution. The paradox of the small-life media is precisely that "digital" media of no more than five megabytes in size and no more than five minutes in duration have the potential to transmute the place one walks, sits, stands, metabolizes, and meditates, its spectacle of an infinitesimal, mundane life, a blade of grass, into vast new worlds—a laboratory of thinking making alternative Possibles. Small-file media spark a decolonial search for alternative geologies for contemporary media art. For example, small-file media might be said to follow the logic embodied by talismans in the Islamic Neoplatonic tradition which, as explicated by Laura Marks (Estorick and Marks 2021), form "an interface through which magicians can make a fold in the cosmos by making themselves microcosms: aligning their bodies and technologies with cosmic powers." [4] These talisman-images enfranchise different constituencies from all around the world to exercise creative freedom in an ecologically sustainable way.

My presentation will include a case study of several small-file media submitted to the festival, focusing on how compression aesthetics can become an ally in co-creation, despite its small size affording a pliable material—perfect for diasporic storytelling and haptic experiments.

Imagining pixels

Beyond technical research, few researchers have examined the nature of the pixel in digital media from a philosophical and artistic perspective. Pixels can challenge the human-centric perception of the world and, consequently, offer a new understanding of temporality and change. Each tiny pixel within a moving image beholds a universe consisting of light. Their experience of the world as light can free our imagination from a single-point perspective and linear experience of time. Like *suspended images* (*muthul mu'allaga*), which, according to a concept of Persian philosopher Shihab al-Deen Suhrawardi (1154-1191), float "not in a place nor in a substrate" (Lit 2018), pixels with their algorithmic characteristics exist in between the visible world of matter and the invisible world of ideas or intelligible forms. [1] In practice, these tiny elements that constitute a moving image can offer new possibilities to think about the world differently and to make moving images where the smallest part as a microcosm may unfold infinite imaginal images (Jambet 2006). [2] Unconventional technologies, pixelated images, and low-resolution pictures can help reclaim our senses in order to live through the body, or even beyond the body into the imaginal, such that momentarily we may become a stone, a grain, or a pixel.

I have tested and developed these concepts through a series of video experiments, two of which I will share in this presentation.

Small-File Ecomedia Techniques

Streaming media have been calculated to contribute a whopping 1% of global greenhouse gas emissions (The Shift Project 2019, Marks et al. 2021). [1] [2] Small-file ecomedia address this problem, providing alternatives to ultra-high-definition moving images. Globally artists are already implementing a wide range of technical and aesthetic techniques that can be adapted and scaled for low-bandwidth mass transmission through existing ICT networks. Small-file media are attractive, memetic, and viral (Steyerl 2012; Goriunova 2014). [3] [4] Practically, steps can be taken in pre- and post-production to reduce the carbon cost of ecomedia intended for streaming, from a reduced color palette to the simple use of a tripod and monophonic sound. Other techniques such as the use of old camcorders, cellphones, and other lens-equipped devices can prolong their life and divert them from the landfill—crucial considering the startling fact that devices account for ¼ to 1/3 of ICT’s electricity consumption—sidestep the carbon pitfall of large-scale media-infrastructure assemblages (Parks and Starosielski 2015). [5]

Small-file ecomedia draws from both do it yourself (DiY) movements and computer-based artistic practices. Datamoshing practitioners can utilize free, cross-platform apps including Handbrake, Any Video Converter and AVIDMUX to compress moving-image content to a fraction of its original size. Some artists use these aesthetic tools to manipulate the granular materiality of digital media objects. The Demoscene movement maximizes the audio-visual potential of miniscule executable files on hardware ranging from vintage desktop computers to cutting-edge gaming machines. While many of the aesthetic qualities of these movements have been appropriated and popularized in HD media, it’s time to reclaim the beauty, integrity, and potential of the small file to grow and foster the flourishing world of ecomedia.

Abstract

This panel will explore historical and contemporary engagements of Art that address our relationships with food and the systems that relate to these. In a wide sprawling discourse that intersects augmentation and ecological aesthetics with Art+Science practice, this panel will present a discussion around the plethora of artist's work that creates cross-bindings and transdisciplinary approaches between the different topics of post-agriculture, post-growth and molecular cooking. The discussion aims to create new thoughts on food systems through artistic research that addresses topics of scale and scope in the Post-Anthropocenic era, micro to macro sub-connectivities in ecological systems, post-nature ideologies, microbial and fungal remedies and molecular transitions in human and non-human bodily encounters.

Keywords

Food Ecologies, Post-Anthropocene, Fermentation, Non-Human Entanglement, Art+Science, Ecological Aesthetics, Augmentation, Bio-Art, Art Histories, Domestic Science

Julian Staddon: Introduction to Panel Theme

Inspired by the Umberto Eco novel *The Island of the Day Before*, the thematic premise of this panel is to explore what we can learn through revisiting historical approaches and engagement with ecology; be they Art's overly romanticised engagement with nature and the sublime, through to more recent fetishizations of food in social media or in Scientific approaches and how its modes of representation and reflection through have changed since Industrialisation, Digitisation, Networked Protocols and Biotechnologies, up until what we now can define as the Post-Anthropocentric Era. *The Island of the Day Before* [1] builds on precedents such as Homer's *The Odyssey* (1050-850 B.C), Daniel Defoe's *Robinson Crusoe* (1719) [2] and even Noah's Ark, where within one vessel an entirely unique and subjective space can occur (as an artificial island) that is rich in histories, stories and even ecologies.

However as with all islands, this is somewhat isolated and therefore limited. In the case of Art+Science there are often several limitations on how a work evolves from idea to work of art and this is compounded when situating such works in the topics of food and ecology, but more so when also setting

them in the public realm, outside of traditional galleries. But within this there is also freedom.

Franz Xaver (1956) often refers to floating islands of information in his artworks that focus on how information is transmitted in the wider contexts of nature, life, physics and the universe. Armin Medosch (1962) also often discussed this same concept in his texts, collaborating with Xaver for several years (until the recent death of Medosch) in regard to signals, information and how working independently or in isolated, smaller communities and collaborations, can often provide a purer message. [3] Through its inherent subjectivity, every work of art provides a unique message and this is of course the case for artworks that augment aspects of human engagement in (post) nature and food systems. Through this panel we discuss how such works of art nourish both our stomachs and the societies in which we live. It is in fact interesting to look at networks in relation to food supply chains, ecological and microbial networks, as all inherently rely on information exchange, however one involves living systems and a wider human intervention. While this may seem rather expansive in its discourse, it was a deliberate inclusion of a wide scope of approaches to understanding network ecologies and ecological networks.

Often in ecological discourse we think in terms of biotopes and debates over how discrete environments and ecologies should have a more networked approaches have been occurring in recent years with natural phenomena such as mycelium networks being more deeply understood through recent scientific findings and similar can be said for microbial networks. [4][5] This of course also links to food supply chains and production processes from seed to farm to table to mouth to stomach back to the earth and inherent to this, is the notion of nourishment and what this entails in regards to not only food, but information, health, ecologies, and of course economies, politics, and other social factors. Perhaps Latour offers an interesting framework for assessing these complex, interwoven layers of ecology and society, though there are of course authors that deal more directly with ecology from an Arts and Aesthetics position.

In *Bleak Joys: Aesthetics of Ecology and Impossibility*, Fuller and Gorionova argue that critical discourse in ecology, particularly in relation to agriculture, industry and contemporary society, is problematic due to the topic being: "An expansive one that is both hungrily sensual and

abstract... about bad things, it discusses conditions such as anguish and devastation which relate to the ecological but are also constitutive of politics, the ethical and the formation of subjectivities and beings. These combine in the present day at multiple scales and in many ways, but they are also too often avoided, considered finite or absolute, rendered indifferent yet totalising, because we do not have the language to speak about them.” [6]

Through adopting an aesthetic approach of Augmenting the elements and processes within food ecologies, Art is able to build a language for Ecological Aesthetics that is both accessible and engaging. This is an aesthetic of augmentation that goes beyond recent iterations of the term. [7] Art has in its tradition, positioned nature in ways that fetishize it as sublime, such as in Romanticism, where the real nature of nature lies hidden in the unconscious. As Morton suggests in *Ecology Without Nature*:

“Nobody likes it when you mention the unconscious, and nowadays, hardly anybody likes it when you mention the environment. You risk sounding boring or judgmental or hysterical, or a mixture of all these. But there is a deeper reason. Nobody likes it when you mention the unconscious, not because you are pointing out something obscure that should remain hidden, that is at least partly enjoyable. Nobody likes it because when you mention it, it becomes conscious. In the same way, when you mention the environment, you bring it into the foreground. In other words, it stops being the environment. It stops being That Thing Over There that surrounds and sustains us. (...) Strange as it may sound, the idea of nature is getting in the way of proper ecological forms of culture, philosophy, politics, and art (...) considering art above all else, for it is in art that the fantasies we have about nature take shape and dissolve.” [8]

Art is historically both a romancer and obfuscator of the role humans have within ecology and food certainly fits this scenario. Art developed a discourse of humans being privileged above all else, separating us from nature and the “otherness and sublime” of it. Of course, not all Artists operate in this manner and many artists meaningfully engage with ecology and the everyday, with food emerging recently as an integral topic within this discourse. Central to human engagement in nature and ecology is linked to food production and our need for nourishment and the speakers on this panel all have rich practice-based careers working in this context. These artists work in ways that intersect the scientific, with more domesticated approaches, technical while more traditional and so on, all working in ways that promote human engagement with ecosystems, ecology and food. This panel questions whether it is possible to consolidate such a range of different iterative strategies for Art making in theory and practice within Food Ecologies, in order to provide a framework for future analysis and comparison.

Erik Zepka: Imperial Energy Capture and the Prophetic Cultures of Exile

The Axial Age marked a moment where human civilizations drastically increased their terrestrial environmental impact. [9] One way this can be expressed is through energy capture, looking at the correlations between affluence and ecological footprint. Certain cultural roles coincide with these material economic moments, including abstract morality,

translatable culture and the theorizing of prophetic alternatives. As slavery increased over time, so did its economic labour displacement, and the consequent alienation and rebellion. Prophetic art and literature epitomize the rebellious mode in accelerating imperial expansion and resource extraction. The exile is displaced into a labour unit, turned into a permanent migrant, imported for economic over human reasons.

While the Achaemenids were reaching unprecedented civilizational size, Hebrews were rehashing the migrant image of Noah in the age of contrarian speakers like Isaiah and Daniel. The Greeks were persisting in post-war city-state clusters just as Odysseus had clambered to survive displaced after the Trojan war. In India the 16 Mahajanapadas are in turmoil while in China the Warring States period has just begun. In this period of activity explosion, the human energy capture level dramatically increased, and it is a useful period for looking at environmental expansion and its cultural consequences. The rise of the literate prophetic exile coincides with this explosion in scale and impact. [10] In the current age of unprecedented global imperial expansion, it is crucial to develop a cultural grammar for the migrant culture that results. Developing a deep framework over time allows for increased empirical data and a more robust view less susceptible to modernist fetishes and ideological bias. The role of the cultural worker becomes tantamount in navigating and identifying the rootless world whose accelerating changes contrast sharply with environmental catastrophe and our ties to geography and domesticity. What are the symbols of this world, how do we travel, how do we relate the realities of our life histories to planetary exigencies.

The nomadic cultural perspective offers projects and epistemological incursions that seek to grapple with that symbolic landscape. [11] Touring the materials and ideas of those concepts, I hope to outline a picture of exiled experience that operates within the historical view presented. The migrant worker, the extractive society, the displaced thinker - culture mediated out of home, and the panoply of biological reminders that bring us back. Exile and energy, the materials taken from the earth can only travel so far.

Maya Minder: Fermenting Anthropologies

Fermented foods and beverages have been part of human civilization for more than 6000 years. [12] Some historians even suggest that its arrival was mutual with the advent of agriculture and settlements of humans. Producing the sacred and magical drink of fermented alcohol demanded a stable source of wheat or sugar containing fruits and seeds. While fermentation as a culinary event is currently celebrated as a global trend [13], it has always been part of human immaterial culture and present in all geographical hemispheres. [14] Knowledge was protected as maternal intergenerational transmission and has so far persisted in time and existence, handed over as oral tradition in deep time associations. In every culture one can find distinguished recipes, hyperlocal and adjusted to local soils and climatic conditions and talks about a harmonious agricultural co-existence between human and nature. [15]

With the food trend of fermentation people also become more aware of the biomedical connectivity of the human body with its microbiome, our digestion, its connection to our immune system, the brain - gut axis connectivity,

modern disease and in greater prospect our metastasis. The research and dispute if by the intake of probiotic foods and beverages will inhere and improve our microbiota inside our guts [16] is still ongoing but rather to send a finale proof and judgment it is so much more interesting in regard of a decentralized view of human anthropocentrism, when considered the perspective that we might be only the body providing a house for its bacteria. [17] According to Vernadsky's and Margulis ideas of the endosymbiosis theory, humans could be also considered as a symbiotic organism, and the fact that we are made of trillions, carrying more bacterial cells than human cells inside us is shifting the viewpoint. [18] Taking this as a starting point and considering environmental humanities as a reference, it can provide a departure into new insight towards a post-anthropocentric viewpoint. [19]

Maro Pebo: Art Histories of Food Micro-Bio-diversities

Food is the rich place of convergence among need and pleasure, and as such has a unique power of convergence of crucial elements, such as knowledge, community, health, and flavour. In this intervention, the notion of food as an art medium will be interpreted as the place to construct community, knowledge, and trans-species diversity.

The first approach is a review of the art history of Relational Aesthetics [20], where food brings communities together. In 1992 Rirkrit Tiravanija cooked Thai food as a form of gathering the participants, triggering conversations, building home, and connecting the guests to his histories and culture. [21] Later in 2007, Michael Rakowitz proposed his *Enemy Kitchen* where food and the way it is served acted as a departure point for a criticism of the United States involvement in the Iraq War. [22] The second builds upon this cultural dimension and looks into the knowledge related to food, the diversity of techniques and flavours that take place in local kitchens and that can be layered and exchanged to achieve more sustainable and nutritious recipes, but also to bridge individuals as a method to overcome otherness. As in the work of Maya Minder, producing Kimchi but also sauerkraut collectively. These fermentations are also crucial to understanding the connection to the microbial species that sustain us and are at the centre of the third part of the argument.

Our lifestyle is quickly reducing the variety of microbial species living with us and this loss of biodiversity has a direct impact on our health. This phenomenon is called Loss of microbiota diversity (LOMD). There is growing evidence that dysbiosis, or a disruption of the balance of the microbial population of the gut, is associated with pathogenesis, and that many elements of our industrialized modern lifestyles can trigger this unbalance [23] related to a great number of diseases such as allergies, Type 2 diabetes, obesity, metabolic syndrome, Chron's disease. Sclerosis, Alzheimer's, depression, and others. Addressing this, the third take presents contemporary works such as the *Riverbank Buffet* (2021), which build upon the three notions of this intervention: as a relational aesthetic that gathers a community to discuss, by bringing complex favours through enriching its culinary proposals from a diversity of cuisines and finally, addressing the loss of micro-biodiversities with a great diversity of fermented and microbially rich foods and drinks.

All of this process underscores the value of defending our microbial, cultural and food diversities.

Roland van Dierendonck: Fermentation: A Less Biohazardous Way to Make BioArt at Home

Within Art+Science there is an ongoing trend to work with polycultures of wild organisms, to move beyond Anthropocentrism towards an entangled, enmeshed view that emphasizes relationships with the microbial world inside and outside of us. A recent example of this is *Proximal Spaces* (2020), initiated by the ArtSci Salon in Toronto, where participating artists during the pandemic took samples of their surroundings, creating an awareness for the "*microorganisms, dust specs and other invisible guests have populated the space undisturbed while the humans were away. The building is alive. Exhibition spaces are alive. they are living, breathing creatures populated by imaginary and real monsters, invisible creatures.*" [24] Or Annike Flo's *Your Everyday Exuberance* (2021), second-hand cotton textiles overgrown with microbes, which states that "*Humans are no longer considered to be individuals, but metaorganisms, revealed as chimera, monsters. (...) The line between artist, her surroundings and materials begins to blur and dissolve. Intimately entwined with our bodies and lives, clothes, and the microbes that reside within them, can be seen as monstrous hauntings of, and by, ourselves.*" [25]

These projects often use standard microbiological techniques to culture the microorganisms, using non-selective growth media such as nutrient agar. At the *BioHack Academy* of Waag in Amsterdam, part of my role was to train participants in such techniques: washing hands, disinfecting surfaces, measuring, mixing and autoclaving nutrients, and working near a bunsen burner [26]. The goal of such steps is to work in sterile ways, in other words, to prevent contamination with bacteria or mould spores. Although microbiology labs sometimes add antibiotics that are selected for specific strains that have been modified to become resistant, in the context of BioArt and -Design, especially within the European context, there is a tendency to work with non-selective agar plates. Such growth media, then, are very suitable when working with monocultures of known organisms. However, when working with wild (i.e. unknown) samples, agar-based growth media can form a friendly environment for hazardous bacteria or moulds, creating a potential biosafety and biosecurity risk. Moreover, an agar plate is a very artificial environment that tends to favour aggressive strains. Hence, the use of such a monocultural, artificial laboratory method to grow wild polycultures is a contradiction, perhaps stemming from a fetishization or misinterpretation of scientific methods.

Therefore, in the quest for post-anthropocentric art and microbial polycultures, we should look at other methods of growing wild microbes. Old methods of fermentation are such methods, where the acidity or otherwise selectivity of the environment creates the space for multiple wild organisms to co-exist. Focusing on domestic kitchen science instead of laboratory technique is also more accessible and affordable. Wild fermentation is hands-on; as Michael Pollen puts it, the act of fermenting for example sauerkraut is "*nothing less than a way of engaging with the world. Or rather, with several different worlds, each nested inside the*

other: the invisible world of fungi and bacteria; the community in which you live; and the industrial food system that is undermining the health of our bodies and the land.” [27] In this paper, I argue to not only focus on agar-based microbiology techniques to culture wild organisms in the context of artistic or design research and exhibitions, but to include and embrace fermentation.

Marta de Menezes: Educating Bio-Art and Ecologies in the Field

The intersection of Art, Biology and the Environment offer unique opportunities to visual artists. An innovative summer was developed that allows non-specialists to acquire theoretical and practical skills in biological and environmental sciences in connection to the visual arts. The *Summer School* explores the interdisciplinary relationship between art, life

and environmental sciences through hands-on exercises, combining theory and practice in an informal environment, along with seminars, debates, visits, and the creation of artworks with biological media, all activities mediated by the local traditions on making bread, cheese, using local products and researching what is around us.

The activities in the Summer School at Cultivamos Cultura address issues such as the cultural representations of technology and science, ethical concerns and the evolution of bioart as a cultural phenomenon. The practical component will focus on hands-on exercises in the laboratory, workshop, and within the natural environment. The possibility of transforming abstract concepts into art objects, the collection and selection of organisms for artistic purposes is highlighted, and, finally, visits to different parts of the natural park also take place.

GGenerating Condolences: Coding Grief During Covid-19

JJanna Ahrndt

Indiana University
Bloomington Indiana, USA
jahrndt@iu.edu

Abstract

In this work I try to reconcile the traditional role of mourning ritual - language and iconography with generative computing art making in the time of Covid-19. deepestcondolence.com is an expression of communal grief during a global crisis. It is my intention to reexamine traditions surrounding womxn's roles in the grief and mourning processes while using this work as a public intervention that also questions the often hallow words of condolence we receive from political figures during a time of crisis. As I develop this work into a public installation it is my hope for participants to generate and mail condolence cards to government representatives who are endangering communities by refusing to pass common sense mask and vaccine requirements or just to tell their own pandemic story.

Keywords

GAN, Covid-19, mourning, condolences, markovchain, generative language

Historic Mourning Sewing Samplers

Figure 1. Rebecca Ballinger's Sampler, 1830, National Museum of American History

There is a long-standing cultural expectation for feminine sentimentality and public mourning in Western culture. In these cultures, women have often been the family historians and curators, saving objects and images to later be passed down as the family archive. This expectation extends into cultural practices surrounding mourning and death.[1] In the past this included washing and preparing the body for burial, mourning dress practices, and organizing family services.

Often in times of mourning women are the primary archivists and creators of memorial and sentimental objects for the family after the death of a loved one. [2] Above is an example of a mourning sampler produced around 1830

in the United States marking the deaths of family members of its creator. (Figure 1) This example depicts typical mourning iconography of the time like flowering plants, grave markers, and weeping willows. [3]

Grieving online

A simple search for “memorial” using the Way Back Machine from archive.org will yield various memorial websites created to commemorate the death of loved ones. The GeoCities era provides us with GIFs of candles, roses, and doves carefully laid-out by their creators forever flickering and fluttering their wings read much like the sewing samplers of the 18th and 19th century. Websites such as tinymemorial.com, memorialsforever.com, and forevermissed.com provide digital platforms for loved ones to memorialize the departed in bits and bytes and build communities, now many funeral homes provide digital memorials and social media platforms have archival options for deceased users accounts.[4] Since the early days of memorial sites social media platforms have also become a place to express loss publicly which has caused many to question the sincerity of these expressions of emotion. While the emotion may or may not be felt, there is an element of desire to build a community as well as gain attention. [5]

Image via @gabbydarienzo

Figure 2. Memorial for loved ones during Covid-19 in the video game Animal Crossing 2020

The internet is becoming ever more involved in our funeral practices. During ongoing the Covid-19 pandemic under threat of a highly contagious disease, the internet became the site for gathering and communicating loss via teleconference funerals. [6] The bereaved watching the proceedings from miles away in rows of isolated squares typically reserved for business meetings. The only option was to grieve online and adapt and create new rituals such as the growing popularity of virtual gravesites in video games such as Animal Crossing. [4] (Figure 2)

Generative Condolences

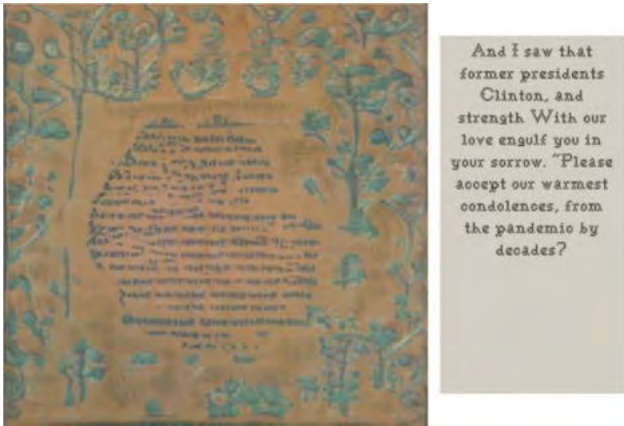

Figure 3. Condolence Card Generated Using deepestcondolence.com

The text on each card is generated using a predictive algorithm that uses a dataset of language taken from Hallmark cards and transcripts of political speeches about Covid-19 relief packages. The language on these cards can range from typical to completely outlandish. Somewhere in between it can land on something more truthful that feels akin to “saying the quiet part out loud”.

The images are derived using a machine learning process called a GAN (Generative Adversarial Network) trained on a dataset of over 1000 mourning and educational sewing samplers from the 1700’s and 1800’s. The outcome is a digital or physical object that has all the parts of a condolence message but none of the sincerity that we assume of a human made message.

Further Questions

As new-media artists how do we have an impact in how technology mediates and shapes new rituals for exploring complex emotions and life events like death? How can I create a work that both explores the role gender plays in grief and the political implications involved in mass death such as a global pandemic or the increasingly frequent mass shootings in the United States? How do social gestures carry over from the flesh space to the digital realm when dealing with grief? Will the pandemic change our funeral practices forever?

I intend to continue this line of questioning and explore further the queering of textile history as well as studying how death iconography and condolence language is changing in western cultures during the internet era.

Janna Ahrndt (She/They) received her MFA in Electronic and Time-Based Art from Purdue University. She is part of a wave of new media artists rejecting the notion that craft and technology are directly opposed. Her work explores how deconstructing everyday technologies, or even making them for yourself can be used to question larger oppressive systems and create a space for participatory political action. She is currently an Assistant Professor at Indiana University where she teaches interactive media.

Resurrecting Data as a Phenomenological and Spatial Object

Thomas Asmuth, Domani Turner-Ward

Department of Art and Design, University of West Florida
Pensacola, Florida, United States
tasmuth@uwf.edu, adt67@students.uwf.edu

Abstract

Planes is a proposed sculptural artwork that displays data from a specific environmental study. This project seeks to bridge gaps in scientific communication that occur between the phenomenological experience in the field, laboratory analysis, and presentation of the resulting data. It is a three-dimensional model displaying hydrogeochemical data and is created using laser-etched slides illuminated by an LED strip governed by a microcontroller. The authors chose these aesthetics in response to the ineffectiveness of previously utilized two-dimensional graphs. *Planes* returns the data to the spatial world to connect it with the phenomenological and virtual.

Keywords

Arduino, data visualization, Deleuze, hydrogeochemistry, microcontroller, Multiplicity, phenomenology, sculpture, STEAM, understanding

Introduction

In scientific and academic studies, there is often an epistemic disconnect that occurs during the process of field studies, laboratory analysis, and data communication. The project suggests a solution to the gap between the phenomenological experience that occurs in the field and in the creation of meaningful information. The project addresses this disconnect through the creation of a sculpture that reveals environmental data as a spectrum and references the environment where it was recorded. Rather than the language of mathematical symbolism, this work explores what is possible when information is presented using color. As a sculptural piece, this work goes beyond the world in which most data representation resides and forces innovation, creating a space for experimentation and variability. This provides not only a more meaningful way to communicate the results of a specific scientific study but also acts as an exploration of conceptualization methods that can be applied to other issues.

Figure 1. Digital concept art for *Planes*, with the most fundamental iteration enlarged and with secondary designs shown along the top edge.

Proposed Design

Planes is a proposed sculpture utilizing three separate planes of translucent material. Overall, it occupies a space around one meter in width, forty-five centimeters in depth, and sixty centimeters in height. Each plane is animated with color transitions that reflect data sets as a field of shifting hues and brightness. Materials include wood, acrylic sheeting, addressable RGB lighting, and microcontrollers.

There is more than one way that this structure may appear in its final design, but all possible iterations have the same basic form. This can be seen in digital concept art the authors have created using Adobe Illustrator (see Fig. 1). The overall plan for this piece can also be understood through the maquette the authors have created (see Fig. 2).

Environmental Data

The environmental data comes from a critically important study of the Pensacola Bay System. These nutrients strongly contribute to eutrophication, a global issue that is

Figure 2. A maquette of *Planes* that occupies a space thirteen inches in width, three-and-a-half inches in depth, and three-and-a-half inches in height.

particularly concerning in watersheds bordered by agricultural and industrial activity. The dataset demonstrates concentrations of nitrate, nitrite, and phosphate found in porewater throughout a vertical plane of sediment perpendicular to the shoreline at a site on Pensacola Bay. Eutrophication involves excessive bacterial growth due to the overabundance of nutrients and leads to widespread plant and animal death due to hypoxia (a lack of oxygen) and other resulting environmental conditions. Nitrogen and phosphorus are two of the most important nutrients involved in eutrophication, with nitrogen occurring as nitrate, nitrite, and ammonium and phosphorus occurring as phosphate.

It is valuable to monitor the presence of these nutrients in the Pensacola Bay System due to its significant susceptibility to eutrophication in the event of increased pollution, and the source of this artwork's data is one of many ongoing projects assessing the health of this system. A historical analysis of this system's health conducted by local scientists Caffrey and Murrell demonstrates degradation due to industrialization in the mid-twentieth century, with such dramatic effects as major fish kills and seagrass bed loss. These issues have been reduced but not resolved by enforcement of the Clean Water Act and would likely be easily exacerbated by the increased introduction of pollutants [1].

Resurrecting Data as a Phenomenological and Spatial Object

As a whole, this methodology is an effort to reconcile the three individual 'worlds'—field experience, laboratory data analysis, and information—that cannot be achieved without all three of these other 'worlds' working in tandem. This method of artistic expression is evocative of Deleuzian discourse on Multiplicity and mirrors a phenomenological analysis of science; specifically, one that identifies a divide between the perceived Nature and the cognitive construction

of the World littered in personal bias, shapes, experience, and understanding [2, 3].

Planes is a critical examination of science communication. In public presentations of a previous porewater nutrient study, it was found that the graphs used to demonstrate the processes and results failed to increase understanding. This experience led to an interest in how data visualization can be intentionally designed to impact public understanding and engagement.

Additionally, this piece having a programmable nature creates an opportunity for it to maintain flexibility and grants it the ability to display the data in multiple ways. In this way, the sculpture evolves alongside understanding and can adapt to changing needs or interests and may even become interactive.

The goal of *Planes* is to act as a communication catalyst that bypasses opacity or noise present in many other data communication devices. While the intent of *Planes* is to communicate the findings as an informational design similar to infographics, interactive displays, and such, the spatial object intends to reconnect the phenomenological as a spatial object. The sculpture as a type of graphing interface challenges the conceptual pitfall that scientific data encounters when removed or excised from the phenomenological experience. Although the data here relates to a specific issue, the principles this project explores can be applied to a plethora of other instances in which a similar disconnect in communication occurs.

Identification, socialization and professionalization of Art and Design students through a techno-pedagogical model.

Quelic Berga-Carreras, Laia Blasco-Soplon, Javier Melenchón Maldonado

Universitat Oberta de Catalunya (UOC)

Barcelona, Spain

qberga@uoc.edu

Abstract

We are working on the construction of a tool and network of e-portfolios [1] based on Wordpress that proposes the student to create their own identity, generate a network and community promoting peer learning and, at the same time, facilitating the creation of a professional portfolio throughout life. With this project we want to find out what impact the integration of open content managers such as WordPress, which are rich in interactive media, has on learning management systems, specifically on Art and Design students. Our objective is to reinforce the idea that an online learning model benefits from being centered and based on the process of identification, socialization and the potential professionalization of the student.

Keywords

Constructivism, Design Based Research, e-portfolio, online identity, network learning, professionalization, WordPress, CMS, LMS, community learning.

Introduction

The model that we present was born with the design and subsequent deployment of the Grado de Diseño y Creación Digital (2014-2016) and the Grado de Artes (2015-2017) of the Universitat Oberta de Catalunya (UOC). The memories of the degrees, written in collaboration with the faculties of 1) Art and Humanities, 2) Communication and 3) Computer Science, Multimedia and Telecommunication, reflect the need for a techno-pedagogical solution that allows visual interaction and where the learning process, the student and the professional portfolio stays at the center.

Maintaining a multidisciplinary and critical view of ICT, it seems relevant to connect the culture of sharing and participation [2] from any issuer and context, together with formal learning models. It seems interesting to promote the propagation of formal learning towards informal networks [3] to integrate the potential of online or hybrid university structures, together with their Learning Management Systems (LMS) and social networks.

In March 2018, to fulfill those needs, the development of a tool, an infrastructure and a series of methodologies started. The first prototype was conceptualized by a professor of the university together with a developer specialized in eLearning. It's resulting interaction model focuses on the learning process while creating an online identity throughout life in a rich media open source platform such as WordPress while being accompanied by the university. On the technical side, this translates into the implementation of plugins that integrate each student Content Management System (such as WordPress) with the LMS of the university. For that, students are conceptualized as adults willing to enhance their representation on the network with a personal profile while allowing them to socialize with others through their personal spaces, and, at the same time progressively creating their professional portfolio.

Methods

Following the principles of design and creation, a tool has been prototyped, developed, implemented and evaluated iteratively, using agile methodologies. Those methodologies are consistent with the principles of Design-Based Research and Design-based Scientific Research. (Design Science Research).

Through the use of agile methodologies, a continuous refinement has been applied that lead to the improvement of the educational process and tool, maintaining a group of informed key users (teachers, students, technicians and researchers) that collect risks and functionalities in an iterative way. Two modes of iteration have been established: a system for collecting modifications (JIRA) and a system for collecting bugs by users (an online form). With the collected data, developers have planned 241 improvements or bug resolution from which 194 have been implemented and solved along five semesters. With the online form, teachers and students have reported 43 bugs and proposals for improvement, of which 39 have been resolved and integrated into the project. In total, 233 improvements have been done, implemented and evaluated by the developers team.

At the end of each of the five semesters, satisfactory surveys of students and interviews with the teaching staff have been carried out.

Folio: a techno-pedagogical model.

When studying in those online degrees, each student has a personal space called Folio, in which each one can manage their learning outcomes, while connecting them to the Virtual Classroom activities. Thus, individual web spaces are created using free technologies (WordPress) that are highly scalable and with a wide penetration in the professional sector.

Thanks to the PubliNET plugin that we developed, each student can choose the privacy level of each content they create. This permission system has been developed to allow users to choose which other users see what content (private, teachers, classroom mates, everyone in the virtual campus or completely public).

The second developed plugin, called ActiFolio, allows students to link any created content to activities from the virtual classroom. This has several advantages, a) the student always works in his/her personal space, b) the content becomes tagged with classroom activities, c) this common tagging allows learning and sharing in community thanks to the Agoras.

An Agora is an automatically generated website that, being part of the classroom virtual space, gathers each student's Folio content tagged with the classroom's ActiFolios. This creates a place to show, share and learn from others, becoming a node to interact between peers.

Figure 1. Schematic representation of the interaction model: Personal Folios (CMS WordPress) are related to the Virtual Classroom (LMS) and allow socialization in the Agoras.

In this sense, we have begun to study and implement methodologies that propose types of teaching activities. We define activities according to the objectives of identification(id), socialization(s) or professionalization(p).

- **Identity activities (id):** focused on the creation of dynamics that allow students to generate content in which they identify themselves. For example, the study students' favorite authors justifying their choice through students' tastes and preferences.
- **Reflective activities (id):** those for the evaluation of the personal learning process.
- **Exhibition activities (s):** Oriented so that each student contributes knowledge to the rest of his classmates. For example, an activity in which each student chooses a different concept and presents it to the group of students in the classroom, allowing collaborative learning.
- **Work in progress activities (s):** in which the students are invited to share their process to receive comments and feedback before the final delivery.
- **Professionalizing activities (p):** aimed at showing quality results. Showing the competences acquired throughout the training. If made public make up the professional portfolio.

Analysis and results

The current model is being used in the Grado de Artes, the Grado de Diseño y Creación Digitales, the Grado de Lengua y Literatura Catalanas, the Máster de Usabilidad y Experiencia de Usuario and the Master de Videojuegos. For the following semester five more programs will be incorporating it. Despite being able to extend the technopedagogical model to the entire community, we have opted for a gradual change to support teachers in the process of adapting their subjects to the former methodologies

References

- [1] Barberà, E., Gewerc-Barujel, A., y Rodríguez-Illera, J. L. (2016). Portafolios electrónicos y educación superior en España: Situación y tendencias. *Revista de Educación a Distancia (RED)*, (50). doi: 10.6018/red/50/7

- [3] Greenhow, C., y Lewin, C. (2016). Social media and education: Reconceptualizing the boundaries of formal and informal learning. *Learning, Media and Technology*, 41(1), 6-30. doi: 10.1080/17439884.2015.1064954

In addition to achieving the initial aim of creating a distance learning model richer in multimedia content, we have seen how some students begin to identify and appropriate their Folios into personal spaces beyond the institution. We've seen how they are adapting their spaces to their needs and asking to continue using the platform beyond the university cycle. We have seen a growing network of nodes (currently more than 3000 Folios) that constantly increase the content (some of them of public access) available today on the Internet, in many cases supervised by teaching staff.

Conclusions and further research

The model has been proven to be useful for other academic disciplines such as language, business and informatics. This suggests that research and development around creative disciplines, when mixed with technical and pedagogical models, can benefit other disciplines. Part of the success of the model lies in conceptualizing students as adults with a natural need to emancipate, socialize and professionalize themselves.

Folio understands the learning process as a social and community act. The learner is nurtured and contributes to the network, considering the process as a constantly updating and evolving phenomenon. The teaching function then becomes much more organic and dynamic, as a system of advice, support and certification. In this model the process of individual representation, social responsibility and community validation gains importance against the traditional marking system.

The method proposed in this poster points towards a model based on free (as libre) WordPress software that allows the integration of academic teaching (online or hybrid) with the widespread practice of social networking. With this, multiple consequences arise that we are still analyzing: the empowerment of the student and university communities, the increase of the presence on the internet and the generation of open content. The project promotes technological sovereignty when representing ourselves online.

We are now working on:

- the creation of a legal institution to protect the openness of the project;
- development of federated network mechanisms to allow a decentralized governance;
- compatibility with any LMS (Moodle, Canvas, etc.) to allow other institutions to adopt the model.

E-Waste: The Unnatural, Natural Resource — A Case Study on Creative Uses of Obsolete Technology

Erik Contreras

University of California, Davis
Davis, California, United States
ehcontreras@ucdavis.edu

Abstract

With many issues surrounding our high-tech products including: 1) planned obsolescence, 2) a linear “cradle-to-grave” life cycle, 3) the accumulation of electronic waste (e-waste), and 4) consumer culture, there is potential of finding practical/creative solutions to reusing/repurposing our obsolete technology. These solutions not only benefit the consumer, but also the communities that are affected by the growing e-waste problem. These issues analyzed through a case study where an artist converts a typewriter into a USB printer using the design principles laid out in this poster, including the use of open-source hardware and software as well as incorporating adaptive design for future updates. While it is unfortunate that our massive accumulation of e-waste has turned this material into an unnatural, natural resource that can be foraged, there is potential for projects (both practical and creative).

Keywords

Electronic Waste, Right to Repair, Maker Community, DIY, Hacking, Consumer Electronics, Industrial Design, New Media

Introduction

With many electronic products being designed with planned obsolescence and a linear “cradle-to-grave” life cycle, we are witnessing a growing accumulation of e-waste [1] and a diminishing supply of standardized replaceable parts (the latter being fought in many countries through Right to Repair legislation[2]). Sadly e-waste has become an unnatural, natural resource that can be foraged for potential projects. Fortunately, there is potential to deviate from this wasteful and expensive linear lifecycle in the forms of: 1) repair, 2) modification, and 3) reuse. These lifecycle modifications can extend the lifespan of our technology-advanced products, empower individuals and their communities and support secondary businesses, such as repair and modification shops as well as suppliers of open-source hardware like the Arduino Uno.

This empowerment does not only reference practical applications of repair, modification and reuse, but also includes cultural and creative applications as well[3]! The latter refers to opportunities for individuals to instill their personal tastes and wants into their well-used products. The biggest challenge to deviating from the linear life cycle is the level of

technical literacy required for repair and modification of consumer electronic products. This paper provides literary examples of how individuals can access educational makerspaces to raise their level of technical literacy.

The points that are made from the provided case study where an artist converts an old typewriter into a USB printer, using basic open-source hardware (Arduino Uno, Relays) and software (Arduino IDE). Throughout the process, the artist will note key methodologies that corporations could follow to lower the technical thresholds that prevent the average consumer from modifying and extending the lifespan of their products. This includes using open source software, providing 3D printable replaceable parts, and using a modular design in their product’s assembly. The artist will also note good practices that individuals and communities can do to extend the lifespan of their products while also incorporating their own creative modifications.

Case Study - Arduino AutoType

The following case study involves a conversion process that turned a discarded 1994 Smith Corona Mark VI daisy wheel typewriter into a functional USB printer (Figure 1), compatible with modern computers, through the use of open source hardware (Arduino Uno, relay array). Each item of obsolete tech was foraged from a local dumpsite.

This modification from typewriter-to-USB printer was done in two parts. The first modification was in hacking into the typewriter’s logic integrated circuit (IC) that translated each keyboard button press into a mechanical keystroke. Each keystroke had a unique combination regarding which pins on the IC had to be connected together. These combinations were able to be mapped out by following the traces of the keyboard circuit board (see Figure 1). Then, jumper cables were soldered onto the chip’s legs and fed out of the typewriter’s enclosure. To maintain a clean exterior for the case, a parallel board was mounted to the edge of the enclosure and the jumper cables were soldered to the individual contact ports. The benefit to using a standardized port was to incorporate some modularity to the prototype build.

The second modification was in creating a ‘prototyping module’ that would house the open source hardware. The importance of having a prototyping module is to incorporate a form of adaptability to the design that would allow for future updates around the user’s needs or updates in technology.

Figure 1: (Left) Exhibition of the Arduino AutoType at the Manetti Shrem Museum. (Upper-Center) The printed circuit board for the typewriter keyboard. (Upper-Right) the serial port that was added to the typewriter. (Bottom-Center) The Arduino AutoType Relay Module used to facilitate the communication between the typewriter and computer, note the blacklight sensitive labels on each module. (Bottom-Right) A sample print-out of the Arduino AutoType. ©Respect Copyright.

This prototyping module was built around a discarded Cisco 2600 Series Modular Access Router which provided an ample amount of space to house the prototyping hardware. This hardware included an Arduino Uno, a series of 8-bit shift registers, and an array of relays. In addition, each of these key components were broken into modules, with blacklight sensitive labels (see Figure 1). The array of relays were connected to a serial port that would link up to the typewriter's logic IC. The Arduino Uno would take in inputs from the user's computer via a USB interface. From there, each symbol from the requested printout would be broken down into a 16 bit pattern that would be read by the shift registers, which would then trigger two of the relays. Based on which of the two relays that were triggered, the logic IC from the typewriter would assume one of the keyboard buttons was pressed and thus triggering the requested keystroke from the typewriter.

At the current state of this working prototype, a user could easily create typed up letter and ASCII art pieces using the original daisy-wheel typewriter technology. An example of typed up ASCII art can be found in Figure 1. Keeping true to the methodologies stated in the previous sections of this paper, the use of open source hardware and software, as well as incorporating modular design, helps future-proof this hacked typewriter turned USB printer. Future work with this project includes adding a Raspberry PI to allow for internet connectivity and potential for 3rd party user input. As technology and skillset of the artist improves, so will the product; this is the future I would like to see in upcoming consumer tech.

Conclusion

While it is unfortunate that we live in a world with piles of e-waste, there is potential for practical and creative endeavors that involve this unnatural, natural resource. This case study only scratches the surface when it comes to the 1) repair, 2) modification, and 3) reuse of obsolete technology. With proper infrastructure and community resources, there is a potential for more exploration in this field of obsolete electronics. With community resources that raise the technical literacy of individuals, we can see a greater emergence of function art pieces in the discipline of new media.

Abstract

This demo presents a single knitted textile cone (i.e. a petal) of the electronic sculpture-installation work by the authors entitled *Flower Antenna*, exhibited in Spring 2021 at the Museum of Modern Art, New York City (MOMA). The work operates as a large receiving antenna that senses electromagnetic fields in the gallery space. Using a logarithmic amplifier circuit, electromagnetic fields are converted to sonic expressions heard in the installation space, revealing the site-specific electromagnetic atmosphere of the gallery. The demo presents textile antenna samples and EMF-sensing circuits designed throughout the development of the work.

Keywords

Electromagnetic waves, EMF, architecture, sound installation, media art, computational textiles, electronic textiles, smart textiles, textile design, antenna.

A Petal from a Flower (Antenna)

This demo presents a single petal of the larger electronic sculpture-installation work, *Flower Antenna*. The Flower Antenna was exhibited in Spring of 2021 at the Museum of Modern Art, New York City (MOMA). The Flower Antenna is an elliptical shaped flower, 21' (6.4m) long by 15' (4.5m) wide. The work operates as a large receiving antenna that picks up electromagnetic waves passing through the gallery space, and using a logarithmic amplifier circuit, converts the received frequencies to sound waves to be heard in the installation space. 34 knitted textile cones are suspended around a light-weight elliptical ring that is attached to the gallery ceiling. The cones are hung closer to the ring at one end of the long axis and drop downward to the floor at the other end creating a rising section underneath the piece (Figure 1). The project has a pink underbelly made of conductive copper and cotton yarn used to create the conical forms (Figure 3) that is electronic and is used to sense EMF, which is then translated as sound in the gallery space.

EMF-Sensing Electronics

The Flower Antenna uses a logarithmic amplifier circuit that detects high frequencies in the range of 2.4GHz and 5GHz,

Figure 1 The Flower Antenna installed at the MOMA in Spring 2021 ©Germane Barnes, 2021

which spans Bluetooth, WiFi, GSM, and GPS, and other intermittent spectrum noise. The circuit has been adapted from the open-source design of Howse and Mizayaki's *Detektors* circuit used for sonically expressing EMF [1] It has been modified to allow for the knitted petals of the Flower Antenna to affect the frequency of the signal based on the textile antenna properties. The circuit interprets the radiant qualities of the textile material over an area, and the scale of the radiant surface in order to set the gain of the signal. Further, the positioning and scale of the Flower Antenna in the gallery space is directionally sensitive to the reception of electromagnetic waves within the frequency range.

Knitted Textile Antenna

Each petal of the Flower Antenna contains a knitted copper conductive surface that composes the antenna area. This section consists of 8-ply conductive copper yarns (Apache 8, by Volt Smart Yarns) in a 1x1 rib structure knit

ted on a Shima Seiki industrial flatbed knitting machine. The auxetic quality of knitted textiles combined with the ribbed textile structure allows the textile to stretch around the conical frames that form the petals of the Flower Antenna. The conductive copper section of the petals are connected to the frequency and gain points on the EMF-sensing circuit, allowing the textile density and scale to indeterminately affect the electrical behaviours of the greater system. The imprecision of their behaviour lends itself to the artistic expression that can be found in the sonic expressions of EMF heard in the installation.

Her PhD research explores interactive electromagnetic textile expressions through experimental design methods. Prior to her studies in Sweden, Erin was an instructor at OCAD University (OCADU) in Toronto, Canada, where she taught wearable technology in the Faculty of Design, and was a researcher at OCADU's wearable technology design lab, the Social Body Lab. She was formerly the Manager of Education at Canada's leading new media art gallery, Inter/Access, in Toronto.

Berfin Evrim is a current Ph.D. student in Environmental Design student at the University of Calgary. She graduated with Integrated Bachelor of Architecture and Master of Science in Architecture (Design Computing) from Pennsylvania State University. Her research focuses on digital fabrication, computational design, and lightweight smart materials. Currently, she studies the combination of 3D printing and knitting fabrication methods to design adaptive building skins. She utilizes simulation techniques to understand the structural behavior and environmental performance of the knitted vertical element.

Farzaneh Oghazian started her Ph.D. in 2018 as part of the Design Computing cluster at Penn State University. Her research focuses on developing computational methods to enhance the implementation of knits as a material for architectural design. Behavior, form-finding process and predicting the shape of knitted textiles are central to her research. She uses machine learning methods for the reverse form-finding process in architectural knitted textile structures. Farzaneh is currently a research assistant in the SOFTLAB@PSU at the [Stuckeman Center for Design Computing](#) in the School of Architecture, doing research on large-scale application of the knitted textiles under supervision of Dr. Felecia Davis.

Introduction

"Delicious Memories" is an intergenerational storytelling workshop and media art installation that brings together older and younger New Yorkers to tell and connect stories utilizing craft and interactive technology. The installation and the performance stitches delicious stories together into a sonic multi-sensory communal tablecloth (figure 1).

Figure 1. Delicious Memories tablecloth. Fabric, embroidery, microprocessors and speakers. Embroideries by workshops participants. Tablecloth design and fabrication by Peter Ciesla. ©Laura Nova

The project draws on lived experiences through sensorial prompts about "delicious memories," those highly somatic and multi-modal experiences that are deeply embedded in our bodies. The experience of physically crafting creates a connection that activates and sustains dialogues between generations. While the project employs traditional craft techniques, it integrates them into contemporary digital technologies.

Workshops

During a series of workshops held from May through the end of June 2022, we met with the workshop participants remotely to develop, share and stitch our stories together in

a virtual circle. The stories were developed using prompts to create a zine that included writing and drawings (figure 2).

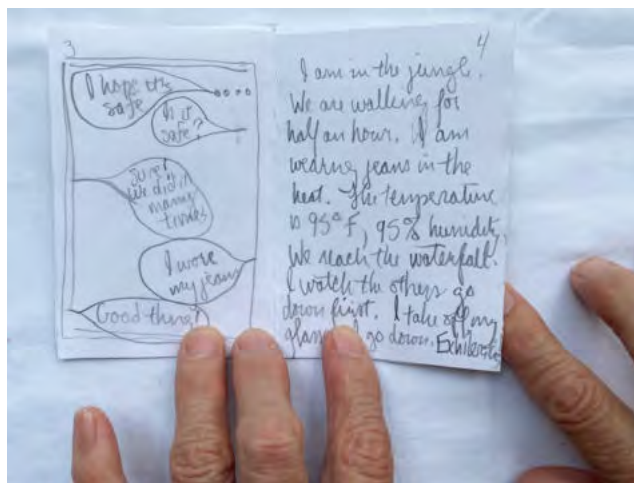

Figure 2. Delicious Memories zine by Mafa Edwards ©Laura Nova

The prompts were chosen to illicit deep somatic memories about "delicious" experiences which included seaside visits, swimming in the ocean, sliding down a waterfall, baking and tasting family recipes, creating gardens, and bonding with pets (figure 3). After exploring their stories in the small book format, they chose an image and began the stitching process. Given that most of the participants were over seventy, the process of regaining and retelling their stories was a powerful experience. Many of the participants commented that the slow experience of embroidering their memories allowed them to focus on them, relive them and soak them up again.

Figure 3. Delicious Memories tablecloth close-up. Fabric, embroidery, microprocessors and speakers. Embroidery by Sheila Longrono. ©Sigal Ben-David

Digital Handicraft

The handwork of crafting while storytelling provides an embodied mode of personal and collective creation to spark memory and nurture social wellness. The embroidery materials included cotton and conductive thread combined with other metallic objects stitched onto fabric by the participants. These materials integrate conductive components that connect to small microprocessors. The surfaces invite intimate tactile interactions by listeners who, when they run their fingers over the varied textures of embroidery, hear the participants' recorded audio stories via bluetooth speakers placed on the communal tablecloth.

The experience of listening is augmented by tactility and the communal connection of sitting together at the table touching the embroidery sensors to play the audio stories. On the table, the visitors interact with the embroidered tablecloth that acts as touch and proximity sensors that amplify individual stories. The general public and the participants themselves "perform" the stories.

Figure 4. Installation and pop-up in Essex Market. ©Sigal Ben-David

Site Specific

Listeners and participants gathered in the public space of Essex Market around the tablecloth in a pop-up installation and performance. Essex Market, located in New York City's Lower East Side, was established in 1818. The Lower East Side is known for its vibrant immigrant population and over the past two centuries Essex Market has reflected the community character. It is a place where people can come together to buy and sell food in a shared communal space. During the pop up, several visitors to the market engaged in listening to the participants stories (figure 4).

Embodied Listening and First-Voice Storytelling

Tactility affects how we feel. It nurtures empathy, well-being, understanding, gratitude, respect, connection, condolence and knowledge. What does it feel like to trace the

tactile designs of someone's story? What happens if you stop touching and the story stops? What kinds of agency does this action build between listener and storyteller? A story is the shortest distance between two people. First-voice storytelling that uses "I" establishes a sense of connection between the listener and the teller, bringing them into the personal experience narrated. The design that the participants chose to embroider becomes itself the psycho-geographic narrative interface. Does the user wander through the story; does the listener search for the audio fragments? Conductive thread is a tactile interface that requires different qualities of touch depending on the density and texture of its embroidery. Does the story ask for a light touch of the finger tip, tracing the chain stitch line, or a firmer motion over the satiny surface?

Conclusion

The project and its installation in a public setting offered an opportunity to touch, hear and see hidden narratives. This intergenerational project brings together physical computing, storytelling and traditional craft arts and insists on the import of one's surrounding community.

MOVING MOUNTAINS (Congress Poster)

Victoria Febrer, Artist

Universidad Politécnica de Valencia / City University of New York (BMCC)

Valencia, Spain / New York, USA

Victoria@FebrerArts.org

Abstract

My artwork explores our perception of the landscape by drawing attention to the relativity of our memories of the natural world. In the *Moving Mountains* series, I use projection to map fields of colored light onto paintings from the *Untitled Marine Vistas* series to change our perception of the landscape and draw attention to the relativity of color, using material and media as metaphors, proxies, and surrogates to explore issues of permanence and impermanence. Structured and iterated combinations of paint and projected light allow me to explore our relationship to representations of place and position. I use digital video projection as a source for colored light, which through its interaction with the elements on the canvas, the environment of the gallery, and the passage of time, changes the image perceived by the viewer. Manipulating the light which illuminates the paintings allows for the combinations produced by the programmed sequence I've created, by the intervention of viewers in the space, and the change of conditions in the environment of their display. Landmasses move not only along the x axis of the canvas, but also spanning time and three-dimensional space, emerging from traditional points of painted perspective within the canvas, and from pinpoint sources of digital projection. My work explores the borders between the real and the imagined, the physical and the perceived. Separating what is within from what is without, what is physically accessible from that which exists only within memory or imagination, serve as a point of departure for considering the role of not just the act of painting and the act of remembering, but the sea, the desert, the wind, the salt, the earth, and the light in this process—the way that the non-human elements exert their existence and connect us to history, time, and geography.

Abstract

The Proceedings of the International Symposium on Electronic Art will be compiled from electronic manuscripts submitted by the authors. This paper provides brief style instructions that will facilitate high-quality, consistent, proceedings. The title “Abstract” should be 10 point, bold type, centered at the beginning of the left column. The body of the abstract summarizing the thesis and conclusion of the paper in no more than 200 words should be 9 point, justified, regular type.

Keywords

The title “Keywords” should be 12 point, bold type, centered at the beginning of the left column. Using 10 point, justified, regular type, write up to ten keywords that highlight the main areas of your essay’s content.

Introduction

“*El Bosque*: the development of an immersive environment in Visual Reality. An artistic approximation to environmental awareness” starts from a wide artistic perspective of research in Ecology and Virtual Reality. With an inter- and trans-disciplinary approach, the aim is to give an experience in Virtual Reality as an artistic practice while demystifying progress from an eco-feminist viewpoint.

The main objective is to develop a theoretical-practical project in an immersive environment while generating empathy for terrestrial ecosystems and non-human factors. Viewing *El Bosque* as a threshold from which to reflect on the dichotomy between culture and nature, redefining the relationship between the environment and society. At the same time re-thinking the forces of nature as non-inert acting forces, as proposed by Bruno Latour in the Theory of the Actor Network, understood as a set of shared methodological principles and not so much as a theory in itself. We therefore want to respond to the questions: What kind of future awaits us and our forests? What will be our role in the system of the Earth? And especially, How can we integrate non-human factors in historical narratives?

This poster is part of the R+D+i Project PID2019-111720RA-I00, financed by MCIN/AEI/10.13039/501100011033.

References

Starting from theoretical reflections removed from apocalyptic positions, we look into the concepts of artists such as Nathan Shafer, Stephanie Dinkins, Koert van Mensvoort, Dominique González-Foerster, Jakob Kudsk Steensen or Daniel Steegman; and scientists and thinkers like Suzanne Simard, Robin Wall Kimmerer, Donna Haraway, Bruno Latour, Felix Guattari, Timothy Morton, Byung-Chul Han, Andreas Malm and Rosi Braidotti.

Stages

We will interview experts in social sciences, natural sciences and the humanities to explain the contemporary problems in the ecosystems in order to create new narratives.

Interviews

Analyses by specialists in social and natural sciences and the humanities in 2021 – 2022

Development of a non-linear narrative VR 2021-22

Direction of the art of experience VR 2021-22

Technical production VR 2021-22

Exhibition of *El Bosque* in 2022-23

These stages will be carried out with a multidisciplinary group in open participation.

Interviews

We propose the value of interdisciplinary actions and the art-science-technology relationship with society. VR technique and technology as a tool and context enables us use strategies combining experiments, research and creativity. The challenge is to create a VR experience to consider questions on how to improve people’s lives, stabilize the climate and protect the natural world.

Ephemeral value mappings – staging feedback loops between algorithms and emotion in online trading as an immersive multimedia experience.

Jānis Garančs

RIXC - Centre for New Media Culture
Riga, Latvia
jg@rixc.lv

Abstract

This paper briefly describes the author's current practical investigations, during the creation of *etude* series of audio-visual installations and VR environments, algorithmically extrapolated from the time-sequenced changes of multiple values, e.g., from financial data feeds. The work series critically reflect upon gambling tendencies in the global trading of various, increasingly immaterial assets. Algorithms and emotions of greed, euphoria, and despair meet in virtual scenery, where almost everything can be offered as a fungible and non-fungible token for exchange and trade.

Keywords

Market society, immersive analytics, ephemeral values, online trading, VR experience, neuroaesthetics

Introduction

This work series is critically motivated by the re-emergent and growing prominence of gambling factors in global economic activities – such as institutional promotion of increasingly complex investment products for masses, crypto-asset trading, online casinos, etc. Political philosopher Michael J. Sandel describes several last decades as a “drift from ‘market economy’ to becoming a ‘market society’”. [1] As sociologist Georg Simmel had observed it in already in 1900: “Reality and value as mutually independent categories through which our conceptions become images of the world”. [2] Mapping of the behaviour patterns in trader psychology has been an important aspect of the training in the trading process, besides the implementation and development of various mathematical models. It now appears, that value storage and trading infrastructure increasingly merge with methods of manipulation of human attention and emotions, and are mediated by computer networks, and increasingly – Machine Learning and AI.

Simulated sensorium for immersive mappings

There has been a range of historic and more recent examples of 3D visualization of various multi-dimensional data sets – as GUI for various professional software products and artworks, however, this project tries to establish a gradual journey between the extremes of intended usability and ‘sublime dysfunctionality’ within the aesthetic experience. The investigative aspects of this project are also embedded in the emerging research area of immersive analytics, which is considered a fusion of more recent developments in visualization, auditory displays, computing, and machine learning, that have been developing in an ad-hoc way, and there have been recent efforts of elaborating the definition and proposing and organizing framework for the further research. [3] These audio-visual etudes are a theoretical and practical investigation into the continuum between immersive analytics and VR/AR artwork. In the

scenes, the progressing complexity or visitor-triggered mode-shifts induce a challenge to the audio-visual sensorium: the experience of the conflation within multiple reference systems and plays with the visitor's perception effort of ‘sense-making’. Various sound properties, such as pitch, timbre, rhythmic elements are juxtaposed in linear- and non-linear grids and ephemeral relationships are revealed and emphasized by the spatially organized audio-visual cues (perspective, sharpness/blur manipulation), audio-panning, and timbral modulation (using a combination of 3D VR engine, live audio packages and sound spatialization software *Zirkonium*. [4])

Figure 1 – Interface study screenshot

Figure 2 – Interface study screenshot

Metaphors and terms

The analogy of *simulated anisotropy* - as an algorithmically simulated phenomenon of *anisotropy* known in physics, chemistry, microfabrication, neuroscience as direction-varying of material, tissue, and space properties.

The notion of the *instrument* is used both as a generic definition of a task-specific tool (or toolset, involving appearance and action parameters, that be used to e.g., detect, measure, modify a specific situation or manipulate a specific object) – and in analogy to the musical, medical, or industrial instrument.

Other terms ‘*ensemble visualization*’ or ‘*ensemble data*’ are used in the context of data visualization as ‘concrete distributions of data, in which each outcome can be uniquely associated with a specific run or set of simulation parameters’. [5]

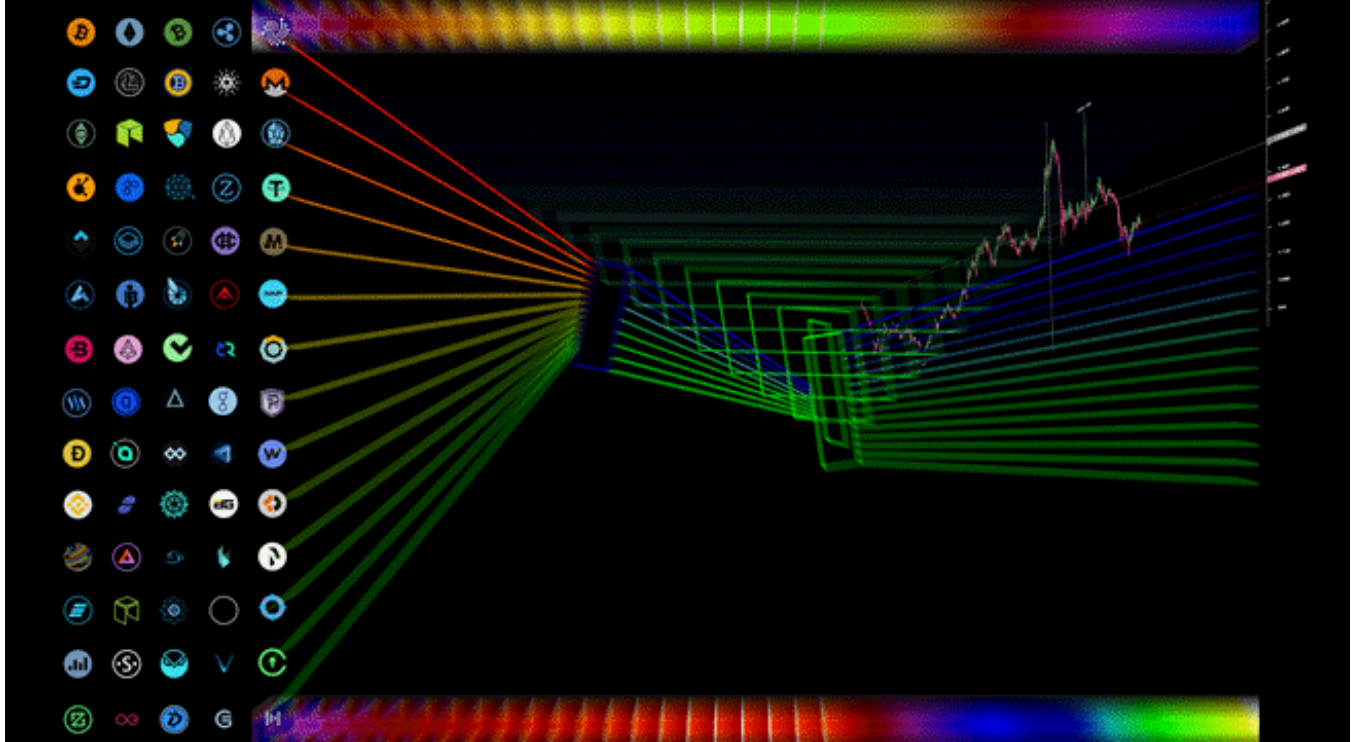

Figure 3 – Interface study screenshot

Conclusion

Algorithmically manipulated financial trading is a prominent arena where algorithms merge with human emotions and drives like greed, FOMO (“fear-of-missing out”), euphoria, confusion, and despair into a global hybrid sensorium. As a phenomenological effort, this work proposes a set of parameters for simulated anisotropy, useful for designing the structure, notation, and physical, mathematical dimensions in the VR interface and environment. The framework for simulated anisotropy instruments is envisioned as a contribution to the emergent fields of immersive analytics and neuroaesthetics, developing guidelines for a hybrid interaction system, consisting of networked hardware specifications and custom-developed software modules. Through algorithmic feedback, virtual instruments with anisotropic properties can enhance the experience (in egocentric and exocentric navigation), on-screen manipulation, and the synchronized off-screen structuring of the content. This project will implicate experimental strategies with uncertain capacities in the effectiveness of interaction, and impact of integrated audio-visual language, expanding the vocabulary of spectromorphology [6].

Recycle or Die: A Virtual Reality Application to Encourage Positive Behavior

Brittany Garcia, Soowan Chun, and Jinsil Hwaryoung Seo

Texas A&M University

College Station, TX, United States

brinni@tamu.edu, soowanchun@tamu.edu, hwaryoung@tamu.edu

Abstract

On average Americans throw away seven pounds of trash a day causing the US to make up 30% of the trash in the world. By educating individuals on the ways to properly recycle we can reduce this amount. We present the VR game *Recycle or Die* where users are forced to recycle. In this game we provide various recyclable and nonrecyclable materials accompanied with information on how to properly recycle these materials. User study results indicate that the game is enjoyable and informs on various items that can and cannot be recycled.

Keywords

Virtual Reality, Education in Virtual Reality, Recycling

Introduction

The average American throws away nearly 7 pounds of trash daily and the United States makes up 30% of the world's waste (IILyear4, 2008). Unfortunately, 80% of all products produced in the United States are only used once and then discarded. 95% of plastic and 50% of all aluminum beverage cans are thrown away and never get recycled (IILyear4, 2008). Additionally, there is a lack of knowledge about recycling in the United States that contributes to these statistics. A survey of 2,000 Americans showed that 62% worry that a lack of knowledge is causing them to recycle incorrectly (Waste Advantage, 2019). This same survey showed 22% reported not having enough information about recycling and 18% admitted that they don't understand what can and can't be recycled. As a result, we wanted to create a socially responsible virtual reality application that can educate users about proper methods of sorting recyclable material. We chose virtual reality because these environments support a wide range of activities like activities in the real environment (Sung, Moon, and Lin, 2011). By increasing knowledge about recycling, we believe that our application can help minimize the amount of recyclable materials thrown away in landfills and increase the amount of recyclable materials that get reused and recycled.

Recycle or Die Application Description

Recycle or Die is an educational recycling game where users identify products and determine whether it is recyclable if recyclable users determine where to place the recyclable product. This will teach them how to identify recyclable products to apply to their everyday life. In the following sections we will describe the design and development of the application along with a brief discussion about a user study conducted to test the application.

Design of the Application

Environment Inspiration We wanted to create an environment that resembled a warehouse seen in a horror film, like the *Saw* franchise. Pulling again from this franchise, we wanted to use negative elements to reinforce the will to recycle properly to escape the room they are trapped in.

Figure 1. *Recycle or Die* Virtual Environment

2D Asset Creation Similar to *Saw*, we used a TV to instruct users how to begin the game. The TV has a static texture, glitch effect, and text distortion. At the end of the game the player will be given a report of their total points along with information on how many of each item they recycled.

3D Asset Creation We wanted to include as many daily recyclable materials as possible for users, therefore we incorporated the following: plastic bottles, aluminum cans, glass bottles, straws, paper, and magazines as well as materials that are not recyclable such as pizza boxes contaminated with food particles, Styrofoam containers, and lightbulbs

(Figure 2). Additionally, a conveyor belt was created for these materials to move in front of the user. The textures applied imitated those that would be seen daily (e.g., Coca-Cola and Aquafina branding). Because the theme was a horror warehouse it was important to add textures that were grungy and stained.

Figure 2. 3D Assets

User Interface Our application gives information to the player with diegetic user interfaces. Instructions and points are displayed on the TV screen. Other miscellaneous details such as recyclable materials and the end of day report is provided on a piece of paper that the user can pick up and read. **Audio** To further immerse the user we incorporated sound. Audio includes ambient room sounds, mechanical sounds for the lever and conveyor belt, sounds associated with object material, and sound indicators for when user correctly and incorrectly recycle.

Preliminary Study Description

We conducted a usability study with 5 participants (3 male and 2 female), 4 participants aged 18-24 and 1 aged 25-34. We investigated whether users learn how to properly recycle trash (e.g., light bulbs and Styrofoam), glass bottles, plastic (e.g., bottles and straws), paper (e.g., pizza box and magazine) and aluminum items after using the application. Users were recruited by word of mouth. During the study participants completed pre- and post- surveys and tested the application. The pre-survey consisted of basic demographic questions (e.g., age and gender), previous VR experience and recycling experience. Post-survey items were rated on a Likert scale and addressed participants' overall experience, learning experience, presence in the application, and usability. We used the Oculus Quest 2 to test the application. In total the user study lasted 30 minutes.

Results

All participants had experience using VR devices (e.g., HMDs, Google Cardboard, HTC Vive, Oculus Rift and PlayStation VR). Participants reported using gaming (3), educational (1) and engineering (1) applications. Participant responses indicated that they had enjoyed their previous VR experiences. 4 out of the 5 participants reported that they recycled to improve the health of the environment. Those

who did not recycle indicated that it took too much effort, and they were not well informed. When asked about their knowledge of recycling participants reported moderate knowledge. Survey results can be found in Table 1.

Table 1. Survey Results

Survey Items	Average
Overall Experience	4.8
Usability	4.54
Presence	4.4
Recycle Knowledge	4.2

Participants reported an average of 4.8 for their overall experience. When asked about their rating participants said that the game was engaging, fun, the difficulty level kept them wanting to continue to play and that they learned they couldn't recycle certain items. Participants felt as if the application was easy to use. With regards to presence participants felt as if they were in the virtual room. Participants had an increase of knowledge about recycling after playing the game. Users responded that they would have liked to have more visual feedback when they recycled items incorrectly as well as visual cues for important information in the room.

Conclusion

We developed the application *Recycle or Die* to promote better recycling habits and to inform users how to properly recycle. Overall, users enjoyed playing *Recycle or Die*. Users reported that the application was easy to use, however in the open-ended responses they did provide ways to improve the user experience of the application by providing clearer indications of why items were not properly recycled along with providing indicators for what information is important in the environment. Improvement for learning was minimal as users reported a moderate amount of obtaining new knowledge about recycling. This can be improved by, as a participant mentioned, including some text that indicates how an item should be properly recycled while playing the game. The likelihood of participants recycling in their daily lives also did not increase, this may be associated with feelings of not learning enough about how to properly recycle. In the future our team would like to include different levels that would allow users to recycle more items at a faster rate.

Totem Teller as Digital Archaeology

Ben Kerlake, Jerry Verhoeven, Alexander Swords

Grinning Pickle Studio

Melbourne, Australia

Abstract

Totem Teller is a digital game exploring folk tales categorised ATU 327: The Children and the Ogre, and ATU 450: Brother and Sister and their variants. It demonstrates a digital archaeological process using poetry, glitch aesthetics, processed art and gameplay including exploration, discovery, dialogue, removal of digital grime and experimental composition. The player will act as archaeologist in uncovering elements, contemplating their meaning, and then in understanding the meaning they've created, understand the role of inspiration, stories and more about themselves.

Keywords

Digital game, folk tales, narrative, archaeology, literature, surrealism, transcendentalism, game design, poetry, image processing.

Introduction

Totem Teller is a digital game that provides the player with an exploration of folk tales classified ATU 327: The Children and the Ogre, and ATU 450 Brother and Sister and their variants. The experience is a type of digital archaeology relying on surrealism and transcendental style using poetry and glitch aesthetics. While the purpose of archaeology can be understood as a search for answers from the past, our focus has been on how the process of archaeology provides a mirror for the archaeologist and change them.

The Experience

The player character in the game is not the protagonist, but a familiar in the form of a moth that can guide the attention of the protagonist, the Muse. The relationship between Muse and Player is intended to mimic that of the attention and

curiosity present in any individual undertaking exploration and research.

Initially formed by a spark and manifestation, The Muse will first appear in The Ruins. Our analogue for the cold light of day, a brief time of anticipation before adventure. Via player guided meditation sequences, The Muse will occasionally leave this space. A deliberate choice to stop and contemplate. They will return throughout the game.

Through meditation, The Muse will appear in Story Cycle 1 and so enter the first layer of digital strata we've provided. A rural landscape and a summary status quo formed from the amalgamated source stories. It will be familiar and somewhat expected, but already requiring a small amount of interpretation through a lightly abstracted, thoroughly processed art style. Traversal involves large distances between points of great disparity providing time for observation and contemplation. Throughout the traversal they will encounter World Text as readings of the landscape. Eventually they'll discover a Major Tableau and transition into a different phase of gameplay – a point in the landscape for digital excavation. In Story Cycle 1 these occur where someone may expect an introduction to the characters, but instead are a deeper investigation into motivations, hopes and failings as informed by the history of how those stories came to be and changed throughout time.

Major Tableaux

Each Major Tableau is structured around a poem and the words are artefacts to be uncovered from within the resolved image elements. These elements are in a state of chaos, wholly or partially covered by other elements and digital grime.

The player can then clear digital grime away to literally uncover the elements underneath. Once that is done, they can manipulate some elements, piecing them together in an interpretation led by their curiosity. This is deliberately kept abstract and open to interpretation – there is no truth here, only meaning, and that meaning is to be decided by the player with shades of author, curator, editor.

Finally, a state of clarity is realised that will trigger the full reveal of the poetry. But much like in archaeology, the uncovering of all the artefacts of a scene only reveals that there is much work to

be done in interpretation. The poetry doesn't exist to provide answers, but only give form and context to the questions the player must now contemplate.

Return to The Ruins

The player will continue through 3 Story Cycles, recovering Major Tableaux throughout, and building their own meaning. Each of these Cycles is punctuated by a return to The Ruins. It is gradually populated by characters from the stories, but in a state of self-awareness akin to an actor out of character, discussing the role they're playing. They'll also be asked to relate their findings to The Tellers. These characters are searching for the inspiration fed by The Muse and their curiosity, so that they are empowered to create. A model for the player to take their own understanding of the experience and be inspired to contemplate and create.

Style

The surrealist style allows us to create a story landscape to explore and strata for the player to investigate through distortion, juxtaposition, abstraction and the manipulation of the mundane. We also aim to contribute to the legacy of surrealist artists in using the style for social commentary. We present the stories broken, subverted and interrogated from a feminist perspective.

We've structured our experience informed by the transcendental style usually associated with that form of cinema. This has allowed us to provide a narrative-driven experience with drama founded on the concept of disparity instead of the conflict found in Western conventions. In doing so we've avoided contrivances that would interfere with the player's relationship with the game and have been freed from "typical game design" conventions like task-oriented play and failure states.

1001 Nights - An Open-domain Narrative Game Using Text Generation Model

*Email: yuqiansun@network.rca.ac.uk

Abstract

To immerse everyday storytelling into real-life contexts in digital interactions, we created a game that turns entities in a story into digital assets that have functional roles. Taking the classic folklore as inspiration, we created *1001 Nights*, a co-creative, mix-initiative storytelling game using an existing AI creative writing system. In this game, Shahrzad (driven by the player) needs to tell stories through a dialogue interface, while the King (driven by the AI model) will continue the player's story in turn. Text from the story is utilised in actual game mechanisms, so that weapon keywords in the game like "sword" or "shield" will turn into equipment that can be used for battle. The game aims to facilitate player engagement and creative interactions through "invading language", which points to the text that will change the reality in game.

Keywords

Intelligent narrative, machine learning, gaming, storytelling

Motivation

Through the development of Natural Language Processing (NLP), emerging text adventure games give a player more control over the game without fixed choices in traditional games. For instance, *Interview With The Whisperer* [3] and *Mystery Of Three Bots* [7] set mysterious plots to let players explore the story with natural language text input through Semantic ML, a tool for semantic analysing developed by Google [6]. Fraser et. al.[5] presents different studies on open-domain social conversational AI using emotion detection [5].

The main goal of such games is to enhance the game playing experience by providing an immersive and player engagement by creating conversational interactions through a free-input dialogue system. However, to achieve that, despite players can have free text inputs for conversations, these games set very fixed storylines that cannot be changed by players' choices. This led us to think about the possibility to let players decide the plot inside the game, and making mechanics corresponds to the narrative framework of the game story. The game is more dynamic when players' choices define the game directions.

Assuming video games are hallucinations created by computers, then Machine Learning (ML) with creativity can keep it growing according to the player's intuition. The base of

the game, *One thousand and one nights*, is a classic example of a framed story and embedded narrative: the character narrates a set of tales, and tales contain other tales. Based on the folklore, with the text generation model, this game allows players to affect the direction of the story by telling stories themselves through natural language. With the help of NLP, we aim to create a novel form of storyplaying [4] accomplished by humans-agent conversational interactions with the help of NLP, by presenting a procedural rhetorical experience [1] that makes metaphoric stories invade into the reality in the game. This is centred on the main game concept "Invading language", just like Wittgenstein's statement: "The limits of my language mean the limits of my world" [8].

Game Design

The game includes two parts: storytelling and battle. Figure 1 illustrates the game mechanics: the player needs to keep telling stories to lead the King (AI agent) to produce a story continuation that includes the important items for battle. The King's text generation model is based on the dreamily.ai [2], a story generation model developed by Caiyun technology. With a large fiction dataset for training, the model is familiar with common tropes in various adventure stories. For instance, if the player writes a paragraph about a knight meeting a demon on a road, then the king might say "The knight slashed his blade", then the player could materialise the word "blade" and put it into the inventory. After experiments with the model, we set six keywords of items that are frequently triggered in stories: sword, shield, knife, dagger, blade and armour.

After collecting enough weapons and armours, the player can enter the turn-based battle part to fight with the king. Under the structured digital environment, the game not only produces an entertaining experience but also provides a creative writing collaboration with AI (Figure 1B). The exchanged dialogue changes the fate of game characters: defeat the king successfully or got killed for failure.

We add a mini-printer during a two-month off-line exhibition in Beijing to emphasise the concept of "invading language" and to improve public engagement. Each time when a keyword is triggered, the current piece of the story will be printed out (Figure 1D). In this game, the keywords are the materialised language that becomes part of the "reality", and to players, the printed text are stories that are tangible output

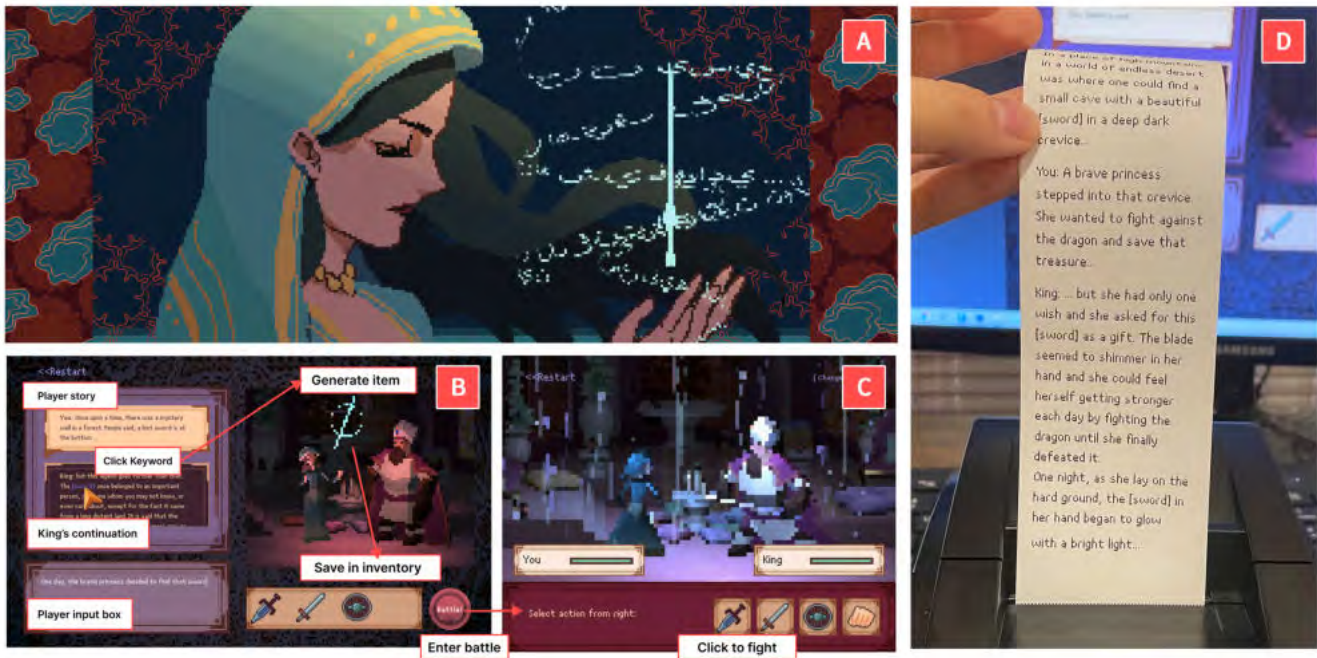

Figure 1: (A)Shahrazad (Player character) with a magical ability to turn “language” into reality (B) Storytelling phase, where player writes stories with the King (driven by AI) Weapon words like “sword” can be turned into real weapons in-game (C) Turn-based battle phase, where the player can fight with the king in turns (D) Printer will print the story when a weapon word is triggered. This matches with the core concept of the game: bringing storytelling to real-life ©Authors.

from the game to the real world. This function encouraged people to spend more time at the exhibition since they can bring away their own stories.

Conclusion and future works

In this poster, we present a text-based game adopted from the *One thousand and one nights* that allows players to write stories together with an AI-powered character. A set of keywords can be triggered into game objects for the battle, so the gaming mechanic is corresponding to the concept of “invading language” that brings words to reality.

After two months of a digital art exhibition, we received over 17000 pieces of stories from the visitors that wrote collaboratively in a human-agent dynamic. Here are several testimonials from the players at the exhibition:

- “Great applause to the artist! I highly recommend playing it at the exhibition in person, definitely interesting.” (Female, wrote a story about a male singer who is arrested on suspicion of rape recently in China, posted feedback on social media)
- “I think it helped me a lot for my recent writing. I got many inspirations from the game.” (Female, fiction writer)
- “This game provides huge player freedom. Unlike other adventure games, it won’t provide any choice. All ideas in your mind are the choices.” (Male, animation director)
- “Because this game is powered by a language model, and language express everything, this game brings high freedom for players.” (Male, CEO of a technology company)

Players with previous gaming experience are aware of the player freedom brought by the AI agent, but the ones who have not noticed the difference still enjoy the experience.

In the future research, we will do semantic analysis based on the data to see what and how would people write with an AI agent under a narrative context, and how will that help in further human-AI interaction works.

From the Mothers' Movement to *Cradlr*: An Interaction Design for Refugee Children

Jing Zhou

Monmouth University
New Jersey, USA
jzstudio@yahoo.com

Abstract

This poster presents the rationale, implementation, social and cultural influences, and historical background of *Cradlr: An Interaction Design for Refugee Children*, a human-centered digital network concept designed to keep displaced children—one of the most vulnerable groups who doesn't have cell phones—connected with their families, resources, and heritage. Inspired by the Mothers' Movement in China—a women's movement rescued and educated 30,000 refugee children—and European countries during World War II, this project goes beyond the realm of digital product design in an attempt to find a humanitarian solution for a complex social challenge. It envisions a global network preserving a collective memory that might help displaced children to overcome many adversities and receive more love and brighter futures.

Keywords

Interaction Design, Website, User Interface, User Experience, Mobile Application, Human-centered, Refugee Children, Mothers' Movement, China

Introduction

The seed of the *Cradlr* project was sown in 2018 when I initiated the *Jiang Jian* project—a research and web design initiative that sheds light upon the forgotten stories of Jiang Jian (蒋鉴) and the Mothers' Movement in China during the Second Sino-Japanese War (1937-1945). Supported mainly by donations, the Mothers' Movement rescued and educated 30,000 displaced children during the war. This inspired me to question and learn how European countries protected and rescued children in World War II, such as the large-scale evacuations of children in the United Kingdom and its Women's Voluntary Service (WVS). Through research, I discovered that no digital platforms have hitherto been established for displaced children—one of the most vulnerable groups who doesn't own mobile phones, while 93% of all refugees live in areas covered by mobile networks based on the 2016 UNHCR/Accenture study. Since then, the inception of *Cradlr* began to sprout.

According to the United Nations, the growing global refugee crisis in the recent decade has reached a staggering height and over half of this population are under the age of 18. Lining up incidences from different regions and eras while serving as a university representative to the United Nations Academic Impact (UNAI), I was devastated to observe the ineffable human suffering in refugees happened in history was still taking place today. Although incapable of stopping ongoing wars and adversities, I hope to help displaced children worldwide by envisioning an unprecedented digital network system that transcends political boundaries and connects various parties to rescue and nurture young lives collectively.

The Jiang Jian Project

The Argentinian writer Jorge Luis Borges once stated that one must believe that whatever happened to him or her was an instrument; everything has been given for an end. [1] I learned Jiang Jian's story in my childhood from my grandparents, who knew Jiang personally (Figure 1). Little did I know that I would later spend two years engaging in the research necessary to design the *Jiang Jian* website that tells the forgotten story of this extraordinary woman—the “Chinese Nightingale”, “Mother of Wounded Warriors,” and “Mother of Refugee Children” who passed away as a nonpartisan at age 38 in 1940.

Figure 1: Jiang Jian's portrait taken between 1938 and 1940. Photographer unknown.

While the Chinese version of this website jiangjianz.com powered by WordPress aims at achieving an effective information architecture with visual clarity to carry heavier content, the English version jiangjianz.com/eng built in HTML, CSS, JavaScript, and an open-source web framework focuses on bringing a compelling aesthetic experience to the audience. In the English version, the body text has been shortened to one third comparing with the Chinese version to reduce the noise level and make the main story more prominent [2]. This design approach of full-screen immersive design with slow subtle motion reserves enough space for early 20th century photographs and dynamic graphical elements, which reflect Jiang's cultural heritage and elicit a warm nostalgia atmosphere with a gentle touch of melancholy. (Figure 2)

Figure 2: The homepages of the English version (left) and the Chinese version (right) of the *Jiang Jian* website. Screenshots and design © Jing Zhou.

today and create *Cradlr: An Interaction Design for Refugee Children*. From 1938 to 1946, 30,000 refugee children were rescued and educated throughout China, Hong Kong, and Southeast Asia organized by the Chinese Wartime Refugee Children's Relief and Education Association supported mainly by donations. After World War II, unfortunately, the Mothers' Movement has been overlooked for half a century due to the Chinese Civil War followed by decades of political turmoil and unrest. Unfortunately, no studies in English are hitherto available. Celebrating the 80th anniversary of Jiang Jian's death, this website was launched in 2020 and dedicated one page to the Chinese Mothers' Movement in hopes of deepening our understanding of common human experiences and stimulating social change for generations to come.

The Cradlr Project

Enlightened by Jiang Jian's story and the Mothers' Movement, I was curious about how European countries rescued and protected displaced children in World War II. What would people do to ameliorate catastrophic situations, if digital aids were available then? Through user experience research and studying countries such as the United Kingdom, some social patterns gradually unveiled and the ideation of *Cradlr* came to fruition in mid-2020 during the COVID-19 pandemic when millions of displaced people struggled to survive. After examining recent digital tools produced for refugees, I discovered that no digital platforms have been built for displaced children. Not only do they need opportunities to grow and receive education, but also have connections to their families, resources, and heritage. For this very reason, it is crucial to weave a tapestry of collective memories for displaced children by their guardians. Therefore, I believed that creating this project was a meaningful and feasible approach in search of new ways to help this vulnerable population who doesn't own mobile devices (Figure 3).

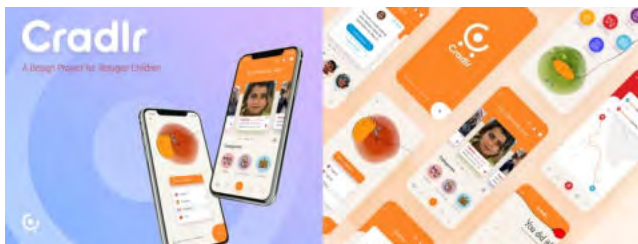

Figure 3: The cover image (left) and display image (right) of *Cradlr: An Interaction Design for Refugee Children*, 2020. Design © Jing Zhou.

Good design starts with an understanding of psychology and technology.[3] To achieve human-centered design (HCD), a comprehensive study is an inevitable process to understand “human needs, capabilities, and behavior” before designing. After research, I spent over two months during the pandemic lockdowns to complete the preliminary case study and the designs (the sample document http://www.jingzhoustudio.net/projects/cradlr/JingZhou_Cradlr-Evidence-1.pdf), from mission statement to brand illustration, from user analysis to interface design, and finally the project presentation and a three-minute video introduction (vimeo.com/465617976). The preliminary case study unveils the rationale and solutions behind each step of this project. Although I didn't have the access to interview current refugees and carry out user surveys in the initial stages of the project, I instead analyzed historical evidence and existing interviews of both current and past refugees from various media. This step provided direct

branding and illustration, the full design for the Cradlr Global Network should consist of a website and a mobile app. Because of time constraints, I decided to focus on the app prototype for the primary users—families, teachers, and foster families. Multiple digital tools—Adobe XD, Photoshop, Illustrator, Photoshop Sketch, InDesign—were used to render the designs and illustrations. To further develop this design and improve user flow, I would like to conduct usability testing, more iterations, and additional research on specific features of this digital platform in the next step. It is a great honor that *Cradlr* later became a United Nations Academic Impact (UNAI) project at Monmouth University.

Conclusion

The creative journey and design process presented in this poster were influenced by various aspects from both the past and present. The renowned scholar Abraham Joshua Heschel pointed out that the authentic individual is neither an end nor a beginning but a link between ages, both memory and expectation. [4] On the one hand, through the *Jiang Jian* project, I inquired, inherited, and examined the history, but on the other hand, learning from my findings, I questioned, explored, and envisioned a solution for an ongoing social challenge in the *Cradlr* project. What stands behind the first project is the unwavering passion and compassion fused by the Mothers' Movement; what emerges from the second one is a meaningful transformation of that energy using digital means. As design and technology continuously evolve and reshape our culture, the two projects presented here were created using different digital media yet linked by one single thread—the universal love and reverence for life shared by many.

Mapping for the Future: The Challenge of Preserving Digital Literatures in Latin America

Carolina Zúñiga Vásquez

Laboratorio Digital Universidad Diego Portales

Santiago, Chile

carolina.zuniga@udp.cl

Abstract

Innovation has become the key to understanding the functioning of contemporary capitalism, where "the new" is at the center of the productive model. Digital technologies are constantly updated, making obsolete and disposable all those products that are not able to adjust to the model of hyper productivity and competitiveness, which also includes ideas and cultural productions. How does this condition affect digital arts, digital literature? How to preserve works marked by the constant threat of technological obsolescence? How to build an archive of them, whose very principle, which is remaining, goes against the constant movement of the new, present in informational capitalism?

The construction of the Cartography of Latin American Digital Literature project was born in response to these questions, presenting an interactive map to account for a compilation of 200 literary works created for digital media and composed with code language by authors from Argentina, Peru, Chile, Colombia, Ecuador, Uruguay, Venezuela and Mexico in the last 30 years. The project was carried out in collaboration with the "Atlas of Brazilian digital literature" with about 150 works compiled by Rejane Rocha, a researcher at the Federal University of San Carlos in Brazil.

The cartography is navigated by different variables that relate genre classifications, formats and characteristics of digital literary works in the region, taking the same language of the web to create an interactive and scalable experience -to which new works can be added-, where the traditional boundaries of a political map fade away. In addition, this visualization is linked to a repository, which, as a digital library, contains an information sheet for each work, folders with images, navigation videos, interviews with authors, and technical documentation.

Figure 1. Information sheet example at "Cartografía de la literatura digital latinoamericana" <https://www.cartografiadigital.cl/>. The information sheet depicts "IP poetry" of Argentinian author Gustavo Romano.

In order to carry out the research, other digital literature repositories belonging to different countries and institutions, both Latin American and American and European, were consulted, in addition to researching the authors' personal sites and academic compilations such as ELMCIP, CELL Project, Electronic Literature Collection, Literatura Electrónica Hispánica, CIBERIA, Editorial Centro de Cultura Digital, Cultura Digital Chile, Broken English, among others.

In the compilation process that initiated in 2018, many works had begun to disappear from the Internet, or had stopped working partially or completely as a result of updates, such as the case of the

Flash software removed from browsers at the end of 2020, affecting an important part of the interactive literary works of the first decade of the 21st century.

What is archived when a work of digital literature is archived? We wonder about the root of the act of archiving when the document that challenges us to safeguard it does not have a fixed format, is constantly threatened by technological obsolescence and its activation is determined by a user. This project seeks to account for the different layers of complexity that this kind of research can have, which in our case crosses literature, technology, archive, digital media and creative processes. Furthermore, our intention is also to connect the experience of artists with the users of this preservation platform to consider the idea of an archive as a living and updatable format.

Preserving and archiving today is an act of resistance in the face of technological obsolescence, where everything is born destined to be lost and forgotten. Perhaps the point is to understand that in digital materiality nothing is finished, but rather a process in development.

LONG PAPERS

“Always Only Once:” The paradox of preserving performative digital works

Amy Alexander

University of California, San Diego
La Jolla, California, USA
ajalexander@ucsd.edu

Abstract

The 20th century saw various approaches to expanded cinema performance, including color organs and mixed media “psychedelic” light shows. These practices were difficult to document technically and were, to various extents, based on performance in the moment. Technically, archival 20th century visual performance documentation and preservation ranges from the non-existent to the surprisingly future proofed. But expanded cinema historian William Moritz summed up the unrepeatability of performance experience in a 1969 review of the mixed media performance ensemble Single Wing Turquoise Bird: “always only once.” Contemporary performative digital practice shares some parallels with these earlier performative practices: the work may be performed live by a performer, or an algorithm may perform the work automatically. In either case, preservation faces the paradox of recreating moments that were intended to happen “always only once.” Examining 20th century attempts to preserve the ephemeral can inform not only how we approach preservation of performative and process-based digital works, but also which works we attempt to preserve.

Keywords

Digital preservation, digital archiving, expanded cinema, digital performance, algorithmic art, light shows, color organs, live coding, networked art

From Object to Algorithm

A problem frequently arises in digital media art curation and preservation: the presumption that artworks are tangible, or at least static, is at odds with the realities of computational media practices. The contradiction was evident by the mid-to-late 1990s, at the point when the concept of net art (then often known as “web art”) first began to take hold. But, historically, when “new media” first emerge, they typically imitate the forms of their predecessors: early photography imitated painting; early cinema imitated theatre. Early “web art” was still popularly perceived as the placing of art objects – paintings, sculptures, photos, etc. – on the internet.

But net artists like Olia Lialina were already working beyond such assumptions; they were working with the form of the internet. Lialina’s 1996 “My Boyfriend Came Back from the War” was interactive and dynamic. [1] And it implicitly proposed a cinematic language specific to net art, using browser frames and space as narrative elements. The “art object” of “My Boyfriend Came Back from the War” was not an image: it was HTML code, written in dialogue with the rendering capabilities of 1996 browsers. As a dynamic, code-based work, “My Boyfriend Came Back from the War” presents different issues for exhibition and preservation than a static work. Perhaps not coincidentally, Lialina has gone on to become a prominent figure in pushing the thinking about preserving net-based works.

Yet “My Boyfriend Came Back from the War” in some ways still functions as an object. The code is self-contained and complete; it does not access external data or run any generative processes. The files are static data and HTML code; they are not executable. As a result, the archival issues are more about the display – the foreground – than the processes taking place in the background. This is something of an oversimplification. In fact, Lialina’s digital

Figure 1 – Olia Lialina, “My Boyfriend Came Back from the War,” 1996. Image courtesy Olia Lialina.

preservation work has often emphasized historical digital and exhibition context, including the ability of later browsers to properly interpret earlier HTML code like that in “My Boyfriend Came Back from the War.” But these computational concerns still focus primarily on the display, versus the generation of the content itself.

But by the mid-1990s, process-based net-based art was also being created. My first net art piece, “The Multi-Cultural Recycler,” was a generative work based on my semi-ironic prediction of a near future web celebrity phenomenon. [2] My prediction, and the Recycler, were based on the growing popularity of early webcams; it would be almost ten years before YouTube launched. The project’s title is a pun on the early web’s awkward attempts at multi-culturalism – which were basically cultural homogenization – and the popular 90s phenomenon of cultural recycling.

The Multi-Cultural Recycler allowed users to choose live webcam images and recycle them into kitschy artworks. It ran server-side software that downloaded two to three live images from a continuously updated selection of internet webcams, then ran custom image processing routines that would generate collaged kitschy images.

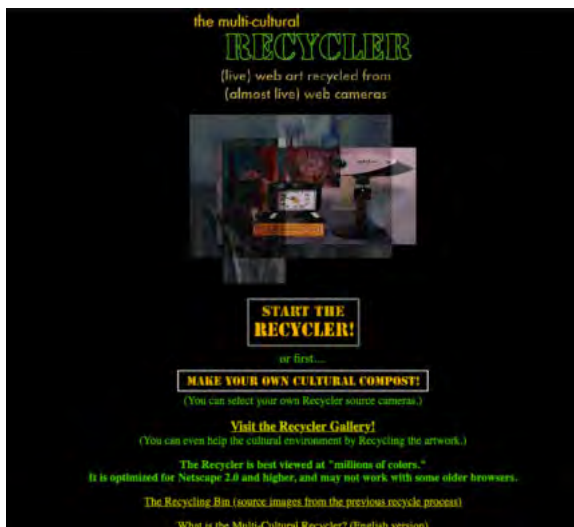

Figure 2 - "The Multi-Cultural Recycler," ca. 1997

The Recycler was always performing and always changing. This made preservation quite a challenge. I have the project documented with screenshots of various pages and images generated by the project on a handful of days. I also have a screen-capture video that I made in the late 90’s to document the navigation. But the video, like the screenshots, shows the site on a certain day and time in the 1990s. There’s no adequate way of archiving something that ran and changed

¹ The connections between Happenings and John Cage scores run deeper than mere similarity. An event organized by John Cage at Black Mountain College in 1952 featured several unrelated

performances by various artists that occurred in structured time brackets, sometimes simultaneously. The event is often considered by historians to be a direct predecessor to Happenings.

continuously over nearly twenty years. It’s durational and performative. The Recycler is no longer running. Ironically, although we usually worry about software obsolescence when we talk about digital preservation, it was the physical vulnerability of objects that did the Multi-Cultural Recycler in. It finally stopped running live in late 2015, when both the main server and backup servers were destroyed in a plumbing flood. So just like any artwork, digital artworks are vulnerable to their own physical fragility.

But net art performativity and process weren’t actually new in the 1990s. Networked art was performative as far back as 1980. “A Hole in Space,” by Los Angeles artists Kit Galloway and Sherry Rabinowitz, used satellite networks to transmit video, long before the days of webcams and video chat – or even public access to the internet. [3] The project transmitted and displayed life size video images of visitors at Lincoln Center in New York into a department store window in Los Angeles. Simultaneously, it displayed life size video images of visitors at the store window in Los Angeles to their counterparts at Lincoln Center.

The artistic focus of “A Hole in Space” was not the transmission of the images themselves, but the social interactions that happened over time across the network between people thousands of miles apart. If we think about the nature of networks as conduits across which things flow, it makes sense that duration and performativity would be more or less native to networked art.

“A Hole in Space” has unusually thorough video documentation for its day: some video was recorded by local news crews; other footage was created by the artists and their associates. So, video documents this particular work of performative early net art. But video cannot archive or preserve the event. It happened only once.

Performative and artistic interventions may seem to fit naturally with electronically networked art, but of course they didn’t start there. Surrealist performances and Hugo Ball’s Cabaret Voltaire are recognized as early 20th century performance art precursors. [4] “Happenings,” launched by Allan Kaprow and others in the 1950s and 60s, were performance art interventions, usually intervening into public space. These events were generally scripted, with both artists and members of the public given instructions of what to do when. The performances were part theatre, and, like a John Cage score,¹ part instructional algorithm set into motion. In the case of the Happenings, what was ultimately important were the social outcomes that took place in the space of the social network between the participants. By the late 1960s and early 70s, the term “Happening” was used colloquially in the US as a general term to refer to the energy of free-flowing social interactions.

performances by various artists that occurred in structured time brackets, sometimes simultaneously. The event is often considered by historians to be a direct predecessor to Happenings.

As we think about archiving contemporary digital performance practices, we have a few problems to consider. Figure 3 shows the live coding group Reggaetron performing at an Algorave. [5] An algorave is a live coding event inspired by raves. At an algorave, attendees dance, party, drink, etc., to the sound and image of algorithmic music being coded live. The photo depicts performers, the performance, and the crowd. And importantly – the process: live coding. We can't experience the process directly because it's the artists' creative process. We experience its representation – its documentation – in what we see on screen and what we hear. At the performance, we experience this representation in real time as the performer creates it. In documentation, it's past tense.

Figure 3 - RGGTRN at International Conference on Live Coding, 2017. Image courtesy RGGTRN. Credit: Tatiana Durán.

But the crowd is important in the photo too; it suggests all that the image can't communicate. What about the event? The social interaction? The Happening? The Rave? You can try to take crowd video that captures the energy. But the Happening can only be represented – in the form of images and sound.

Live algorithmic performance doesn't just refer to live human performers, however. Algorithms are processes, which, once launched by their human creators, can continue to perform over time indefinitely. For example, in my recent project, "What the Robot Saw," algorithms continually curate newly uploaded videos from YouTube that have very few subscribers or views. [6] These are videos that search and recommendation algorithms often render invisible – so they might be seen only by online robots. Algorithms then edit, crop and sequence the curated videos into a collaged, livestreamed film. When human speakers (aka "talking heads") appear onscreen, "What the Robot Saw" labels them using Amazon Rekognition's marketing-oriented, neural net-based face analysis algorithms, which aim to determine demographic and emotion data.

Figure 4 - Still from "What the Robot Saw," 2020

The resulting algorithmic stream runs endlessly, and it's always in the moment. It's an endless performance: the algorithms are the performers. What to do about archiving that? You can document segments, but as with the Multi-Cultural Recycler, they are just snapshots in time. But performance – especially with time-sensitive elements like recent videos – is always in the moment. Archives will always be representations of an ever-receding past.

How can we think about this? Let's look to the past for guidance. Liquid light shows were a type of visual performance that mainly took place in the late 1960s. These were mixed media projections that were performed at concerts and other events. The events sometimes tied in with LSD experimentation and other deliberate attempts at conscious altering experiences. Light show ensembles projected combinations of films, slides, strobing colored gels, and colored oils onto the screen.

The Los Angeles light show ensemble, Single Wing Turquoise Bird were known for their intensely collaborative, multilayered projections. A high level of improvisational, intuitive collaboration between members was necessary for the individual performers to create a cohesive whole with one another's projections and with the music. The ensemble performed at a range of events from rock concerts to collaborations with avant-garde musicians.

Always Only Once

Some of the writing from the time of Single Wing Turquoise Bird's performances can be useful toward thinking about current questions of performance preservation. Gene Youngblood wrote in his 1970 book, *Expanded Cinema*: "Unlike other light artists, The Single Wing Turquoise Bird has no definite program; each presentation evolves from the interacting egos of the group working in harmony. What we see cannot be called a work of art as traditionally conceived: a unique, perishable, nonreplaceable entity reflecting the talents of an individual. They don't produce an object in the sense that a movie is an object; they produce software, not hardware." [7]

Film historian William Moritz reviewed one of the group's performances in 1969 for Los Angeles's *Weekly Planet*. After describing the various visual elements of the show, Moritz, adopting a Gertrude Stein-like syntax, wrote: "These words are not telling it all because it is a 1960s thing and most English words are a 14th or 16th century thing and if Single Wing Turquoise Bird could be writing it they would be writing it, but they are showing it and always only once because Friday January 17, 1969 was not like Saturday January 18, 1969, even though many things about them seemed to be being the same and if you did not see Friday January 17, 1969 when it happened you will not have a chance now because it was living not writing and this is just writing you are doing now...." [8]

Moritz's "always only once" might be a good approach to how we think about archiving of contemporary media performance as well. The "happening" can be represented and documented, but never really archived or preserved. And from a practical perspective, it can be quite difficult to capture good sound and image in a live audiovisual performance setting with the type of inexpensive setup available to most non-commercial performing artists. It might be tempting to give up. But the problem is, historicization depends on documentation.

Single Wing Turquoise Bird was a real light show. But the images (Figures 5 and 6) are from a Hollywood film. In the late 1960's, Hollywood director James Bridges attended some of Single Wing Turquoise Bird's performances, having learned about the ensemble from the painter Sam Francis, who was a patron of the ensemble. [9] When Bridges co-wrote and directed the 1970 feature, "The Baby Maker," he included a scene that takes place at a light show, with Single Wing Turquoise Bird performing and appearing as the light show ensemble.

Figure 5 - Still from Single Wing Turquoise Bird performance in the 1970 National General Pictures film, *The Baby Maker*. Photo courtesy Michael Scroggins.

Creating film documentation of their visual performance was impossible for Single Wing Turquoise Bird themselves. Pointing an available 1960s movie camera at a projection screen would not have produced a satisfactory result. For "The Baby Maker," the movie production company worked with the light show members to shoot and composite layers of their performance, producing a high-quality clip that was inserted into the film. Since the ensemble appears in the film performing their visuals, the scene in which they appear also serves as documentation of the performance itself, albeit fictionalized.

Figure 6 - Still from Single Wing Turquoise Bird performance in the 1970 National General Pictures film, *The Baby Maker*. Photo courtesy Michael Scroggins.

Single Wing Turquoise Bird were a highly regarded light show that received significant critical attention during the period they were active. But they are also one of the few 60s light shows for which there is adequate documentation for historians to view and analyze. This has likely helped them to become better historicized over the years than some of their peer light shows who lack strong documentation.

The existence of Single Wing Turquoise Bird's documentation is due in part to luck. Although they were clearly a prominent light show, they were also in the right place – Los Angeles – at the right time and with the right connections to appear in a film. But we also understand that the film is just documentation at best. As Youngblood and Moritz's texts point out, the light shows were "always only once" and could never be preserved. Anything performative never can be.

Sixties light shows were a form of "expanded cinema," a term coined in 1966 by the American experimental filmmaker Stan VanDerBeek. Gene Youngblood went on to make the term "expanded cinema" famous in 1970 with his book by the same name, which I have mentioned previously. Youngblood's book, which was influential in establishing the field of media arts, proposed that cinema had expanded beyond film to incorporate television, video art and computer art.

Despite the term's 1960s origins, broad views of expanded cinema can encompass earlier forms of non-

narrative moving image, often invented by independent artists, inventors, and tinkerers. Contemporary practices we've been discussing, like live coding, live audiovisual performance, and algorithmically generated cinema can also be considered expanded cinema performative practices.

Now that we've looked at some of the issues around documenting 1960s liquid light shows, let's consider some even earlier cases of expanded cinema performance documentation practices. Histories of modern visual performance often begin with the color organ. Color organs comprise a broad category of visual instruments that have taken various forms. However, most involve some sort of a machine that is designed to be performed with a keyboard, but which produces colored light instead of pitched musical sounds.

Credit for the first color organ usually goes to Father Louis-Bertrand Castel's 1700s invention, the ocular harpsichord, which generated colored light using candles. Various color organs were developed over the next two hundred years, but development became more active in the early 1900s when access to electricity became more widespread.

One twentieth century color organ inventor was Mary Hallock Greenewalt. Greenewalt was born in Syria but moved to the US as a child, where she lived most of her life in Philadelphia. Greenewalt trained as a classical pianist, then decided to devote herself to development of the art of performing colored light. Greenewalt named the performance instruments she invented – the color organs

Figure 7 - Mary Hallock Greenewalt, half-length portrait, at electric light "color organ", which she invented, 1925, Underwood & Underwood. Library of Congress, Prints & Photographs Division, LC-USZ62-93477.

² After World War II, Wilfred developed several larger, self-playing Lumia systems as museum and commercial commissions. Yale University Art Gallery restored several of these for a 2017

themselves – “Sarabet,” after her mother. She called the art of color light play that she was developing, “Nourathar.”

Greenewalt's contemporary and rival color organ developer Thomas Wilfred was born in Denmark and spent most of his life in New York City. Like Greenewalt, he gave the art of color-light performance he developed a name distinct from that of his color organ inventions. He referred to his color organ as the “Clavilux,” and he referred to the art of color light play that he developed as “Lumia.”

Wilfred has been better historicized over the years than Greenewalt. Although Greenewalt's work has received increased attention in the past few years, up until recently it was difficult to find much written about her work at all. Although both Greenewalt and Wilfred presented and performed publicly, Wilfred has been cited within visual performance histories far more consistently than Greenewalt.

Wilfred received attention from the contemporary art world during his lifetime, which Greenewalt did not. As a result, Wilfred received more substantive press attention than Greenewalt, who was typically treated as a novelty performer in press reviews. So, it is easy to see why Wilfred's work would be treated differently by historians. But it is difficult to discern how much of the difference in their access to performance venues and critical attention during their lifetimes derived from their work vs. personal attributes like gender and demeanor.

There may be another factor that facilitates discussion of Wilfred's work by a larger number of contemporary historians. Like Single Wing Turquoise Bird, Wilfred's work benefits from fortuitous documentation beyond what would have ordinarily been available at the time. Wilfred, Greenewalt, and most other color organ inventors continually tried to figure out ways to make a living from their work. Wilfred had tried both exhibiting his Clavilux in the art world and performing it in the music world. Eventually, he had an idea to develop a home version of Clavilux he could sell to consumers. This version would play automatically, rather than having need for a performer. Wilfred called this system the Clavilux Junior.

The Clavilux Junior operated through the use of hand painted glass records, each with an opus number. Light was projected through the records, reflected off various surfaces within the machine, and eventually projected onto the screen. The user could use the keyboard to make various adjustments to the light as the records played.

There are several Clavilux Juniors known to still be extant, mostly in private collections. Those that are operational can play their glass records, so the units can be exhibited as video sculptures in contemporary exhibitions.² In addition, their screens can be recorded with modern video

exhibition. Yale has produced high quality video documentation of the output of these later systems. As with Clavilux Junior documentation, the Yale documentation is available online. [12]

equipment. So, Wilfred’s original 1930’s time-based light works are now documented in contemporary high-definition video.

Operating the Clavilux Junior machine ninety years later recreates the original “algorithmic” performance, rather than merely representing it. The marks painted on the glass disks function as executable software code that generates time-based visuals – and the software can still be run. So, we find ourselves able to view contemporary high-definition video documentation of generative work from the 1930s. Doing so feels like time travel.

Figure 8 - *Thomas Wilfred at Clavilux Keyboard*, ca.1930. Image: Thomas Wilfred Papers (MS 1375). Manuscripts and Archives, Yale University Library.

Clearly, the success of this approach emanates from the fact that Clavilux Junior was a self-contained hardware system that was produced in some quantity and distributed to people in various geographic locations, providing redundancy against loss or damage of individual units. That said, Clavilux Junior’s painted records are essentially rare software disks recorded on very fragile media: it’s fortunate that a number of the glass records have survived. In any case, Clavilux Junior shows us the advantages of keeping our eyes open to the possibility of time travel.

There’s comparatively little visual documentation of Mary Hallock Greenewalt’s Sarabet output. I am not aware of an extant, functioning Sarabet that can generate the work, and there’s also little photographic documentation from the time. But there is a great deal of documentation of Greenewalt’s process. She gave lectures and performances,

and those were reviewed in newspapers. But she also did an extensive amount of self-archiving. As her papers reveal, during her career she continually seemed to feel she was not receiving the credit she deserved for her inventions. Apparently for this reason, she saved and often annotated a vast quantity of materials documenting and discussing her work. She continued this self-archiving over the course of her career. In 1936, she began donating the materials from her archive to the Historical Society of Pennsylvania. She continued these donations until 1949, a year before her death. [10]

Figure 9 - Handwritten note, Mary Hallock Greenewalt, *Mary Elizabeth Hallock Greenewalt papers* [0867]. Describes a scrapbook within her archives. Photo by the author. Reproduced with permission from the Historical Society of Pennsylvania.

The Historical Society of Philadelphia’s *Mary Hallock Greenewalt papers* collection contains thirty-five boxes, which the public can request to review a few boxes at a time. The boxes contain thousands of pieces of paper that historicize Greenewalt’s practice and research: newspaper press clippings, technical diagrams, lecture notes, jotted ideas, letters to vendors, notes from the many times she challenged what she felt were infringements on her intellectual property. While being able to operate and document Wilfred’s Clavilux Junior has value, there is something in the vastness of Mary Hallock Greenewalt’s archive – the obsessive performance of self-archiving – that archives Hallock Greenewalt’s work in a way no machine, nor film of a performance, could do.

That Greenewalt’s archive is preserved at Historical Society of Pennsylvania is no doubt fortunate; one guesses that the materials likely would have otherwise been destroyed. But with the archive housed in boxes in Philadelphia, the materials are invisible to most of the world. So, over the past several years, I’ve been endeavoring to make them more visible. I periodically travel to Philadelphia and photograph as many items in the Historical Society archive as possible. I then post the images in a public online archive I call the Mary Hallock Greenewalt Visibility

Project. [11] The visibility project itself is in some ways performative: the posting of the multitude of images mirrors Greenewalt's performative, almost compulsive compilation of the vast archive that documents her process in a way she knew nobody else would.

Figure 10 - Partial screenshot of Flickr "Photostream" view of Mary Hallock Greenewalt Visibility Project website.

Part of my process involves displaying lengthy streams of unlabeled images, to document the extensiveness and eclectic nature of Greenewalt's archive. But I also organize the items using keyword tags, so that the public can discover new connections and networks between the many disparate items in the archive. My database is very crude and incomplete; it is limited by time and resources. But the act of producing an online archive of scrap clippings compiled by an artist who died in 1950 always feels to me like another act of time travel. As with Wilfred's *Clavilux Junior*, I think it's always useful to look for these less obvious opportunities to connect preservation and historicization of the present to the work of the past.

Lessons of the Past

What might we learn from these past expanded cinema practices that can be useful in thinking about archiving of process-based computational work?

"Always only once."

Although a half century of consumer recording technology might confuse us into thinking otherwise, reflecting on William Moritz's description of the unrecordable, performative and social energy of *Single Wing Turquoise Bird's* events should give us some clarity. We can consider the failures of adequately preserving processes,

performance and happenings a success.

But don't let the "always only once" paradox of preservation stop us from documenting and historicizing.

We can consider how alternate forms of documentation and archiving can function to represent practices for which the process is more important than the display.

Alternate approaches can be especially important in increasing visibility of historical and contemporary practices that might otherwise be overlooked.

Considering how visibility impacts history, we can try to think proactively – and retroactively – about how we can make hidden histories more publicly visible. Are/were groups underrepresented within their practices also underrepresented in access to traditional forms of documentation and archiving?

We can consider an artist's attempts to historicize their practice as an archived work in itself.

The performance of archiving may be as significant as the archive that's created. Broadening our thinking about what constitutes an archive, as well as ambiguity between practice and archive, can allow us to broaden our recording and understanding of the histories with which we engage. Always look for opportunities for time travel.

Author Biography

Amy Alexander has been making computational` art projects since the 1990s. She is a Professor of Computing in the Arts in the Visual Arts Department at UC San Diego. Alexander has worked in performance art, installation, software, and online media, generally employing custom software to generate real-time video that reflects on cultural issues. She has written and lectured on topics including software art, historical and contemporary audiovisual performance, algorithmic bias and algorithmic determinism, and media preservation. She has served as a reviewer for festivals and commissions for new media art and computer music.

Alexander's projects have been performed and exhibited at venues ranging from The Whitney Museum, Prix Ars Electronica, Transmediale, SIGGRAPH, ISEA, NIME, and the New Museum to club performances at Sonar (Barcelona), First Avenue (Minneapolis) and Melkweg (Amsterdam). She has also performed on the streets of Los Angeles, San Diego, San Jose, Zürich, and Aberdeen, Scotland.

Stayin' Alive. Southern Cone Video Art Archives in Context

Alejandra Crescentino

Universidad Autónoma de Madrid

Madrid, Spain

alejandra.crescentino@uam.es

Abstract

This presentation addresses some problems affecting physical and digital archives dedicated to video art in the Southern Cone, relating to matters of accessibility, preservation and dissemination of video-based art collections in the present. In an attempt to map such a complex situation, firstly, I look at some of the most relevant Latin American video art festivals. I take as case studies the Encuentros Latinoamericanos de Video, the Festivales Franco-Chilenos and Franco Latinoamericanos de video arte, VideoBrasil and Buenos Aires Video, which promoted the production, circulation and dissemination of audiovisual arts in the last two decades of the 20th century and, alongside, fostered the creation of physical archives or video libraries in the region. Secondly, I identify some institutional and academic projects that, since the mid-2000s, have carried out tasks of valorization and remediation of video-based art collections. Actions through which it has been possible to give visibility, accessibility and survival to some video art works, and documentation related to the above-mentioned festivals. Finally, under the premise of problematizing the initiatives that safeguard this audiovisual culture and its difficulties to endurance, I point out common challenges to audiovisual archives in the present, and the answers articulated by some research projects to face them

Keywords

Video Art, Video Art Festivals, Audiovisual Archives, Obsolescence, Remediation Projects, Southern Cone.

Introduction

The purpose of this presentation is to reflect on some challenges affecting physical and digital archives dedicated to video art in the Southern Cone in the present. In order to give rise to this discussion, I will refer to some relevant Latin American video art festivals that fostered the production, circulation and dissemination of audiovisual arts in the last two decades of the twentieth century and, alongside, fostered the creation of physical archives or video libraries in the region. Secondly, I will explain some institutional and academic projects that, since the middle of the year 2000, have carried out tasks of valorization and remediation of video-based art collections

Regarding methodological aspects, this approach is based on classical sources (bibliographic and documentary) and electronic sources (websites, databases, online archives, research project platforms, etc.). Likewise, Documentary Resources Centers and Archives in Chile, Argentina and Spain have been personally consulted. The unfeasibility of completing a comprehensive study of all the institutions and archives dedicated to video art in the Southern Cone, it made necessary to establish a cut that would allow a more concrete approach to the subject. To this end, we focused on some archives and projects linked to five pioneer video art festivals in the region: the Encuentros Latinoamericanos de Video, Festivales Franco-Chilenos and Franco-Latinoamericanos de Video, VideoBrasil and Buenos Aires Video.

The examined academic-institutional projects propose possible ways to remediate and give visibility to video based-arts and physical archives related to those festivals.

In relation to the general frame of reference, the theoretical contributions of the New Media field offer conceptual tools that are appropriate for our approach. On the one hand, we ascribe to the notion of remediation proposed by Bolter and Grusin [1], which alludes to the power of digital media to remediate old media through a process of refashioning or transcoding [2]. This argument allows us to conceive of today's institutional digital archives and repositories as refashioned extensions of physical archives and video based-art libraries. After the advent of the digital world, new hypermedia platforms have emerged—some of them with no basis in pre-existing physical spaces—that also operate under this logic: remediating old audiovisual media works and offering hypermedia content.

On the other hand, this approach considers critical and theoretical contributions dedicated to explore the crossings between institutions and new technologies, and the role of these technologies in the dissemination of cultural heritage. Perspectives that address the impact of digitalization and globalization processes in the field of contemporary cultural creation, transforming artistic practices and the material and institutional apparatus in which they are inserted [3],[4].

In relation to the above, Argentine researcher Jorge La Ferla identified several difficulties linked to the absence of

comprehensive collections to trace a memory of the audiovisual arts in Latin America. In his reflections on “Por una praxis de archivo para las artes tecnológicas experimentales en América Latina”, he pointed out very relevant issues regarding the circulation and preservation of audiovisual works. Among them, the scarcity of public and private projects aimed at the creation of panoramic institutional archives in the region. He also alluded to the fundamental role played by some traveling video and experimental film exhibitions in the creation of archives, the theoretical reconstruction and the material recovery of pieces that were thought to be lost. He stressed that, in the absence of consistent public policies for heritage protection in the Southern Cone, some institutions and agents had taken on the task of preserving and updating technological works that would otherwise remain inaccessible. Finally, there was another set of difficulties in relation to existing collections. Among them, the undefined heritage status of the pieces incorporated into the institutions, the fragmentary nature of these heritages and, as a consequence, the difficulty of making interpretative readings of the whole [5], [6]. These observations, made more than a decade ago, constitute a starting point to offer a re-reading of these issues in relation to the Video Art archives of the present.

Festivals and Video Art Archives in the Southern Cone: Legacies of the Past

It is necessary to look back, at events that took place and archives that were created in the past, in order to understand the current state of the institutional physical archives holding videographic works in analogue media.

The use of video as a support and means of artistic creation date back to the early seventies, linked to a few institutions. Among them, the Centro de Artes y Comunicación (CAYC) in Buenos Aires, and the Museu de Arte Contemporânea at the Universidade de São Paulo (MAC-USP), with paradigmatic trajectories in this regard. Both entities provided the artists with porta-pack equipment, thus encouraging experimentation through new technologies. Under the direction of Jorge Glusberg, the CAYC became one of the first institutions in the region to organize international video exhibitions and to promote videographic production. Unfortunately, none of the works exhibited, nor those produced by the CAYC, have survived to the present day. As Alonso emphasizes, this was due to the high cost of these new technologies, which made it difficult to keep backup copies [7]. Under the management of Walter Zanini, the MAC USP also occupied a pioneering role by creating a Video Sector and a room dedicated exclusively to video programming - the Espaço B - in 1977. In recent years, a research project headed by Roberto Moreira S. Cruz addressed the study of this space. During 2020, part of his research was reflected in “VÍdeo_MAC”,

¹ Among others: library of Museo Nacional de Bellas Artes de Chile; the Chilean documentation center CEDOC; the CC Ricardo Rojas Archive of Universidad de Buenos Aires (CCRR-UBA), the

an on line exhibition of great patrimonial and documentary value, since it allowed to know Brazilian productions in this support totally ignored until now [8].

However, beyond these specific examples, video did not achieve a significant presence until the eighties, when some institutions in the Southern Cone held festivals and generated collections dedicated to video art. As La Ferla pointed out, the proliferation of video festivals during this period was a major factor in the creation of audiovisual archives. Likewise, video libraries became highly appreciated as they offered the possibility to consult audiovisual materials in different magnetic or optical formats. In such places, the copies of the works participating in the festivals were juxtaposed with records of activities carried out by the institution and videographic works of international referents.

Of course, video art flourishing coincided with a process of gradual growth in the number of users of the electromagnetic media, closely linked to the expansion of mass media and new technologies by transnational capital. Logically, such circumstances had an impact on the art world, and by the middle of the decade, video-based art had entered — albeit timidly — in various institutional spaces through viewings, conferences and meetings, largely promoted by artists, producers and independent filmmakers. An illustrative case of such convergence is the Encuentro Latinoamericano de Video (1988-1993), promoted by independent producers from all over Latin America. Among the hundreds of associations and collectives at the forefront of these meetings was the Centro de Medios Audiovisuales (CEMA), an Uruguayan production company that stood out for its extensive audiovisual work. For this reason, it became the subject of an academic research project, which will be referred to later in this paper.

Video art also grew as an autonomous artistic discipline, supported by an international circuit specialized on video art. Thanks to the support of foreign financing agencies, especially those of the French and the Spanish Cooperation, numerous festivals, exhibitions and awards were created and organized. These articulations strengthened existing regional ties and stimulated production and reflection on video art in the Southern Cone.

Examples of these initiatives are the Festival Franco-Chileno de Video Arte (1981-1994) and the Festival Franco-Latinoamericano de Video Arte (1992-1996), which were consolidated thanks to the support provided by the French Ministry of Foreign Affairs and the participation of numerous local institutions. For more than a decade, Santiago de Chile was the capital of an event that attracted the attention of its southern neighbours. In the early 1990s, the festival expanded its regional scope to become a multi-site event that spread to Argentina, Uruguay, Brazil and Colombia. As a result projected to the present, each participating institutions¹ formed a partial collection of the

Colombian National Library and the Information Center of Museu da Imagem e do Som (MIS) in São Paulo.

same, safeguarding videographic pieces, vestiges and/or documentary sources.

In Brazil, the precursor in this field was VideoBrasil festival (1983-Present). Celebrated at first at the Museu da Imagem e do Som (MIS), later editions were organized by the Associação Cultural Videobrasil together with the Serviço Social do Comércio (SeSC). Starting in the 1990s, the festival declared the expansion of its sphere of action to the entire geopolitical South and founded the association to house an increasingly broad heritage of documentation, publications and video based-art collections. Thanks to its institutional policy and the direction of Solange Farkas, the task developed by this entity has gained a great value, and is unparalleled by other similar associations within Brazil or in the Southern Cone [9].

Also in the late eighties, the Buenos Aires Video festival (1989-2001) was organized at the Spanish Cultural Center of the Instituto de Cooperación Iberoamericana (ICI-AECID) in Buenos Aires. The first editions, curated by Carlos Trilnick, were held under the exhibition format proposing a local videographic panorama. From the sixth edition onwards, the festival became competitive and included selections from other countries, which stimulated the circulation of Argentine productions in the region. From the very beginning, the institution created a video library with equipment for on-site consultation. Its collection, dedicated to Spanish, Argentine and Latin American video art, was gradually enlarged with the entry of works selected by Buenos Aires Video. However, after the digital shift, both the festival and the video library ended their task, and the latter ceased to be accessible to the public [10]. The advent of digital, networked and globalized culture decisively modified the ways of using and accessing information. With the “passage to the world of screens”, there was a dizzying cultural leap that changed the register of everyday life and mediated life [11]

Thus began a gradual process of institutional computerization, in which computer tools became allies in the documentary management of archives and collections, displacing analog systems and technologies. In the case of video libraries and audiovisual archives, equipped with analog technologies and devices, this transformation led to their deactivation as reference spaces and their consultation materials became “archaeological objects”. Although many institutions have preserved these collections (mostly composed of U-matic, VHS, Betamax, Betacam, among the most popular ones), very few have undertaken a process of digitization.

On the other hand, the digital turn had an impact on the ways of looking at and thinking about the phenomenon of regional video art. There was a shift from the narratives of the national scenes, delineated by events during the eighties and nineties, to the construction of narratives from the local scenes connected and immersed in the global map of the networked world. Some institutions began to post a large amount of content and communicate activities on their institutional websites. Simultaneously, new research projects began to explore the dispersed paths of the art-

technology relationship in the Southern Cone, under a format of associative work between institution and academia.

Due to this interest, a significant number of platforms dedicated to regional video art began to emerge in the mid-2000s. Such hypermedia linked to academic and institutional projects and articulated as online archives or databases, have formulated new readings on Latin American video art. On occasions, they have also been accompanied by exhibition and editorial proposals aimed at giving visibility to works in now extinct formats.

Remediation of the analog past As Bolter and Grusin have pointed out, the search for intermediation runs through the entire history of media development in the West. Immersed in this logic, the new media have expanded this capacity for mediation thanks to their power to incorporate almost all of the previous supports and technologies. To allude to this media agentiality, the authors have proposed to understand the notion of “remediation” as “reform” and as “repair” of other media [12]. Thus, remediation can be understood in two ways. On the one hand, as a form of mediation of a prior media, an intermediation. On the other hand, as a repair, a way of preventing a danger, in this case, the disappearance of works born under formats that become obsolete.

In the case of analogical archives, these “remediation” have been articulated from valuable research projects that rescue from obsolescence or invisibility a part of those audiovisual archives linked to the path of festivals and institutions proposed above. One aspect to be emphasized is that all these developments not only propose the digital remediation of analog audiovisual or documentary contents, but also actions to revitalize these collections through publications, exhibitions, debates and viewings, among other activities.

One of the first to appear was the “U-MATIC” Chilean Audiovisual Heritage Project, headed by documentary filmmaker and researcher Germán Liñero. The initiative explored works made under this format in Chile between the years 1975 and 2000, including productions presented at the Festivales Franco-Chilenos and Franco-Latinoamericanos and the Encuentros Latinoamericanos de Video, among others. The results of this research were articulated in three axes: the materialization of the “U-MATIC Exhibition”, held at the Museo de Arte Contemporáneo of Santiago de Chile in 2005; the publication of the book *Apuntes para una Historia del Video en Chile*, in 2010 [13]; and the creation of a website. The latter (now defunct) exhibited digitized fragments of more than twenty selected audiovisual pieces, and more than four hundred technical files of titles with reviews of their authors.

In 2015, the Chilean and Argentinean collections of the Festivales Franco-Chilenos and Franco-Latinoamericanos revitalized thanks to the donation made by Pascal-Emmanuel Gallet, the French cultural attaché and promoter of the festivals. This legacy generated revisions and a retrospective reflection on the impact of these events on the local scenes. In Chile, it was integrated into the

Documentation Center of the Museo Nacional de Bellas Artes, as part of the 12th Bienal de Artes Mediales celebrations [14]. In Argentina, it joined the Instituto de Investigaciones en Arte y Cultura Dr. Norberto Griffa (IIAC) of the Universidad Tres de Febrero, and resulted in the exhibition “La imagen que desborda: viaje, diario y videoarte” celebrated in 2016 [15]. The exhibition became a unique opportunity to revisit the works and documents that make up the Pascal Gallet Fund and the IIAC Archive, particularly the exchanges of gazes proposed by the video travel diaries in made by French, South American and Baltic artists involved in the aforementioned festivals.

In 2008, another important project was orchestrated to rescue CEMA's U-matic archive in Uruguay. As mentioned before, the Centro de Medios Audiovisuales was a Uruguayan audiovisual production company that developed a significant video production since 1982 and played a very active role in the organization of the Encuentros Latinoamericanos de Video. The team coordinated by researcher Mariel Balás — supported by the Universidad de la República and the Instituto del Cine y el Audiovisual (ICAU) — undertook the digitization of the production company's archive in order to save it from irremediable deterioration. Subsequently, they edited the book “CEMA: Archivo, video y restauración democrática” [16], which covered both the work carried out by this audiovisual collective and the trajectory of the research project.

For its part, the cultural association responsible for the organization of the VideoBrasil festival has focused its efforts on maintaining a physical headquarters to safeguard its collection, composed of thousands of catalogued audiovisual and documentary pieces. Among them, around 1,500 are videographic works that have passed through the festival. The digitization process of this collection began in 2007. At this time, the possibility of publishing them online was considered, although in the end this task was not carried out due to copyright limitations [17]. However, the option to consult the catalog of its institutional website allows access to files that provide a brief synopsis, an image and the details of its participation in VideoBrasil [18]. Likewise, the association has not ceased to promote activities for the re-reading and reactivation of its collection, including exhibitions, publications, artistic and research residencies, among others.

In close connection with the need to give visibility to works shown in events such as Buenos Aires Video, or the Festivales Franco-Chilenos and Franco-Latinos, the ARCA Video Argentino project was born. The initiative emerged in 2008 with the aim of digitally remediating the pieces of a history of Argentine video that addressed the works exhibited in the city of Buenos Aires from the 1980s to the present, and under the desire to extend to the whole country. Coordinated by researcher Mariela Cantú, it had the support and funding of the Universidad Nacional de La Plata and the Argentine Fondo Nacional de las Artes in the different phases of the project [19]. Revamped in 2021, the website embed videos and information from many other online platforms and sites. The collaborative and non-profit nature

of Arca website appeals to the interest of the authors themselves to circulate works which helps to complete the history of Argentinian video art. In this way, it avoids some of the difficulties posed by copyright when it comes to making this content accessible [20].

Although there are many more, the cases presented allow an approximation to initiatives that have proposed to face the challenges involved in the rescue of stories linked to unstable media. Likewise, not all the works and documents published on these platforms have a physical backup, i.e., much of the information published only exists in digital format. On the other hand, the physical collections (partially) digitized and converted into digital archives; facilitate the circulation of works and documentary collections on video art of the Southern Cone. In this sense, both those that have physical support and those that do not, become resistant forms of archive [21] keeping the works alive and making possible to formulate new approaches and narratives about video art in the region.

Video art and archive: a problematic relationship

After this punctual mapping of video art festivals, audiovisual archives and remediation projects, it is possible to point out some problems video art archives have to face. The issues proposed below are not exclusive to analog and digital video art archives in the Southern Cone, but they pose methodological challenges and technical difficulties to researchers interested in studying these corpuses. Regarding each one of these points, some of answers articulated by the referred research projects are pointed out.

Geographical Dispersion. Geographical distance between archives makes the possibilities of consulting audiovisual collections in the Southern Cone scarce or intricate, and makes the approach to local and regional histories a difficult task. Furthermore, while many of the institutions mentioned offer partial online cataloguing records, others do not even provide this information.

Although presented as the better answer, the digital remediation of video-based art and their circulation on various online platforms does not solve this problem. The dispersion of audiovisual content and the difficulty of finding a corpus of works gathered in the same place also exist in the networked world. However, most of the research projects that have online archives also facilitate cross-referencing with other audiovisual platforms and with websites of related or connected projects, an aspect that partially facilitates the exploratory task.

Documentary Gaps in Archives. The criteria for the creation of video art archives and video libraries have not been stable, nor have uniform standards been established for the registration and cataloguing of the pieces incorporated. Audiovisual works usually come together with records of activities and various institutional documents related or not to these works. However, the biggest problem arises when institutions lack records, documentation or copies of the materials edited or produced by the institution itself. A feasible hypothesis about these gaps is that, at the time of

the flourishing of video art, those institutions simply did not contemplate the possibility of implementing systematic documentation and archiving practices on these time-based artistic manifestations. Therefore, the safeguarding of these materials was at the mercy of the involvement and archival skills of those responsible on duty.

Perhaps the only solution to the problems posed by the dispersion and gaps in the archives is to support local research projects, in regular contact with the institutional collections, capable of constructing critical readings and deepening the investigation of these materials in different archives. Only the circulation of multiple projects that propose this type of approach will make possible the articulation of new regional panoramic research.

Status of work and copyright. As a recurrent policy, video art activities and festivals stipulated in their terms & conditions that a copy of the selected work should remain at the disposal of the organizing institution. By participating, the author automatically consented that his or her work could be used for non-commercial cultural purposes, or destined to video libraries. In this way, the collection of these materials grew gradually, according to the success of the events organized. For the institutions, video was easy to exhibit and store, and for the video artists, its inclusion in institutional collections ensured the circulation of their productions. Thus, the pieces presented acted as "works" when screened at the festivals, but then regained their "copy" status in the archive. When the festivals ceased to be held and the video libraries closed their doors to the public, the supports remained in a place of patrimonial lack of definition, sometimes aggravated by gaps in their documentation. In other words, although there is some document that proves that they entered the institution, their condition between movable object, patrimonial work and documentary collection keeps them in a state of undetermined status, and, therefore, any type of audiovisual record for publication would incur in copyright problems.

In this case, the solutions implemented by projects such as ARCA have consisted of becoming open collaborative platforms. Its expansion strategy is based on achieving voluntary assignments, and offering hyperlinks to websites of authors and institutions, which own the copyright of the original works or documentation.

Inaccessibility and Loss of Works in Unstable Media. As long as archives and video libraries remained active, video art works remained alive and continued to be included in multiple proposals. With the digital transformation, the analog technological equipment provided to access the works became obsolete, and the works became inaccessible. As already mentioned, very few archives and institutional video libraries have undertaken the task of digitizing their collections. This has been excused on the grounds of copyright issues and the high costs of digitization for the institutions, and although some authors have undertaken this task individually, other works have been lost or are inaccessible today.

However, there are other important reasons that have

marked this state of affairs, linked to the fickle institutionalization policies in the region and the preservation challenges posed by unstable media-based supports. Video art has traditionally played the outsider's role in museums and cultural spaces. Besides, except for some — genuine or opportunistic — demonstration of interest subject to certain management, there have been created none public policies for specific protection, nor have there been any sustained efforts to enhance the value of these productions.

On the other hand, we start from the premise that both analog and digital supports are unstable, and although their digital remediation would allow extending their endurance, it is necessary to accompany such actions with others that provide them with meaning and ensure different ways of persistence.

In this sense, the work carried out by projects such as "U-MATIC" in Chile, the rescue of the CEMA Archive, or the exhibition "Video_MAC", constitute multidisciplinary research projects that go beyond digital remediation. They open the possibility of generating new readings on collections that would otherwise vanish from the memory of regional art histories. As we have seen throughout this presentation, these efforts favor the study and dissemination of video art works, through the conservation and remediation of historical pieces, the circulation of these investigations and the expansion and reformulation of the genealogies of video art in the Southern Cone

Conclusions

The aim of this presentation was to reflect on the unstable and complex relationships established between video art and archives —analogical and digital— linked to pioneering video art events in the Southern Cone. The cases presented have sought to make these problems tangible and to make visible the need to aspire to an archival praxis that allows for the protection of this audiovisual heritage. The aforementioned research projects show the importance of having funds and archives that make possible the survival of works and documentation on video art production.

In reference to the advent of networked culture and the digital turn, it has been emphasized the positive aspects of the emergence of research projects and audiovisual remediation which have made possible it to articulate new narratives on video art in the region. However, digital platforms —emerged from some of these projects— are also ephemeral, as Mariela Cantú points out the internet is "an accumulation of ruins, links that do not work, replicated information, outdated data" [22].

Supporting and stimulating the development of research in this field is necessary and complements, but does not replace, the responsibility that institutions have taken on in hosting documentary collections and audiovisual works. The institutions that safeguard these collections should promote actions for the endurance of this valuable patrimonial material, articulating joint rescue and research projects that allow the synergy of forces and financing

between cultural and educational institutions. Ultimately, this could be a way to ensure the continuity of the analog and digital past.

Thanks to the action of projects with an academic-institutional base, it has been possible to recover patrimonial works and to reconstruct stories of great value, which constitute an exceptional example of what could and should be done. The value such actions, as many media archaeologists insist, is that it reinscribes the analogical past in the coordinates of the present, and guarantee the institutional commitment to preserve the works and ensure their longevity.

Acknowledgements

This presentation is framed in the R&D project The Publics of Contemporary Art and Visual Culture in Spain. New Forms of Collective Artistic Experience since the 1960s (PID2019-105800GB-I00), directed by Noemi de Haro García and Patricia Mayayo Bost, and funded by the Spanish Ministry of Science and Innovation. In addition, the author of this proposal receive a University Professor Training Grant (FPU/MECD 2016, Ref.16/0331), funded by the Spanish Ministry of Universities, through which develop their doctoral research work directed by María Luisa Ortega Gálvez.

Author Biography

Alejandra Crescentino is a PhD candidate in the Program Artistic, Literary and Cultural Studies (EALyC), and Teaching and Research Personnel in Training (PDIF) in the Department of Linguistics, Modern Languages, Logic and Philosophy of Science, Theory of Literature and Comparative Literature, and East Asian Studies, of the Facultad de Filosofía y Letras, Universidad Autónoma de Madrid.

She obtained a Master's degree in EALyC from the Universidad Autónoma de Madrid in 2016. She graduated with a degree in History of Fine Arts in 2013 and Professor in Art History in 2009 from the Universidad Nacional de Cuyo, Argentina. She is a member of the research group “DeVisiones. Discourses, genealogies and practices in contemporary visual creation”, Universidad Autónoma de Madrid, <https://www.devisiones.com/>

A forgotten, almost lost, and partially hidden piece of history: new media arts in Latin America

Ricardo Dal Farra

Concordia University / CEIARTE-UNTREF
Montreal, Canada / Buenos Aires, Argentina
ricardo.dalfarra@concordia.ca

Abstract

Who tells history? We can find multiple versions of the new media art history, most of them with subtle differences. Still, until a few years ago, it has been unusual to find references pointing to countries out of a small group from Europe and North America. Several projects have been developed to change that situation. UNESCO's Digi-Arts project, and the Latin American Electroacoustic Music Collection, hosted by The Daniel Langlois Foundation for Art, Science and Technology, are examples of the relevant role and the impact that the preservation and documentation of electronic artworks, together with its public access, can play in having another perspective on our recent history.

Keywords

Latin America; new media art preservation; electroacoustic music history; sound art; cultural decentralization; postcolonialism.

Introduction

The journey from the cultural memory and the ethical concerns to the practical strategies on preservation and the impact of disseminating knowledge generated by new media art has been navigating a sinuous road.

Memory's death could benefit some as much as the desire for immortality could block the way to innovation open naturally to new generations. New media art memory has been partially dead, or perhaps deaf or blind or simply looking to the other side, maybe to avoid the perception that the so-called digital revolution has reached most of the known world and that history does not happen only in a few "central" countries. The desire for immortality and for being a cultural lighthouse as much as the guardian of the "right" values and the significant art should not take us all to mislead that intelligence and sensibility belong to a few.

Who tells history? Who knows about it or who has the opportunity to do it? We can find multiple versions about the new media art history, most of them with subtle differences, but it has been unusual -until recently- to find references pointing to countries out of a small group from Europe and North America. Inequalities have always

existed, and if we want to see a change, we will probably need to work hard ourselves to produce new results. Many stories about new media art were lost or are hidden and probably should be part of the official history and not just left aside. There have been people, ideas and concepts, artworks, discoveries and inventions, and we expect someone will take care of keeping the memory of all that for us, but sometimes it simply does not happen, and when we look around after a while, it seems that the history has not been the one we thought it was and we remember, but a different one that is being told by others.

Between the obsession for archiving everything and the difficulty and strong responsibility of deciding what to preserve, the opportunity to archive new media art makes us face a challenge involving technical, political, social, cultural, and economic aspects.

How many histories can be told about the same subject? To whom is their narrative directed? I have heard some educated young people saying that "if something is not on the Internet, it does not exist." Then, today the digital divide could be not linked to who has access to the web but to who dominates the inclusion of content or develop the strategies to keep our attention on certain places and not others. It looks like we are flooded with cues guiding us to consider that the art conceived by some cultures is the only one to be recognized as valid.

Several projects have been developed to change this situation regarding the history of new media art: UNESCO's DigiArts project was a major initiative "aiming at the development of interdisciplinary activities in research, creativity and communication in the field of media arts." [1]

The Daniel Langlois Foundation for Art, Science and Technology in Montreal has been a leading organization heavily focused on studying theoretical aspects related to preserving new media art and actually archiving it. Several meaningful projects have been developed or hosted there since the late 90s, including the Steina and Woody Vasulka Fonds, the 9 Evenings: Theatre and Engineering Fonds, the Collection of Documents Published by E.A.T. and the Latin American Electroacoustic Music Collection, among many others. [2]

UNESCO's Digi-Arts project

According to UNESCO's online portal: "DigiArts is a reference website on art, science and technology and more particularly on media arts and electronic music. It resulted from a period of 6 years (2002-2007) activity undertaken by a team of interdisciplinary professionals working in different UNESCO programmes (culture, communication, science, education, etc.) based in various parts of the world, in conjunction with a range of outstanding national and international experts."

It also explains: "The portal contents could be categorized in four major chapters: 1. Information on the history of media art and electronic music as well as a collection of pioneer artists' bios, coming mostly from Asia, Africa, Arab States and Latin America (Media art and Music using technology); 2. A network of specialized institutions dealing with research, training, creativity and promotion of digital art and music, classified by geo-cultural regions (Regional networking); 3. Articles, essays, course contents in different fields related to Digital creativity, open-source software tutorials, as well as other teaching material (Training); and 4. Professional and non-professional digital productions by young people (UNESCO Digital Arts Award and Young Digital Creators)."

Adding that, they take the opportunity to thank all "...partners warmly for their support and cooperation in achieving the main objective of the DigiArts project: to promote North-South collaboration and share information and knowledge on the use of new technology in the artistic field." Closing with "Enjoy your visit to DigiArts." Worth mentioning here that all the relevant information has not been updated since 2008, and the portal, including a massive knowledge gathering on new media art history, is almost non-functioning today and is very hard to find. This major international cooperative effort led by UNESCO was abandoned, and no interest or resources were later invested in it.

DigiArts goals were: (a) Disseminate historical, theoretical, artistic, technical and scientific research in the field of electronic and digital arts, including interdisciplinarity study of the arts and the sciences; (b) Promote information exchange, dialogue and communication among artists, scientists and technicians from different geo-cultural regions, especially enabling developing countries to develop their own approaches and practices in various disciplines and fields of knowledge connected to media arts; (c) Support existing institutions and networks throughout the world in the transfer of knowledge; and (d) Encourage the use of electronic software among the youth for electronic communication and creation. [3]

Four international advisory groups and partners provided overall policy guidance on different areas: the Virtual Library International Advisory Committee; the Art, Science and Technology International Advisory Committee; the

Media Arts History International Advisory Committee; and the Electronic Music International Advisory Committee.

One of the first writings commissioned by DigiArts was the research report *Historical aspects of Electroacoustic Music in Latin America: From the Pioneering to the Present Days*. With over 75,000 words, this text was the result of an extensive investigation led by Ricardo Dal Farra focusing on the history of electroacoustic music in Latin America. [4]

After the original report in English was published in the UNESCO portal, a second version, not translating by complementing the previous text, was also written by Dal Farra: *La música electroacústica en América Latina*. [5]

Figure 1. The CLAEM Electronic Music Laboratory, 1964.

Those texts included information on the electronic works of at least 191 artists and composers from Argentina, 14 from Bolivia, 90 from Brazil, 39 from Chile, 39 from Colombia, 5 from Costa Rica, 44 from Cuba, 3 from Dominican Republic, 11 from Ecuador, 5 from El Salvador, 6 from Guatemala, 73 from Mexico, 3 from Panama, 4 from Paraguay, 15 from Peru, 12 from Puerto Rico, 27 from Uruguay, and 27 from Uruguay. 44 from Cuba, 3 from the Dominican Republic, 11 from Ecuador, 5 from El Salvador, 6 from Guatemala, 73 from Mexico, 3 from Panama, 4 from Paraguay, 15 from Peru, 12 from Puerto Rico, 27 from Uruguay, and 35 from Venezuela.

In addition to information on the works and their creators, these texts included references to unique projects and centres in various countries of the region (e.g., Centro Latinoamericano de Altos Estudios Musicales - CLAEM of the Instituto Torcuato Di Tella, which was, in the 1960s, a critical place for the development of new media art in Latin America). And it also noted some pioneering developments around new technologies applied to the creation of electronic art (e.g., Juan Blanco's work in Cuba, Raúl Pavón in Mexico, Fernando von Reichenbach in Argentina, among others).

DigiArts main Line of Action were: (a) Knowledge and Research: History and aesthetics of artistic, scientific and

technical movements relating to digital and electronic arts; (b) Publication and Information: Virtual library on the electronic arts; (c) Training and Capacity Building: Best practices and directory of creative digital tools; (d) Networking and Partnerships: Creation of a space for interdisciplinary research and experimentation; and (e) The "Young digital Creators" project. [6]

All this is now part of obscurity. Then, we continue to reinvent the wheel, telling new stories and allowing certain facts to be lost while others emerge seeming to be the ones who have led the development of the electronic arts in the world. However, this is not always the truth. It is only part of history.

Latin American Electroacoustic Music Collection

Unavailability of musical recordings, bibliography and almost any basic reference to the many electroacoustic music activities that were developed since the early 1950s in several Latin American countries was commonplace in the 1970s. That situation did not change much during the following decades.

In various Latin American countries, universities, state organizations and major private foundations have taken initiatives to support art research and the use of new media already in the early 1960s. Nevertheless, most projects have stopped before developing the resources to document their processes and preserve the results. Many early artworks, for example, have been lost or damaged.

The Latin American Electroacoustic Music Collection has over 1,700 digital recordings of compositions by almost 400 composers. It is also accompanied by a trilingual historical essay, and over 200,000 words in its database. [7] [8]

This Collection is an example of the relevant role that the archival of artworks and its public access can play in having another perspective about history. It is today an essential resource in the field, being consulted extensively by people from around the world (e.g., new media art researchers, historians and artists, composers, performers, musicologists, and the general public) and is helping to transform the usual perception of "ownership" that exists related to some countries with respect to the new media art history.

The Latin American Collection includes compositions for fixed media (tape, DAT, CD, HD or similar) and mixed works for acoustic instruments or voices and fixed media or live electronics/interactive systems. There are also multimedia works in the database. In the case of pieces for fixed media and other sound sources (e.g., mixed works), complete recordings as well as "tape only" parts (e.g., fixed media) are preserved and catalogued. The database also includes audio and audiovisual recordings of interviews to composers and technical innovators (e.g., Alberto Villalpando from Bolivia, Manuel Enriquez from Mexico,

Alfredo del Mónaco from Venezuela) as well as photographs, videos and some scores (e.g., by Alcides Lanza from Argentina, Javier Alvarez from Mexico, Milton Estevez from Ecuador). [9] [10]

From a technical perspective, the archiving of audio material went through a myriad of problems: recovering from massive hard disk crashes, finding analog tape recorders with old track formats, re-digitizing material to correct severe DC offsets in brand-new equipment, computer operating systems conflicts, etc. Defining how to work with very noisy old recordings was another challenge (some pieces were processed using an advanced de-noise system to reduce hiss, always preserving the original recording and following the composer's advice whenever was possible). The bulk of the process was done between 2003 and 2005 at The Daniel Langlois Foundation offices, working with three different computers and nine hard disks to manage the audio and visual files, the database and huge amount of information, and the daily international communications.

Figure 2. The Latin American Electroacoustic Music Collection, hosted by The Daniel Langlois Foundation.

Worth mentioning that while the recording quality of some music stored on old analog tapes could have suffered through the years, digital technologies for recording storage were the ones presenting the most difficult challenges. For example, some DATs (Digital Audio Tapes) lost part of the

recordings, and only a loud digital noise was in place of the music. In those cases, the problem was not only a poor quality (e.g., because of hiss or the loss of high frequencies) but a complete lack of the recorded signal, without any possibility to recover the original material.

Figure 3. Analog Graphic Converter, developed by Fernando von Reichenbach at CLAEM, in Argentina, during the late 1960s.

There are 1,723 electroacoustic pieces preserved as digital audio -with CD quality- in the database. While all works are available for listening to researchers who ask for an access code (to avoid copyright infringement) contacting the Langlois Foundation, 558 works from those compositions are freely available and can be listened to by the general public online. There are multiple ways of finding the information and resources in the database. The digital audio recording of a composition can be found by its title, the name of the composer, the country linked to that composer, the year or decade when the work was composed, etc. In addition, there are two playlists to access and listen to the compositions: one sorted alphabetically by the last name of the composer, the other sorted chronologically, following the year the piece was composed. [11] [12]

Instrumentation, program notes, production studio, version, composer's bio and more have also been included for each work when the information was available. Part of that comes from the two reports commissioned by UNESCO, previously mentioned.

The Latin American Electroacoustic Music Collection is one of the most visited and consulted collections of the Daniel Langlois Foundation.

Final Words

The UNESCO project, and later the Latin American Electroacoustic Music Collection, have recovered and made visible (and listenable) the creative work of many artists otherwise almost forgotten. They have defied the wish of immortality and the hegemony of the electronic art history narrative, breaking one of the memory's death roads and slowly shifting and widening the way the history of electronic art is being understood.

Those projects cannot fade away. They need to be supported and disseminated the information. A permanent circle of forgetting part of our history will not help us grow and improve as a society.

DigiArts and the Collection are only part of the history of new media art in Latin America. There is so much more to tell and spread: Not only in artistic creation and applied technological development but also in education, there were pioneering programmes that have intertwined art, science and technology in countries such as Argentina, starting decades ago.

We, humans, need to learn better ways to live together, and art and memory are key factors to that end.

Archiving and disseminating electronic and new media art history findings is crucial to comprehending the present and building our future.

Acknowledgements

Thank you to UNESCO, The Daniel Langlois Foundation for Art, Science and Technology, and the many hundreds of colleagues who supported these projects.

Abstract

Art museums are committed to expanding the digital display of their archives by using digital technology, diversifying the types and forms of their exhibitions, increasing archival formats, and promoting repeated visits anytime, anywhere. Many museums have also begun to use virtual reality (VR) display platforms such as Google Arts & Culture, which is intended primarily for viewing art in high resolution images and video. More than 2,000 cultural institutions, including the Guggenheim Museum in New York and Orsay Museum in Paris, use this platform to provide virtual content¹. It is reasonable to infer from this that the rising popularity of VR technology and of online VR platforms targeting the art sector should also have potential application in archival work. For example, the National Museum of Modern and Contemporary Art (MMCA) in Seoul already utilizes VR technology for documenting its physical exhibitions. However, despite the growing application of this technology, few studies have comprehensively studied the forms and content of the artworks archived in traditional museums (i.e., paintings and photographs) and by comparison to electronic art archives that utilize modern VR technology. By analyzing the advantages and disadvantages of virtual reality technology, this study aims to explore the potential of such applications in the context of digital archiving. In this paper, we take several major modern and/or contemporary art museums as examples for analysis and comparison. We show that virtual reality technology has brought advantages to the archival work of contemporary art museums, such as enhanced immersion and expanded diversity of exhibits. Further, it appears likely that the increasing commodification of VR technology will further possibilities in the future.

Art museums, virtual reality, VR, digital archive, visual tour.

Introduction

According to Tallulah Harvey, in her eco-critical research “The Archive”, the role of a digital archive is to digitize human cultural productions [1]. As a result of lockdowns during the COVID-19 pandemic, humanity experienced a greater hunger for culture than ever before. Government policy during the pandemic typically required public institutions to close their doors, creating new and difficult challenges for art institutions. Online presence and content became crucial. Museums and galleries launched 3D and video tours of their exhibitions, and held numerous online artist talks and conferences. For example, the travelling, moving-image exhibition *Watch and Chill: Streaming Art to Your Homes* was held by M+ in February 2022, and featured more than 20 video works by contemporary artists across Asia.²

One of the core issues in discussions about the preservation and online distribution of media art is the difficulty of representing the spatial and interactive nature of such artworks in the form of digital archives. The Ars Electronica Archive³, for example, is a near complete archive platform that documents artworks of the Prix Ars Electronica Festival from 1979 until today and organizes works by award, picture, print, and map. Another

² Watch and Chill: Streaming Art to Your Homes, as part of the M+ International initiative, serves as a springboard for the discussion of innovative forms of collaborations and of the new potential that lies in today’s hybrid environments.

³ Ars Electronica holds one of the world’s largest archives of digital media art and spans the past 40 years. It contains the documentation of the Ars Electronica Festival since 1979. Accessible at <https://archive.aec.at>

important archive for digital art is the Archive of Digital Art (ADA)⁴, which primarily uses video, image, text and audio formats to document artworks. In addition, hyperlinks have a significant role in interconnecting the various entries in ADA. A good search engine is a vital part of every archive, enabling the user to filter entries by category, date, genre, events, and keywords. Both of these digital archives—Ars Electronica and ADA—are extensively used by media art scholars worldwide. However, from the perspective of the non-expert audience, the more complicated navigation of entries and often low-quality videos and images may introduce additional challenges to attaining a complete or immersive/intimate understanding of the archived artworks. What if archived artworks could instead be experienced in VR? And would this be unreasonably costly to achieve?

It is important to ask what the art institutions can do to offer a better experience to their online visitors, to facilitate remote exhibition visits, and to ensure wider access to art shows or specific artworks where requested. Many contemporary artworks are difficult to be archived as a single image or video. For example, while performance art researchers and archivists mainly use video to preserve the art of performance, they admit that it is not the best way [2]. There are, however, limitations to every archiving method, for example, video is essentially a 2D technology trying to describe 3D space and is often compromised for that reason. Similar challenges can arise in archiving interactive and installation art pieces. In addition to image-based media, there are often complex relationships between documents, pictures, and videos. Thus, it may be very difficult, if not impossible, to capture all the details and moments of live art in order to recreate as closely as possible the experience of physical presence.

Figure 1. VR Tour of HKDI Gallery, Zaha Hadid Architects - Vertical Urbanism.

Considering the diversity of archived works of art in various museums, VR accompanied by guiding instruction—such as the archives' VR tour of the MMCA

in Seoul, Korea—may be a practical and efficient method of archiving.⁵ Such a method of documentation can provide a spatial, sensory and immersive experience that is further enhanced by navigation with the aid of narrative and iconographic guidance. For instance, the online VR tour 'Vertical Urbanism', on the Hong Kong Design Institute website, showcases the use of directional circles to improve user navigation (see Figure 1).

Use of VR in Exhibitions and Archives

The world is moving to digitalization, and art lovers are rapidly shifting their interest and preference to museums and artworks that incorporate modern technologies [3]. Art institutions' interest in VR applications has sharply increased during the lockdown, especially after the Oculus Quest 2 VR headset launch. This technology registered five times the projected number of pre-orders as people sought to escape the boredom and social restrictions of the pandemic, engage in the art world, and visit exhibitions. More importantly, the professionals, like art critics and researchers, were able to resume their work. Throughout the course of 2020, museums and art galleries pivoted towards digital solutions, and many institutions made significant investments in VR. The primary advantage of this technology is its immersiveness. It allows the audience to be fully engaged with the artwork and to actively interact with each exhibit too. In their paper, Shehade and Stylianou-Lambert, after conducting multiple interviews with museum professionals, conclude that interaction with exhibits has become a crucial part of audience engagement [4].

Today, visitors want to feel as if they are part of the exhibition; they want to interact with the artworks on a personal level and relate to the emotions and thinking patterns of the artists that produced them. VR technology offers that illusion to the audience by allowing them to enter into a virtual space that may take the form of a 360-degree video or an interactive environment. It enables museums and galleries to bring artworks to life and offers an ideal platform for different and unique experiences as the audience becomes deeply embedded within the virtual exhibition [5]. For this reason, many leading art institutions around the world are actively embracing VR.

In the past five years, several well-known contemporary art museums have utilized various kinds of VR technology to conduct exhibitions or offer educational programs to their audience. For example, in 2019 the Louvre integrated VR technology into its exhibition *Mona Lisa: Beyond the Glass*, and London's Tate Modern integrated VR into its Modigliani retrospective in 2017. The latter offered an immersive experience whereby

⁴ Accessible at <https://www.digitalartarchive.at>

⁵<https://my.matterport.com/show/?m=pmHCAXnPHVu&brand=0>

visitors could interact with a 3D model of Modigliani's artist studio in Paris. Visitors could tour the room and share the artist's personal space, and everyone felt as if he or she was the only person in the studio.

Of course, VR is not only being utilized by art institutions; it is a part of the artist's toolkit too: in the Museum of Modern Art (MoMA), Niko Koppel has showcased his VR project *Crime Scene*, a story about the victims of police brutality [6]; at the Whitney Biennial, Jordan Wolfson exhibited his extremely bloody virtual-reality artwork *Real Violence* [7]; and artist Ian Cheng created a VR *Pokemon Go*-like installation for the Liverpool Biennial named *Emissary Forks For You* [8].

As of January 14, 2022, the website of MMCA in Seoul had 8,771 exhibits on display online, all of which could be viewed in VR on the official website offering visitors a more interactive and immersive experience (see Figure 2). Unlike the traditional method of digital archiving that mainly documents artworks in the form of photography and video, VR technology enables the entire exhibition, its spatial organization, navigation and orientation between individual artworks to be preserved thereby allowing a more complete experience of the show. Nevertheless, the use of one method of archiving need not require the exclusion of the other. On the contrary, VR technology can supplement and support digital archives, introducing novel tools such as VR tours that help to better document entire exhibitions and make the archives more engaging and accessible for the wider, non-professional audience. Like all technology, VR does have its limitations. For example, current VR tours do not offer metadata tagging, which makes it difficult to search for specific artists or artifacts without having first to navigate the virtual exhibition as a whole.

Figure 2. VR Tour of MMCA's 2020 Asia project, *Looking for Another Family*.

The VR tour *To Exhibit – Not to Expose – To Expose – Not to Exhibit*, by artist Mario Santamaria, was produced for the reopening of the Centre d'Art Santa Mònica in Barcelona, Spain in September 2021 [9]. The tour enabled

its audience not only to visit the museum's cloister and exhibition areas, but also to investigate its most inaccessible corners, to explore unusual perspectives and follow its routes—and all without leaving the comfort of home. This particular virtual tour remained open after the exhibition's official dates, which allowed the artist to extend his show in time and space. This example shows how VR can offer an alternative to traditional museum visits that consist of moving from one exhibition hall to another, contemplating the work of art, reading the text on the wall, and buying a souvenir from the store before leaving.

The Pros and Cons of VR Technology

While art institutions have utilized this technology during lockdowns to satisfy their audience's yearning for art and culture, will this new practice of virtual museums continue after the pandemic? The example of MMCA in Seoul demonstrates that VR can be applied to almost any physical exhibition. More importantly, traditional media can be easily integrated into a VR archive, such as photographs, videos, audio, and the texts that are present in digital archives.

To summarize, the potential of VR applications for archives is as follows:

- VR archives can capture the precise details of an exhibition's set-up at the moment the artwork(s) were exhibited. Hence, the audience can get a glimpse of the physical space and design of the exhibition in addition to viewing the individual artworks.
- Time and location do not matter. Visitors can browse an archive by themselves at any time and from any location using VR equipment or with the use of a computer screen if the user does not own a VR headset.
- Installation art can be viewed more fully in VR.
- VR archives can accommodate huge collections and offer an easily scalable solution to the growing archives of museums. It is indeed a challenge for any museum to display all its archived material in its physical space. The Art Institute of Chicago Museum Collection Online has more than 300,000 paintings, sculptures, and decorative artworks from around the world [10]. The Guggenheim Museum's permanent collection offers a searchable database of selected artworks from an online archive of around 8,000 items [11] and is continually expanding. The MoMA collection includes more than 150,000 paintings, sculptures, sketches, prints, photos, architectural models, drawings, and design objects, approximately 22,000 films and 4 million film

stills. Further, it contains more than 300,000 books [12], periodicals and the personal archives of more than 70,000 artists.

- Further developments in VR may enable us to expand beyond visual material and integrate other sensory material too, such as touch and haptic feedback.
- Digital and VR art can be viewed in its original format.
- The use of VR in digital archives allows artworks to become accessible to a wider, non-professional audience.
- The interactivity of VR provides additional potential for educational and curatorial programs.

VR applications in archives also present challenges:

- The equipment can be expensive. Although a VR mode may be available in all visual tours, due to the cost of equipment only a smaller number of people may be able to view that content simultaneously in VR. For the remaining audience, a screen may be used for viewing. Hence, the immersiveness of virtual exhibits may be compromised or lost.
- Elderly people may find it difficult to use VR technology. This could be overcome with additional help and assistance.
- Building a VR environment is a labor- and cost-intensive process, especially at the start.
- Much time and money can be spent on retaining archived data and VR maintenance.
- Existing 3D tour applications, like Matterport, use proprietary software, and this limitation may cause problems in the readability of models in the long term. For instance, Matterport does not offer access to source files.

Is a VR-mediated virtual viewing experience a truly engaging art experience or not? Seeing physical works of art in person is likely to be more moving than viewing them online through a mediated virtual experience, but it is important to note that VR archives are not intended to replace physical exhibitions entirely. Rather, the use of VR is intended to support art institutions in documenting and preserving exhibitions. Nonetheless, the development of immersive technology in the form of VR and advanced computer applications can enable the creation of realistic simulated environments. Some authors and researchers believe that simulations may in the future have ultra-realistic physical similarity to the actual physical environment [13]. Thus, in the context of VR archiving, the relationship between physical simulation of virtual scenes and the cognitive sensory experience of real scenes should be further explored and understood.

Conclusions and Recommendations

Currently, several VR applications are already being used for archiving and virtual exhibition purposes, including Google Arts & Culture and Matterport. It can be that a virtual tour experience is not always engaging, however, it serves for recalling physical visits or creating an as-if-you-have-been-there feeling. In addition, the future development of virtual reality technology in the context of digital archives could enable us to save the operating procedures of interactive and generative art too.

The existing search and filtering methods for archived artworks and artists on institutions' websites are not meant for the general public but for art professionals experienced in navigating digital archives. Moreover, most online archives are 2D displays that are not ideal for digital art that has interactive and immersive qualities.

VR archiving might be very suitable for expanding digital archives, enabling 3D views, and supporting additional formats. More importantly, VR has the potential to be combined with other ubiquitous technologies, such as augmented reality and mixed reality, in future applications. Thus, we should aim to explore, devise and exploit the ways in which VR may enhance digital archives and make them more immersive, such as haptic feedback and other sensory experiences.

Although VR may appear more suitable for exhibition archives than existing methods like ADA or Ars Electronica Archive, its utilization does not need exclusion of the latter. If VR technology is used as an auxiliary archiving tool, it can support and enhance user experiences when exploring archives and help the audience to recall their experience after visiting an exhibition in the physical location. VR is likely to increase the number of digital archives users because its utilization enables content to be presented in a more engaging and immersive way.

Authors Biographies

ZE GAO

Ze Gao is an interdisciplinary artist, curator and media art researcher. Working in the intersection of art and technology. He studied Multidisciplinary Fine Arts at the Maryland Institute College of Art and received his M.F.A from The School of Visual Arts in New York. With a background in both image science and art, his research across different practices and interests, including artificial intelligence, human-computer interaction, museum study and extended reality. He has several publications, mainly in the areas of New Media Art and Chinese Classical, he currently living in Hong Kong and Guangzhou. He has been invited as a visiting scholar to the Department of Philosophy, Sun Yat-sen University(Guangzhou, China,2020), Confucius Institute, University of Bonn,(Bonn, Germany, 2019), and School of Art and Design, Yunnan University,(Kunming, China,2019), residence artists at Nanchuan Lixiang Lake Art residence project, Sichuan Academy of Fine Arts,(Chongqing, China,2020), Glasgow School of Art,(Glasgow, Scotland, UK,2014).

Dr. Varvara Guljajeva

Dr Varvara Guljajeva is an artist and researcher holding the position of Assistant Professor in Computational Media and Arts at the Hong Kong University of Science and Technology (Guangzhou). Previously, she held positions at the Estonian Academy of Arts and Elisava Design School in Barcelona. Varvara was invited as a visiting researcher to XRL, Hong Kong City University, IAMAS (Ogaki, Japan), LJMU (Liverpool, UK), Interface Cultures in the Linz University of Art, and Design, Blekinge Institute of Technology (Karlshamn, Sweden). Her PhD thesis "From Interaction to Post-Participation: The Disappearing Role of the Active Participant" (defended in 2018 in Estonian Academy of Arts) was selected as the highest-ranking abstracts by Leonardo Labs in 2020.

As an artist, she works together with Mar Canet forming an artist duo Varvara & Mar. Often the duo's work is inspired by the information age. In their practice, they confront social changes and the impact of the technological era. The duo has been exhibiting in international shows since 2009. Their works were shown at MAD in New York, FACT in Liverpool, Santa Monica in Barcelona, Barbican in London, Onassis Cultural Centre in Athens, Ars Electronica museum in Linz, ZKM in Karlsruhe, and more.

Accessing and Displaying the Archive

Tabea Lurk, Jürgen Enge

tabea.lurk@fhnw.ch, juergen.enge@unibas.ch

Abstract

The pressure to open archives and cultural collections is increasing. Not only the Open-GLAM movement (Galleries, Libraries, Archives, Museums) demands easy access to freely usable sources. Civil society and even in-house interests (e.g., communication during the pandemic) point to a considerable need for action. This paper therefore considers two types of accessibility: individualized access for humans and ways of (automated) access for machines.

For interpersonal communication a curation tool for the exhibition context is presented that can be used quickly and is easily deliverable to different online and offline places. The automation aspect is structured according to the so-called FAIR-Principles. Here, too, a digital service is described that makes it easier for those archives and collections to become FAIR (Finable, Accessible, Interoperable, Reusable) and capable of (in)formation dialogues that would otherwise have to retrofit the existing systems.

Keywords

Accessibility, Digital Curation, FAIR, Infrastructure.

Introduction

The Corona pandemic (since 2019) has brought the digital dimension of cultural collections and archives to the attention of the general public. Digital accessibility has become a global object of desire. Even earlier, lively discussions about exhibiting and mediating digital assets, art and culture in digitally supported environments took place: literally merged c.f. in web-project “computer aided curation” (c@c by Eva Grubinger et al.), [12] solutions and creative approaches are discussed also by conferences such as ACM Creativity and Cognition and ACI Siggraph, Art.CHI, Ars Electronica, ISEA, Museums and the Web, to name a few. In addition, not to forget the abundance of curatorial and educational approaches in theory and practice. [2]

This lets us easily forget that most of the digital presentations or displays in house and online, which tend to accompany a tour in today’s museums or websites, are still developed, compiled, and made accessible on a case-by-Service, which is presented in the second part, we intend to show that the path from a digital archive with basically inhouse access to a FAIR archive or repository, which

case basis - also for common, recurring formats. To put another way: most of the collections and/or archives that manage digital or digitized cultural assets are far from infrastructural solutions that would allow digital curation practices on a regular basis.

We are not talking about the exhibition of net art here, [1] nor about elaborate, digital mediation formats for specific events (audio-walks in the public space etc.) or any other type of interactive exhibition formats (exhibition/knowledge games cf.) or works of art [16] Rather, we are referring to those types of presentation where digitized/digital content changes from one exhibition to the next, but the way of presenting remains more or less the same in terms of formal aesthetics (cf. full screen display): cf. video exhibitions, where several works are played back one after the other, with or without subtitles or interstitials; slideshows with and without annotations; pdfs with flipping pages on a programmed basis; websites etc. Although many museums have Wi-Fi in the exhibition area, this content is usually brought to the displaying devices on digital data carriers such as USB-memory-sticks, instead of being programmed and played back directly from network based digital storage system. In the case of traveling exhibitions or interlibrary loans, files are sent around the globe.

In contrast to this time-consuming and resource-intensive approach, we will first present a web-based tool that facilitates online and offline exhibitions. The system enables updated or new curatorial display at remote places within seconds. We call the system *Info Screens* because it was developed in an academic art library for displaying archival content (as information) next to analog media such as books and journals: videoart and performance documentation, results of the practices-based final thesis of art and design students, reference material from teachers as well as research results, new acquisitions and special collections.

While the *Info Screens* support also displaying copyright-protected content in a (in terms of location and time) controlled digital environment, shielded from access by unauthorized persons or machines, with the so-called FAIR-provides the community with high-quality, trusted sources, is viable also for smaller cultural institutions.

Figure 1. Exhibition View of *Info Screens* (above) with schematic concept of main components (below).

Info Screens

The *Info Screens* were specifically designed for the exhibition context. They consist of three components (see fig. 1 – left to right):

- *Controllers*: which ensure the correct data being displayed on the right screen/client at the right time.
- A *Proxy*: which regulates the communication between all devices. The *proxy* guarantees that data security is given - especially in the case of copyright-protected material.
- *Exhibition clients*: Computer with screens or beamer, etc.

All components are natively programmed in *Go*. [11] Since the code is freely available on *Github* [8] and can be updated with the respective playback content, the following explanations focus primarily on the technical structure.[9] From back, which means the *proxy* as data security (enabling communication), to front, in terms of the *clients* or playback, the *Info Screens* work as follows.

Proxy

All clients and controllers establish an encrypted connection with the *proxy* and set up a virtual network. To ensure that the connection is secure, the logon of the clients is certificate-based. Every instance has its own certificate.

The virtual network supports different protocols:

- Via *gRPC* (a high performance *Remote Procedure Call* framework) the *controller* gives the clients display

commands and manages what's exactly shown right now or a defined moment in time (preprogrammed).

- Clients and controller can exchange data over the virtual network via *http://*. The clients do not have to be connected to the free and open internet; content can also be exchanged over a completely isolated LAN-network.
- The network time protocol *NTP* has been integrated into the virtual network via *gRPC*. This component enables the synchronization via an internal clock of the clients and thus allows to run animations over different clients (running text, distributed video snippets on varying screens, hand-over of video signals etc.).¹ Same can be applied to other media that are to be addressed in a synchronized, remote way.

Furthermore, the proxy saves the status of the different clients. Thus, they automatically receive the same content any time they connect. This feature is especially useful if you have setup the devices in a way, that they automatically start up in the morning or after a power interruption: As soon as there is power on (again), they reset in a predefined way. The *exhibition clients* register themselves with the *proxy* and receive (once again) the information/data – automatically, without any human intervention.

Controllers

The *controllers* have two interfaces: a *web-based frontend* and a so-called REST (REpresentational State Transfer) API (see fig. 2):

- The *web frontend* allows addressing the screens remotely and individually. Beyond programming and automation, the clients can thus spontaneously be updated with (remote) information such as e.g.

¹ An artistic example in which different screens are partly covered with videographic images and image-excerpts would be Alexander Hahn's sculpture at the building project "Home of IT" for Roche

(Kaiseraugst, CH). [13] Even if this system has nothing to do our *Info Screens* described here, it shows the creative potential of multiple remotely and synchronized controlled screens.

welcome message for specific guests or emergency information).

- The REST-API enables automation.

Figure 2. Info Screen Network Communication.

The *web interface* contains furthermore a screenshots option, which might remind one of classic light desks for slides (see fig. 3). It allows to create a screenshot of all running clients at the push of a button. The images represent the content being displayed at the same time, in real time at the exhibition floor.

Supported by the debugging protocol of the Chrome browser (see below), the feature is very handy to find errors or to check, if all clients are really booted automatically, e.g. in the morning.

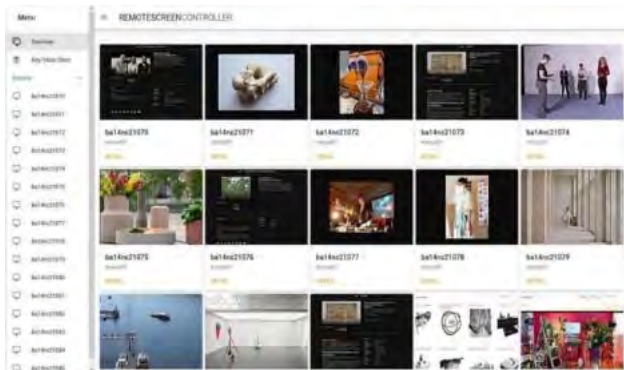

Figure 3. Web interface of controller.

The content to be displayed at the *exhibition clients* is put together in so-called *controller scripts*, which are also delivered to the *exhibition clients* by the *proxy*. These scripts contain the respective configurations, kept in json-files.

Before going more into detail about the curation process (of configuration) and how the *exhibition clients* are actually equipped with content, it is worth to take a quick look at the *exhibition clients*.

Exhibition Clients

For ecological reasons, we use old Macs computers as *exhibition clients*, which were to be discarded. Because they do not have to be connected to the internet and are shielded from the common security risk areas that present vulnerabilities, it is possible to keep outdated computers up running until they die. We have simply replaced the original hard disks with more robust flash drives and installed an image that allows, for example, the automated startup and shutdown of the computers and maintenance for all in exactly the same manner.

Beyond concrete curatorial or displaying concerns, for our context at least, it is only important that a current *Google Chrome* browser is installed on the machine(s) used. Google Chrome was chosen (as displaying App) due to the above-mentioned remote-control option.

We use the browser in its full-screen mode. That's basically all the clients require. Furthermore, if e. g. video or other content with sound is displayed, deactivating the sound might be a good idea in different situations.

Last but not least: Using a current browser furthermore saves programming effort and guarantees that common data formats are displayed correctly.

Digital Curation of Content

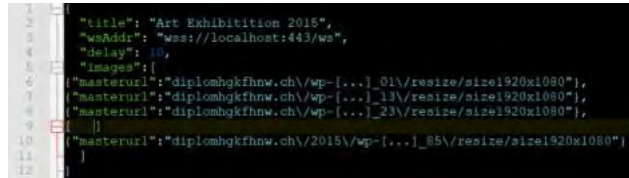

The only thing that remains regarding the *Info Screens* is how the content is to be arranged and played out. For the

sake of simplicity, we refer to the process of selecting and assembling digitized content (data) as “curation action”. Here two types of scripts are needed:

- *Controller scripts* contain the target URLs of the digitized content (images, videos, PDFs, web pages etc.).
- *Media templates* provide the functionality for displaying the different media formats.

Since the structure of the scripts is more or less the same, it seems sufficient to comment on the existing samples, which oriented to the needs of the <institution>. We use currently most of the time media templates with one for each type of media. In addition to these templates for a) slideshows (timed image sequence), b) video exhibitions, c) PDF and d) web pages, combined templates as well as those for other/future formats may be implemented.

All exhibition data must be in an online addressable form – following called *MasterURL*. Once a client receives a dedicated *exhibition file* (json), it plays this very same script until it receives the command for a new exhibition file. Within this exhibition file all information is listed one after the other (see fig. 4).

```
1 {
2   "title": "Art Exhibition 2015",
3   "wsAddr": "ws://localhost:443/ws",
4   "delay": 10,
5   "images": [
6     {
7       "masterurl": "diplomhgkfhw.ch/wp-[...]_01/resize/size1920x1080",
8       "masterurl": "diplomhgkfhw.ch/wp-[...]_13/resize/size1920x1080",
9       "masterurl": "diplomhgkfhw.ch/wp-[...]_23/resize/size1920x1080",
10      "masterurl": "diplomhgkfhw.ch/wp-[...]_85/resize/size1920x1080"
11    }
12  ]
13 }
```

Figure 4. Excerpt of *media template* data for a slideshow.

It is possible to specify contextual information such as the duration of display for the images, overlaying metadata information (such as title, author, date etc.), QR codes, logos for example. The information can be defined for all files in the same way or individually for each *MasterURL* – depending on specific requirements or institutional guidelines.

Fig. 4 shows, for example, a simple slideshow: starting with the displaying information for all images and a duration of 10 seconds, type of script (here: images). In the following area where the *MasterURLs* are presented, you find a command to adjust all images on the fly to fit the display size with <resize>. Defining the background color or image, specific frame-layouts etc. is also possible.

Regarding videos exhibits, one might define starting point or max length (duration) of a file for display. For example, if you don't want to play the whole video, but only a short ‘appetizer’ sequence of 150 seconds starting at second 620, this can be defined within the (json-based) exhibition file.

In case of PDF-data, we always display a QR code so that viewers can download the source and read it at their leisure on their mobile device, for example. And we flip pages after 10 seconds, which can be adjusted, too.

The handling is therefore very simple and virtually self-explanatory. Only the layout of the *MasterURLs* must be converted from backslashes to ‘backslash-slashes’ combinations to support the JSON syntax. If the system is

used more widely, this operation should be automated - using Excel for example or other scripting tools.

Since the software used does not need to be purchased or trained in a complex way, freelance curators or, in our case, students and teachers can put together their own exhibition programs and then have them played automatically on devices that have a current browser - without these devices having to have particularly large memory capacities.

FAIR-Service

Moving from the *Info Screens* to the *FAIR-Service*, a) automation and b) aspects such as institutionalization of services in terms of infrastructural solutions build a common ground. Main concerns of the FAIR-Service become clear by breaking up of the acronym of FAIRness: FAIR actions support the improvement of the *Findability* of (re-)sources, *Accessibility* (in terms of documented availability, including access status), *Interoperability* (for automatized exchange of information) and *Reusability* (by clearly described copyright or license information).

Though the FAIR-Principles [10] were developed in an academic environment to facilitate automatized scientific communication, [4] and exhibition institutions and archive occasionally pursue slightly different interests than science, the FAIR-specification seem fruitful also to curatorial concerns – especially when openness becomes a strategic goal. Skipping strategic issues and concerns regarding the quality of (semantic) metadata, [3] *the FAIR-Service* offers help when decisions have already been made and technical solutions for fulfilling core requirements are need. Within this situation we face three technological gaps, current archives often suffer of:

- provision of so-called *persistent identifiers* (PID), including associated re-direct services (FAIR:F1),
- *OAI-PMH* interfaces for automatized information exchange (FAIR:A1.1), and
- documentation of *deletions* (FAIR:A2).

The following considerations focus on implementation issues such as the database behind the service (*FAIR-DB*), metadata mapping, persistent identifiers, redirection and multi-client capability. Beyond that, FAIR databases or (data-)systems should ensure authentication and authorization (FAIR:A1.2). Regarding further requirements for trustworthy archives see e. g. references [3] [5].

FAIR-DB

Technically speaking, our *FAIR-Service* consists of a small database (PostgreSQL), which we call *FAIR-DB*. This database contains the metadata of the *source* system (archive or collection management database). In addition, it holds an intermediary metadata schema, which allows the conversion of the existing metadata structure to the *target* schemata, which are delivered via the OAI-PMH interface. Even though the target schema can theoretically be defined by the hosting institution, the OAI-PMH interfaces are

usually based on a standard implementation of the core fields of Dublin Core. [7]

The *FAIR-DB* is also able to manage different data sets. This allows grouping of items for selective harvesting. Defining access to subsets is relevant, if data (of an archive) is not to be made accessible as a whole but in dedicated, e. g. curated groups or collections.

If the *source* metadata system of the archive or collection gets lost or is temporarily out of service, the *FAIR-Service* displays the stored metadata information of the *FAIR-DB* on its own web interface or website. Even though this web page delivers rather rudimentary metadata information, since very often only part of the source metadata is made publicly available, the system guarantees continuous access.

Metadata Mapping

Taking a closer look at the metadata of the *source* database systems, the FAIR specifications reveal common gaps. This seems natural as these systems and their primary purpose focus different interests: Collection management systems facilitate for example interinstitutional loans. Long-term

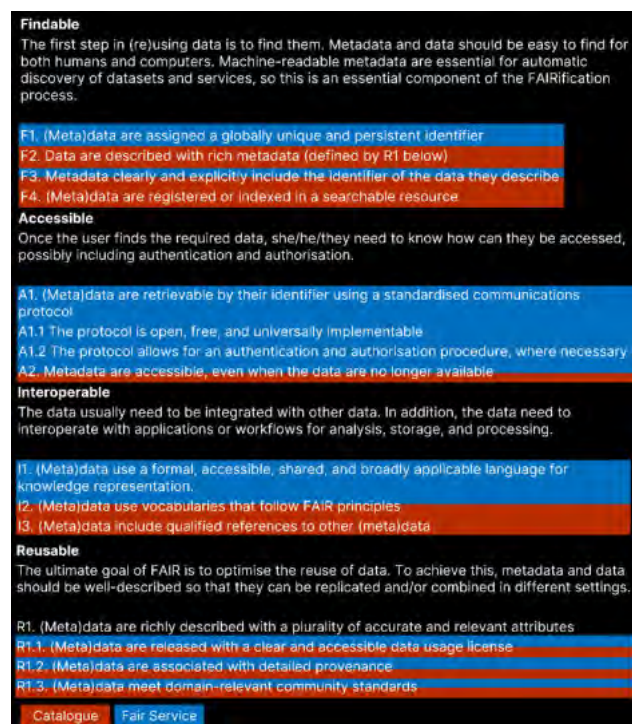

Figure 5. Schematic representation of how FAIR specifications are covered by common database systems.

archiving or preservation systems enable (among other things) monitoring of data consistency and integrity by (re-)calculating checksums on a regular base, etc.. Neither have open, machine-readable exchange options for information as a dedicated or primary aim. Even though the

² A study on scientific open collections was presented by Beer, for example. [16]

situation is different at each institution, one can see that many metadata systems do not natively meet all FAIR-specifications – even in the context scientific special collections [17].

Fig. 5 shows a schematized view on this topic, based on our own experience. It lists the FAIR-specifications by highlighting dedicated requirements. While the red layer indicates information that is usually provided by the *source* database systems, the blue one represents additional needs that are provided by the *FAIR-Service*: Features include persistent identifiers, references to the applied access protocols (e.g. for OAI-PMH), norm-data, open and freely available interfaces etc.

The extent of supplements depends on the institutional set-up or starting position.² With regard to the FAIRness of a collection or archive, the accessibility of the metadata schema and its compliance with common standards play, among other things, a certain role. Therefore, wherever available, vocabularies and/or thesauri used should be accessible. Furthermore standardized (meta-)data such as authority data facilitates communication.

Persistent Identification of Records

Due to the spreading, the *FAIR-Service* generates automatically Handles as default *persistent identifier*. This happens automatically when data is declared as FAIR in the source system in order to guarantee persistence.

Via the *editorial interface* of the *FAIR-Service*, DOIs (Digital Object Identifier) can be generated manually in addition to Handle. This might be of interest when data is dedicated as publication or content shall be (re-)published. Even though one might generate DOI automatically, like many publication servers, we prefer the manual operation due to cost reasons. Not all FAIR-data really required DOI as identifier.

Furthermore sometimes DOIs must be reserved before the completion of a publication: e.g. when the DOI is to be integrated in the imprint of an exhibition catalogue. However, activation/release is only allowed by DataCite when the final publication is indeed available.

While DOI is used in the scientific context mainly for identifying publications (especially articles, text-based resources or more recently data publications), Handle is less restrictive. It is the technical basis for DOI and can be applied for dynamic data objects, allowing updates, growing resources etc. In contrast to DOI, Handle can be assigned by the respective institutions after registration in a cost-neutral manner. If DOI is to be supplied, a mapping to the DataCite metadata schema should be granted, too. [6]

Redirection

Offering PIDs means also to guarantee access even if files are relocated at a server. The *FAIR-Service* therefore contains a *redirector* service.

The *redirector* points to the referenced record in the source data-management system. In our case, the result ends up in a record of the collection catalog, which aggregates content from different sources (databases).

Redirection services as intermediate layer are useful for institutions that have more than one database (e.g. different Filemaker databases or database instances). Providing a common, searchable data view, which is based on a defined (e.g. full-text) index, follows FAIR:F4 specification requirement.

In addition, the *redirector* plays an important role regarding the documentation of *deletions*: In case of deletion, data records should not just disappear. FAIR means that it must be indicated that the data once existed and is for example no longer available.

Multi-Client Capability

The *FAIR-Service* can manage virtual instances. Within the academic context this feature supports universities to provide different repositories or data sets according to the respective disciplinary target communities, layout, expectations of appearance etc..

The virtual instances are neatly classified and grouped by the dedicated area of interest.

For smaller archives or cultural institutions, this feature support inter-institutional cooperation. Institutions, which do not want to or cannot afford providing an own OAI-PMH interface, may join forces regarding the *FAIR-Service*, by staying perceived completely independent from the public.

Perspective

If *FAIR-Service* is used as source or delivery system for the formerly introduced *Info Screen* system, exhibitions can be almost automatically assembled. This happens due to the common metadata format used and supported by the *FAIR-Service*.

In this case, a *controller* script and *template* is developed in which nothing but the internal IDs or Handle/DOI-part of the source is referenced (rather than the entire masterURLs). The script address then the respective master directly. Of course this seems suitable only for items with a clearly identifiable, master media object.

Summary

Summing up this paper, one might state that the *Info Screens* and the *FAIR-Service* represent two opposite sides of the archiving coin of the future: while the *Info Screens* rather face curators or collection-based needs, the *FAIR-Service* directs towards a digital public, which is not necessarily known any more.

By presenting different types of accessibility, both tools direct online archiving towards a new direction in that curation and access are transformed from case-specific, one-by-one solution to an infrastructurally level of automatization and sustainable archival routines.

We are regarding infrastructures as a set of fundamental facilities, systems and features, that support a durable and continuous functionality of an institution. This perspective helps to simplify recurring workflows for archival playback of content and for reaching out to common public requests.

While selection of content and decision making remain subject of everyday curatorial work, the *Info Screen* system shortens, metaphorically speaking, the way from desk to the exhibition space. By doing so, it eases a) the digital display of archival content, b) supports safeguarding resources (Wi-Fi) and c) secures data provision as compared analogue procedures such as copy-paste data carrier solutions.

The fact that all exhibition screens in the building may display important messages in an emergency case – at the click of a mouse – can d) provide a important surplus effect.

FAIR services, instead, and the specific tool in particular increases visibility and outreach of data by presenting a concept of free and open access to data. Following the headline topic of the Danish Open GLAM conference “Sharing is Caring”, [15] one can identify in FAIRness a key element for enabling and promoting access, interest, relevance and impact of cultural assets for the long term.

That this view has long since ceased to be a secret, is illustrated, among other things, by the Open Glam Survey by McCarthy and Wallace, which is continued since 2018 [14]: More and more collections and archives are moving into the public arena and thus create options for cultural participation,

Authors Biographies

Tabea Lurk hold a PhD in art history & media theory and a master in library & information science. Since August 2015 she has headed the media library of the HGK FHNW. From 2006-2015 she worked as a lecturer for digital preservation at the Academy of the Arts (BUA) BFH Bern. Between 2008 and 2015 she headed the ArtLab (BUA) which functioned as an interface between the humanities and natural sciences. In 2012 she established the Master of Advances Studies (MAS) in Preservation of Digital Art and Cultural Heritage. Main areas of work: Access to digital information; information literacy; data management in the context of art, design and artistic research; digital archiving.

Jürgen Enge is a computer scientist and head of the IT department at Basel University Library. Previously, he worked at the Academy of Art and Design FHNW Basel, the University of Applied Sciences and Art in Hildesheim, Holzminden und Göttingen (HAWK), the Zurich Univery of Art, Bern University of the Arts, University of Deign (HfG) and Center for Art and Media at Karlsruhe. He has always been interested in the interplay between art, technology and society. He has built extensive and specialized data management and archiving systems. In addition, he has developed countless websites and digital tools that enable (automatized) indexing, sustainability and FAIR access and preservation of cultural digital sources and data. The services described above originate from him. Main areas of work: digital archiving; data & system development; digital communication; information infrastructures.

AR[t]chive – Augmented Reality Experience for a Digital Art Archive

Tiago Martins, Christa Sommerer, Laurent Mignonneau

Abstract

This paper introduces an immersive augmented reality (AR) experience of interactively exploring a digital archive. AR[t]chive is being designed for an exhibition context but also to serve as a research tool, around the content of the Archive of Digital Art (ADA). Archive contents are presented as virtual elements arranged in real space. Users are able to walk among these, manipulate them directly using their hands and use virtual tools to create compositions in 3D space. This work is part of a larger collaboration and represents an exploration of future-facing ways to access and utilize ADA, but can also inspire work on other digital archives. The paper outlines the design of the interactive experience, including the different considerations taken. This is followed by a description of the current implementation, which constitutes work in progress. To conclude, we offer a brief outlook and future directions.

Keywords

Augmented reality, mixed reality, digital archive, information visualization, interactive art, interaction design, human-computer interaction, embodied interaction.

Introduction

Museums and archives may benefit from harnessing the latest digital technologies for better preservation and dissemination of knowledge. [1, 2] Archives which are natively digital hold an advantage in making their content available remotely via digital means, such as web-based user interfaces; offering complex functionality for (re)searching, cross-referencing, organizing and displaying different types of content; and allow users to create and share personalized collections. [2, 3] As the case in point, augmented reality (AR) can allow visitors to interact with and dive deeper into artifacts which are otherwise kept safe behind glass panes. [4, 5]

Due to technical advances and a marked push from tech giants, AR has become increasingly commonplace. Besides the technical facilities offered by personal computing devices such as smartphones and tablets, consumers also increasingly gain access to head-worn AR devices – such as

the Nreal Light headset, which resembles a pair of sunglasses. [6] The tendency is for AR to become ever more prevalent in daily life, complementing or even replacing smartphones as the de facto personal interface for communication, entertainment and information access. [7]

While the user interface (UI) of AR devices like the Nreal Light or the Microsoft HoloLens borrow much from that of screen-based mobile operating systems (such as Android or iOS), soon enough it will be commonplace to access and interact with virtual objects spatially present in our real environment – among real people and objects, while on-the-move, using gaze, voice and/or gestures.

The design space for user experience (UX) and interaction in AR is still open for experimentation. [7] A native AR experience for a digital archive benefits not only that specific archive, but may also be translatable to other archives or collections; and inform the design of future AR applications such as browsers or even operating systems.

AR[t]chive

In this paper we introduce AR[t]chive, an augmented reality (AR) experience which offers participants an embodied and playful way of interactively exploring a digital archive, based on the Archive of Digital Art (ADA, for short) and with focus on the interactive artworks of C. Sommerer and L. Mignonneau. [8, 9]

AR[t]chive is being developed as part of the project “LeFo – Lehr- und Forschungsinfrastruktur für Digitale Künste an Hochschulen” (trans. “infrastructure for education and research in higher education”, please see Acknowledgements for more details). Briefly, the project concerns the expansion of ADA both as archive and as network, as well as the development of immersive interfaces that allow users to access and browse the contents of the database in future-facing ways. With AR[t]chive we explore the possibilities for data visualization and interaction offered by a wearable AR device, the HoloLens 2.

Related Work

Chen introduced an early approach to a virtual reality-based interface for a collection of digital documents. These and the relationships between them are visualized as a force-directed graph. [10] The author introduces a content-based similarity model and addresses issues such as information density.

The works *The Living Room* (2001) and *The Living Web* (2002) by artists C. Sommerer and L. Mignonneau serve as examples of immersive intelligent spaces which track the visitors' gestures and speech, to "engulf" them in images related to their actions and conversations. [9] The project *Naked in Paradise* (2017, ongoing) by Luc Courchesne, is an immersive interactive VR database where assets such as photos, videos, audio clips, texts and 3D objects collected from the artist's personal experiences can be organized and displayed in different ways (such as in a timeline or by categories). [11]

The work *Legible City* (1989) by artist Jeffrey Shaw serves as an earlier example of using text to populate a city-like virtual space which users can explore. [12] More recently, the HoloLens app *Type in Space* enables users to create immersive sculptural or architectural elements by laying out virtual text three-dimensionally in real space. [13]

Technical Framework

The Microsoft HoloLens 2 headset was chosen due to its comfort factor and technical characteristics, and the style of AR experience it offers. These include:

- wearability factor and the see-through display which allows participants to remain aware and able to act in the physical environment;
- native capability to scan the geometry ("mesh") of the physical environment, which can be used to simulate physical interactions between virtual elements and the real environment;
- native hand-tracking allowing for experiences where participants interact with virtual elements using their hands.

The device also provides eye-tracking and speech recognition facilities, which may help to increase accessibility (e.g., for participants with motor limitations), provide an alternative to a virtual keyboard for text-based input and queries or (more generally) complement gesture-based interaction.

The HoloLens 2 is a high-end device meant for enterprise use-cases. While accessible in a research or art production context, it is not a mass-market product. However, it is reasonable to expect that within a few years consumers will have access to similar devices, with a form factor approaching a pair of glasses. While the HoloLens 2 provides for a presently rather unique interaction style, it nevertheless allows us to design and experiment with scenarios likely to be relevant in the near future.

That said, it is conceivable that the experience can be adapted to some degree for more commonplace devices –

smartphones and tablets. Hand-tracking frameworks for mobile devices are already maturing, and some of the latest iPhone and iPad models come equipped with a LiDAR (light detection and ranging) scanner, able to capture the geometry of the physical environment.

User Experience Design

AR[t]chive is initially intended as an installation or experience within an exhibition context, where the wearable device is provided for visitors. This opens up the UX design space for exploration and experimentation. On a longer-term, AR[t]chive or a subset of its features would ideally be made available to users in a wider context (e.g., as a downloadable app for mobile devices) including those who wish to explore ADA for research purposes. As a result, we try to balance the possibilities of playing with the archive content at an exhibition setting with the more utilitarian aspects of the software as a possible tool for research contexts.

Archive Content

The types of media that we can primarily retrieve from ADA helped to shape the design space. These are mainly and presently images, videos and text of varying length, including: artwork and manuscript titles; names of artists, collaborators, institutions and events; abstracts and descriptions. Relations between entries in the database can allow us to display or derive these contents in many forms, for instance as timelines, maps, or clouds.

The Archive of Digital Art contains thousands of entries for artworks alone. To these are connected artists, institutions, events, media and publication, among others. To facilitate our first steps we opted on focussing first on eleven artworks by Sommerer & Mignonneau, as the AR experience will feature in a traveling exhibition format developed around these. We later included the remaining artworks by Sommerer & Mignonneau, using a combination of data from ADA and data provided by the artists themselves (essentially, the archive of the artists' website).

Technical Factors

The characteristics of the device influence the interaction design to an extent. Among these, the characteristics of the display are a major factor.

The waveguide display essentially draws using light, and is referred to as a "holographic display". [14] In contrast to camera-based AR – such as that on tablets and smartphones, where a camera image is captured, augmented with virtual elements and then displayed to the user – the HoloLens projects light to the wearer's eyes. This means that virtual objects with darker colors will either be perceived as transparent or altogether not visible. When displaying a virtual object, image or video in front of a bright surface (such as a white wall), the darker parts of the object or image can be hard to perceive. Thus, the visual design of the HoloLens' native UI employs vivid, bright colors, and its components are referred to as "holograms". [14]

While the user is able to see their surroundings clearly through the transparent visor, the field of view of the waveguide display itself is comparatively limited. If the user approaches a large virtual object, the “seam” between the AR display and the user’s natural field of view would become apparent as the object would be “cut” at the edges. In general, scenes composed of a few relatively small elements (such as a model of the solar system) work better than large elements (such as a car in real scale) or compositions with high density (such as a realistic model of the Milky Way).

Design Guidelines

Taking into account the factors presented above, we adopted the following guidelines.

- *A simple visual style*, considering the device’s limited capabilities and the eventual number of elements to display. Additionally, should the experience be extended to other archives, the visual identity of the interface remains subdued in relation to the actual content.
- *Small modular elements*, especially considering the field of view limitations mentioned above. Small elements also lend themselves better to manipulation. Modularity helps with displaying collections consistently, or creating aggregations at run-time for data visualization. Users can also benefit from modularity, more concretely in using elements as construction pieces (see below).
- *Enable playfulness and creation*, through direct manipulation of elements and by harnessing their modularity. Ideally, information retrieved from the archive can be presented as units or assemblies of virtual “construction blocks” with a consistent behavior. Participants can combine elements to create their own content.

Exhibition visitors may freely experiment and play, even if they are not initially interested in the archive content. Goal-oriented users (e.g., researchers) can follow trails and discover connections, assemble mind-maps and clouds, create moodboards or curate AR exhibitions. This type of open-ended, playful engagement can potentially inform future directions for UX design.

Inspiration was taken from multiples sources, including: construction set toys and games with modular components (such as Lego, BRIO, and also Minecraft); AR/VR creativity and design tools (such as Tilt Brush, Gravity Sketch and Type In Space); as well as link charts or mind maps (such as the investigation boards often depicted in detective movies).

A storyboard draft (Figure 1) was developed to illustrate the interaction aspects of a user’s journey, introducing the basic elements which served as a starting point for the first prototype. The current implementation, described below, is quite close to the storyboard.

Current Implementation

The prototype is being developed iteratively and is considered work in progress. Features are added mostly step-by-

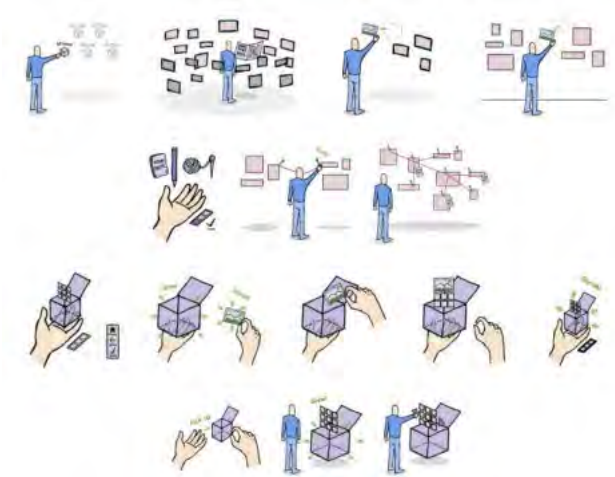

Figure 1. Interaction design storyboard (condensed).

Figure 2. Starting home view, resembling a galaxy.

Figure 3. Media related to an artwork, displayed as a swirl.

step and tweaked afterwards. You may refer to the storyboard (Figure 1) as visual aid.

The software is being developed using the Unity game engine, the HoloLens development kit and tools provided by Microsoft, including the Mixed Reality Toolkit (MRTK).

Home (Galaxy)

The participant is initially presented with floating virtual objects representing each of the artworks. While originally

a count of related words (i.e., for a given keyword, those that appear often in the same texts).

Tools

The participant can access a set of tools in the palm of their hand (Figure 6). The pin can be used to create lines, connecting items placed in the world (Figure 7) – that is, not those in a collection like the swirl or word cloud. Also on the user’s palm is an inventory box for storing media items (figure 6). Dragging a media item into the box will store it inside. The box is transparent and displays the most recent items. Given the box’s small size, in order to retrieve items from within the user must first pick up the box and drop it near the floor, in which case the inventory enlarges and displays a paginated view of contents, which can now be grabbed (Figure 8). The enlarged inventory can be picked up, in which case it returns to its smaller size; and placed back on the user’s hand.

The inventory makes it easier to transport several items at a time across a room, but will serve other purposes at a later point. Conceivably, users may be able to switch between several inventory boxes, label them and save them into a personal account.

Conclusion and Future Work

We have introduced AR[t]chive as an augmented reality experience for a digital archive; and an exploratory design for a research tool. While this constitutes work in progress, at the current stage AR[t]chive makes it possible to view archive data as virtual elements in a real three-dimensional space; to manipulate and rearrange these directly using one’s hands; and to feel truly immersed in the resulting composition.

An augmented reality environment may allow users to remix and recontextualize archived materials in ways that would not be feasible using other interfaces or interaction frameworks – for instance a web-based UI. Ideally, users should equally be able to create a link chart for research or a virtual sculpture for fun – depending on their mood or goal.

The interaction design is left open to accommodate further tools, containers, collections or arrangements of archive data. By keeping the audiovisual design, interaction design and behavior consistent between the basic elements we may generate other structures based on these, as data visualizations based on the different types of relation present in the digital archive.

In the longer-term, participants should be able to save their compositions – arrangements of media items and other elements in physical space – and view them later, e.g. on a mobile device and/or web interface. It is also desirable to accommodate a multi-user experience, with multiple users wearing AR headsets, or even a mobile-friendly version of the software.

Abstract

Informed by contemporary research in performance studies, this writing examines the ongoing challenges and possibilities of using XR technologies to create a virtual archive of embodied theatre techniques. This is part of a research project working with the (analogue) archive of Odin Teatret in Denmark, in which we are facing the challenge of transferring the embodied knowledge of actors' training into a virtual navigation system which evokes interaction and affect. We begin by outlining a critical epistemological framework which calls for new accounts of knowledge distribution and the place of embodied and affective praxis within this frame. We describe the process of having different training strands from practitioners of Odin and pupils being mapped with the use of motion capture technology. Further on, we approach one of the key aspects of this research, that of the translation of such embodied techniques and movement qualities into data and, consequently, into an immersive experience of archival navigation. With this paper we aim to contribute to the discussion on documentation of embodied knowledge in present times, one which calls for new approaches to practices of transmission, archive interaction and embodied navigation.

Keywords

Embodied Knowledge, Virtual Archive, Body-as-Archive, Motion Capture, Translation, Theatre Anthropology, Epistemology, Document, Intangible Cultural Heritage.

Introduction

This presentation draws on new approaches in Performance Studies concerned with the development of an epistemological framework for studying theatrical training techniques through archival reconfigurations in virtual reality. Whilst these writings are informed by an ongoing interdisciplinary research project, the aim is to investigate what it means to develop, practice and perform an archive through the activation of Odin Teatret's (DK) embodied

legacy in a virtual environment, addressing the translation of technique through immersive technology whilst developing dramaturgical approaches to archival practices.

Epistemology, a field of study traditionally linked to philosophy, has undergone substantial developments in the past few years, transitioning from a more traditional way of investigating a subject that knows singular with a focus on rational thought, paving the way for a more complex description of knowledge as "situated" [1] and "tacit" [2]. It has adopted theories that presuppose thought and cognition as "embodied" [3] and "enactive" [4], subject to, rather than disconnected from, emotion [5]. Following what Theodore Shatzki has called the practice turn, a notion that is linked to Performance Studies as much as to contemporary social theory, the concepts of knowledge and truth are mediated both by interactions between people and by arrangements in the world. Shatzki considers knowledge not as "the property of individuals, but rather a characteristic of groups, along with their material configurations" [6]. A contemporary archive of theatrical training, therefore, can no longer depend on a static system of representations: "Not only practical understanding, but ways of proceeding and even the configurations of the material environment represent forms of knowledge - it presupposes propositional knowledge and depends on them" [ibid.].

Embracing these ideas, we situate our epistemological account in relation to long-standing practices of work on the knowledge theory nexus in feminist, queer and other critical studies which include the articulation of identity and otherness as entangled matters [7,8,9,10,11]. Furthermore, we ask: what does it mean to account this entanglement as embodied knowledge in the context of a performer?

More recently, this framework has given voice to a growing demand from the performing arts field to document and analyse creative processes and techniques- which in an artist's vocabulary is called training- from an embodied perspective that connects the process of making, an artist's

poetics, to a broader social and political structure. As John Matthews notes, "Because of the specific problems presented by being a body-in-the-world today, training has achieved a new status as a global ideology" [12].

Moreover, the progress made in the fields of technology, information theory, computer modelling, and immersive multi-sensory displays bring the notion of the body-as-archive into a new perspective, especially with regard to theatrical techniques.

Praxical Agency, Technology, and Archive: Incorporating the Practices of Odin Teatret

Odin Teatret is one of the oldest theater groups in the world, with a tradition of research in embodied practices for more than fifty years. The group is the main force of the broader artistic institution known as Nordisk TeaterLaboratorium (NTL) in Denmark, which today is also home to new generations who have built their artistic work in dialogue with Odin's legacy. Over these decades, Odin has built up an extensive archive that is a fundamental source of knowledge for creators, academic students, and theater researchers. This archive involves not only the written documents stored over the years of its long history, but also the codified physical training methods that the group developed to enhance the actor's bodily skills and presence.

A performer's praxis incorporates a series of embodied techniques, and as dance scholar Judith Hamera points out, technique is "the primary tool by which ideals are embodied or resisted"[13]. Thinking "the body-as-archive" [14,15] through the documentation of technical processes, we align with current concerns in the field of Cultural Heritage, where the notion of "document" is being rapidly transformed. Document "has become multimedia information, often even a dynamic form of information that is fully embedded in interactive systems" [16]. In this sense, the dissemination of information through documents has become fluid and volatile. We can argue that "the value of interactive multimedia culture tends to be based on experiences of interaction with interactive multimedia devices, rather than documents"[*ibid.*].

In this way, we follow the current discourse on archival practices by urging users and developers to reread history as a reconfiguration of documents, oral tales, and reconstructions through affective transmissions, where "architectures of access [...] place us in particular experiential relationships to knowledge"[17].

During this project, we are facing the challenge of designing a navigation system through virtual reality, allowing for an embedded embodiment to engage interactively and creatively with the archival material. One researcher in the field of Performance Studies focuses on the content of the archive, with particular attention for the embodied knowledge of Odin Teatre's performers and their trainings, and its translation into metadata. The other

researcher works in the field of computational modeling and virtual technology research and focuses on the design of the navigation system, finding solutions to inform interactive databases.

The challenge is to document actor training techniques in a digital and virtual manner, while allowing for a situated, personal approach, starting from the particular body-as-archive of every practitioner. Instead of focusing on only one Method, informed by the long actor training tradition of Odin Teatret, the interactive navigation design allows space for a genealogy of practitioners to unfold, including both Odin's performers and the new generations resident in their space. As such, the archive becomes a space to incorporate the tensions between subjective transmission and method-acting paradigms.

The body as a living archive is in perpetual modulation and hence not only stores but also creates and redefines the ontological nature of movement and performance into an enduring ephemerality – which corresponds to the changing position of the archive and memory in our digitized culture [18]. The interactive navigation system of the archive should hence not only be used to reconstruct embodied techniques, but also allow for interactive and creative transformation. The development of the navigational tool is informed by current dramaturgical and psychogeography strategies of drifting: a moving through the archive in an undirected way, in which the user charts its own course, however situated and organized by open systems.

On a very concrete level, the starting point are the returning principles developed by Eugenio Barba, the founder and director of Odin Teatret: a series of continuously elaborated concepts and techniques that structure a training. Barba considers the actor's craft in three meanings: he refers to 1) craft as technical skill; 2) as energy or kraft (strength, power in Norwegian); and 3) as the personal and professional identity, forged from technical skills and kraft. These three interrelated meanings are not elaborated from aesthetic or stylistic choices in different performance cultures, but from "pre-expressive scenic behaviors upon which the different genres, styles, roles, and personal or collective aspects of the traditions are all based" [19]. These recurring principles are: altered balance (an alteration of the daily technique of walking, of moving in space, and of keeping the body immobile, which leads to complex, seemingly superfluous 'luxury' balance), dynamic opposition (the way in which a performer's body is shaped by a myriad of micro-tensions between opposing intentional forces), consistent inconsistency (the ways in which scenic behaviour is consistent within the realm of theatrical practice, but inconsistent in terms of daily life), reduction (reducing the size of action in space whilst maintaining the energetic quality in time), equivalence (the building of scenic equivalents to daily behaviour), and actor's dramaturgy (the amalgamation of the pre-expressive principles in the actor's body-as-archive), and they are

investigated with precise reference to the metaphors and technical vocabulary of various performance traditions around the world by Barba [20]. They reside in written documents, audiovisual material, and, most importantly, in the body archive of practitioners.

Barba led an extremely interesting study about the use of energy within several theatrical traditions. He describes the importance of manipulating the energy that exists in any living body as the key to acquiring an extra-daily presence in a theatrical context:

“Every theatrical tradition has its own way of saying whether or not the performer functions as such for the spectator. This ‘functioning’ has many names: in the Occident, the most common is energy, life, or more simply, the performer’s presence. In Oriental theatrical traditions, other concepts are used [...], and one finds expressions like prana or shakti in India; koshi, ki-hai and yugen in Japan; chikara, taxu and bayu in Bali; kung-fu in China. [...] It is paradoxical that this elusive quality is arrived at by means of concrete and tangible exercises.” [21]

Because of the many words one can use to describe such presence, for the purpose of this paper, we will stick with the word quality.

Navigation, affect and translation

In the past few months, we have begun with the process of motion capturing the practitioners involved in the project.

In this mapping of techniques, we are undertaking 4 strands of training inherent to Odin's tradition, and which are dealt with extensively in the current archive:

- Intersections between rhythm and commedia. Here the focus lies on rhythmical techniques that enlighten notions of rupture, dramaturgy, balance, improvisation and relation with objects.
- The Bridge of Winds vocal and energy work. The Bridge of Winds is an international theatre group, incorporated into the NTL and led by Odin Teatret's actress Iben Nagel Rasmussen. The group's training tools have been distilled in five different kinds of exercises. Each of these five exercises were devised to cultivate a specific working energy. The exercises evoke precise corporeal qualities from which the performers learn to draw their theatrical presence.
- Roberta Carreri's Dance of Intentions. This Odin Teatret's actress has developed a complex training process which focuses on an elaborated work of the spine and eyes to activate organic creative material. Her work draws on many masters of Japanese theatre traditions and in a key concept she calls *dynamic immobility*, which brings awareness to inner movements of one's body (Figures 1, 2).

- Vocal and breathing work. Here the focus lies on subtle corporeal layers engaged with vibration, resonators, and flow. Odin Teatret has built a consistent set of techniques to investigate this realm.

Figure 1. Roberta Carreri during her motion capture session, September 2021. ©Bruno Freire

Figure 2. Roberta Carreri and Patrick Campbell during their motion capture session, practicing one of Carreri's exercises called Pushing and Pulling, September 2021 © Bruno Freire

These strands of practices are mapped into data and performed several times, with intermissions for feedback on the capturing process, by 10 practitioners, both performers from Odin Teatret and long-term pupils of them, which throughout their own careers have incorporated and transformed the original practices, adapting them accordingly to situated cultural circumstances, professional careers and contemporary politics that have affected the theatre landscape. This collaboration reinforces therefore the genealogy of the practices investigated, starting from their creators reaching new generations.

When creating such an archive, new possibilities and challenges arise alike. The body of the performer, as well as that of the avatar, present and not present at the same time [22], encode the information within them in two parallel ways. The physical body carries the embodied knowledge in its materiality, while the virtual body holds patterns of

information which can change with the slightest tweak in the code. Thus, it is this translation of information from embodied to patterns of data and then to an experience, which will reintroduce the archive as an embodied experience, inevitably of another nature than the one first captured with the practitioners. We are called to translate corporeal energies into virtual forces, physical bodies into their abstracted virtual counterparts, from physical and vocal technique to metadata to an immersive textural architecture for navigating archives.

After an intense period of experiments with the data captured, we came to realize that the heart of this affective translation process lies indeed on the texture of the archive, the (virtual) space in-between the user and a practitioner's avatar. We have begun to design environments that can change one's movement quality, providing visual stimulus for interaction, allowing us to expand the digital topological analysis and description of actions into an affective and immersive experience to the user.

The interweaving of these textural formations builds the archive like a net: a fabric of lines, textures that make the materiality of this construction more "archi-textural than architectural" [23].

This term, following a tradition of critical thinking in geography and space studies, refers to

"[...] the communicative fabric that mediates between the structural properties of space and the spatial or communicative practices that (re)produce space." [24]

We are therefore, ultimately, aiming for a system which- inspired by Deleuze's ontology- will unfold space as a dynamic force, embedded in topological textures which articulate difference through interaction (Figure 3).

Figure 33. Environment interacting with performer's movement, from Roberta Carreri's exercise called Six states of Water, January 2022. © Ioulia Marouda

Aligned with Deleuze's enunciation that "difference in quality is always subtended by a spatial difference" [25], we argue that the articulation of these differences in one's inner processes can be produced by the encounter of the user with a designed environment. Encounters, from his

perspective, are generative and catalysts of processes of making sense [26], altering one's bodily qualities in similar fashion to the ways in which the recurring principles mentioned above are articulated to enhance a performer's presence.

In dealing with theatre techniques, one's interest and research lies in creating and codifying different *qualities* of moving which are filled with subtle intentions, intensities. In a few words, more than creating scores of movement, an actor looks for the inner processes within these scores. These inner processes have, naturally, an intrinsic relation to physical patterns of movement- slow, fast, strong, soft, etc.

From this context, we have begun to embrace Suely Rolnik's words:

"[...] asking about the politics of inventory becomes necessary since there are many ways to approach the artistic practices one wants to inventory. Such policies are distinguished less by the technical options that guide the production of an archive, and more by the poetic force that the proposed device itself is able to convey. I am referring to its aptitude to make the practices inventoried have the possibility of activating sensitive experiences in the present, necessarily different from those originally lived, but with the same critical density. Faced with this proposal, a question soon arises: what would a poetic inventory itself be like, that is, the production of an archive "for" and not "about" an artistic experience or its mere cataloguing, pretentiously objective?" [27]

As we are now, these designed virtual environments have become praxical territories that stimulate proprioception and kinesthesia, activated through the play between the (im)materialities of the virtual and the actual (Figure 4). As (author's name) has mentioned elsewhere: "The term praxical territory denotes the discipline-specific knowledge we each carry and its imbrication with our wider, lived subjective experience. This fusion of craft and life opens up a 'space and place' that reverberates with legacy and landscapes of mutual belongings." [28].

These new technologies we are playing with are becoming able to allow us to think processes of archiving differently. Not anymore as mere reproductions of what we suppose as truth, but as different translation systems which expose other logics to the process of acting upon knowledge. We begin to step away from the process of knowledge representation towards processes of techno-organic translations, which allows techne to be constantly actualized and re-assembled as models for praxis and transmission.

Figure 44. Environment interacting with performer's movement, from Roberta Carreri's exercise called Six states of Water, January 2022. © Ioulia Marouda

Conclusion

We have shared in these writings an ongoing research process, which aims to nourish the pressing discussion in archive studies on how to account for the documentation of embodied knowledge and intangible cultural heritage. The demands of such a discussion in current times call for a careful rearticulation of the goals of the production of archives, bringing space for the experience of the encounter of a user with the living materiality of the documents archived to unfold into new ways of making sense of the embedded (embodied) knowledge displayed.

By elaborating on hybrids of both physical and virtual spaces, we allow a user to drift towards a new awareness of embodied knowledge transmission, production, and distribution, in which the freedom of a theatre laboratory provides the space for an interactive and creative encounter with codified artistic techniques and practices through virtual reality immersion. In this sense, the archive becomes a dramaturgical tool for the actor, dancer and performer, an 'architecture of access' to find one's way through the great amount of data available nowadays through lived experience. By treating archive/embodied heritage as an interactive tool where the main focus is on an interdisciplinary functionality of one's experience, this research gives voice to its potential on fostering innovative expressive communication.

The Australian Emulation Network: Accessing Born Digital Cultural Collections

Melanie Swalwell

Centre for Transformative Media Technologies
Swinburne University of Technology, Australia
mswalwell@swin.edu.au

Abstract

This paper outlines a new funded project which aims to conserve and render born digital artefacts widely accessible by establishing an Australian Emulation Network. High value cultural collections from university archives and the GLAM sector requiring legacy computer environments will be targeted. The project expects to generate new knowledge across media arts, design, and architecture. Expected outcomes include stabilising and providing researchers with emulated access to born digital cultural artefacts, sharing legacy computer environments across the network, and establishing an Australian software preservation community of practice, building skills in preserving and emulating digital cultural artefacts with substantial future applications also in scientific preservation.

Keywords

Media arts preservation; digital infrastructure; emulation; Emulation as a Service Infrastructure (EaaS); software preservation; digital preservation.

Introduction

Australians were – and continue to be – significant contributors to the development of digital media arts, design, and architecture internationally. But our digital art and design history of the last thirty or more years is fragile and largely inaccessible to researchers at present, having only recently begun to make its way into cultural institutions and other archives. Such born digital artefacts constitute the record of how we became digital, from earliest endeavours right through to very recent history. The risk of losing this heritage material is real. This project will stabilise these collections so they are not lost, and make these digital creative and cultural artefacts accessible, through emulation. The physical media on which legacy digital objects are stored – whether magnetic or optical (i.e. floppy disks, CD-ROMs) – deteriorate over time. Obsolescence of computing environments is also a significant problem. Once computer hardware, operating systems and utility software become obsolete, files and other software dependent artefacts cannot be opened or run without digital preservation interventions. The solution to these twin problems involves the creation of disk images of obsolete media carriers, which can then be run under emulation. Emulation simulates the function of

obsolete systems and is a key digital preservation strategy for accessing content. These are now widely accepted solutions. For example, the British Library aims to image its entire disk collection, making it available to users in its Reading Rooms [1]. While not trivial, the two-part operation – imaging and making collections available through emulation – is eminently feasible. Realising the scale of the task, digital preservationists agree that international networked, collective action is a must [2], with CSIRO advising “Digital preservation urgently requires coordinated, national, cross-sector approaches to avoid losing access to historical digital materials” [3].

This project is rooted in both international collective action and national, cross-sector collaboration. We will join recent international infrastructure developments – notably the Emulation-as-a-Service Infrastructure platform (EaaS) – together with the learning that our team has gained from research and practice in disk imaging [4]–[6]. We will assemble ‘end-to-end’ software preservation infrastructure in Australian university and GLAM (Galleries, Libraries, Archives and Museums) institutions: this will enable an organisation that currently cannot access a file or an artwork to create disk images and emulate these in house.

Disk Imaging and Emulation

The first part of the process involves creating disk images. Previous work has shown that disks that have not been kept in ideal circumstances fail at a higher rate to those stored in climate controlled conditions (61% to 94%), highlighting the perils that legacy collections with non-optimal storage histories face [4]. One Stanford study found optical media was failing at an alarming rate, with only an 8% success rate imaging CD-ROMs [7].

The second step is to emulate imaged content. Developed by computer scientists at Freiburg University, the Emulation-as-a-Service (EaaS) platform provides access to obsolete computer environments (hardware, operating systems (OSes)) enabling legacy software and other complex digital artefacts to be emulated and accessed by users in a web browser. The most developed emulation solution, EaaS is being used or evaluated at a number of institutions, including Rhizome, the Tate, the Canadian Centre for Architecture (CCA), and the Dutch Digital Heritage Network [8]–[11]. We are currently using it in Australia in two ARC Linkage Projects lead by the author –

“Play It Again: Preserving Australian videogame history of the 1990s” (LP180100104) and “Archiving Australian Media Arts: Towards a best practice method and national collection” (LP180100307) – where it has proven a very valuable tool for rendering the complex digital artefacts we are working with: 1990s games and 1980s and 90s digital media art. Funding from the Sloan and Mellon Foundations to Yale University has enabled a group of US university libraries to develop a networked version, called EaaS (EaaS Infrastructure). EaaS delivers a scalable emulation service, linking US libraries with born digital collections into a decentralised network where they can not only emulate content in house, but also share images of utility software and preconfigured legacy environments with other library nodes [12]. For instance, if a manuscript in one library requires an environment of Word 7 running in Windows 95, an administrator can search for and download the environment someone else has configured, saving time and resources.

Access to the EaaS platform is now being offered via a hosted pilot through the Software Preservation Network (SPN) [13]. This pilot brings together over 15 US university libraries and archives such as Yale, Harvard, Stanford and Cornell University, which will use EaaS to share configured environments. SPN is a membership organisation which our partners AARNet and the National Archives of Australia have joined, together with these North American organisations keen to access the hosted pilot. SPN’s pilot is similar to what we will build. A gateway provides computing power remotely, tracking users and environments and managing resources (RAM and CPUs) as needed, so that minimal IT resources are required from an organisation wanting to run EaaS in house. Controller computers are used by node administrators to build environments in EaaS’s backend, and users access emulated artefacts via a webpage [14]. Such a setup was envisaged by EaaS’s creators as early as 2014, when they wrote of “an EaaS service-provider [being] responsible for efficient hardware utilization and concentration of technical expertise...[lightening] the memory institutions’ technical workload and requirements on necessary infrastructure” [15].

Network Participants and Aims

The project comprises universities (Swinburne University of Technology, RMIT, the University of Melbourne, University of South Australia, Western Sydney University, the University of Western Australia, and the University of New South Wales), National and State Libraries, other major cultural institutions (the Australian Centre for the Moving Image (ACMI), the Museum of Applied Arts and Sciences (MAAS), the Art Gallery of New South Wales (AGNSW), the Australian Institute for Aboriginal and Torres Strait Islander Studies (AIATSIS), and the National Archives of Australia (NAA)), software archives (the Australian Computer Museum Society), a research

technology provider (AARNet), and supporting overseas partners (Yale University, OpenSLX, Cornell University). This grand consortium is necessary as the market has failed to ensure that legacy content can be accessed, and most libraries and other archives in Australia lack the requisite infrastructure and know how. We propose to set up a network of fifteen university and GLAM sites across Australia. This will be a major national facility. Nodes will be located at the sites where digital creative and cultural collections are held. Setting up a network of organisations leverages collective effort and makes good financial sense [16]. The consortial approach builds on: existing networks such as the peak body National and State Libraries Australia (NSLA), collaborative work packages NSLA has undertaken [17], as well as previous projects in which Chief Investigators have been involved: Anna Munster and Sean Cubitt on “Reconsidering Australian Media Art History” (LP100200442) which produced the “Scanlines: Media Art in Australia since the 1960s” database [18], Harriet Edquist on “Design and Art Australia Online” (LE140100120), and Swalwell’s “Creative Micro-computing in Australia, 1976-92” Fellowship (FT130100391). Finally, the project directly benefits from the two aforementioned project collaborations involving installations of EaaS (at Swinburne, ACMI, AGNSW, and AARNet), and the specialist personnel associated (Dr Cynde Moya). The project has secured Australian Research Council LIEF (LE220100057) funding for infrastructure in the form of specialist expertise, vintage soft and hardware, cloud computing, storage, and tools to preserve, emulate, and share software resources across the nation, according to different organisations’ needs. The project will – through a combination of technical infrastructure and knowledge transfer – deliver software preservation and emulation capabilities across 6 of the 8 states and territories, with a high likelihood of future growth.

Joining together, we will build nationally significant digital heritage infrastructure, creating a network of technology, people, and emulation nodes seeded with legacy software and preserved content. Specifically, we aim to:

1. Stabilise at risk media arts and similar born digital cultural artefacts;
2. Deliver access to born digital cultural and artistic artefacts to researchers over an EaaS network;
3. Develop a Community of Practice (CoP) for software preservation in Australia, building skillsets and confidence in preserving and emulating digital artefacts.

Targeted Collections

We will stabilise and emulate culturally significant media arts, architecture and design collections. We target at risk born digital creative and cultural collections across five key domains: (1) media arts; (2) architecture and industrial design; (3) games and apps; (4) AR/VR; and (5) web and pre-web networking. These digital collections constitute key research resources which CIs and their teams require access to. As Sean Cubitt and Oliver Grau wrote of media art in 2011: “As a result of rapid changes in technology, many

major works made even 10 years ago can no longer be shown or are disappearing without a trace. If this situation is not addressed, we face losing an art form that is a central part of our post-industrial digital culture. To date, systematic global preservation and documentation campaigns do not exist” [19]. Part of the Media Arts Histories conference series, the so called “Liverpool Declaration” received some 237 signatures from artists, theorists, and curators, internationally. Cubitt and Grau’s assessment holds equally for other domains. Content is either already inaccessible, often at risk of being lost, or fast becoming inaccessible.

While the collections we will work with are disparate, a decentralised network of organisations and collections is precisely what EaaS has been built to service. What these collections demonstrate is a new focus on distributed collections across the nation, similar to what is seen in the UK AHRC’s “Towards a National Collection: Opening UK heritage to the world,” attracting an £18.9 million investment [20]. The inter-relationships that will surface between the collections will be one of the most exciting aspects of the research that this infrastructure investment will enable. That diverse collections will be rendered accessible through a single platform should augment their usefulness to researchers.

Significance and Benefit

Access to the abovementioned content will enable CIs and their teams to lead genuinely transformational research in born digital cultural histories, across the five domains. Few Australian researchers currently have access to born digital artefacts once computing environments become obsolete, unless they are running an emulation solution themselves. This means that scholars who are commenting on contemporary digital productions, for instance, are doing so without access to digital process or historical antecedents. Rendering these sources accessible will genuinely change what it means to undertake research. Rather than relying on second hand textual accounts or memory, researchers will be able to re-access historic titles or even previously out of reach design drawings, bringing new perspectives to historic and contemporary analyses. Emulation capabilities will generate new forms of evidence, citation – as has already started to happen in video game history [21] – and transformative methodologies. For e.g., architectural and design historians need new methodologies based in artefact analysis to account for the shift to digital design and modelling and the drift toward digital methods of documentation, from the mid-1990s.

We will build a technical and human network, training GLAM and university archival professionals with the skills they need so that the high value archival collections in their custody can be stabilised and rendered accessible. The project is premised on a conception of infrastructure as involving both people and technology. While the Australian GLAM sector has been developing digital preservation capacities, this has often targeted the ‘low hanging fruit’ of digitisation. Despite concerns about the greater fragility and

time criticality of stabilising born digital artefacts, progress has been much slower, particularly as regards software-dependent artefacts. These have often been placed in the ‘too hard basket,’ due to a lack of specialist skills and infrastructure. Each organisation is at a different stage of maturity in its ability to deal with complex born digital artefacts. We will train staff from nodes in universities and the cultural sector in how to create disk images where such training is required, or simply in how to build emulation environments in the EaaS backend. We will seed the development of a CoP by running web forums and seminars where practitioners can share their learning and ask questions, leveraging novel solutions to problems developed by those with more experience.

A Community of Practice will build confidence in the GLAM sector around born digital collecting. Existing GLAM infrastructure has not allowed for collecting or providing access to much of our contemporary digital heritage. This project establishes a CoP, which includes training in imaging and emulating such artefacts, as well as ongoing mutual support with the varied creative and technological challenges. This is critical professional development for the 2020s that will complement what is learnt in library and archival science and conservation degrees. The Australasia Preserves community is committed to the support of digital preservation strategies in Australian and New Zealand institutions, and recent activity indicates strong interest in an EaaS network across Australian institutions [22]. The establishment of such a specialist network will give our partner archives and others in the sector the confidence they need, making future collecting of digital design, including mobile applications, video games, social media, design and engineering documentation seem more feasible. This will in turn enable research into new forms of digital sociality and cultural production, such as app cultures and algorithms.

Deploying the EaaS platform enables legacy software and configured environments to be shared between nodes. Software products are both cultural artefacts worthy of study and enabling infrastructure for accessing digital content. Often, born digital files have been collected without the software required to open the files, or the operating system required for utility software to run. The process of building emulation environments is streamlined by the ability to share imaged software and configured environments. In addition, sharing effectively eliminates competition for purchasing scarce, second-hand software products. Emulation is now a viable strategy with a clear legal framework for use in Australian institutions. Recent changes to the Copyright Act (the “Research Exception”, in s 113J) permit a library or archive as defined in the Act to make research copies of copyright materials and to make these copies available to be accessed at the library or archive or another library or archive, provided certain conditions are met. Partners across the EaaS network will have access to a range of collections of utility software from sites including the Australian Computer Museum Society and the National Library of Australia.

CIs will further develop partnerships with others in the emulation field, for mutual benefit. Currently, Australian media art is probably being studied more in overseas contexts than at home. For instance, Dr Dene Grigar of the Electronic Literature Lab at Washington State University has hosted several artists to discuss and play their work. Dr Megan Heyward visited to make a “traversal” in 2019 – a technique of interviewing people with their artwork running on original hardware – and it was the first time she had been able to access “Of Day of Night” (1996) in almost twenty years. Video traversals constitute a useful form of documentation but they are imperfect as a method of preserving what are inherently interactive works. Not many of these labs are pursuing emulation, so they will likely find themselves unable to access work in the future. Cornell University is an exception. It has been one of the leaders in the US. Prof Timothy Murray wrote widely about and collected CD-ROM art when it was still contemporary, curating the Rose Goldsen Archive in the Cornell University Library; the Library developed a widely lauded online digital preservation tutorial; pioneered good practices in the archiving and emulation of digital media art in an NEH-funded preservation project [23]–[26]; now they are a participant in the SPN hosted pilot of EaaS. Norie Neumark is keen to explore international research and exhibition opportunities between the various Australian and US based collections. Similarly, the Canadian Center for Architecture (CCA) is working with Yale to implement EaaS into their access workflows for born-digital material, specifically building it into their access interface SCOPE. Gaining access to our born digital heritage content now will position Australian researchers to lead debates in our respective fields of historic media arts, born digital design and architecture, and what emulation means for them. Continued contact with other international leaders – such as the CCA and Cornell – will enable us to develop new collaborations, and put Australian artefacts in international context.

While many born digital artefacts are historic, this infrastructure is about the future as much as the past. Rapid obsolescence is making access to relatively recent VR works challenging. Digital work practices are now integral in fields such as architecture, and the future of practice in other fields is similarly digital, presenting challenges in archiving including establishing rationales for preservation, archiving processes and achieving digital continuity. Future historians are going to require access to much contemporary media (e.g. social media) in order to do their work. While digital connectivity has come to the fore during Covid-19 lockdowns and there has been some focus on rapid collecting in relation to the 2020 pandemic (e.g. at NAA’s “Documenting Covid-19 in Australia” (2020) symposium), born digital materials acquired now will need appropriate computing environments to remain accessible into the future.

The Emulation Network will span academic and GLAM institutions, leveraging existing network infrastructure operated by AARNet. CIs and their teams will either access EaaS within GLAM reading rooms on the premises, or on

university premises. Future copyright reforms that are anticipated but not yet enacted may enable organisations to offer remote access to authenticated users in the future [27].

Building software preservation and emulation infrastructure in Australia will have far reaching benefits for CIs, their teams, and the broader research community. While the project focuses on art and cultural domains, the technological and methodological development will have applications across all areas that use and need to study interactive systems. Inevitably, other software dependent collections and datasets will be identified at the universities and partner organisations which the infrastructure can be used to stabilise and emulate, including historical artefacts in education, social sciences and empirical data-rich science. This is in alignment with FAIR data principles, which emphasise that data should be Findable, Accessible, Interoperable, and Reusable [28] and will have important benefits for reproducible science, including software required to reproduce computationally dependent research results. Bodies such as OSF (Open Science Foundation) encourage the publication of complete research works – that is, an integrated set of data, analytical code, results and interpretation that can be re-run and modified at will by future readers and researchers. This clearly requires solving the same issues of long term change in hardware, OS and software that we are addressing in this project.

Stabilisation of obsolete storage media is an area of great need. Collections are at risk with the National Film and Sound Archive noting the “consensus among audiovisual archives internationally that we will not be able to support large-scale digitisation of magnetic media in the very near future. Tape that is not digitised by 2025 will in most cases be lost forever” [29]. Born digital components bring special preservation and access challenges: videotape degrades, magnetic computer disks suffer bit rot, computer hardware quickly becomes obsolete, and software dependencies present special access challenges. Time is of the essence if we are to prevent the loss of digital heritage, protecting the investment Australia has already made via arts funding. And as already noted, an emulation solution is not just needed for archiving the past, but increasingly for accessing recent scholarship, and for contemporary and future digital cultural collections.

Many organisations are grappling with how to develop a full production process for users who encounter content that requires emulation in their collections and need to use it for informational purposes. Yet few institutions have the infrastructure or skills to offer researchers access to born digital artefacts requiring emulation. This project’s focus on emulating obsolete software is identical to the needs of such users and readers. If we are to develop a capacity to safeguard digital collections in Australia, then we must work together, both across the sector and with those who have developed platforms internationally. We need to train a cohort of skilled people and support them with a CoP. We intend to do just that, giving the often professionally siloed GLAM professionals – archivists, librarians, and

conservators – a place where they can turn for help when they run into challenges.

Finally, EaaSII has the potential to complement and increase capability within other eResearch frameworks and institutional platforms, including in scientific and other research data management. This is in line with the international push towards open access, as journals and university repositories increasingly require deposit of research data that supports a thesis or publication.

SHORT PAPERS

Archiving Strategies in the Computational Age: Creating a Media + Data Art Digital Media Library Based on a Curatorial Methodology

Abstract

As an innovative solution to the challenges of documenting, indexing and researching new media art, this proposal proposes the creation of the Video-Policy media library (from now on MeViPol) within the framework of the research group HUM-1062: Policies of the audio-visual image and its technological environment in artistic practice. This project focuses on two lines of research. On the one hand, curatorial strategies for archiving works developed in Media Art and Data Art. On the other hand, we consider that the artistic trends encompassed in these two blocks have characteristics of obsolescence due to the rapid advance of technology, so MeViPol proposes a virtual space in which both the programming code with which these works are developed and the records generated for their development, both technical and conceptual, is collected.

Keywords

Interactive Archive, Media Art, Data Art, curatorial politics, territoriality, otherness, art research

Introduction and background

We start from the conviction that audio-visual artistic production and its exhibition and dissemination are knowledge producers. Thus, we face the complexity of contemporary artistic practice. It is increasingly necessary to provide multidisciplinary tools to society and local culture to encourage understanding of new audio-visual languages. From this point of view, we focus our attention on the functionality of the media library, whose main purpose is to protect the audio-visual memory and to point out the importance of image and sound in culture.

Media libraries are resource centres designed to meet the academic community's cultural, educational, or research needs. For Marita Sturken, Professor in the Department of Media, Culture and Communication at New York University, "postmodern excavations of the archive" operate by drawing on its contents and at the same time dismantling its structures. In this sense, "much contemporary art can be seen as a deliberate disarrangement of the archives - institutional, authoritarian, colonial - that were considered a guarantee under modernism" [1].

Although the artistic practices around Media Art and Data Art have become critical elements at the intersection of art, science and technology, there is a risk that threatens these creative tendencies, namely rapid technological obsolescence, which implies, among other things, the impossibility of executing certain projects if the technologies with which they were created are no longer updated or their development is halted. To face this problem, it is essential to develop innovative solutions to deal with the collection of documentation, indexing and media art research [2], i.e., creating up-to-date archiving policies.

We can observe that the computational factor is becoming more and more common in the creative field as it allows for a more fluid construction of interdisciplinary environments of interaction between human beings and technology. As Foncuberta (1998) states: "Electronic culture forces us to rethink the whole cultural and political architecture of our value system, it induces us to investigate its remains and to examine ourselves" [3]. In the artistic field, working with specific programming code has enriched the different disciplines by providing the layer of artificiality that allows the spectator/user to interact with the work more directly, making them a participant in the transformation and state of the work [4].

Other studies in this line of research include the curatorial project entitled Deep Storage, 1998. This became the first thematic exhibition of what is today, for many, one of the most important trends in the art world: the figure of the archive. In the catalogue of Deep Storage, Ingrid Schaffner noted that the main aim of the exhibition was to address "storage and archiving as image, metaphor or process in contemporary art. In many cases, fine art storage has practically become an art in its own right" [5].

From this conceptual framework arises our proposal for the creation of MeViPol, whose aim is to meet the pedagogical, cultural and research needs of the Spanish-speaking academic community specialising in Digital Humanities, specifically in the creative environment linked to Media Art and Data Art. We are committed to reflecting on the

diversity of styles in contemporary creation from a broad understanding that integrates new artistic trends and their staging. We believe that observing these movements will provide new research methodologies and diverse processes of creative experimentation.

The fundamental strategy of this project is oriented towards promoting and experimenting with different multi-purpose digital technologies of modular visual programming that are being incorporated into various trends of artistic expression. These new tools demonstrate their usefulness in representing questions around the construction of identities as a differentiating element in the constitution of societies [6] at a time when the figure of the other, the body, the subject, the territory and, in short, coexistence are inevitably crossed by these digital technologies. In this sense, the creative experiences inscribed in the analysis of the ideas of otherness and territorialisation that we intend to highlight are containers of a specular reflection that unites audio-visual praxis, production of the subject and research of the environment [7]. These principles will lay the foundations for establishing the curatorial line implemented in MeViPol.

This project intends to establish a certain taxonomic order from a purely artistic strategy such as curatorial discourse, that is, to create a "proposition, often affirmative, interrogative, inquiring or denouncing, whose arguments are the artistic manifestations selected by the promoter of the story itself" [8]. In addition, we tried to establish cataloguing based on the conceptualisation of a series of artistic works and practices that use audio-visual support and code support. In this way, MeViPol focuses on updating digital resources and their integration into academic research in the artistic field. We aim to articulate new relationships between theory and practice, linking concepts from science and computer technology with interdisciplinary artistic experimentation, using different digital tools and their transmission in workshops and exhibitions, to encourage, promote, socialise and disseminate the use of Media Art and Data Art.

The different lines of action that precede this project support the intention of establishing relations between contemporary art theory and computational artistic practise within the visual arts. The purpose of this is to point out the fusion between the scientific and creative methods to provide a humanist vision linked to the processes of creation related to Media Art and Data Art.

Initial hypothesis

Our hypothesis is based on the need to attend to the archiving of contemporary artistic material developed in Media Art and Data Art environments to create repositories of artistic work, paying special attention to the results generated with creative programming code, as well as to the software, hardware and resources needed for the

visualisation and compilation of the code with which they have been developed.

On the other hand, we consider it necessary to attend to this progressive incorporation of new generative and visualisation languages using curatorial policies and methodologies [9]. This updating is essential to be able to name, through artistic representation, the changes that the phenomenon of globalisation incorporates both in our experience of everyday life (virtualisation of the environment) and in the shaping of our identity processes, like the desire for identification, in the processes of subjectivation, in the perception of the environment and the Other, in short, in the modes of social encounter. This technological knowledge is a very useful instrument for an artistic reading of our present.

Objectives

In this context, the design and creation of MeViPol have been proposed for the management of Media + Data Artworks by the different formats, content supports and visualisation tools and code compilation. We offer the first approach to creating a diverse and combined collection of audio-visual material with other content in visual programming code accompanied by ad-hoc visualisation tools, which will allow us to collect the necessary information following the MIDECIANT model [9]. The objectives we propose for these purposes are the following:

Objective 1: Virtualisation and musealisation of Media Art and Data Art.

This phase aims to virtualise and musealisation of audio-visual products and their standardisation and homologation to design a repository of artistic production as a historical repository of Media + Data Artworks.

Objective 2: Creation of MeViPol as a repository of the artistic practices of Media + Data Art.

The idea of the MeViPol project arises as a space with a clear academic component for the reinforcement of artistic production conceptualised in principles of otherness and territorialisation with works ascribed to the categories of Media + Data Art.

Objective 3: Content management, access policies and MeViPol dissemination platform.

This objective contemplates the policies of incorporation, acquisition, donations, free access to part of the collection, with restricted access to a database of scientific rigour open to researchers.

Objective 4: Develop workshops and artistic production proposals based on transversal competence training.

The workshops will introduce the tools and produce Media + Data Art projects based on the thematic strategies that characterise MeViPol. The interdisciplinary workshops will specialise in a range of modular visual programming tools,

which will be kept up to date to review the latest software updates and study and incorporate them into these workshops. In this sense, a study has been initiated to establish categories and typologies of software according to their creative use from their application in different innovative trends [figure 1].

Figure 1 Diagram showing some pieces of software organised by their typology of use in a hybrid creative environment. Image created by Vertedor-Romero, J.A.

Methodology and working plan

The nature of this project is open and alive in its creation and development, where MeViPol is presented as a qualitative online repository formed by artistic projects that will be selected following curatorial criteria and methodologies through various strategies, these are projects created in the workshops, open calls and own exhibitions, following the line that so far has been developed from the research group, HUM-1062. The aim is to substantiate a development community that offers free access to all the documentation and streaming broadcasts of projects in progress, making the devices that generate them visible.

As for the curatorial methodology to be followed, we will reference the principles established by Harald Szeemann. He is one of the key figures that helped understand how curatorial practice expanded as an autonomous field from the 1960s. His contributions form cartography of curatorial practice, from its independent origins in the 1960s and 1970s to the experimental programmes developed by European and American institutions in our own time. Szeemann describes his curatorial methodology as "structured chaos". His eclectic and varied exhibitions "translucent a boundless energy for research and an encyclopaedic knowledge not only of contemporary art but also of the social and historical events that have shaped our post-Enlightenment world" [10].

On the other hand, there are numerous methodological cases for classification or taxonomy concerning the vocabulary of these new media, languages, and codes, aiming to contrast and categorise works developed in interdisciplinary artistic fields. These studies "start from definitions and technological components of new languages" [11]. In this sense, we will take different references as a methodological basis, such as the case of the "Variable Media Questionnaire": The Variable Media approach, whose objective is to preserve the current work of art, a product of new media. This methodological reference develops a questionnaire based on a taxonomy of new media through behavioural categories [12].

To conclude this section, the following flowchart shows the interaction of the project with the parties (figure 2). On the one hand, MeViPol incorporates the experience in developing the structure of similar repositories in previous research projects, such as VOREMETUR, AEMA or MIDECIANT, in which researchers currently present participating in the MeViPol project has worked. We also consider production lines, curatorship, workshops and internationalisation as resources that will provide MeViPol with content. We add the dissemination of results using their internationalisation and transfer through festivals, publications, congresses and other collaborations. Finally, access for researchers is indicated as the main point of consultation.

PhD in Communication in the audiovisual research line at the University of Málaga. Master's in Interdisciplinary Artistic Production at the Faculty of Fine Arts in Málaga. Research support grant for postgraduate studies at the University of Malaga. Artist-in-Residence Scholarship at the Faculty of Fine Arts in Malaga. Fine Arts at the Faculty of Fine Arts in Malaga.

Robles-Florida, J.C. Lecturer in Sculpture since 2019, with three six-year periods of research CNEAI, active, since 2019, Director of the Department of Art and Architecture of the UMA. My artistic research is concerned with making visible the conditioning factors of the formation of desire to elaborate strategies for approaching the Other in the current moment of mass media globalisation of culture. Through photography, video, sculpture and intervention in public space, I open a reflection where the contemporary multitude inhabiting is the protagonist.

Newsslider, smart navigating archives

Danielle Arets, Martina Huynh, Jonas Althaus, Tijmen Altena

Fontys University of Applied Sciences, Journalism & Responsible Innovation
Tilburg, Netherlands
d.aret@fontys.nl

Abstract

Currently, the potential of (media) archives in journalism is underutilized. Historical data is scarcely used to connect historical developments to current events. With the design research project Newsslider, we explore how emerging technology (artificial intelligence and natural language generation) can empower journalists to connect historical events to contemporary reporting.

Keywords

Archives, Artificial Intelligence, Research through Design, Journalism

Introduction

The digitization of information has created enormous data volumes in recent years. The digital archives are a rich source of information. However, their potential is often underused (Hawkins, 2021). To what extent can we mine archival information so that we facilitate journalists in using historical data to contextualize the debate on current issues better? How can AI support journalism to include traces of the past in their daily reporting?

In 2019 a research group of journalism researchers from Fontys University of Applied Sciences in Tilburg, Cream on Chrome, a design research studio in Rotterdam, ID Fuse, a Utrecht based AI- development studio, and the Netherlands Institute of Sound and Vision in Hilversum, supported by the fund for Creative Industries, embarked on a design research journey exploring the possibilities of using AI tools to unlock historical information for journalism.

In our design research project, we explored three topics: The German refugee crisis, Brexit and Climate Change. All themes are frequently in the news - and are expected to remain topical for some time to come. Moreover, a historical context is crucial for these themes to interpret and understand the current events and future developments.

Utilizing a mixed method approach (Creswell, 1999), we combined Critical Discourse Analyses (CDA)(Fairclough, 2001), sentiment analyses using automated text mining, And named entity linking, and research through design (Stappers & Giaccardi, 2017).

Critical Discourse Analyses

For the first case study, the German Refugee crisis, we researched how German chancellor Angela Merkel's much-cited phrase "Wir schaffen das" ("We can do this") was portrayed in the German newspaper Süddeutsche Zeitung between 2015 and 2018. As a result, this sentence became a touchstone for migration politics in German media.

Utilizing Critical Discourse Analysis, we came to understand that within three years, the meaning of the famous quote shifted fundamentally: In 2015: "We (the European Union) can help refugees currently stuck in Hungary" to 2016-2017 "We (German citizens) can help accommodate refugees by making an extra effort" to "We (the German economy) must integrate these refugees and give them all a job" in 2018.

The CDA gave a clear insight into how discourse is changing against the backdrop of social, cultural, and political change. The message Wir Schaffen Das thus takes on a new charge.

4-D News installation

To explore how audiences value and interact with this contextual information, Cream on Chrome translated the insights into 4-D News, an exhibition piece that allows visitors to pull up or down a physical scrollbar. Visitors can explore bits and pieces of the original 30 newspaper articles that appear, disappear, and replace each other, thus revealing different sentiments and framings in different times. In correspondence, a small monitor displays the everchanging definitions of "WE", "CAN DO" and "THIS", systematically revealing shifts in public discourse. The 4-D News installation was exhibited at Z33 House for Contemporary Art, Design & Architecture (BE), BIO26 Design Biennale (SLO), Dutch Design Week (NL), and at Hamburg Museum of Arts and Crafts (DE). The

installation was actively used in the exhibition and visitors reported gaining a better understanding of the German Refugee Crisis through interaction with the exhibition piece. The playful interaction with time and seeing the subtle shifts in discourse were specially mentioned as a valuable way of providing information. The installation also aroused interest among media organizations and journalists, who saw opportunities to contextualize the news better in the four-dimensional news space.

Figure 1. 4D News installation by Cream on Chrome.

AI Analyses

In a follow-up study on the topic of Climate Change and Brexit in 2020, we decided to translate the physical installation into an online tool that would encourage wide use and could potentially support both journalists and researchers in their work. This involved partnering with ICT studio ID Fuse, and Clariah Mediasuite, the archive of the Netherlands Institute of Sound and Vision.

The Media Suite is an innovative digital research environment, that allows researchers to explore and experiment with multimedia data collections. With advances in Natural Language Processing and Artificial Intelligence driven methods of extracting information and correlation from textual data, ID Fuse expanded from the above-described process by comparing related keywords to track changing terminology and complex modes of data analysis.

Using these AI-driven methods, we mapped the changes in the climate and Brexit debate. We displayed the tracked information on a timeline, indicating different terminology, sentiments, and important iconic images on the time axis. This provides an overview of how both debates change over times.

The smart technology search options were incorporated into a simple design interface by Cream on Chrome. The Newsslider tool allows users to enter a search term, for example, climate change. Based on named entity linking-where AI intelligently searches the archive and tracks common word combinations (acid rain, emission rights,

ozone layer)- related search terms then appear. Next, a timeline shows how often these terms have been used over time. The polarity of these themes is also displayed. Finally, the timeline shows image fragments that have had a substantial impact on the debate, such as a UN climate conference, Greta Thunberg's speech or a climate demonstration.

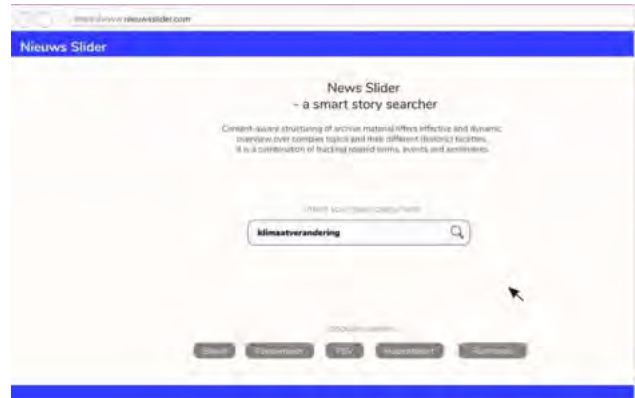

Figure 2. Online tool Newsslider

Figure 3. words linked to climate change, overview of sentiments and iconic images

Design Sessions

During the development of the tool, we conducted four design sessions using context mapping (Visser et al., 2005)- to explore how the tools can be meaningful to (investigative) journalists and researchers. Participants were asked to construct a view on the climate change debate where they share both ideas of the past, the current situation, and dreams of how a future debate could be reported upon.

We organized four context mapping sessions with:

1. Three chief editors and four journalists of regional

and national news outlets

2. One chief editor and three investigative journalists of a public broadcaster
3. Six academic researchers on climate change
4. Four journalists of regional outlets and five ICT experts of Fontys University of Applied Sciences

In these sessions, we had participants experiment with historical data themselves, reflecting on how they currently incorporate historical information into their work and the methods used to do so. We then had them experiment with the Newsslider tool, engaging them in a conversation about how this service could be meaningful in their daily or future work. We ended the sessions by identifying opportunities for integrating the Newsslider tool into daily operations.

Insights

We came to understand that the tool is meaningful for journalists as it gives a clear overview of how sentiments change over time. Journalists say that they can provide better interpretation with these insights.

“This allows us to contextualize the news better and give a positive outlook on topics discussed in more nuance today. The tool shows we do make progress.”

“It also gives us as journalists good insights into ways in which the narrative is changing and how we can continue to question it in our research and interview process.”

The data journalists also mentioned that the tool is helpful as the named entity linking gives a quick and lucid overview of important search queries.

“I see many opportunities for quickly mapping social media data and making smart connections in the data. That could speed up our research process.”

The consulted academic researchers mentioned the tool could support the exploration phase of their research.

“We already use the media suite archive for our research, but see a lot of potential in the Newsslider to quickly identify research topics. The overview of iconic images is helpful in this.”

Furthermore, both the researchers and consulted journalists see opportunities in the tool for the dissemination of research and more public engagement in journalism.

“I find the way you make the archive attractive to the general public interesting. The inviting design and the visual overview of historical information invites to interact with historical information.”

“I could imagine this could be an inviting tool for our news users to navigate our archives.”

The insights generated from the sessions were used to develop a minimum viable product of Newsslider.

So far, the consulted climate researchers already implemented the tool in a scientific application aimed to develop new climate narratives.

The trajectory has also sparked journalistic interest in engaging with archives. The presentation of the tool to regional public broadcasters has now resulted in a follow-up study (2021-2022) focusing on the smart mining of the archive within a regional journalistic context.

Furthermore, we are exploring the educational use of the tool as a way to interest journalists early in their education in new smart search methods as well as ways to include historical data in the journalistic process

Reflection

The thinking through making approach (Rajmakers & Arets, 2015)- where the creation of the prototypes and the systematic reflection on them went hand-in hand, contributed to a fruitful collaboration between the disciplines (journalism researchers, design researchers AI developers, archive experts) involved in this project.

The physical installation of the Newsslider and the active interaction with the physical timeline by museum visitors was a vital step in the idea development of the Newsslider tool.

Incorporating all the complex technical AI capabilities into concrete mockups, allowed journalists and scientists to imagine how this tool could work within their own practice

The design research trajectory taught us that AI driven research methods can be meaningful for the journalistic practice. A design-driven approach in which making the research tangible at an early stage of the process, helps to understand and communicate the potential of new AI-driven research methods with journalists, chief editors and academic researchers.

Furthermore, the strong design language (tangible and visually appealing interface) contributes to a better understanding of the possibilities and the desire to interact with historical data.

To conclude, our design research shows the potential of an AI tool to better unlock the archive for journalistic and scientific purposes. Further research on how this can be applied in practice and how it results in more meaningful journalism is highly desirable.

Conservation of Multimedia Art: Case Study on Teoman Madra Archive

Selçuk Artut, Begüm Çelik

Sabancı University

Istanbul, Turkey

selcuk.artut@sabanciuniv.edu, begumcelik@sabanciuniv.edu

Abstract

This paper focuses on the archival process of the multimedia artist Teoman Madra who is an acclaimed artist creating artworks with technological means of multimedia capabilities between the 1960s to early 2000s. Preserving multimedia artworks is a challenging task that requires comprehensive solutions due to the nature of the always-changing technological environment. It is inevitable that there is a paradigm shift from the traditional approach to preserve the artworks as self-contained physical objects to a broader scope of regarding the artwork as an entity with its tangible and intangible dimensions. This manuscript stands as the debut academic dissemination of the intensive archiving process of the Turkish multimedia artist Teoman Madra and it aims to shed light on the missing answers for the following question, "How did the media arts evolve in Turkey between the 1960s and 2000s?" The cataloging process of the linear media (VHS, BETAMAX, miniDV, negatives, diapositive, etc) and the methodologies implemented for descriptive analysis have been discussed in detail.

Introduction

No art movement or artistic thought in history has emerged out of nowhere. In the last few decades, there has been a huge increase in the number of digital artworks produced, and interest in this type of art has skyrocketed. In the plethora of audiovisual carnivals, while revisiting Teoman Madra's works today, this study aims to put the missing stone into its place to underline the importance of endorsing the continuous transformation of art's cumulative evolution.

Background: Teoman Madra's Art Career

Photography and multimedia artist Teoman Madra was born in Istanbul in 1931. After graduating from Galatasaray High School, he went to the United States in 1950 to study for his undergraduate education. His interest in Contemporary Art and Avant-garde Jazz Music grew during his education in California and New York between 1950-54. In 1955, he bought his first Voigtlander Vito B camera from a major during his military service in Turkey. In his own words, he defines himself as a Fluxus artist, literally after 1962, thanks to this camera that allows superimposing one after the other. In 1964, his first exhibition - The Abstract Exhibition with Jazz Lines was shown in Istanbul, Beyoğlu City Gallery.

With his debut exhibition of abstract photogram works, Madra had started his half a century career in art production. Between 1970 and 1990, he produced artworks influenced by Fluxus aesthetics that are mainly based on abstract photography, contemporary dance, and contemporary music.

Teoman Madra held his first exhibition abroad in 1967 at the Paris Young Artists Biennial, with the "Photograms in Jazz Rhythm" exhibition. Then, he continued to exhibit his photogram series, which he named Light Games, at home and abroad, accompanied by Modern Jazz music. During the 1970s, he tried to interact with multiple senses with light, music, and movement in the multimedia shows he organized around the concept of Synesthesia. Teoman

Madra defines Synesthesia as the combination of contemporary arts with aesthetic sensitivity and the definition of multimedia as the application of advanced technology to new areas of use in unusual environments.¹

In 1985, he acquired his first computer, the Amiga. While he continues to exhibit multimedia shows at every

¹ From a program note on the Synesthesia 83 performance at the Turkish American Society, 27th of May 1983

opportunity, after a while he begins to include computer-generated visuals in his works. He is one of the leading artists in Turkey, who prepares multimedia shows accompanied by contemporary music using these new technologies in the 1990s. In an interview, Madra summarizes his work as follows: “I am creating my work on random fiction. I combine technology with art. I reshape the photograph using digital possibilities. I create images as I want at that moment without a certain scenario or rule. There is always contemporary music in the background. I can say that my works are more abstract and experimental.”

In Madra’s early works, we are observing a series of experimental photography works based on the techniques of photogram and long exposure. These works have been generated by moving a flashlight gently in front of an open lens with hand gestures accompanying modern jazz music in a dark room. Similar to the work of a painter on a canvas, with the harmony of the music, various shapes and compositions were produced inline within the spatial depth that the photography provides.

Table 1:

Archiving Processes and Brief Definitions

Exploration of the collection	Detecting the archival material and researching related archival material
Technical Examination	Inspection of the physical and digital material, draft categorization for conversion operation
Media Conversion	Converting existing media formats to updated formats, digitization, storage
Determining significance	Distinguishing the relevant materials, eliminating the redundancy
Building a Data Structure	Configuring a proper data structure for cataloging items effectively
Copyrights Management	Managing intellectual properties, negotiating licences, describing usage rights
Preservation	Configuring maintenance measures, prevent physical deterioration
Accessibility	Allowing outside users to explore the contents and to participate the process

Preservation Strategy: Technical Examination and the Digitization Processes

Since it is necessary to approach the classification of technological works of art through the overlapping axes of art, science, and technology, it becomes difficult to make a clear and comprehensive definition. [1] As a consequence, the emergence of portraying artwork-specific methods and processes becomes inevitable when preservation measures are considered. The targeted methods and the planned

processes within the scope of this research have been described as in the above chart.

The initial step of archiving the Teoman Madra works was attempted in January 2021. The archival materials were located in three different locations, a large collection in Madra's hometown, Ayvalık, and the remaining in Madra’s home and a depot in İstanbul. Physical storage media were abundant in the form of prints, dia slides, negative films, VHS, Betamax, miniDV, hi8 video tapes, DVDs, CD-ROMS, hard drives, and thumb drives. However, no proper cataloging effort had been done

before, and the materials were about to deteriorate due to poor physical storage conditions. Also, except for a few items, they were not identified by proper name tags. Transferring physical materials to digital media was an urgent necessity for long-term access. First, the existing materials were organized into groups according to their media types i.e. VHS, Betamax, negatives, prints, and they were tagged physically with such media type-based unique identifiers. Later several digitization processes have been implemented with different techniques due to the varying medium necessities. According to Cleveland, digitization is the process of scanning, sampling, or even re-keying any fixed or analog medium, such as books, journal articles, images, artworks, or microforms, into electronic form. [2]

In the scope of this paper, we include only the archival process of static images and linear temporal multimedia works. In the beginning, due to the inability to predict the vastness and usefulness of the materials at hand, the digitization process mainly relied on the simple recovery of the analog content while establishing the referential links between the original media and the digitized content. Thus, it is assumed that those who would like to set up research on the archive, should need to use the referential system to gather more precise and high-resolution visual content with the technical capabilities of the time. After a year of intensive work on the hard cataloging and digitization process, 351 hours of linear media (VHS, Betamax, miniDV) and 14,494 slides/negatives have been digitized and backed up safely on local drives and cloud storage services. As Gómez-Baeza states conservation does not end with digitization but presupposes a continuous struggle with the medium itself. [3] Preservation's principal aim certainly is to provide access to the original, but continuous technical advancements pose a threat to this aspect. Likewise, digital preservation should be seen as a constant effort to remediate the existing content. [4]

Cataloging Digital Media

The cataloging process has been initialized after the digitization of all accessible media was finalized. This process requires a detailed descriptive analysis since there are no work-specific statements of the artist nor a title is given. The question asked at first was "What am I cataloging?" as recommended in Cataloging Cultural Objects to set a framework for the choices to be made. [5] Teoman Madra was an artist, who practiced photography and video as an artistic medium, as well as a decent documenter. Since both videos and photographs have the potential to be an art medium in itself and also documentation for other works of art, it is essential to differentiate whether a recording from his archive should be considered as artwork or documentary. Teoman Madra,

as a multimedia artist, was collaborating with many artists from various disciplines such as contemporary dance, performance, and music, by this means, he was actively taking part in the art scene of the time. That being the case, his archive includes his artworks and additionally many documentation of artworks owned by others, happenings, and events at the time. These documentations have not been eliminated from the digital archive, because besides the potential to reflect the art scene the artist is in, they contain records that may not even be available to the authors of the works being recorded. In the process of developing a fielded database, this dual nature of records, the possibility of being documentary or artwork, was taken into consideration.

After what to be cataloged has been decided, the second step taken was to agree upon data standards including data structure, data values, and data content for the sake of consistency in descriptive cataloging and an increase in end-user access. [6] In the establishment stage of standards, starting from the data structure which can be described as the metadata element set to format the database of records, the widely acclaimed schemas were investigated. Although there is no such scheme as a "one-size-fits-all" metadata system, many major museum management systems' data dictionaries are based on the CDWA scheme. [7] Categories for the Description of Works of Art (CDWA) schema have been chosen for this archive as well because of its widespread use in today's digital museum systems with its comprehensive categories for characterization of artworks and allowance for integration of data to other systems.

Once the database structure was built, examination of all digital materials was started. The first data entries were the records of the digital scans of negative slides. Thanks to the descriptive naming of each image file done by Tulya Madra, daughter of Teoman Madra, data values were filled following her identification regarding the characters, events, and locations the photographs were taken at. Since Tulya Madra is largely an eyewitness to the artist's production, she can examine the contents of the photographs based on her own experiences. The titles of artworks remained 'Untitled' followed by consecutive index numbering since there are no specific names given by the artist himself. Next in order comes the examination step of the video recordings, the digitized versions of VHS, Betamax, MiniDV, etc., which requires further feedback from project holders. In that stage, each file was aimed to be cut into multiple coherent pieces concerning the artist's intention of creation. In general, the partition operation was performed based on empty tape displays in between the video records. If not so, the pieces were arranged according to the content of scenes, their visual style, or the musical compositions. The obtained pieces were uploaded to the previously obtained cloud service while keeping them

together in the same directory with the original recording untouched. In the descriptions of these pieces, both the phrases the artist gives references to and the appropriate choice of keywords from the initially decided tag cloud were provided. Even though the artworks or documentaries were described by project holders using associated terms, the data values for other identifiers including the characters who took part in, the locations, or the date when the artwork was born could not be presented distinctly. It is considered that the data contents, which cannot be fulfilled at this stage of the research, would be completed in future studies. In such cases, where the information for core fields, marked as necessary by CDWA authority, is missing and can not be supplied for previously mentioned reasons the data values are substituted with “unknown” values as recommended in the CDWA List of Categories and Definitions. [8]

Future Work

On the current course, the digitization and cataloging stages necessitated a significant amount of archiving effort. Nonetheless, there are many more to be taken in this path. After all digital media is examined by authors, the subject tree, in other words, the classification scheme, will be constructed following the content of the Teoman Madra archive since it will be fully observed. The Art and Architecture Thesaurus by the Getty Research Institute has been determined to be used for that purpose by the reason of its multilingual, semantically structured thesauri which is described as a powerful tool in the case of enriching the knowledge and providing valid interconnections for cultural heritage information resources by Baca and Gill. [9] A subject tree can be described as a hierarchical structure of named categories that might be browsed for information on a specific subject in a web directory. In the stage of developing a subject tree, the polyhierarchical approach will be taken. In this way, the same subcategory will be accessible under various categories. This approach will provide more flexibility in the categorization of such a digital environment with its allowance for several routes that make users access the requested information. [10]

In line with the explanation given above regarding the cataloging process, one may suggest that the approach is biased since it solely depends on the judgment of project holders because of the lack of formal information. It is undeniable that the scarcity of artist statements or art critiques specified for individual pieces leads to ambiguity in the case. Since the artist was not able to be involved in the process due to health-related concerns, it is not possible to claim that the archive is purely objective, on the contrary, requires the interpretation of authors relying on how they perceive these historical records of the past technological works. However, in addition to being

individual collection pieces, the artworks became knowledge bearers for events and experiences of the past if they are preserved and thereby embedded into an archival system. [11] Thus, the collective examination is a necessity in the case of providing an unbiased approach to works, and also for the fulfillment of missing stones in descriptive identifiers. In line with this purpose, the database of records will be open to discussion in gatherings for whom it may be concerned, the people who were collaborating with the artist, the art critiques of the time, etc. The process of digital art preservation is therefore interdisciplinary, not only because of the collaborative character of its creation, moreover because it necessitates the participation of many other professions for the required combination of theoretical writing with practice-based research. [12]

Conclusion

At this stage of the archiving study, the first five steps of the archival processes (Exploration of the collection, Technical Examination, Media Conversion, Determining significance, Building a Data Structure) that were listed in the chart previously have been achieved. By labeling the original documents belonging to the archive, it is possible to access all the source material in a single physical location with the relevant index references when necessary. After all the digitized contents are categorized, the classification process continues intensively. In the second phase of the research, the remaining materials will be covered with similar methodologies applied. Especially as a result of the widespread use of the Internet since the mid-1990s, we observe that Teoman Madra has appeared more in this environment. In addition, the works he produced with the iPad in the 2000s, which he started to use frequently in the last stages of his active artistic production, will be examined in depth at the second stage of the project.

There are many goals and benefits to be achieved with this research. The first of these is to present important analyzes of what was done in the past in the field of Turkish Media Arts after the 1960s, by leading the work of Teoman Madra to come to light. Another desired outcome is to facilitate the access of Teoman Madra's video documentation to the masses, thus enabling more analysis to be made about the recent history of the cultural and artistic environment. If we look at the issue from a broader perspective, this research presents a comprehensive case study on the preservation of technological art and thus opens up original solution proposals for relevant discussions. It is possible to say that after the archiving work is completed and the archive is made accessible, further research and analysis on the archive will incline to follow.

Authors' Biographies

Selçuk ARTUT's artistic research and production focus on theoretical and practical dimensions of human-technology relations. An author of six books and an editor of one, Artut is an Associate Professor at the Visual Arts and Visual Communication Design Program at Sabancı University, Istanbul where he mainly teaches Sound and Interaction Courses.

Multidisciplinary artist Begüm ÇELİK is pursuing her master's degree in Visual Arts & Visual Communication Design program where she completed her B.Sc. in Computer Science & Engineering in 2021. Her artistic production is fed from her interdisciplinary journey by combining technology and performance since she is engaged with many theater practices.

historical approach led to Artpool's 40 years long history, and characterizes the engagement towards the digital archival methods evolving during the decades.

Artpool.hu developed between 1995-2020 was the first website of art institutions in Hungary. The nineties are known as a period not only characterized by the techno-optimistic vibe around the emergence of the Internet, but also by the positive expectations towards the change of the regime in the post-socialist region. Information on underground art was hardly available publicly before 1989, therefore the potentials of the World Wide Web as a global network established an utopian atmosphere for artists, whose activity was formerly controlled and censored. Artpool's website illustrates the enthusiasm for developing a complex hyperlink-structure by creating a multimedia environment for artworks and information on the Hungarian and international artworld, linked to each other on several layers. Inspired by Galántai's former mail art activities, the Internet served him as a platform for communication and building networks from the very beginning. [Figure 1.] The net provided possibility for Artpool to share information on the avant-garde art of the 1970-80s, and by doing so creating the largest database of the documentation of underground art in Hungary digitally, also including the documentation of experimental practices by utilizing the multimedial potentials of the web.

Figure 2. Home page in 2015, Artpool website, accessed January 18, 2022, <https://artpool.hu/Defaultte2015.html>. © Artpool Art Research Center – Museum of Fine Arts Budapest.

This example of experimental archiving also illustrates a specific methodology of the process of self-historicizing, introduced by Zdenka Badovinac in regard of the archival practices of the post-socialist region. [1] Artpool's activity on the website can be traced back to the antecedents of the establishment of Artpool, György Galántai's Balatonboglár Chapel Studio between 1970-73, as an illegally organized hub for avant-garde artists whose activities were restricted and isolated by the socialist regime. The first unite of Artpool's archive was compiled from the materials collected at the Chapel Studio, later also shared on the website. The

Artpool website supplies several functions of a digital archive, such as the encyclopaedia, [2] chronologies ("context chronology", mail art chronology, "surveillance chronology", etc), [3] collection of bibliographies, [4] register of artists and actors of the underground, [5] and the huge amount of digitized visual content shared online. Artpool.hu is therefore not only a virtual space for sharing knowledge based on the materials of the archive, but also a platform for documenting the operation of Artpool itself, as a self-archiving method.

The current conditions of the webpage are strongly connected to the institutional transformations around Artpool over the past decades. After operating as an illegal underground project during the socialism for more than 10 years, and as an NGO for another 25 years, in 2015 Artpool became a department of the Museum of Fine Arts Budapest, as a result of the ongoing political attempts in Hungary, rendering the existence of non-governmental organizations nearly impossible. The new institutional circumstances were accompanied with the assignment of the new generation of leadership of Artpool, which together with the operation as part of a state institution has urged the renewal of Artpool's website. The new version of artpool.hu was published in 2021, however, the previous version remained available as an artwork-like page from the new site. The archived webpage is therefore not only interesting for studies of web archiving and Internet history, but also serves as an experimental digital archive of the Hungarian underground art, especially on the 1970-80s.

The renewal of the webpage was one of the first results of the musealization. Already in 2015, when Artpool became a department of the Museum of Fine Arts Budapest, Galántai released a new home page on artpool.hu with the title "After the end of history", [6] [Figure 2] referring to Vilém Flusser's essay *On the end of history*, [7] thereby reflecting on the institutional transformation also effecting the interpretation of Artpool's history. As an initially avant-garde project, Artpool was never intended to become part of a larger entity, but its existence became dependent on financial and infrastructural support.

Besides the presentation of the Artpool website as an online archive, this paper intends to reveal the possibilities of maintaining the avantgarde nature of Artpool's archive despite the ongoing institutional transformation, with a focus on the potentials of digital archival approaches. The paper builds on the hypothesis, that the challenge does not lie in the sufficient use of the digital infrastructure for archiving, but rather in the potentials of operating with an underground attitude within the contemporary digital environment. By examining Artpool's example this case study also reflects on the perspectives of digital sovereignty within institutional frameworks in the art sector.

Author Biography

Flóra Barkóczy is an art historian working as an archivist and researcher at Artpool Art Research Center Budapest. She is also a PhD student at the Film, Media and Contemporary Culture PhD program at ELTE Budapest. At Artpool she is responsible for the development and research of materials based on new media and digital technologies since the 1980s. She is interested in new interpretations of Artpool's presence on the Internet since the mid-nineties, as a continuation of its former networker activities of the 1970s. Her research focus includes new media art, contemporary fine art photography, and internet-based art practices from the 90s on. As a PhD candidate, she is focusing on the development of digital culture and media art in Hungary and as a broader context in the East-Central European region in the nineties and its conditions determined by the establishment of liberal democracies right after the change of the regime.

“The Right to the Image”: Ethics of Representation and Appropriation in New Media Art Archives since the 2011 Arab Uprisings

Lisa Deml

Birmingham City University
Birmingham, United Kingdom / Berlin, Germany
lisa.deml@mail.bcu.ac.uk

Abstract

In 2017, the Syrian video art collective Abounaddara, that earned international acclaim for documenting Syrian life amidst conflict, removed the vast majority of its videos from their Vimeo archive in response to what it regarded as their improper use by the Triennale Milano. Curator Massimiliano Gioni countered that the exhibition only made available material that was already in the public domain and that underscored the Triennale’s commitment to Syrian migration struggles. This case illustrates ethical concerns regarding authorship, authority, consent, and copyright that permeate the presentation of openly accessible digital media archives as part of international art exhibitions—which are exacerbated when they pertain to representations of conflict and violence. Now more than ever are we in relationships of moral, affective, and material intimacy with violence, and this calls for a reconsideration of how our senses are solicited by and implicated in the conduct of conflict. Taking Abounaddara’s video art archive as a point of departure, this paper discusses practices of engagement that can respond to the growing demands and responsibilities inherent in new media art archives of conflict and violence.

Ethics of appropriation, representation of conflict and violence, 2011 Arab Uprisings, Abounaddara, authority, authorship, consent, copyright, public domain

Introduction

In the wake of the 2011 Arab uprisings, the widespread hope in the democratic potential of the digital spawned numerous crowdsourced new media art initiatives to challenge archival authority and ideological narrativization commanded by state institutions and global news networks. Yet, while the capacities of the internet have enabled recording, sharing, and archiving the revolts in an unprecedented fashion, these facilities also instituted a globally dispersed reinforcement and recalibration of power, turning memory and knowledge into commodified and copyrighted goods. As Donatella della Ratta, Kay Dickinson, and Sune Haugbolle argue, the corporate online platforms and international exhibition circuits that enabled the emergence of such ‘counter-archives’ also lodge them in informational economies that inflect their liberatory

potential and render dissenting subjects and documents vulnerable to various forms of power. [1] In light of resurging protests and rising authoritarianism across the Arab region and beyond, discourses around archival repositories and historiographic narratives have acquired a renewed and contested urgency. As researchers, curators, image producers and spectators at a distance, it is essential to question prevailing patterns of recognition and representation in order to develop practices of engagement that can respond to the growing demands and responsibilities inherent in new media art archives of conflict and violence.

Since its foundation in Damascus in 2017, an undisclosed number of volunteer, self-taught filmmakers have gathered in the collective Abounaddara to produce short videos with French and English subtitles which are freely accessible on the virtual video-sharing platform Vimeo. The name Abounaddara translates to ‘the man with glasses’, both a hint towards ‘seeing clearly’ and a reference to Dziga Vertov’s seminal documentary film *Man With a Movie Camera* from 1929. Violence rarely becomes directly visible but resonates in anecdotes and stories of commonplace protagonists as well as through video collages of international media coverage and archival footage. [2] By appropriating the aesthetic and formal language of documentary film, Abounaddara seeks to make visible everyday life amidst the civil war. This approach is formulated in opposition to the economy of news gathering and the instrumentalization of citizen journalist practices that went hand in hand with the militarisation of the Syrian conflict. Through processes of anonymization and the display of an increasing level of violence and suffering, ‘the Syrian has been transformed from a dignified revolutionary into a victim who provokes only sorrow or disgust.’ [3] Accordingly, this has led to ‘an unprecedented banalisation of evil,’ that leaves the audience barely ‘a choice between indifference and compassionate voyeurism.’ [4] The collective asserts that, ‘if Syrian image makers want to reinstate the dignity of their compatriots, they must seize the means of production of their own image’. [5] Thus, it is a key concern for Abounaddara to maintain the position of both author and producer of their work.

However, in 2017, the Triennale Milano featured Abounaddara's video art archive as part of the exhibition *La Terra Inquieta (The Restless Earth)*—even though the collective had explicitly declined the presentation of their videos in this context. Their refusal was grounded in the fact that they considered the Triennale's focus on the plight of Syrian migrants and refugees opportunistic and did not want their work to be subsumed under a politico-aesthetic discourse which privileges a Western point of view. [6] When the collective became nevertheless aware of the presentation of their video archive through reviews of the Triennale, they asked for the installation to be removed—a request that was only granted following public outcry. Curator Massimiliano Gioni insisted that the exhibition simply made available monitors connected to the Vimeo archive which was already in the public domain. While he acknowledged the ways in which Abounaddara is reframing issues of authorship and distribution, he questioned the collective's position on maintaining control over their videos, 'that is more restrictive than their own work would seem to suggest.' [7] To this neglect of authorship and abuse of copyright, the video collective could not resign 'except to renounce our fight for the right to the image.' [8]

In effect, the case of Abounaddara serves as a mirror image of our representational apparatus, extending the hegemonic viewing patterns that underlie global news networks to international exhibition circuits. In contemporary art spaces, their videos are framed as raw material for pedagogy and presented as instruments to facilitate ethical responses. As such, the Triennale reproduced the very power structures it sought to criticise, reflecting the sensorial-material infrastructures that perpetuate spectacles of indignity and that fold us as global spectators into complicity with conflict and violence.

I cannot purport to occupy a position outside of the digital sensorium that makes such patterns of viewing and structures of feeling possible. As Asma Abbas has noted, liberal societies are sustained by an uneven distribution of pain between those who suffer and those who are solicited to redress that suffering. The solicitations of empathy, sympathy, and compassion offered by humanitarian art forms thus confirm, rather than challenge, this uneven distribution of suffering. [9] With Daniela Agostinho's words, and in more materialist terms, 'the plight of others is not a mere object of representation, but the very material condition that makes such aesthetic forms possible.' [10] Moreover, Christina Sharpe argues that the incessant circulation and repetition of images of distant suffering as well as their formalisation in aesthetic and art practices do not lead to a cessation of violence but often 'work to solidify and make continuous the colonial project of violence.' [11] Sharpe urges us as distant spectators to think about what these images call forth, to think through what they call on us to do and feel—and how we might be able to refuse the positions and feelings solicited by humanitarian art forms.

The technologies of war connect us across the globe through virtual networks in everyday digital environments and create invisible infrastructural proximities. Now more

than ever are we in relationships of moral, affective, and material intimacy with distant conflict and violence to the extent that we are always embedded and sensorially implicated in the cruel images they convey. This prompts us to consider scale differently, in that it compels us to ask 'whether one can be intimate with the far away, across distance and incommensurability.' [12] Yet, I do not want to suggest that the digital connection provides at the same time social, cultural, or emotional connection; my point is that we require an ethical understanding of distance and proximity if we are to create and sustain a sense of each other sufficient not just for reciprocity but for a duty of care and responsibility. This is to say that our relationship to conflict and violence goes beyond the question of seeing or "looking away"; in an intensely and extensively mediated global world, we are always in relation with their cruel images—even if we do not see them.

To challenge hegemonic and algorithmic infrastructures of knowledge production and dissemination, a still growing number of citizen-led initiatives to archive the 2011 Arab uprisings claim and insist on the right to intervene in and act upon the reservoirs of collective memory. Appropriating the predictive function of the archive as a technique of power, these crowdsourced archives subvert the aesthetic, economic, and geopolitical systems enabling or impeding certain images and protagonists to appear on the plane of the visible—and thus to come into being in past, present and future. This proliferation of citizen journalist media and the concomitant rise of crowdsourced new media archives in the wake of the 2011 Arab uprisings prompt us to reconsider our spectatorial positionality and archival agency. In doing so, the space of image production and reception can expose epistemological gaps in digital and datafied repositories, sensualise what has been abstracted, reconfigure what counts as an archive, and imagine new forms of accountability from within the aesthetic field.

Taking Abounaddara's video art archive as a point of departure, this paper addresses ethical issues that permeate the presentation of openly accessible new media art archives as part of international art exhibitions—which are exacerbated when they pertain to representations of conflict and violence. The presentation will unravel the network of relations between image producers, image protagonists, and image spectators as they converge in crowdsourced archival initiatives, and will retrace the negotiations of authorship, authority, and agency along the shift from online platforms to cultural spaces. From a self-critical and self-reflexive perspective, I want to question patterns of recognition and representation in order to expose curatorial and spectatorial processes that might reproduce the very power structures they seek to criticise. In doing so, my paper aims to untangle the complex correlations between the public domain, artistic and moral rights, and ethical concerns and responsibilities as they are epitomised in Abounaddara's 'fight for the right to the image'. Lisa Deml is a Midlands4Cities funded doctoral researcher at Birmingham City University. She holds degrees in Art History and Philosophy from the Courtauld Institute of Art, London, and the Ludwig-Maximilians-University, Munich. Initially trained as a journalist, she subsequently worked for public cultural institutions and non-profit organisations internationally, including Gropius Bau, Berlin, Haus der Kunst, Munich, and Ashkal Alwan, Beirut. Prior to her doctoral research, she coordinated the multi-year project *Afro-Sonic Mapping* as well as assisted in the preparation and implementation of the exhibitions and accompanying publications *Love and Ethnology* and *The Most Dangerous Game* at Haus der Kulturen der Welt (HKW), Berlin. Her research interests focus on visual articulations of citizenship and artistic strategies to foster transnational solidarity and resistance, particularly in the framework of documentary and new media practices in the Middle East and North Africa.

Archiving the Expanded Animation Symposium: Challenges, Solutions and International Collaborations

Juergen Hagler

University of Applied Sciences Upper Austria
Upper Austria, Austria
juergen.hagler@fh-hagenberg.at

Abstract

The Expanded Animation Symposium, an annual symposium at Ars Electronica, has addressed computer animation in the context of media art since 2013. Based on the early discussions at the media festival and in conjunction with the Prix Ars Electronica's category Computer Animation, the symposium tackles animation at the intersection of art, technology, and society. The symposium serves as a hybrid between practice and theory and features talks, panel discussions, workshops, and artist presentations at various venues (i.e., museum, university, festival, cinema). 164 international experts presented and discussed current positions and future trends in the last nine editions. Due to the pandemic, the previous two editions took place online. All these activities have been documented and archived in various forms. This paper discusses challenges and concrete proposals for archiving the Expanded Animation Symposium and collaborating with Ars Electronica's archive and international partners.

Keywords

Expanded Animation, Symposium, Digital Art, Media Art Histories, Archive, Museum

Introduction

Animation has become a pervasive element in contemporary moving image culture and in our daily lives [3]. Since the digital shift, the manifestations of animation have expanded, and the definitions have become unstable. Meanwhile, moving pictures created with computer technology constitute a very diverse spectrum, particularly in hybrid forms, and are products of highly interdisciplinary collaborative activities of individuals from the worlds of art, industry, research, and science. Over the last 40 years, Ars Electronica (AE) has tackled this issue and discussed animation in the context of media arts [7]. Since 2013, the University of Applied Sciences Upper Austria, Hagenberg Campus, and AE have organized the symposium *Expanded Animation* (EA) [5] which aims to address the traversal of borders, hybrid forms, and fringe areas within the field of computer animation. This paper summarizes the examinations presented in the nine symposium editions and discusses challenges and concrete proposals archiving these various activities and collaborating with AE's archive and international partners.

Expanded Animation Symposium: 2013–2021

In keeping with the motto *Mapping an Unlimited Landscape*, the EA Symposium was established to reflect on the traversal of borders, hybrid forms, and fringe areas of computer animation and continued the ongoing examination at the AE festival. The point of departure was the early discussion on media art and expanded cinema [14, 11] and the current examinations on experimental and expanded animation [10, 9, 3, 15]. The first symposium took place at the art museum LENTOS Linz as a small event in AE 2013 with a line-up of 10 speakers and three panels. Keynote speaker Suzanne Buchan started this examination by introducing the concept of *Pervasive Animation* [3]. Originally designed as a unique event, it has become an established part of the festival. Since 2014, it has been organized in cooperation with AE and serves as an academic component of the Prix AE and AE festival, featuring scientific, curatorial, and artistic perspectives. After two sessions, the symposium was first hosted under the umbrella of the AE animation festival, and together with the Prix Forum, it expanded to a two-day event. The subsequent three editions investigated the utilization of hybrid techniques and technologies, future interfaces in animation, and artistic approaches from various perspectives. The seventh edition, entitled *Out of the Box*, explored the roots of expanded animation and cinema. In 2020 the symposium bared the title *The Appeal of Analog* and addressed the attraction of animation in the context of performance, interaction, computer games, and audio. Due to the COVID-19 pandemic, the media festival and thus also the symposium took place in virtual space. Since 2020 the event has been a 3-day event dedicated to examining the interactions between animation and audio from a scientific perspective. In cooperation with the University for the Creative Arts, Farnham researchers and artists were asked to submit contributions on the subject of *Synaesthetic Syntax*. This scientific/artistic survey was kicked off by the media artist Rose Bond in 2020. The keynote speaker at the second edition in 2021 was Refik Anadol. The latest edition continued as an online event and investigated current processes of change in the expanded field of animation under the motto *Tectonic Shift*.

Retrospect and Perspective

The EA Symposium featured 164 experts from various fields, from animation, art, games, and science (see figure 1) in the

last nine years. The symposium is open to experts in theory and practice, including the Prix Forum, featuring the top prize winners in the category Computer Animation. As at the first conferences on computer animation at AE in the 1980s, practice and theory are equally important [1]. Although the line between practice and theory is always fluid, most speakers are active in both areas. The EA Symposium picks up the idea of the initial conferences on computer animation at AE, fosters the interplay between science and practice, and seeks for artistic congruities. The symposium serves as a hybrid between practice and theory that is open for a broad range of science, from humanities to applied and multi-disciplinary sciences, covering panels in media arts, animation, and film theory as well as computer science. AE animation festival represents a unique position within the international animation festivals, as its roots are in media arts and the focus is on computer animation. The symposium addresses the interaction between art theory, and industry. Since 2016, the panel *Art & Industry* has featured artists and design studios that are active in both areas. Therefore, the center of interest is the reciprocity between independent artistic projects and commissioned works.

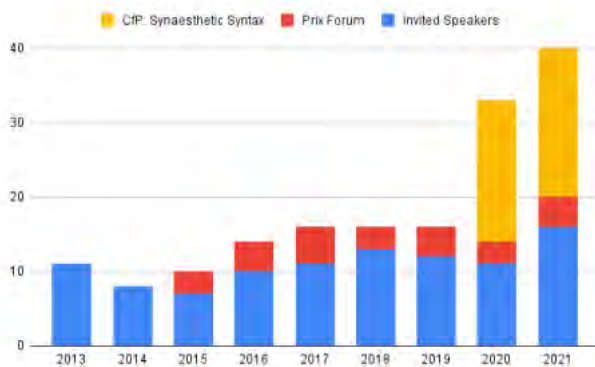

Figure 1: Participants at the Expanded Animation Symposium 2013–2021.

Figure 2: Gender ratio at the Expanded Animation Symposium 2013–2021.

In 2019 we released the anthology *Expanded Animation. Mapping an Unlimited Landscape* [7]. The book features contributions from speakers and artists from the first six editions of the symposium. In consideration of the hybrid format of the event, the book covers articles, essays, and a selection of current artworks, including the prize winners in the category Computer Animation at Prix AE. This anthology makes its contribution by summarizing these studies and examinations, although the selection presented here can only give limited, though essential, insights into the discussion. In addition to the book, the EA archive provides a video documentation of all talks online.

However, what is striking is that only about one-third of the speakers at the symposium are female. Furthermore, the ratio between male and female contributors at AE was not balanced at all [2], and the festival established the initiative *Women in Media Arts* [13]. The EA Symposium tackled this issue several times, and altogether, the gender balance has improved significantly over the past few years (see figure 2).

As the history of AE has shown, trends in media arts and technology come and go. Whereas computer animation was a central topic in the 1980s and 1990s in the context of media art, it gradually slipped out of focus for several years. In the last decade, animation has become pervasive. The boundaries between animation, game, film, media art, interactive art, architecture, sound art, and virtual reality are blurring more and more. At the same time, computer animation gained importance again. There has been a real boom in animation studies on expanded and experimental approaches in the last few years [12, 8], and many conferences and symposia have emerged. The EA Symposium features a unique focus on the intersection of animation and media art. In this regard, this vibrant multi-disciplinary interplay will probably spark many questions for further studies of the expanded field of animation.

Archiving the Expanded Animation Symposium and collaboration with Ars Electronica's Archive

Since its beginning, all the activities at the symposium have been documented in various ways. The talks, workshops, and presentations have been streamed online. They are available on the symposium's website [5], at the AE archive – talks & lectures [1] and on DORFTV [4], a local community TV channel. One special challenge here was the permanent changing of the venue. The first editions took place at the art museum LENTOS Linz, others at a former cinema, at the University of Applied Sciences Upper Austria, Hagenberg Campus, at the AE festival area and at the AE museum. Furthermore, the symposium took place at many locations simultaneously, for instance, at the AE museum, and at the festival area. Each venue required a unique setup for the video documentation. The different formats posed a further challenge. For instance, presentations at Deep Space 8K, a special exhibition room at AE museum, or screenings were documented by video. However, these videos give insight and are not intended to archive the artwork properly. Whereas video documentation of presentations and panel discussions are partic-

ularly appropriate, archiving interactive and expanded art is challenging [6]. In 2021 an online archive was implemented at the symposium's website, including video documentation, pictures, and articles. Unfortunately, we cannot provide all materials online, due to copyright issues. Some video documentation, for instance, Erick Oh's world premiere of *Opera* or Mike Winkelmann's presentation of his *Everydays* at Deep Space 8K, are exceptional because of the unique setting at the AE museum (see figure 3). Furthermore, in the course of the pandemic, the symposium was streamed via YouTube, and the video archive moved from vimeo to YouTube. In addition, the symposium was hosted on Mozilla Hubs in 2020. This platform was found inappropriate for such activities and has been rejected since then.

Figure 3: Beeple — Matthias Winkelmann presenting the project *Everydays* at Deep Space 8K, Ars Electronica 2019.

Conclusion

To document and archive a media art symposium that started as a small event and emerged to a vivid collaboration between a media festival, a museum, and international partners, we recommend following a broader approach (i.e., website, video & image archive, publications) and start documenting from the start. The symposium's website features the current edition and provides a comprehensive archive. In addition, the video documentation is available on AE's archive and DORFTV. The anthology *Expanded Animation*, available on the festival's archive and the symposium's website, serves as another form of archiving the symposium, including links (QR code) to the online archive. In addition, the symposium is featured in the annual AE festival catalog. The *Synaesthetic Syntax* conference complements the symposium with a more scientific chapter. Proceedings are in the planning and will be archived on the website. Archiving all these activities is

quite challenging due to the symposium's hybrid format. Dissemination and archiving on various platforms have proven to be particularly suitable. The website is the central hub, connected with AE's website and other online video sharing and social media platforms. This very broad-based strategy enables wider dissemination, increases the chance that the documentation will still be available in the future and the connection to the AE archive opens the door to one of the most extensive media archives.

Author Biography

Dr. Juergen Hagler is an academic researcher and curator working at the interface of animation, game, and media art. He studied art education, experimental visual design and cultural studies at the University for Art and Design Linz, Austria. Currently, he is a Professor for Computer Animation and Media Studies and the head of studies of the degree programme Digital Arts at the University of Applied Sciences Upper Austria, Hagenberg Campus. Since 2014 he is the co-head of the research group Playful Interactive Environments with a focus on the investigation of new and natural forms of interaction and the use of playful mechanisms to encourage specific behavioral patterns. He has been involved in the activities of Ars Electronica since 1997 in a series of different functions. Since 2017 he is the director of the Ars Electronica Animation Festival and initiator and organizer of the Expanded Animation Symposium.

Restoring the recent past: Learnings from producing a retrospective of VR content from the UK

Aki Järvinen

Digital Catapult
London, United Kingdom
aki.jarvinen@digicatapult.org.uk

Abstract

The Immersive Arcade was a retrospective of UK-based immersive content, showcased during 2021. The project was not set up to archive the content, but to restore it for new audiences. The production team made several observations about the lifecycle of immersive content and what types of considerations regarding the identity of a piece of content emerge in a restoration process. They are documented in this short paper with the aim to inform work on future retrospectives and similar archiving and restoration projects.

Immersive art

Introduction

The paper documents learnings and observations from a retrospective of UK-produced VR art and games, showcased in a virtual museum during 2021. The project, called Immersive Arcade, was part of a research and development programme that was supporting the growth of the creative industry employing immersive technologies, such as Virtual Reality, Augmented Reality, haptics, projection mapping, and so on. [1]

The retrospective was produced by Digital Catapult, a non-profit organisation set up to accelerate the adoption of advanced digital technologies by UK businesses. The work was exhibited in Museum of Other Realities (MOR), an online VR museum space. This paper is written from the point of view of the Digital Catapult delivery team on the project.

Figure 1. The entryway to the Immersive Arcade showcase in Museum of Other Realities. ©Digital Catapult & UKRI.

Retrospective as a form of restoration

The Immersive Arcade (see Figure 1) was not positioned at any point to be an archiving project, because that is not in the remit of the organisations involved. Instead, it was produced with the goal of showcasing outstanding immersive content and enabling broader access to it. The aim was to bring together highly regarded VR experiences before they run the risk of being forgotten and enabling access to audiences who had not seen them, nor necessarily even ever experienced VR before. The latter goal was met by organising a tour of the retrospective across the UK. The tour specifically aimed at reaching young female audiences, with the goal of making them aware of potential career paths in immersive.

Upon reflection, however, the fact that Immersive Arcade was a retrospective, in practice meant that the production became a restoration project. Unfortunately, the project did not become a permanent archive, as it has not been available since November 2021 due to licensing arrangements.

The fact that the organisations involved were not able to continue Immersive Arcade on a sustainable basis speaks to the commercial reality of restoring technically complex and inaccessible work. In the following, we summarise some of the reasons why and believe that these insights contribute to the discussion on what types of institutions are well-placed

to run similar retrospectives, perhaps even in a systematic manner. We believe these insights contribute to discussions of new forms of archiving and how to restore digital art from such archives for future audiences.

Content lifecycle as an archiving constraint

The first observation has to do with the lifecycle of VR content and who owns it. Because Digital Catapult, nor the funding body (UK Research and Innovation), are not a heritage or museum organisation, acquiring the intellectual property with perpetual rights was not an option.

Consequently, licensing the content become the only feasible way forward. What we found entering these discussions with the content creators was that given the relative recency of the content, they saw that their intellectual property still ‘had legs’ commercially and hence were happy to agree to a time-based licensing deal that we offered. In other words, in terms of their lifecycle, the projects were not yet ready to be archived.

Due to budgetary considerations, it was necessary to phase the retrospective into three volumes, so that licensing costs per individual project could be limited, yet more projects could be included in total across the six months that the Immersive Arcade was open to the public.

While archiving the content for permanent access was never our goal, this sequence of events highlights an interesting aspect of the state of the immersive content domain: institutions intending to practise archival and collection in a commercially underdeveloped space, such as immersive, need to set their expectations and historical focus carefully.

Technical process

From a technological point of view, our work started with the assumption that a software project, likely developed with a real-time game engine (Unity or Unreal) would be available for each piece of licensed content. Or, in the case of 360-degree video content, a media file was required to be available.

The responsibility to deliver the executable was on the original content producers and IP holders, in dialogue with the Digital Catapult delivery team and the MOR technical team. Due to how the project was set up, there simply was no time to spend reverse engineering executables. This was an advantage that we might not have had with less recent projects.

Once the executable was received according to specifications, it was embedded to the Museum of Other Realities VR application (that runs on PC-tethered VR headsets and is available to download digital distribution platforms, such as Steam and Viveport).

Technical challenges from UX to versioning

The process described above mitigates many challenges, such as third parties accessing software projects originally created by others and trying to migrate them to another software environment. Many of the technical restoration challenges regarding VR applications discussed by Ensom and McConchie [2] were not an issue for the project.

Regardless, other types of issues emerged. While we were not expecting a completely smooth process, the challenges tended to be of the type we did not foresee.

For example, user experience inconsistencies emerged: even as recent as five-year old VR projects caused extra integration work so that they could be showcased next to others with a consistent approach. A project in the retrospective had been developed at a time when conventions for configuring VR controllers’ interaction schema - i.e., what button or trigger is used for teleportation or selecting an object - were not yet established. The project in question used a somewhat unconventional method. It did not work satisfactorily with the latest and most widely adopted standalone headsets without additional work.

Another piece of work had successfully extended its lifecycle after initial launch by versioning: there was an original interactive six degrees-of-freedom version, but also a 360-degree video version aimed at audiences with less powerful headsets. Our intention was to showcase the work in its original interactive format but in the end, we never managed to get access to a working build that would have fit the exhibition platform.

In discussing the challenges of documentation and restoration in the context of installation art, scholar Annette Dekker mentions how at times ‘where to locate the work’ can become a problem for restoration [3]. For us, this was a concrete issue.

Negotiating the work’s identity and creative control over it

The above two anecdotes serve to illustrate what can happen with a piece of standalone content that was originally developed with the same technology, in this case VR, only few years apart.

Besides licensing and technical aspects, we also came across challenges that had to do with the identity of the original work and how to maintain the creative vision in a new exhibition context.

The overall curation process of the retrospective became a negotiation of what was available and what we wanted to include. Our aims were ambitious in that we were also looking for ways to include content from projects that were originally ran as location-based installations, with VR content as segments in a larger physical whole.

From a practical point of view, this presented a challenge in terms of what to include into a ‘vertical slice’ of history. It was an exercise in rescoping the content in the face of a different distribution opportunity.

From a theoretical perspective, we were negotiating what the elusive essence of the work was, and how its identity was bound to change when restaged for the retrospective. In this case, we supported the original creative lead in making the decisions. As a result, the output was not compromised but rather a reimagination of the original work.

However, we learned that one cannot expect such flexibility from all creators. Some of them demanded a level of control that we could not give, due to the technical restrictions of the platform. This was understandable but did mean that some flagship content from the UK was left outside the retrospective.

Finally, there was another aspect to restaging the work. Because the Museum of Other Realities is a virtual environment, each piece of content was accessed through a custom-made environment that was designed to reflect the theme of the content and its audio-visual qualities. In this part of restaging the work, we asked the teams to deliver assets (3D models, audio, etc) that could be included in the space (see Figure 2 for an example).

Again, we found different levels of commitment and control over this aspect. Some teams embraced the opportunity to instil creative control over the staging, while in other cases, no team was left to do it, and the MOR team worked with the assets provided to create the environment where users arrived to find the executable. In these cases, an additional approval process needed to be put in place.

Discussion

We believe it is useful for archivists, collectors, and conservationists in this space to take note of our experiences with Immersive Arcade. The practices of licensing and restoring immersive artistic content are far from established.

It can be a miscalculation to assume that a piece of immersive content has a team still attached to it in one way or another, and necessary files and documentation have been rigorously stored. If there is a gold standard in restoring VR work, it likely is the continuous redevelopment and

maintenance activities around Char Davies’ pioneering VR work [4]. However, it just might be a beautiful outlier in an otherwise chaotic field.

Concerning the legal aspects, a similar risk emerges from assuming that there is a clear point of contact regarding intellectual property ownership. During the production of Immersive Arcade, there were cases where the content was technically ready to go on the platform as part of the launch of the next volume, but we were waiting for the licensing deal sign-offs due to complex IP ownership structures.

To summarise, producing a retrospective of immersive content from the recent past is not only a case of restoring technology and content, but also a case of restoring creative teams, negotiating creative control, chasing access to assets, and navigating complex IP ownership arrangements.

Abstract

A series of consoles have been developed to investigate the sharing of digital collections in public libraries. The interfaces reduce in complexity throughout the study to facilitate ease of access whilst maintaining playability and engagement. Interaction in the final interface is sufficiently simplified to enable browsing and publishing of the collection with hand movements, using a low-cost infrared sensor.

Keywords

Console, digital collections, publishing, online archives, crowdsourcing

Introduction

The paper describes a series of interfaces developed for sharing digital collections in public libraries. The first is a touch screen device for combining digital objects from multiple collections, and the last is a console for a single collection, which uses hand gestures and an infrared sensor for interaction.

The research was with the Visual Interaction Group at Computer Vision Center, and testing took place in the Living Lab at the Library of Sant Cugat.[1]

Memory Fields

The first interface installed in the Living Lab was *Memory Fields* [Figure 1]. It is a touch screen interface for two collections: A collection of posters from the Spanish Civil war, and a collection of contemporary audio field recordings from Catalunya. The interface generates dynamic audio-visual compositions on a large public display.[2] Mixing the collections generates montages,

which can be annotated and published to a new online archive.[3]

The interface was developed from an earlier artwork called *ablab*, which is a performance tool and originally shown in Electronic Language International Festival, 2004. [4] *ablab* facilitates selecting and mixing audio and visual objects from multiple online digital collections and is used for live performance as well as being installed in art galleries.[5] In a similar way to a Video Jockey or a Disc Jockey mixing live, *Memory Fields* is “performed,” in the space.

Figure 1. Memory Fields installed in the Living Lab, Sant Cugat

Modular Testing

Memory Fields used five software modules for interaction with digital objects.

- A rotating graphic carousel for browsing [Fig.2]
- Slider controls for mixing and balancing audio and visual material

- Slider controls for zooming into visual material and controlling volume
- A text box for annotation
- A tool for publishing annotated material online

[Figure 2] The carousel is a valuable graphic tool for displaying and browsing collections. It combines control, play, and chance. The addition of audio effects to the rotation increases playability.

Each modular element can be separated and recombined in new configurations, and this was done for a series of workshops in the Living Lab.[6] Library users provided their own digital collections for analysis and experimentation. The reconfigured modules provided novel ways for participating in the process of presenting, annotating and adding meta-data to historical documents and contemporary collections. The process explored usability, playability, and public engagement with large scale displays.

The testing resulted in the simplification of interface design.

Publishing by Crowdsourcing

The next interface, called *@Brossainedit*, is a touchscreen interface for a collection of over 1200 visual poems by the Catalan poet Joan Brossa, made with input from Joan Miro and Antoni Tapies. The large collection was digitized by the Museum of Contemporary Art (MACBA), Barcelona and the Joan Brossa Foundation. The console for this collection was built to engage the public directly in the act of annotating and publishing the previously unpublished collection to a new online archive. [7]

@Brossainedit is simpler than *Memory Fields* in that it uses a single collection with four software modules: to browse (carousel), to examine (zoom), to annotate, and to publish. The poems are published using Twitter, and include annotation, geolocation (the generated tweets include a hashtag referencing the physical place in which

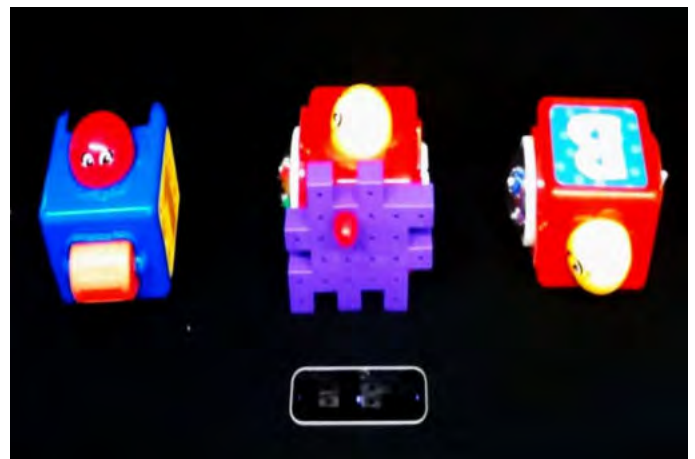

the installation was exhibited (e.g. *@Brossainedit #SantCugat*), and a date time stamp is added.

The importance of the cultural material, and the simplified user-friendly interface, increased user participation. The interface was installed in the Living Lab and also presented in MACBA and at the Mobile World Congress, Barcelona. [8][9]

Infrared, Tangible Objects, and Hand Gestures

The simplified interaction of *@Brossainedit* enabled a final development: the expensive touchscreen interface could now be replaced with a low-cost infrared (IR) sensor.

Interaction via the IR sensor is guided by the use of four non-electronic, brightly coloured, tangible objects. [Fig.3] These objects guide the user's hand movements by providing clear interaction patterns, and the hand movements can then be interpreted by the IR sensor.[10] The objects are a cylinder that rotates, a pin-hole grid pattern, a zip, and a large push-button.

[Figure 3] non-electronic objects and infrared sensor used to monitor interaction patterns

Interaction in the collection is as follows:

- Spinning the cylinder rotates a graphic carousel on screen and browses the collection. Stopping rotation selects the current image, which is displayed on screen
- Sticking a peg into the grid pattern selects a specific area of an image
- Moving the zip; zooms into and out of the selected area
- Pushing a button publishes the selected article to the new online media archive

The decision to use simple shapes for interaction originated with the aforementioned: *ablab*, which contains a

collection of brightly coloured animated objects for interacting with sound [Figure 4]. This use was further investigated by the Visual Interaction Group in a series of eye-tracking and head-tracking studies [11], which examined the value of basic shapes for use with low-cost sensors to interact in digital collections.

Providing objects with clear interaction patterns, means that little or no explanation is required for use. They provide a playful, robust, and low-cost way of introducing digital objects in public space. The use of an IR sensor reduces the need for contact with technology, which can be fragile and expensive for public use.

[Figure 4] *ablab* interface showing objects from a collection of animated shapes, which are used to generate sound.

Observations

Selecting and mixing are two creative information behaviors. The artist John Baldessari states: “Should I do this rather than that? Should I choose this image over that one? That’s it at its heart - the artist’s role is about selection.” [12] Selecting and mixing engage the public in exploration and production and can generate insight and new knowledge simply by combining material. As Swanson observes, “The significance of the “information explosion” may lie not in an explosion of quantity per se, but in an incalculably greater combinatorial explosion of unnoticed and unintended logical connections.” [13]

Installing interactive digital consoles in local libraries creates a sense of community around collections. Interactive installations create small local events, around public displays. They create a social experience, a performance action, and a tangible exchange of knowledge and ideas around digital culture. Consoles provide curators and archivists novel activities to offer the public an opportunity to view collections and information. Collections can enter directly into the public domain. The interface systems act as a library service, whereby citizens

publish first instances online, mixed with personal annotation and metadata.

Abstract

Many media projects done via the Internet have either been forgotten or scattered by the author's memories, notes in the print media or have simply disappeared as if they did not even exist. Some works are archived in libraries, on the websites of artists, or art associations. Data on them is scarce, however, and few can still be viewed in their original form. Through reinterpreting and media transformation, some of the works performed this way, through VR technology, can be preserved, archived, and made available to a wider audience. Currently, there is no platform for VR archiving of such performed/reinterpreted works; the existing, mostly gaming, platforms can be used for this purpose. This paper aims to show, in one example, what are the possibilities and which benefits can be obtained from such presentation and archiving of works of media art made through the Internet.

Keywords

Internet, media arts, archiving, online writing, virtual reality

Introduction

Many libraries, university libraries, museums, associations, collectors as well as individuals, archive digital media art. These are mostly archived websites of artists, projects, festivals and events, and often specific works of art. The goal of such archiving is to preserve works and information related to them, their public availability, as well as educational needs in the field of art. Users of these archives can search for data related to the author/authors and their field of artistic engagement and link, if any, to a specific piece. These links are often unavailable online or require an access request, and are usually not free of charge. Still, such archiving has great advantages and social justification through its possibility to preserve media art, which, generally, has an expiration date.

Today, we are one step away from a global change in the paradigm of art, which is noticeable by the fact that more and more authors are submitting their works in the form of NFTs. Art production is changing, the market is adapting, artists are focusing on new media approaches, and digitalization is inescapable. Archiving at a time of general change in the field of artistic activity has also been forced to adapt to the new conditions. One of the more recently

announced an increasingly noticeable is the unstoppable concept of Metaverse networking, where virtual reality (VR) will completely change previous experiences in creating, consuming, exchanging, and with that, the process of archiving 'new art'. Can art be new? This is just a synonym for something that is already visible and that does not change the essence of art, but only its present-day concept.

More and more artists will turn to the realization of their ideas for the needs of this new paradigm. VR already today enables online painting, the creation of free sculptural forms, the performance of theater plays, etc. Archiving such works in a newly created context requires accelerated adaptation and solutions that will help preserve global production. Everything is changing quickly, and it is necessary to look at areas that have already been adapted, such as the field of video games. Platforms for VR games (SteamVR, Oculus Store, etc.) have already been created due to their immense commercial demand. Still, there are no platforms for archiving artistic VR works, and most of the works are either not widely available, or are placed on gaming platforms.

VR in the archiving function

Virtual reality represents objects, situations, or phenomena through computer-generated data by the models. [1] According to Rheingold, VR enables simulation or dynamic modeling, the art of creating a simulation with certain rules, simulating different situations, to see how the system reacts as a whole. [2] These examples show the possibility of VR to generate simulations for industrial processes, scientific research, education, different types of training, entertainment, gaming, creative artistic process, etc. Along with that, VR is being increasingly used for theatrical research, since the theater is also a medium of illusion. [3] VR is becoming more widespread and attainable to a wide range of users with more affordable equipment, the quality of which is improving constantly.

In the context of modern reality, like NFTs or the Metaverse, it is necessary to regulate many things related to the VR – from copyright protection to the possibility of VR archiving, i.e., professional preservation of some selected works, which should be publicly available to a wide range of users. Among other things, it is necessary to archive the

artifacts of new media art production. Oliver Grau defines new media art as a comprehensive term that encompasses art forms that are either produced, modified, and transmitted using new media/digital technologies, or, more broadly, using new technologies derived from scientific, military, or industrial contexts. [4] He also sees that the art of new media calls into question the very foundations of object-centered understanding of art, especially its characteristics of interactivity, nonlinearity, immateriality, and transience, along with its intricate interrelationships between the artist, art, and observer. This type of art production is very diverse and, according to Grau, includes virtual art, software art, Internet art, game art, glitch art, telematic art, software art, bio-art, computer animation, interactive art, and computer graphics, as well as practices in the field of art and activism, such as hacktivism and tactical media. The question is how to archive such different media productions in VR and what is its intention? The intention of VR archiving is not only to protect or classify selected new media art projects, but also to refresh them with the possibilities that VR enables. With its availability to a wide field of users, such archived works gain a new dimension and liveliness. The possible concept of archiving in VR is based on these premises.

VR archive - concept

The primary concept of VR archive is based on four steps: 1) selection of new media artwork that needs to be archived, 2) preparation and adaptation phase, 3) archiving, and 4) accessibility to users, Figure 1.

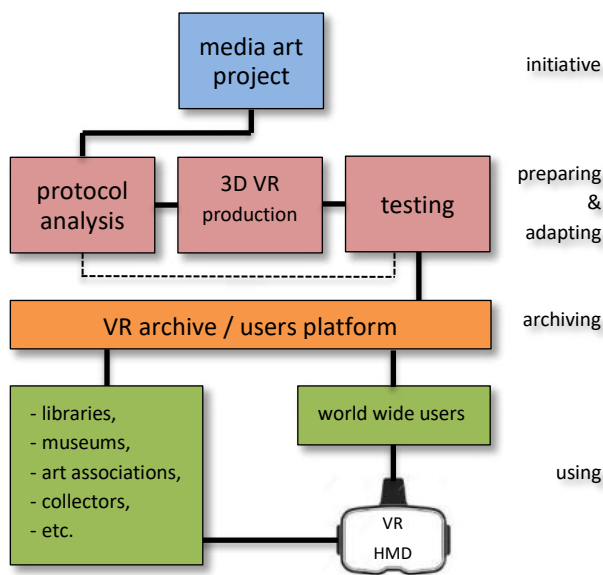

Figure 1. Workflow from initiative to archiving new media art and associability for users via the Internet

The first phase refers to the selection of work to be archived. There are two options – directly transferred work as it is for its use in the VR, or adapting to the needs of use in VR. In

general, the selected work should be digital, interactive, spatially defined, and have enough data to be used for its direct ‘introduction’ or adaptation to the VR medium. The next phase is to analyze the existing work in all its protocols related to functionality, media characteristics, duration, specifics, etc. This is the basis of the next phase of VR production, such as 3D modeling, creation of given functions, programming, rendering, sound processing, etc. In this phase, the work is tested and, if necessary, corrected to complete satisfaction and compliance with the selected original work. The work prepared in this way is ready to be published on the VR archive platform. The last phase is the public availability of archived work. Libraries, museums, art associations, collectors, as well as all interested individuals from all over the world, can access the work with approval or compensation, in cooperation with the copyright owner.

As already mentioned before, there is no VR platform for archiving new media art at the moment, so it is possible to use the existing gaming platforms, with certain specifics. The technical solutions of the concept of VR archives platform of new media art exceed the level of this paper, and we would not dwell on them here. Instead, here will be given an example of preparation and adapting an online writing performance for the VR archive.

Reinterpreted media artwork for VR archive

Here will explain the phases of a possible concept of archiving a new media art project on the Oculus App lab platform, which at this time can be used for archiving and public availability to users around the world.

Due to its historical and media significance and specificity, the work ‘Spiral of Words’, realized in 1998, was chosen as a case study of this work. This was an ‘online writing performance’, performed from three locations, by three authors, in real-time via the Internet. The authors sent their creative texts by e-mail in a precisely defined time rhythm to the recipient's address. It was an event called ‘The Academy of Noble Skills’, which took place on the slopes of Sunny Valley on Fruška Gora, near Novi Sad, Serbia. The documentation on this project was in a book published by the ‘Academy of Noble Skills’, as well as from the author's archive. [5] The authors built a ‘spiral of words’ by alternately sending textual narratives, which were dedicated to one of the philosophers (Hamvas, Buber, and Berdjajev), starting with one word, then a sentence, followed by a paragraph to end the story. The texts received in this way were read directly – performed by two actresses and an actor, so that the audience had the opportunity to mentally experience the construction and enlargement of the spiral, with the help of words in a certain rhythm and time interval. The authors who participated in this project were in London, UK, The Hague, Netherlands, and Novi Sad, Serbia.

After the final selection of the artistic work for VR archiving, as a first step, its general protocol analysis was

done, Figure 2. As it is a textual narrative performed online via e-mail from three locations by three authors, the focus was on conceiving each text, defining their differences, and preparing for VR production.

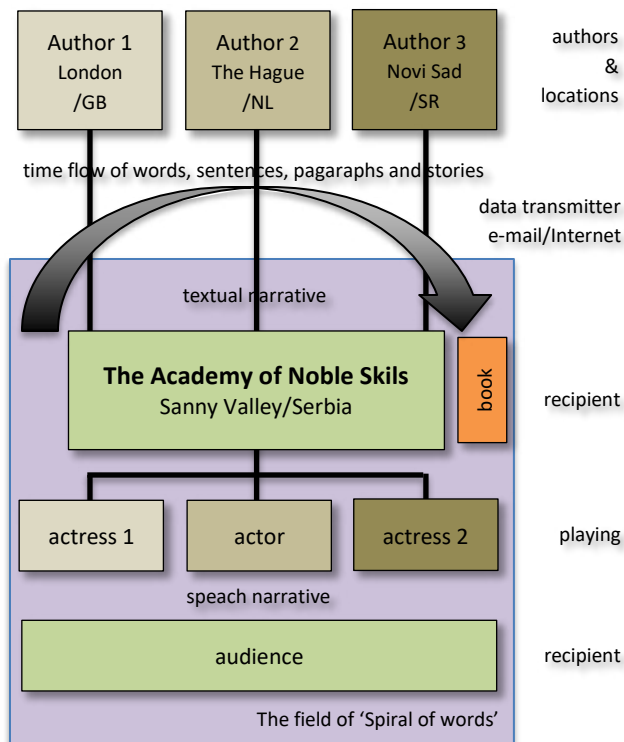

Figure 2. Scheme of the protocol analyses of online writing performance 'Spiral of words'

After the protocol analysis, the next step was conditioned by the transformation concept of the original work and its preparation for VR production, Figure 3. The first step in the realization of the reinterpreted work for archiving and use in VR was the mathematical definition of the partial appearance of words, sentences, paragraphs, and stories. This was followed by programming in the C# language. After the first testing of the program code in VR, the project was advanced to defining specific VR functionalities, such as the use of controllers, navigation, selection of handles, editing of selected words, sound signals, etc. This was done with the combination of Unity 3D game engine and C# programming. Testing followed, then corrections in code and functionality, then re-testing. In the final phase, specific, symbolic visual effects were added for certain words, such as the word God, where the selection activates a strong light effect.

When the reinterpreted work was fully prepared and compared with the original piece, the project *build* was sent for verification to the Oculus App lab. After their positive response, the VR reinterpreted 'Spiral of Words' is automatically archived, posted on the Oculus App lab platform, and thus made publicly available.

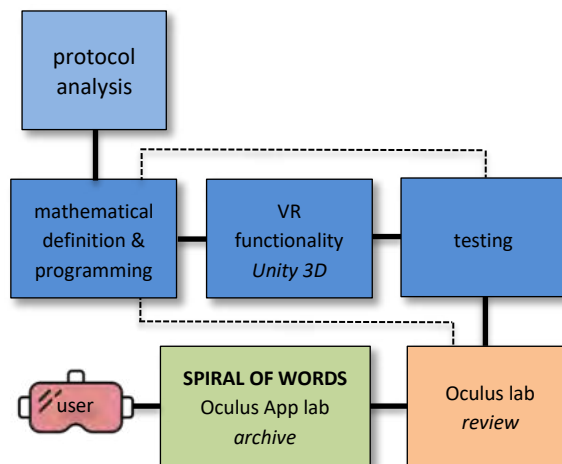

Figure 3. Time flow process from the protocol analysis phase to the final users' stage

Downloading the archived project 'Spiral of Words' from the Oculus App lab platform can be accessed through their browser, and from a direct link or QR code from the //VirtualUnit website¹. The artistic VR project 'Black Carbon' has also been archived on the Oculus platform² and is publicly available.

When those interested who want to join the 'Spiral of Words', through their Oculus Quest 2 HMD sets, download the project to their device and put it on their heads, the construction of a virtual word spiral begins. Users actively monitor the spiral by reading the text that appears in front of them, or, more precisely, around them, since the users are in the center of the spiral. The color of the parts of the text signifies belonging to a different philosopher: red – Hamvas, blue – Buber, and orange – Berdjajev. Through the controller, users have free movement and navigation. It is also possible to be creative, to choose one word at a time from the spiral with the help of the controller. The source of the words is limited. With a total of 4578 English words, of which about 1000 are unique, the users are free to create their poetry, short story, or just play with them. With its selection, each word appears on a transparent "board" directly in front, but just below the user's eye line, and in whichever direction they move, it will be visible to them.

¹ <https://virtualunit.org>

² <https://www.oculus.com/experiences/quest/4188524877934961/>

The selected words, Figure 4., in the new textual meta-narrative can be edited directly, via the controller, on the board in front of the users, i.e., change their order.

Figure 4. Selected words for creating meta-narrative appeared on the transparent board in front of a user, ready for direct editing

This would complete the reinterpretation of the original 1998 project, but a step further was adding effects to individual, pre-selected words, which are based on the symbolism or direct information assigned to that word. That is a strong influence and feature that is close to theatrical and performing arts. These give the users an extra level of fun because they get unexpected and surprising visual and sound effects, Figure 5.

Figure 5. The visual and sound effects when the word God is selected

Conclusions

This paper presents a possible concept of archiving new media art in VR. For now, such a VR platform for archiving does not exist, but existing gaming platforms can be used instead. A case study presented, as an example of reinterpretation, preparation, and adaptation of an e-mail online writing performance, for archiving and use in the VR. It has a wide field for the possibility of transformation and additional creation of previously made or performed new media art projects. VR can refresh and enliven them by interacting, changing, supplementing, or creating new

approaches within a given framework. By archiving and posting such customized and transformed projects on specific platforms for VR users, they will again be publicly available and attractive to all who are interested in them. With the announcement of the Metaverse and its establishment, it is expected that famous museums, galleries, libraries, collectors and others interested will create their VR archives and collections, and thus enrich and profile, now a quite chaotic situation related to this area.

INVITED TALKS

Introducing Arc-hive

Antonio Gagliano, Luciana Della Villa

Affiliation: HANGAR

Location, Country: BARCELONA, SPAIN

Emails: antonio@hangar.org, luciana@hangar.org

Abstract

'Introducing Arc-hive' is a 10 minutes presentation by Antonio Gagliano and Luciana Della Villa that proposes to introduce Arc-hive's framework, its fundamental objectives and challenges, and to open up the collective research process carried out so far.

Keywords

platform, artworks, specimens, living materials, free software, open data, best practices, case study, open resources, infrastructural maintenance.

Introduction

Project Arc-hive creates an open source digital platform that aggregates, preserves, publishes, distributes and contextualizes a variety of information, knowledge and documentation on art with a focus on biomedica, ensuring open access to a variety of users, and a wide outreach of digital materials across cultural sectors and territories. Arc-hive addresses the challenges of creating and distributing cohesive digitization and dissemination protocols through a centralized digital space where knowledge and best practices relevant to art predominantly using biological materials are collected. Created in collaboration with six partners working in NGO and museum sectors, publishing, IT and audiovisual fields, the platform functions as a catalyst for the activities of artwork and museum specimen digitization, archiving and distribution; remote event participation, planning and realization; augmented publishing; staff and student education and training; and topic contextualization and interconnection. Aimed at building capacities of various cultural agents working with biological and living materials, the project provides a feasible and tailored digital solution to some issues fundamental to the field, following philosophical principles of open data and information sharing throughout all project phases.

The presentation proposes to introduce Arc-hive's framework, its fundamental objectives and challenges, and to open up the collective research process carried out so far. Archival practices have rarely explored how to cohesively build-up and maintain open source digital infrastructures to host cultural objects that, by the very living nature of their components, are elusive and difficult to be digitally captured. The uninterrupted life cycles of mutation, degradation and regeneration of artworks predominantly based on biological materials open up several questions around digitization and cataloging practices and protocols. Where, for example, does the most important part of an artwork focused on living materials reside? Is it possible to locate and migrate it in such a way that it can inhabit the digital field without becoming permanently distorted? Should we capture all the stages of its life cycle? The beginning and the end, or just one of its phases? Should we correct or absorb the extraneous elements that emerge during the process of digitization? Should we assume that the utterly abstract, generic, mathematical space of digital three-dimensionality always brings with it the obliteration of its specific surroundings?

Even though many of these questions are also relevant to the digitizing and cataloging of other fields such as dance or performance (that are elusive to the archive because they are also based on living and dynamic media), the infrastructures for hosting works based on biomaterials underline in a special way the question of maintenance and care. It is problematic to define what kind of close ties needs to be assumed to keep physical metabolic artworks alive, to understand how to lend them to other institutions, how to transport them and catalog them, how to acquire them and integrate them into museographic collections, and the development of a digital platform doesn't solve all those issues but rather reinforce them. Digital does not make it easier. One of the conceptual forces driving Arc-hive is to reflect and explore how digitized living materials could be hosted on a network of federated

servers that ultimately seeks to generate an ecosystem of open source data and code. A cornerstone metaphor of the project's major challenge is contained in the project logo: the division of the word 'archive' into two elements, mimicking the cellular phenomenon of mitosis, metaphorically connects the biological replication process of a single cell with the endless replicating capacity of free code. Thus, when we refer to living matter and ecosystems we are not only talking about networks of life within the pieces itself, nor a vibrant community of specialized readers, but also to a multi-dimensional community of researchers, editors and open source developers who will continue taking care of the infrastructural levels of the platform, generating new iterations of the code, getting behind the content and expanding the tools and features we've already created.

What performative effects do artworks focused on living materials produce on hard structures of knowledge, such as the collection or the archive? What can archival practices learn from engaging with digitized artworks focused on living materials? The encounters between the political background of open source communities and the specialized field of artistic practices working predominantly with biomedial opens up an infinite space of thought and conceptual articulations. These are, in any case, forms of institutional research that acquire existence in practice, as happens with artistic research in general. They exist as knowledge because they are made in the making, and in alliance with the materials rather than before. It is almost impossible to think how diverse digital objects and heterogeneous collections can fluidly coexist within a platform before thinking about what open source web design allows us to do. Establishing a set of curatorial criteria that organizes the admittance of content to the platform invites not only to craft editorial statements but also to imagine administration roles and design a sustainable and accessible UX for platform contributors. It is in the reciprocal entanglement of discussion and technique applied to materials that a deeper understanding of how to take care of living things is finally produced.

Biographies

Luciana Della Villa has a degree in Art History from the University of Barcelona and a master's degree in Cultural Heritage Management from the same center. She was part of the Art Department and the Communication Department of the Vila Casas Foundation, both at the Can Framis Museum and the Espacio Volart. At the same time, she develops his personal project Svper linked to music, and works on musical creation for advertising. Since 2017, she coordinates the Communication area of Hangar.

Antonio Gagliano is a researcher and artist. His projects intertwine practices around structural imagination to explore the multiple ways in which knowledge emerges, is organized and distributed. He has participated in exhibitions such as *La tradició que ens travessa* (Arts Santa Mònica, 2022), *Acció. Una història provisional dels 90s* (MACBA, 2020) or *Manufactories of Caring Space-Time* (Museum voor Schone Kunsten, 2017). He has contributed to newspapers such as *Der Spiegel*, *Süddeutsche Zeitung* and *La Vanguardia*, and books such as *Pornotopia. An Essay on Playboy's Architecture and Biopolitics* (Paul B. Preciado, MIT Press, 2014). For the last decade, he has contributed as editor and sound producer at Son[i]a de Radio Web MACBA and has been a regular contributor to the museum's educational programs. Since 2020, he coordinates the Research and transference of knowledge area of Hangar.

Revealing Higher Impact of Media Art Archiving

Oliver Grau (PI), Laura Ettel, Philipp Hoffmann, Alexander Wöran and Carla Zamora

University for Continuing Education
Krems, Austria
oliver.grau@donau-uni.ac.at

Abstract

Media art poses a multitude of specific challenges for archiving, e.g., the weak interconnection of thematically similar archives. Furthermore, digital tools developed for image analysis as well as art research usually fall short when confronted with media art. LeFo and ImDaLi, the projects presented here, intend to address these issues in their research.

Keywords

Media art archiving, image analysis, media art research

Introduction

The field of media art holds a special position in art research and archiving due to its process-oriented, methodological and disciplinary diversity. Considering the ongoing technological developments in general and particularly in the digital field, which are rapidly finding their way into the production of media art, as well as the constant transgression of boundaries between different areas of knowledge, archiving strategies and digital tools developed are not always optimally suited for digital art. In order to do justice to the broad spectrum and fast-moving nature of media art production in the context of scientific research, the projects LeFo and ImDaLi set out to develop interactive and immersive virtual spaces optimized for media art. Both are focused on creating new prospects for the exploration of perception and the value of collections. ADA (*Archive of Digital Art* www.digitalartarchive.at) is a community platform for the documentation of media art, which gathers hundreds of leading artists and scholars and over 50000 documents. It serves as foundation for innovative strategies and applications developed within the projects.

Infrastructures for Digital Arts Teaching and Research in Higher Education (LeFo)

LeFo extends the Archive of Digital Art as a platform for research and teaching of themes emergent from the field of Media Art. ADA is a community archive of selected artists that documents significant media artworks supporting technical documentation, like interfaces etc. developed by

the artists. In order to extend the platform as a teaching tool, the project extends the ADA collection and integrates visualizations of the archive's content, themes, tools and practices as a research methodology. Additionally, LeFo is developing Augmented Reality interfaces to the archive's collection, thus investigating new paradigms for presenting and navigating digital collections. Most ambitiously it will also develop technical foundations for connecting disparate but thematically aligned online archives so that content is directly discoverable and comparable across overlapping collections, reinforcing the value of each platform in the context of research and teaching in media art.

Tool Development for Image Data Literacy (ImDaLi)

ImDaLi researches and designs digital tools for image databases with the aim of both improving the user experience when using archive platforms and testing different approaches to digital image analysis. To reach these goals, ImDaLi addresses two core topics within its research. Firstly, the controlled vocabulary of the Thesaurus, which already encompasses keyword-tags for the numerous artworks within ADA, is used for extensive analysis to explore visualization concepts that contribute to media art research. Furthermore, it will be explored if and how the Thesaurus could potentially enrich semantic web data on media art to further interconnection and integration among media art archives. Epistemological structures of archives however, often developed organically over time and are thus modeled around their respective needs. Consequently, basic alignment of vocabularies anchored in a mutually accepted standard (like the Getty Art and Architecture Thesaurus) is a prerequisite for improving the accessibility of content across databases. Secondly, the Lightbox tool already available to users on ADA is further developed for in depth image analysis. Starting from Aby Warburg's approach of comparative iconography, which focused on the analysis of semantic and visual connections between artworks, the Lightbox will be adapted for the analysis of media art, e.g., 3D viewing allowing for experiences of a work of art within the digital realm.

ACM SIGGRAPH History Archives: Expanding the Vision through Teamwork

Bonnie Mitchell; Jan Searleman

Bowling Green State University, Clarkson University
Bowling Green, OH, USA; La Jolla, CA USA
bonniem@bgsu.edu; jetsza@gmail.com

Abstract

The ACM SIGGRAPH History Archives is a team effort involving students, interns, volunteers, and computer graphic pioneers. In 2022, it expanded from an online archive to include a physical archive of SIGGRAPH publications and artifacts. These archives include information about presentations, exhibitions, screenings and events at the annual conference as well as information about SIGGRAPH communities and committees. With such a vast array of information, developing a robust infrastructure was essential. Team members researched, digitized and entered tens of thousands of entries and programmed innovative features that enable users easy access to this valuable resource. The SIGGRAPH History archive team is also preparing the archive to be part of the world-wide distributed network of new media art archives.

Keywords

SIGGRAPH, online archive, computer graphics, interactive techniques, electronic art

Introduction

ACM SIGGRAPH is an organization that has a long history of showcasing cross-disciplinary research, innovation and creative endeavors in the field of computer graphics and interactive techniques. The annual conferences began in 1974 and since that time their programming has expanded from technical paper presentations to include art exhibitions, emerging technology demonstrations, virtual reality experiences, animation screenings and much more. They have also produced hundreds of publications including art catalogs, animation videos/DVDs, proceedings, quarterly newsletters, etc. SIGGRAPH has a number of committees such as the Digital Arts Community, Education Committee, Pioneers, etc. as well as affiliated Chapters around the world that also produce content and host events throughout the year. With such a breadth of material to document and preserve, the job of creating an online archive for the organization was a daunting task. The project began as an extension of a previous project, the ACM SIGGRAPH Art Show Archive, spearheaded by Bonnie Mitchell and Jan Searleman and expanded to include all conference and organization materials in January 2021.

Information Access

The goal of the ACM SIGGRAPH History Archive is to connect information related to conferences, contributors, events, publications, and the organization in a meaningful way. Before that could happen, access to the information dating back to 1972 was necessary. There has never been a physical location where all the SIGGRAPH materials were stored. Fortunately, Mitchell had her personal archive of SIGGRAPH materials to work with but it lacked materials produced before 1990 and was incomplete. SIGGRAPH community members provided information from their private collections but a lot of information was missing (and still is). To develop an online archive in a systematic way, having gaps in the information proved problematic and impeded the progress of entering data into our custom-built online archive system. In early 2022, the University of Waterloo had plans to renovate its computer graphics lab and wanted to donate all of its SIGGRAPH publications to our group. This collection, combined with Mitchell's materials and other donated items formed the start of the ACM SIGGRAPH Master Collection which is temporarily housed at Bowling Green State University, the host of the second SIGGRAPH conference in 1975.

Teamwork

With access to a such a wealth of information, it was necessary to create a complex content management system that would be able to establish relationships between various types of data. Alexa Mahajan, a student at Bowling Green State University, created a sophisticated interface that enabled the user to access the information in gallery view or as a table, and sort it or filter it using a number of parameters. She also created menu systems and customized the fields, relationships and taxonomies to manage the data. All the selection icons were computer programmed using Processing by Alexa as well.

Lane and Liam Sykes along with Dayle Bennett, students at Bowling Green State University, worked on researching, gathering and entering data. Lane entered the SIGGRAPH courses and is now entering information about animations, a task started by Felix Bangert in the summer of 2021. Liam has worked exclusively with adding the Emerging Technologies demonstrations and Dayle enters information about panels and posters. The archive team also consists of two graphic design interns from the University of Guanajuato, Monserrat Meza Rico and Mariana Martínez Uribe, who designed the panel icons. SIGGRAPH also distributed swag at the annual conferences and Dan Pillis, a PhD student at MIT Media lab, does the imaging work to display these collectibles in the archive. Luis Wilson, originally an intern from the University of Guadalajara and now an employee at Microsoft, created import and export features to expediate the processing of data which sped up the data entry process. He reprogrammed the *Contributors* section and completely rewrote the back-end code to create the SIGGRAPH Plugin that we use in a WordPress environment to replace our distributed code fragments. These incredibly talented students, interns, and volunteers were directed by Bonnie Mitchell and Jan Searleman.

Pioneers

Because the knowledge of the past does not rest solely in documents and artifacts, this project would not be what it is today if it were not for help from the Pioneers of Computer Graphics. Mary Whitton, the chair of the SIGGRAPH History committee has donated materials and knowledge and helps secure resources to continue our work. Pete Segal, original programmer of the AT&T Pixel Machines, helped with publications, early courses and researching our

scanning specifications. Maxine Brown and Dana Plepys, both from the University of Illinois, Electronic Visualization Lab, have been incredibly helpful by providing information about the early days and the history of animation at the conference, respectively. Many more pioneers (too many to mention here) have sent information, advice and this archive would not be where it is today without their help.

Expanded Content

The ACM SIGGRAPH History Archive has been divided into a number of main menu categories: *Conferences*, *Contributors*, *Exhibitors*, *Experiences*, *Publications*, *Learning*, *Awards*, *Community*, *Collectibles* as well as information about the physical collection, etc. A category such as *Experiences* contains topics such as *Appy Hour* (App Development), *Art Show*, *Computer Animation*, *Emerging Technologies*, etc. Within each of those areas, the content can be viewed by *Year*, by *Conference* or by *Type* (VR, Haptics, etc.). This hierarchical branching of information enables the user to do broad or narrowly defined searches. Most of the content, but not all, is connected to a conference and a contributor and therefore appears on both the content's entry page as well as on the *Contributor* and *Conference* page. As the team uncovers additional content in the physical collection this structure expands.

The Future

The ACM SIGGRAPH History archive is currently focused on researching, digitizing and entering data as well as building a robust system that will manage the relationships between the data and provide a meaningful experience for the user. At the same time, we are planning for the future as we move the content to a new virtual machine, develop the code to connect to other archives and build relationships with communities that have the knowledge we aim to embed in this expanded online archive.

Authors Biographies

Bonnie Mitchell (Ohio, USA) is a professor of Digital Arts at Bowling Green State University and co-director of the SIGGRAPH History and ISEA Symposium online Archives. She is an organizer of the Summit on New Media Art Archiving and a member of the ISEA International Advisory Committee, SIGGRAPH History and Digital Arts Committees and SIGGRAPH 2023 History Chair.

Jan Searleman (California, USA) is a retired Computer Science Professor at Clarkson University and now serves as an adjunct research professor. Her research areas are VR, HCI, and AI. Jan is on the ACM SIGGRAPH Digital Art (DAC) and History Committee and co-organized the DAC Online Exhibition "The Earth, Our Home: Art, Technology and Critical Action". Jan co-directs the ACM SIGGRAPH History and ISEA Symposium Archive.

Interconnecting Archives: Paving a Path Forward

Abstract

The concept of connecting information from various repositories of information has been around for quite a while, yet most online new media art archives exist independently without direct connections to each other. Programmers working on the ISEA, SIGGRAPH and FILE online archives have been collaboratively developing a system to link information about the people and art events documented in their respective archives to each other. This initiative will extend to include the Archive of Digital Art and Ars Electronica archives, as well as other archives, once the prototype is completed. This panel will discuss the challenging process of developing interfaces, building APIs, and working with wikidata as well as the process of analyzing, sanitizing, authenticating and modifying databases containing information about people and new media art events.

Keywords

archiving, connection between archives, database sanitization, wikidata, name authentication

Introduction

The idea of a global interconnected network of repositories of knowledge dates back to Paul Otlet's quest for a substitute for the book in the late 1800s¹ and more recently to Ted Nelson's Project Xanadu in the 1960s². The development of the World Wide Web, begun in 1989 and publicly released in 1993³ implemented Nelson's concept of Hypermedia⁴ using the internet as a means of transmission thus furthering the goal of creating a global network of interconnected knowledge. Archives, both web-based and physical, represent pockets of focused information on specific topics, genres, or events. Physical archives, because of their dependence on locality and spatiality, are nearly impossible to connect to one another without the addition of digitization and the establishment of a complementary digital archive. Because information exchange and artifacts in the 21st century are increasingly digital, archivists who work with new media art, often opt to document physical artifacts and include copies of digital assets in electronic archives. If publicly available via the web, these archives offer immense opportunities to realize

Nelson's concept of "the universal, democratic hypertext library that would help human life evolve into an entirely new form." The challenge though is in the implementation of establishing a connection between these online archives. This panel will discuss goals, first steps and implementation procedures conducted over the past year between the ACM SIGGRAPH History Archives⁵, ISEA Symposium Archives⁶ and the FILE (Electronic Language International Festival) Archives⁷.

History

The call to action to connect new media art archives began with the Liverpool Declaration⁸ (Media Art Needs Global Networked Organisation & Support) which was signed by nearly 600 professionals in the field of new media art. The Declaration's second goal was "Supporting an International Association/Institution for Shared Data." In 2019, Wim van der Plas, co-founder of ISEA, and Oliver Grau co-moderated a roundtable discussion at ISEA2019 and it became apparent that the time was right to begin the planning and implementation of an interconnected network of new media art archives. Representatives from ISEA, SIGGRAPH, Ars Electronica⁹ and the Archive of Digital Art¹⁰, met periodically over the course of 2 years to discuss strategies and outline challenges. In 2020, the first Summit on New Media Art Archiving was organized by representatives of the ISEA, SIGGRAPH, ADA and Ars Electronica archives and held online during the ISEA2020 symposium. Representatives from the FILE Festival archives contacted the ISEA and SIGGRAPH archive directors after the Summit expressing their desire to be involved with this initiative and invited ISEA and SIGGRAPH archive representatives to give a talk at the FILEAlive¹¹ online meetings. This relationship with the representatives of the FILE Festival initiated the implementation phase of the project to connect new media art archives globally.

Central Repository and Authentication

The SIGGRAPH, ISEA, and FILE archive team met with Dalton Martins, coordinator of the Tainacan¹² project at the University of Brasilia, to discuss the development of the new FILE archive. While working on taxonomies, relationships between data, and information architecture, the team also began the implementation of the complex infrastructure to connect the archives. Dalton Martins led the discussion of the technical requirements of the project¹³ with his vast knowledge of how to use wikidata¹⁴ as a central repository for information as well as a unique identifier for people. Plans were made to connect people's profile pages located in the three archives to each other using wikidata as the central repository for the structured data related to a person's identity. This method of authentication was chosen because it is an open source knowledge database accessible to all archives free of charge and most likely to resist obsolescence. The challenge was preparing the data for the process of uploading the basic information related to people (name and affiliation) in the archives to wikidata.

Establishing the Connection

Alexa Mahajan, a programmer for the ACM SIGGRAPH History Archives, began the implementation procedure by designing a means for the connection data to be input into the archive system and displayed on the front-end of the site. When a person has an entry in another archive, the appropriate archive icon appears on their profile page and this icon links to the corresponding webpage within that other archive.

The goal was to establish a bi-directional link between archives without having to enter each connection manually.

She designed the system to automatically establish the links to other archives by dynamically populating the data fields. As we tested this procedure, it became apparent that each archive's database of "people" information would need to be carefully scrutinized to ensure that a person was not entered twice into the archive. Because of the use of nicknames and various other ways of listing one's name, complicated by the fact that females often change their names through marriage, we needed to identify all entries in the database that referred to a single individual by different names and consolidate those entries. With over 10,000 names in the SIGGRAPH archive and nearly 8,000 in the ISEA archive, ensuring there were no duplicate listings was a challenging task.

Name Comparison Code

The back-end programmer for the SIGGRAPH archives, Luis Wilson, developed code to compare names from one archive's database to another archive's database to see if any names in the two archives matched. With the goal of distributing an application to the partners involved in the project, Alexa Mahajan developed the front-end interface using Python. This interface allows the user to select two databases and run a comparison between their exports, enabling the list of "people" names in their own archive to be compared with the exported list of "people" names in another archive. This non-trivial code uses fuzzy logic, based on Dalton Martins' advice, to compute the percentage of likelihood that a match exists between two names. In running the application to compare the SIGGRAPH names to the ISEA names, it became apparent that there were many instances of the same individuals being entered repeatedly into the system using a variety of different naming conventions (with or without nicknames, middle names, married names, etc.). We realized that we could use the same application to compare the ISEA archive to itself and the code would identify these duplicate and related names. Using the results of this code, we determined that if an entry received an 85% chance of a match (or above) with another name in the database, we needed to take a closer look to determine if it truly matched. Even when the system ranked the match as 100%, we still needed to manually ensure the two entries in question were, in fact, the same person (to account for cases where distinct individuals share the same name).

Data Export

Since the SIGGRAPH, ISEA, and FILE archives are still in development, this need to compare each archive's list of names mandated that we also program a means of exporting the data we needed. Although the information architecture is similar between the three archives, the differences posed unforeseen challenges. The SIGGRAPH archive was in the process of being moved to a virtual machine and the export of data was only possible with an older cloned version of the archive. In addition, both the SIGGRAPH and ISEA archives treated artist collectives

and companies differently than the FILE archive. This discrepancy posed challenges in comparing the data exports, and so Alexa reprogrammed the way that SIGGRAPH and ISEA handle these entities within their databases. Implementing this change required us to go through the 18,000 entries and move all artist collectives and companies from the “people” table to the “collectives/groups” table.

Next Steps

After sanitizing our data to ensure the list of “people” names did not contain duplicates and that a similar export structure was maintained between archives, the next step was to use OpenRefine to further cleanse the data and compare it to existing wikidata “people” entries. This is the current state of the process. The database preparation enables us to upload the basic information about a person from each of the archives into wikidata and input the link to the new media art archive page that contains a profile of that person. After we have populated wikidata with this information, we will write code to check this repository to see if an entry in our archive exists in wikidata and then populate the fields in our archives to establish the connection to other archives. This entire procedure will then be utilized to connect art event entries in each of the archives since many artworks, animations and performances often are documented in each of our individual archives. We will then make the applications we developed publicly available for new media art archives to create direct data connections to other new media art archives around the world.

Authors Biographies

Bonnie Mitchell is a digital artist, animator, and archivist, as well as a professor at Bowling Green State University in Digital Arts, Ohio, USA. Mitchell is the co-director of the SIGGRAPH History and ISEA Symposium online Archives and also is a member of the organizing team of the Summit on New Media Art Archiving (first held in 2021 online and again in 2022 in Barcelona). She is also a member of the ISEA International Advisory Committee, the ACM SIGGRAPH History, and the Digital Arts Committees. In 2023, Mitchell is in charge of the celebration of the 50th SIGGRAPH conference in Los Angeles.

Alexa Mahajan is a senior at Bowling Green State University, majoring in digital arts and minoring in computer science and math. She is interning at Pixar Animation Studios in the Pixar Undergraduate Program for technical direction, summer of 2022. Mahajan also works as a programmer for the SIGGRAPH History Archives, focusing on user interface development and content organization. She aspires to work as a technical director and get to combine her passion for animation and programming to develop tools that help others create with excellence.

Luis Wilson obtained a bachelor's degree in Computer Science from the Monterrey Institute of Technology and Higher Education in Mexico in 2021. Currently he is a software engineer at Microsoft working in web development, his main area of interest. Since 2020, he has been a volunteer programmer for the SIGGRAPH History Archive, helping the site grow and reach its potential. He is also involved in the archive's mission of creating interconnected data between new media art archives by creating tools that aid in establishing the relationship of data coming from different sources.

Oliver Grau (DE) is first Chair Professor for Image Science in the German-speaking countries at the Danube University since 2005 and has held more than 350 lectures and keynotes. Grau's “Virtual Art,” (2003) is the most quoted art history monograph since 2000. He conceived scientific tools for digital humanities like the Archive for Digital Art (ADA, since 1999) and developed international MA programs like Image Science and the joint master in MediaArtsCultures. Grau was founding director of the MediaArtHistories Conferences. He has received several awards for books including *Mediale Emotionen* (2005), *Imagery in the 21st Century* (2011), recently: *Digital Art through the Looking Glass* (2020). 2014 he received a doctor h.c., 2015 he was elected into the Academia Europaea.

FILE ARCHIVE

Paula Perissinotto, Fabiana Krepel

FILE FESTIVAL INTERNACIONAL DE LINGUAGEM ELETRONICA

São Paulo, Brasil

paula@file.org.br, fabiana@file.org.br

Abstract

The presentation is about the digital archive of FILE - Electronic Language International Festival. FILE ARCHIVE is an initiative carried out by the independent cultural non-profit organization FILE – International Electronic Language Festival – and aims to make available and share its collection, which brings together 22 years of achievements, in an accessible and free online environment. This expanding collection makes available the last 5 years of FILE FESTIVAL events and exhibitions (2017 -2022), through the free software TAINACAN.

Keywords

digital file; digital memory; cultural memory, digital platform, database, digital repository.

FILE ARCHIVE is an initiative carried out by FILE – International Electronic Language Festival – and aims to make available and share its collection, which brings together 22 years of achievements, in an accessible and free online environment.

From the emergence of the avant-garde of electronic art in Brazil to the rise of interactivity in exhibition spaces, the Festival is present in the Latin American scene as a cultural platform of international visibility that promotes aesthetic, cultural and scientific manifestations; produced in the field of art in the digital age.

Throughout its history, FILE has constituted a unique collection of its kind, having held 49 exhibitions and exhibited more than 8,000 national and international works. The Festival also visited 6 Brazilian states and exhibited artists from 48 countries.

This constantly expanding collection is now available through the free software TAINACAN, developed in Brazilian universities and a product of the work developed at the Faculty of Information Science at the University of Brasilia. FILE ARCHIVE currently makes available the last 5 years of FILE FESTIVAL events and exhibitions (2017 -2022), including archives in different formats, such as digitized publications, biographies, synopses, photographic records of exhibitions and works, as well as information

about symposia, workshops, artistic performances and festival awards, to be shared with the different audiences as illustrated in Figure 1, Figure 2, Figure 3, Figure 4 and Figure 5.

Figure 1. Launched 02/2022. © Copyright. FILE FESTIVAL

Figure 2. FILE ARCHIVE homepage. © Copyright. FILE FESTIVAL

The final structure of FILE ARCHIVE digital repository was composed of 8 collections, where each of them contains specific metadata of different typologies, such as: Artworks, Participants, Events, Educational Activities, Venues, Publications & Media, Physical Archive, Registration form.

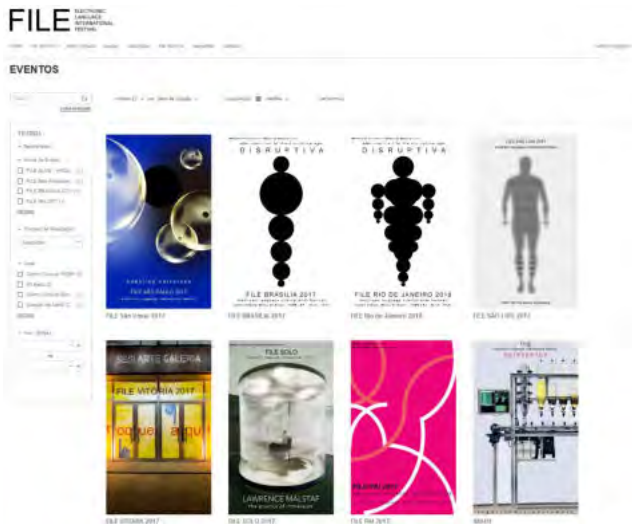

Figure 3. FILE ARCHIVE, Events Collection. © Copyright. FILE FESTIVAL

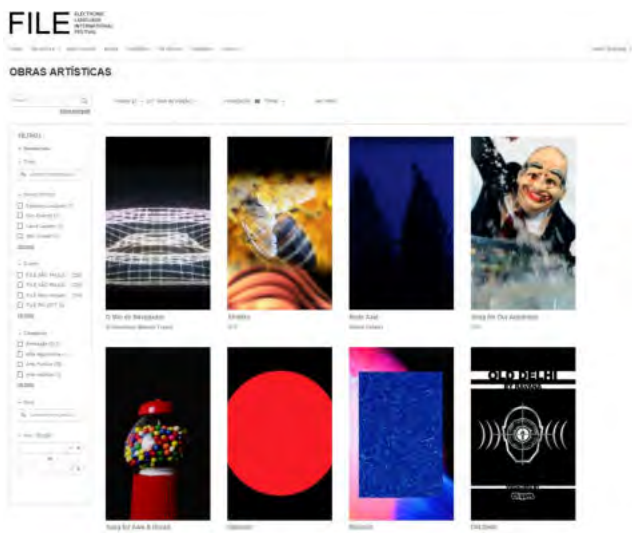

Figure 4. FILE ARCHIVE, Artworks Collection. © Copyright. FILE FESTIVAL

The result of this project offers the public interested in the field of art and technology online access to organized information and contributes to facilitating, to all interested scholars, the means for free access to the information in this collection. In this way, we support, value and disseminate the festival's content, in addition to preserving the material and immaterial assets of the international and historical cultural heritage created by a Brazilian initiative.

Abstract

The ISEA Symposium Archives have undergone significant changes in the past 8 years but in 2021, the project reached a milestone. All the information had been moved from the Classic archive to the New archive, therefore the focus transitioned from data input and basic development to finding missing information, fixing errors, developing structural consistency, cleansing the data, adding videos and developing features that would enable us to connect to other archives. Although the ISEA archives are far from complete, this shift of focus has broadened our vision and enabled us to enhance the usefulness of this valuable resource.

Keywords

archive, new media art, online repository, electronic art, digital art

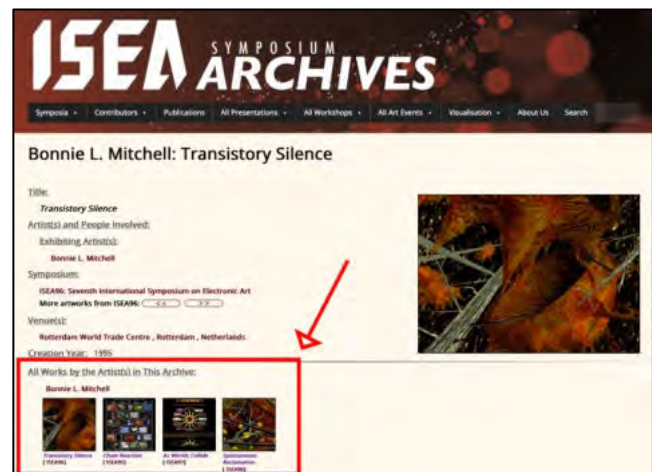

Introduction

The current ISEA Symposium Archives initiative began with the goal of documenting all past ISEA symposia and making this information publicly available on the web. The information from the original ISEA archive was ported to a simple WordPress site and the team spent years adding additional information to this static website. Realising the potential of connecting the data to create complex relationships, we built a structurally more complex system and embarked on a new phase of the project. The primary goal was to move the information from the ISEA Classic Archive and to the various fields in this new system. With over 18,000 entries to add, this required a lot of unpaid volunteer effort and time. In 2021, we completed the transition of data and refocused our energy on the next phase of the project.

Content Correction and Analysis

The new ISEA Symposium Archive requires that the data be added to individual fields thus eliminating the possibility of a direct export and input of the data between the archives. When entering data bit by bit, it is difficult to see the big picture. The ISEA symposium is hosted in a different

country and organised by a new group of people each time, so the structure of the data differs from year to year. By creating year-to-year analysis charts of the structure of the data entered in the archive, we were able to easily spot and correct inconsistencies. We also enhanced our export feature and wrote a program using Python and fuzzy logic to compare people names in our database with other databases. This complex code looked for duplicate and similar names (such as nicknames, married names, etc.) and calculated the percentages of a match. This process enabled us to detect over 350 duplicate people entries in our own archive which took months to fix. We also restructured the way the archive deals with artist collective names so the members are dynamically linked to the collective name. In the past, a collective was treated the same as a “Person” entry thus limiting its dynamic relationships. These are a few of the “fixes” that have occurred over the past year.

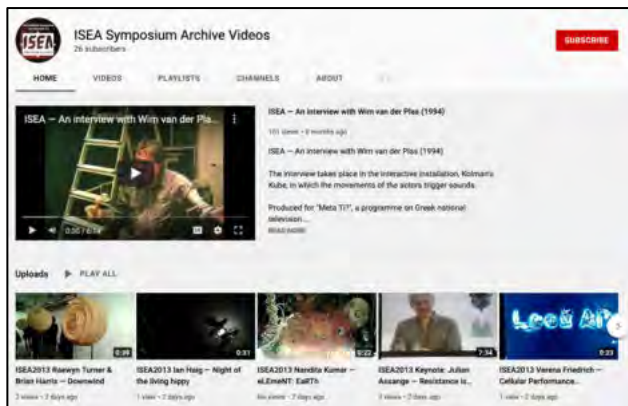

Enhancements

By identifying the many ways in which a researcher may want to traverse the archive, we identified major user interface enhancements to make the process easier. On the art event pages, we added a feature to show icons (with links) of all other art events by the contributors. We added

the ability to go to all the other art event entries related to a symposium within a single art event entry.

We also started a Youtube channel and we digitised scores of VHS and UMatc tapes and embedded those in the archive.

More images were added to the archive and some of the missing information was found. We are now in the process of proof-reading and correcting all the entries in the archive and training new volunteer interns to help with this task. We welcome feedback from users and hope they will help test the usability and accuracy of the new archive.

The Future

Although there is much more to be done in regards to adding information and fixing problems, our recent focus has been to create the ability to connect with other new media art archives around the world. We added the ability to detect if a person has an entry in another archive and if so, display an icon with a link to the other archive. This feature prepares the ISEA archive to become part of a world-wide distributed network of new media art archives. These efforts further our goal to provide access to information about ISEA's past as well as paves a path forward into the future.

Biographies

Bonnie Mitchell (Ohio, USA) is a digital artist, animator, archivist as well as a professor of Digital Arts at Bowling Green State University. Mitchell's artworks explore spatial and experiential relationships to our physical, social, cultural and psychological environment through interaction and physical immersion. Her creative work includes interactive installation art, environmental data visualization

art, experimental visual music animation, net-art, and new media art archive development. Mitchell is the co-director of the SIGGRAPH History and ISEA Symposium online Archives and also a member of the organizing team of the Summit on New Media Art Archiving (first held in 2021 online and again in 2022 in Barcelona). She is also a member of the ISEA International Advisory Committee, the ACM SIGGRAPH History and Digital Arts Committees and is the SIGGRAPH 2023 History Chair in charge of the 50th conference celebration.

Jan Searleman (California, USA) taught Computer Science at Clarkson University for 37 years, retired in 2015, and since retirement has been an Adjunct Research Professor at Clarkson. Her research areas are Virtual Environments, Human-Computer Interaction, and Artificial Intelligence. A senior member of the ACM, Jan is also on both the ACM SIGGRAPH Digital Art Committee (DAC) and the ACM SIGGRAPH History Committee. Jan and Bonnie Mitchell coordinated the DAC Online Exhibition "The Earth, Our Home: Art, Technology and Critical Action". She co-moderated SPARKS talks (Short Presentations of Artworks and Research for the Kindred Spirit) for DAC on "Robotics, Electronics, and Artificial Intelligence" with Hye Yeon Nam, and "Data: Visual Perception, Interpretation and Truth" with Everardo Reyes. Jan co-directs, along with Bonnie Mitchell, the ACM SIGGRAPH History Archive. She also co-directs the ISEA Symposium Archive with Bonnie Mitchell, Wim van der Plas and Terry C.W. Wong.

Wim van der Plas (Netherlands) studied Social & Cultural Sciences at the Erasmus University Rotterdam. He was director of the Foundation for Creative Computer Applications (SCCA, Rotterdam), R&D staff of the Utrecht School of Arts, managing director of the Institute for Computer Animation (SCAN, Groningen), and worked for 3 different departments of the Utrecht University of Applied Sciences. He is co-founder of ISEA, organised the first, second and seventh ISEA symposium and served as ISEA HQ and on the ISEA board since its founding. Currently he is co-director of the ISEA symposium archives and member as well as honorary chair of the ISEA International Advisory Committee. In 2018 he received a Leonardo Pioneer Award.

Terry C. W. Wong has a Bachelor's degree from the Applied Science Department of the University of British Columbia and a Master's degree in Fine Art at the Chinese University of Hong Kong. Currently, he is working on his graduate degree in the School of Interactive Arts and Technology at Simon Fraser University. He is doing his research study on connecting new media art archiving worldwide. Terry is also an archivist and co-organizer for the ISEA Symposium Archives. He was also on the organizing team of ISEA2016 in Hong Kong.

Ars Electronica Archive

Christina Radner

Ars Electronica

Linz, Austria

Christina.Radner@ars.electronica.art

Abstract

The Ars Electronica Archive contains documentation of content since the start of Ars Electronica in 1979. A huge number of artists and researchers from the field of art, technology and society were part of Ars Electronica activities during more than 40 years. They have left their traces in the archive. The presentation provides a glimpse into what the Ars Electronica Archive is and stands for, and what the current achievements and challenges are. Part of the archive is accessible online (Online Archive), part of it only internally (physical Archive & Internal Database).

Keywords

online archive, media art, festival, prix ars electronica, hack attack, challenges, growing

Ars Electronica Archive

Ars Electronica, based in Linz, Austria, and founded in 1979, holds one of the world's largest archives of digital media art. Everything started with the first Ars Electronica Festival in 1979. Next to the Festival the Prix Ars Electronica (yearly competition in several categories, initiated in 1987) and the Ars Electronica Center (museum, open to the public year-round) came into being first, followed by several other divisions. Currently Ars Electronica can be described as stage and competition for media art, festival for art, technology and society, showcase for creativity and innovation, laboratory for research and development, and school of the future. [1]

The Ars Electronica Archives mission is to preserve the ideas and the diversity of Ars Electronica, and to make as much of it as possible freely accessible to users. It's holdings include a diverse array of art works and documentation of projects, exhibitions and activities from the Ars Electronica context and across the entire spectrum of media art throughout the world. Highlights are the winning projects of Prix Ars Electronica in the Prix Online Archive, and video documentation of the early Festival years and Center exhibitions, which was possible through the involvement of the ORF – Austrian Broadcasting Company's Upper Austria Regional Studio at that time [2].

Part of the Ars Electronica Archive is accessible online (Online Archive, Figure 1), part of it only internally (physical Archive & internal Database). Currently the biggest challenges of the Archive are: a) to bring "old" festival websites, placed on an old server structure, back to visibility and usability for researchers (first festival website is from 1995). And b) to deal with the huge amount of newly produced content, arisen especially because of the hybrid format of the Festival in the last two years (video files exploded in terms of amount and file size).

Constantly growing, the archive forms the link between the past and the present. In its continuity and amount of content, it invites to dive into it, to look for changes over time in focus or for example file format or picture quality [3], as well as to research about single artists, works and activities.

Author(s) Biography(ies)

Christina Radner (AT) currently is the responsible project manager for the Ars Electronica Archive in Linz, Austria. In 2009 she got

her master's degree in art history at the University of Vienna. At an internship at the Art Brut Museum Gugging in Klosterneuburg near Vienna, she got a first insight into the archive work of a museum. She was hired project-based, to help work on an artist's estate and to prepare a retrospective and a comprehensive catalogue of works. In 2013 she moved back to Upper Austria and started her work in the Ars Electronica Archive Team. Since 2015 she is the responsible project manager for the Archive and part of the Festival/Prix/Archive Core Team of Ars Electronica.

MACBA Archive

Marta Vega

MACBA Museu d'Art Contemporani de Barcelona
Barcelona, Spain
mvega@macba.cat

Abstract

The archive of the Museum of Contemporary Art of Barcelona (MACBA) aims to conserve the museum's documentary heritage and promote research into contemporary art. The archive preserves documentation of special historical value generated by MACBA and other individuals and organizations related to contemporary art practices. This document collection, built around the discursive lines of MACBA, is shown to the public through exhibitions and activities. The museum has developed the MACBA Digital Repository, an online archive, to preserve and disseminate the digital art and documentary collections.

Keywords

MACBA Archive

The archive of the Museum of Contemporary Art of Barcelona (MACBA) aims to conserve the documentary collections and promote research into contemporary art. The archive preserves documentation of special historical value generated by the MACBA and other individuals and organizations related to contemporary art practices as well as an extensive collection of artists' books. This document collection, built around the discursive lines of the MACBA, is shown to the public through exhibitions and activities and provides a reference source for contemporary art research.

Since its beginnings, the archive has faced the challenge of combining the care of the documents with the desire to facilitate their access to the public. This dual concern has led the MACBA Study Center to initiate a policy of digitization of the archival documents. On the other hand, the MACBA historical fund, which preserves the documents produced by the museum, was receiving more and more documents born in digital format. The need for a digital repository and a system for describing and managing digital files was also essential for the conservation of a significant number of works of art from the MACBA collection.

The museum has developed the MACBA Digital Repository www.repositori.macba.cat to respond to the need to manage digital collections, both digitized and born-digital. The MACBA Digital Repository is an online archive for preserving, managing, and disseminating MACBA's digital fonds, including photographs, audiovisual and sound recordings, graphic material and documents. This digital heritage is organized into two main groups: the Artistic Collection, which includes works from the art collection, and the Documentary Collection.

The MACBA Digital Repository was opened for public consultation in the museum library in 2017, after a design and technical development phase carried out by the museum team. Subsequently, remote access has been progressively available to the public.

The repository project has involved an in-depth analysis of the intellectual property rights and contractual conditions of the works and documents stored to determine the possibilities of making each material available to users. Depending on rights there are three main levels of consultation: internal for specialists in the treatment of the materials; access from the MACBA spaces, and open to consultation from any place for any user. Access to the collection is also being progressively integrated into the MACBA website www.macba.cat with the aim of making the museum collections increasingly more widely known.

Author Biography

Marta M. Vega is head of the MACBA archive and library. She holds degrees in Art history and Documentation from the University of Barcelona. Her previous experience in libraries includes the Biblioteca de Catalunya and the Museu Nacional d'Art de Catalunya. She co-authored the e-pub on museum archives *Folding the exhibition*, MeLa Project, 2014.

Global Archiving Network: A Case Study at the Second Summit on New Media Art Archiving at ISEA2022

Terry C. W. Wong

ISEA Archives, Simon Fraser University
Vancouver, CA
terrywong.cw@gmail.com

Abstract

One of the primary functions of an archive is to act as a repository to store essential documents and records throughout history; consequently, these stored archival materials can help us re-imagine a collective memory of the past. With rapid changes in the dissemination of information in recent years, the conventional ways of archiving may not be able to capture all the essential records of our time. This is especially concerning in regard to new media art archiving. Many recently created important new media artworks have been disappearing without being archived. If this issue is not addressed, we may lose a significant part of our digital cultural heritage. To respond to the issue, archives worldwide have attempted to approach the problem collectively. This lightning talk discusses a case study that will be conducted in response to the Second Summit on New Media Art Archiving at ISEA2022.

Keywords

archive; new media art; digital culture heritage, global archiving network; Liverpool Declaration; ISEA; ISEA Archives

Introduction

New media art is a contemporary-art category in which the media itself is very technology-dependent. Artists often incorporate emerging technologies in their artworks and constantly redefine the category. Unlike many other more static traditional art media, this evolving genre of art faces a severe problem: many recently created artworks can no longer be exhibited and may disappear without a trace due to technology obsolescence, lack of data, and insufficient documentation. New media art archives around the globe have been facing this challenge independently in the past. As technology changes, the challenge in archiving new media artworks has become more critical. Therefore, an initiative to establish global collaboration between new media art archives was initiated with the publication of the Liverpool Declaration. [1] The Declaration has outlined two main goals: 1) Establish international and sustainable funding structures and 2) Support an international association/institution for shared data. Additionally, it suggested an action agenda for the alliance to promote collaborations. [1]

Since then, major new media art archives around the globe (ISEA, SIGGRAPH, FILE, ADA, and Ars

Electronica) have had group discussions, implementation meetings, and have done presentations at various conferences in an effort to develop an international research-archive infrastructure. An important conference dealing with this topic is the Second Summit on New Media Art Archiving at ISEA2022. The First Summit took place at the ISEA2020 symposium held online and hosted in Montreal, Canada. [2] After the success of the First Summit, the Second Summit was co-organized by the ISEA Symposium Archives and the SIGGRAPH History Archives and in cooperation with ISEA2022 Barcelona, the Barcelona Museum of Contemporary Art (MACBA), the Electronic Language International Festival (FILE) Archive, the Archive of Digital Art (ADA) and the Ars Electronica Archive. [3] The Summit series is an effort to establish a global archiving network as defined in the Declaration. These events allow different stakeholders to exchange ideas related to new media art archiving and lead to collaborative archiving protocols and strategy development. This makes the summit ideal for conducting a case study for the emerging global archiving network research. The goals of the case study are: 1) to identify the current status of the emerging archiving network, 2) to analyze the various problems and solutions, and 3) to report the findings back to the archiving community as a contribution. The case study consists of data collection mainly through observations, literature reviews, surveys, and interviews.

LIGHTNING TALKS

The Different Histories of Electronic Art in the V2_ Archive

Arie Altena and Michel van Dartel

V2_ Lab for the Unstable Media
Rotterdam, The Netherlands
arie@v2.nl, michel@v2.nl

Abstract

V2_ Lab for the Unstable Media is an interdisciplinary center for art and media technology in Rotterdam, the Netherlands. It strives to build a ‘living archive’ of electronic art, using its own documentation from over 40 years, made accessible on its website. This presentation outlines some of the strategies to bring out the *different* histories of electronic art that narrate the art form’s critical role in giving meaning to and (re-)interpreting the real-world effects of technology.

Keywords

Living Archive; Electronic Art; Art History; Dissemination.

Introduction

V2_ Lab for the Unstable Media is an interdisciplinary center for art and media technology in Rotterdam (the Netherlands). Founded in 1981, V2_ creates a context in which issues regarding the social impact of technology are explored through critical dialogue, artistic reflection and practice-oriented research. The V2_Archive contains descriptions of more than 1,300 events organized by V2_ over the past 40 years, along with about 600 longer accompanying texts (essays, lectures), descriptions of almost 1,000 works of art and other projects exhibited at V2_, and more than 1,600 biographies of artists and speakers. There are also links to hundreds of videos, ranging from full recordings of events to brief interviews with artists; hundreds of scanned program booklets and PDFs; and thousands of photographs. Through its integration in V2_’s website, the archive continues to grow daily with every activity V2_ undertakes. Besides offering a valuable publicly accessible resource for researchers investigating the evolution of the field of art and technology, V2_ strives to activate its archive in order to make this evolution of value for contemporary culture, current art production, and the public.

No unequivocal picture can emerge from an archive like this one. Its diversity and size make that all but impossible. An archive invites research, browsing and discovering connections. We work from the assumption that V2_ archive does not yet represent a history: it possesses the potential for history to be written. V2_ strives for a ‘living archive’, where the documentation that is offers is used to create different stories about the past, that might give insight into the now and the future – especially with regard to the effects that technology has on the arts and on society.

The strategies V2_ currently undertakes to realize the potential of the archive include archival research into the curatorial processes centered around our presentations and productions. This research is also published and/or presented at events. The recent publication *40 Years of V2_*, as well as the establishing of a list of 40 iconic works, chosen by the public, are part of this. One particular example is this is taking key works from the history of electronic art as a starting point for contemporary artistic research in the program *Re-enacting the V2_Archive*. An unlikely success is the featuring of archival research in the monthly V2_radio programme on Operator Radio. The undertakings can be seen as strategies towards achieving a living archive, and a lively discourse on the history of electronic art.

These strategies to argue that their pluriformity is paramount to bring out the different histories of electronic art. This emphasize on the different stories through which the history of electronic art can be told is a critical reminder that archives such as V2_’s are important to challenge the singular innovation-oriented narrative that currently dominates the historical analysis of electronic art. V2_’s archive is an asset in the narration of electronic art’s critical role in giving meaning to and the (re-)interpretation of the real-world effects of technology, but it needs to be used to make those different histories come alive.

Acknowledgements

This presentation is made possible with support from Stimuleringsfonds Creatieve Industrie, Gemeente Rotterdam, and Netwerk Archieven Design & Digitale Cultuur.

Introducing Videotage Media Art Collection (VMAC)

John Chow, Wing Shan Chung

Affiliation (s): VIDEOTAGE

Location, Country: Hong Kong, China

Contact Emails: johnchow@videotage.org.hk, shanchung@videotage.org.hk

Abstract

Founded in 1986, [Videotage](#) is a leading Hong Kong-based non-profit organization specializing in the promotion, presentation, creation and preservation of new media art across all languages, shapes and forms. Videotage Media Art Collection (VMAC) strives as the identity and body that documents Hong Kong's extensive media art history. Through Hong Kong's character of a cultural, geographical and political peninsula that uniquely merges Chinese and Western influences, the collection depicts how the city has been a sensitive witness to a period of art in history. It also displays the development of society as much as that of technology-exploring issues of identity and life in urban, political and cultural environments through a wide array of techniques that mark the transition from analogue to digital artmaking.

Keywords

Video-art, VHS, Digitalization, Art-communities, Collaborative preservation, Hong Kong

Documenting Hong Kong Early Media Art's Communities

VMAC is a unique witness to the development of Hong Kong video media culture in the past three decades. Preserving over 2000 magnetic tapes/born-digital video artworks and 1500 programme documents from the early media art scene. The collection features an extensive scope into local pioneer video artists with manifold backgrounds, covering a great diversity of genres from personal video diaries and letters, workshop result, found-footage remixes, theatre performance, cell animation to feature-length mockumentaries. Notable collections include Ellen PAU, WONG Chifai, May FUNG, Danny YUNG (ZUNI) and HUNG Keung.

We share the gradual challenge in pursuit of preserving artistic authenticity of obsolescing media art objects. With this opportunity, we would like to share our storage practice towards magnetic tapes and obsolescing machines

(such as reel projectors and CRT TVs), and our house digitalization method on tapes and printed materials.

With the objective to build a brand new platform for research, education, curatorial practice, and artistic production, Videotage strives to provide curators, artists, students and scholars resources at VMAC to support project facilitation, realization, concept synthesis, presentation, documentation, and networking. Currently, VMAC is developing an online-streaming platform with semantic taggings in hope of a more effective information retrieval experience to the local research community needs.

Recent notable projects include: "[Why An Archive](#)" (curated by Ariane Beyn), as part of Times Art Center Berlin's exhibition *Readings From Below* in collaboration with Arsenal - Institut für Film und Videokunst e.V.; "[Discourse of Reimagined Hong Kong Art Communities](#)" archival series (curated by Lo Yin-shan), as part of [New Horizons: Ways of Seeing Hong Kong Art in the 80s and 90s](#) exhibition in collaboration with the Hong Kong Museum of Art (HKMoA); "[Either Too Quiet or Too Loud](#)" (curated by Hsiao Bochun) with Taipei Contemporary Art Center and Hong-Gah Museum; and "[Hallucinatory Hereafter](#)" (curated by Vennes Cheng Sau-wai) as M+ Mediatheque guest-curated programme.

In pursuit of collaborative preservation across regions, VMAC expanded their collection towards the greater china region from 2019, and have broadened the collection with 98 new entries selected by esteemed guest curators. Notable mentions including TAO Hui, Liang ZHAO, CHEN Shao Xiong from China Collection curated by SU Wei (Independent art critic and curator, Beijing); Wang Jun-jieh, Yuan Goang-ming, Su Hui-yu and Hsu Chia-wei from Taiwan Collection curated by Song-Yong SING (Institute of Interdisciplinary Art, TNUA).

The Computer Arts Society Archive

Sean Clark & Sean Carroll

The Computer Arts Archive, Leicester, UK

www.computer-arts-archive.com

seanc@interactdigitalarts.uk, seanzshow@gmail.com

Abstract

The Computer Arts Archive is a not-for-profit company that collects, exhibits and promotes computer arts for the benefit of artists, audiences, curators, educators and researchers. We collaborate with other collections, museums and galleries to explore the impact of digital culture and ensure that computer art is recognised as a significant contemporary art form with a rich and diverse history. In particular, we work closely with the Computer Arts Society, a member-based organization founded in 1968.

Keywords

computer art, digital art, media art, histories, archiving

The CAS50 Collection

The Computer Arts Society was established in London in 1968 as a forum for people interested in the use of computers in the creative arts. It organizes meetings and events, hosts exhibitions and publishes its own occasional journal, PAGE.

In 2018 the society put together an exhibition of 2D digital artworks to help celebrate the fiftieth anniversary of the founding of the society. The resulting “CAS50 Collection” featured multiple artworks by 24 significant artists and was exhibited in Leicester and Brighton in the UK, and then as part of “Event Two” at the Royal College of Art and “The Digital Design Weekend” at the V&A, both in London.

The Computer Arts Archive CIC

In order to provide a physical home for the CAS50 Collection, and to create a base from which further collecting could take place, a new non-profit company, the “Computer Arts Archive CIC” was established in 2019 and an office opened in Leicester in the heart of the UK

Other Collections

Despite delays caused by the global COVID-19 pandemic, the Computer Arts Archive has managed to grow its collections over the past two years

We are now custodian of the Electronic and Visualization and the Arts (EVA) conference archive, containing 30 years of material, and the Edward Ihnatowicz Archive. We also have a collection of computer artworks made in the 1980s, plus Sean Clark’s personal collection of “cyberculture” materials from the 1990s.

Our goal is not to attempt to build a “definitive” collection of computer art from the last 50 years, but to focus on previously untold stories within the history of computer arts and to share our work with other archives and collections.

Current Challenges

The Computer Arts Archive is still relatively new. As well as the usual challenges of such a project – obtaining funding and storage space – our key task as present is to index the materials in the archive in a way that will make the data interchangeable with other projects. We are particularly interested in working with other archives to use and develop common metadata standards for data representation, as well as identifying open source archiving software for data storage.

We are also working with De Montfort University in Leicester to investigate how technologies such as Machine Learning and Artificial Intelligence can be used to uncover connections between the materials within the archive.

Digitized Analog Memories – Methods of Visualizing Found Media

Erik Contreras

University of California, Davis
Davis, California, United States
ehcontreras@ucdavis.edu

Abstract

With the rise of home computers in the 1980s and the world wide web being publicly available in the 1990s there has been a boom of media that was created by the public. As these files are getting to be over 30 years old, there is a unique opportunity, as an archivist, regarding curating these files and providing a perspective of this time period for future generations.

“Digitized Analog Memories” is a case study of possible methods for curating personal media found on discarded floppy disks. The method for the study was to create a “desktop vignette”, or digital collage, of the previous owner’s life using legacy hardware and software (Pentium III Windows 98 PC). During the collage process, specific desktop color schemes were chosen based on the content found on the floppy disk as a means of recreating the previous owner’s desktop when they originally created the files.

From this study, three key nodes of discourse around the topic of archiving and presenting historical personal data came up: 1) Is all personal data relevant to archive for historic or anthropological reference? 2) How much subjective flexibility can be given to the curator/artist when it comes to presenting historical digital media? 3) How should the hardware for reading dead formats be maintained for future archival use? From this study, all personal data was relevant, however personal photos and journal entries were the most popular to exhibition viewers. The curation of this material should be minimal and maintain period-correct aesthetics. The media should be raw, but personal information of the original owners should be redacted. While legacy hardware is still cheap and easily available today, institutions need to make the effort to maintain legacy machines for use in the distant future.

Keywords

Digital Curation, New Media, Found Media, Human-Technology Relations, Media Convergence, Digital Archive

Overview

This talk will go over the initial discovery of found digital media on obsolete formats, followed by the methods of salvaging media using legacy hardware and curating pieces for public viewing. The initial exhibition of this work was

hosted by the Basement Gallery at the University of California, Davis. During the curation process, balancing the emphasis between the technology used, the digital media files, and the original creator was key. The goal for this work was to humanize the past i.e., finding the analog memories in a digital space.

Figure 1: An example of a “desktop vignette” using media files found on the “Kodak Image” floppy disk from 1997

Author Biography

Erik Contreras is an interdisciplinary designer and engineer from the San Francisco Bay Area with a background in rapid prototyping, and hardware hacking + repair. His work involves finding alternative uses for post-consumer products and media through hands-on craft and new media digital art pieces. He feels that obsolescence creates an opportunity to showcase a product’s true character in the real world given the influence from consumer culture and technological hype has faded away due to time.

2nd Summit on New Media Art Archiving ISEA2022

Collecting and Preserving Expanded & Extended Nonfiction

Arnau Gifreu-Castells

ERAM – University of Girona
Girona, Spain
arnau.gifreu@eram.cat

Abstract

The history of the evolving field of new media work is pushing individuals to take a huge effort to preserve important artifacts and analyse projects. *Extended Nonfiction* is a project that promotes the study, training, production and preservation of audiovisual, interactive, transmedia and immersive nonfiction narratives. *Extended Nonfiction* is an informative, formative and productive proposal that places emphasis on the field of reality, on real stories; but not just any reality, on expanded and extended reality.

Keywords

Online Preservation, Works collection & Analysis, Database, Non-fiction Narratives; Reality; Audiovisual Narrative; Interactive Narrative; Transmedia Narrative; Immersive Narrative.

Description

The first phase of the project includes the creation of a platform in the form of an observatory that includes and preserves different genres and formats of extended reality. These genres include documentary, journalism, education, museums, essay, political discourse and reality TV, among many others. All these nonfiction genres and formats are mixed with different narrative expression forms, such as audiovisual, interactive, transmedia and immersive. The second phase is the design and implementation of a training academy-school. The third phase includes the stimulation and transfer of knowledge for production, through consulting with companies and brands to generate real storytelling that becomes specific branding. Here we present the results of the first phase of the project, and specifically regarding the platform we are developing in order to preserve works, templates and guidelines for interested audience such as producers, students, companies, etc. The

current proposal is based on the creation of a web platform structured as a database containing and analyzing in detail the production process of 50 interactive, transmedia and immersive non-fiction projects in which we have worked in different roles during our professional career. These projects can be consulted from the delimitation of a set of filters (time, period, topic, etc.) that allow users to generate templates adapted to their needs providing learning and useful guides for the production of this type of works. The project is currently in an advanced state of development, but draws on extensive research in the field of interactive documentary [1] and production of non-fiction works [2] during the last 15 years.

Research-based Online Archive and the Canonization of Net Art

Tereza Havlíková

Zentrum für Netzkunst
Berlin, Germany
tereza@netzkunst.berlin

Abstract

During the project “Calculating Control: (Net)art and Cybernetics” the Zentrum für Netzkunst had designed and built a small online archive, that includes different resources and references related to the topics of cybernetics, GDR, as well as artworks and specifically net art.

Rather than being focused on a singular medium or an art period this research-based archive introduces one possible narrative, connecting net art to local history and supporting its circulation in the collective online memory.

Keywords

research-based archives, online archives, alternative archive structure, collective memory, local histories, net art

Research-based online archive and the canonization of net art

Zentrum für Netzkunst (center for net art) is a small, young initiative reconstructing, maintaining, and preserving net art and net culture. Through their activities, the group researches the possibilities of contextualization of net and digital art. [1] Since 2019 Zentrum für Netzkunst has been a pioneer user in the House of Statistics in Berlin – an urban project aiming to bring together social, artistic, and activist initiatives. [2]

The location of Haus der Statistik was a point of departure for the exhibition and research project “Calculating Control: (Net)art and Cybernetics”. [3] Working from the site-specific history of Haus der Statistik (a building that operated as the Central Administrative Headquarters for Statistics in the German Democratic Republic), the project explored the impact of cybernetics on artistic and social practices, networks, and technology. As part of the project Zentrum für Netzkunst designed and built a small online archive that is still accessible and updatable to this day. It includes different resources and references related to the topics of cybernetics, GDR, as well as artworks and specifically net art. The archive was built by “misusing” the open-source software for bibliographies Zotero. The research assistant program works as the input mask for entries as well as a control panel for the archive. This structure allows making new links between net art and other historical artifacts and references.

The “Calculating control” archive is not directly preserving the material, the books, or the artworks related to the project, but it works as a growing collection of

references. It is archiving the process of the research as well as the parts of the project, stretching the definition of an archive to its limits.

Even though it might seem that such an archive doesn’t fulfill its function as an agency for the long-term preservation of net art, it is not an “empty” archive. It has a specific value and function in the canonization of net art. Rather than being focused on a singular medium or an art period this research-based archive introduces one possible narrative in which specific net art works can be anchored. It connects net art to local history, as well as to a discourse outside of the art historical field.

For an art practice such as net art, the process of canonization has been a difficult and slow journey. Because of the nature of net art that is spread on the internet, often located on a unique domain, the usual tools for a centralized archive are not available. One example of an attempt to establish a net art canon is the Net Art Anthology by Rhizome but as the name hints, it also doesn’t identify as an archive but also operates as a collection of references. [4]

For net art, one possible way to establish an archive or a canon is by continuous reproduction and connection to different narratives and contexts. Projects like the “Calculating Control” Archive support the circulation of net art in the collective online memory, connecting it to different narratives and discourses and stabilizing its position in the still-emerging canon.

Author Biography

Tereza Havlíková (born in Prague) is an art historian and curator living in Berlin. Her research focuses on net art and digital art in a broader context of internet history and culture as well as online curatorial practice. She is a founding member of Zentrum für Netzkunst and a pioneer participant in the urban model project Haus der Statistik in Berlin.

Screen Recordings and Reinterpretations from Archiving to Creation

VISIONS.OF.MOUCHETTE.ORG

Martine Neddham

Independent Artist
Netherlands
martine@neddam.info

Abstract

Mouchette is an iconic virtual character from the early net.art time. Fourteen screen recordings of her website have been found online on Youtube channels. These videos are documenting the viewing practices of some visitors, the way they browse the website mouchette.org the way they comment their visit, and how they embed it inside their own narrative, stories of horror, of magic or of seduction. These recordings are an exceptional archival of this website recorded by the viewers in very different ways.

Introduction

For a website like mouchette.org triggering interaction and participative experience, screen recordings are a frequent practice. They are used for archival, due to the fast changing online environment, and they are used in art exhibition since museums and galleries rely mostly on frontal viewing and wall hanging. Screen recordings as I know them are simply functional, a usual way of archival.

But what if a trove of screen recordings of Mouchette.org, full of creativity and imagination is found on Youtube channels, videos made by young people browsing and recording this website to express their personality and feelings, hoping to gather interest, sensation, and a spectatorship of their own? When the public extends the narratives to their own fancy, rather than archival, we are reaching towards collaborative creation or fanfiction. This is what happened when Nikos Voyiatzis found all these videos recordings of Russian kids visiting mouchette.org and telling stories about it. For me, the author of Mouchette.org, the participative aspect of the website is the core of my creation since the very early net.art period when interactive narratives were created with users' participations kept inside huge databases, kept and maintained to this day, and reworked into new creations. So what a wonderful gift it is to fall upon a new generation of internet users who have invented their own practices to represent and share their reactions to my website!

Among these recordings you can meet:

- -Victoria in the 'Viktory Show' channel on Youtube who plays a cute teenager girl, a 'Mouchette-like' ersonality, pretending to discover the website with surprise and bewilderment.
- -Nikitos and Romanos, too young brothers presenting 'Fears Show', episodes of the scary and supernatural stories that stage and enact physically in their own room and where they digitally insert as screams, animations, gifs and other disturbing elements of their own making inside the website of Mouchette.org.
- -You can also meet some very young kids who have difficulty in typing the URL of mouchette.org on the Russian keyboard of their phone and still manage to record their screen and post it to a Youtube channel, with their own comments and mumblings and a tiny thumbnail of their face in the top of their video.

Within mouchette.org, these are all valid collaborative creations, worthy of finding a place inside my website. In the same way that viewers reactions were and still are, kept and reworked into new pieces, a space inside mouchette.org has been devoted to these visions of mouchette.org, to host these films and give full access to viewers through english subtitles from the comments in Russian. I created a subdomain on the website mouchette.org, where I host all the videos

<https://visions.of.mouchette.org/>

First, together with Nikos Yoyiatzis who originally found them, I archived these videos on my archival website, with original technical data and all the comments:

<http://about.mouchette.org/category/archiving/by-nikos/>

And then I proposed them as online exhibitions in their full right. Here it was exhibited insi The Wrong Biennale.

https://artsubstitute.net/index_en.html

<https://artsubstitute.net/neddham.html>

My next step will be to show these works in the physical space in exhibitions as a part of the creation of mouchette.org.

Participatory Preservation: Experiments in Distributed Networks of Care

Kelani Nichole

TRANSFER Gallery, The Current Museum

Miami, USA

kelaniatwork@gmail.com

Abstract

The recent emergence of decentralized economies has foregrounded an urgent need for new modes of long-view care and stewardship in contemporary Time-based Media Art. This lightning talk presents some learnings and insights from 10 years of hands-on applied research in the gallery and museum context. Case studies are structured around design thinking methodologies, and outcomes from experiments ranging from new exhibition formats, to collecting models, decentralized storage experiments and more

Keywords

Conservation, Time-based Media Art Collecting, Immersive Exhibition, Simulation, Virtual Worlds, Decentralized Storage, Museum Operations, Cultural Infrastructure, Peer-to-peer

Introduction

‘Participatory Preservation’ is a concept that seeks to acknowledge the networks of care and stewardship that surround and support archival efforts. Time-based Media Art is a format that uniquely requires a ‘performance’ in order to experience the work – whether playing a video, interacting with a virtual environment or simply loading a digital image. This is the general sense in which participation will be explored in this lightning talk.

Starting in the context of the gallery as the site of initiation for many Time-based Media artworks, we will look quickly at three efforts piloted in the space of an experimental gallery 1. An approach to exhibiting immersive Time-based Media Art that creates peer context around emerging art to archive a survey of practices 2. A community-focused gallery program that create a connected provenance around a program 3. A blockchain-based solidarity economy infrastructure for exhibiting and preserving complex Time-based Media artworks and redistributing wealth.

Moving next into the space of the institution and museum, we will explore a case study that focuses on a new type of cultural infrastructure that inverts many of the traditional structures associated with institutional longevity, while simultaneously uplifting and furthering the values of rigorous GLAM archival practices.

The Gallery

As the originating node in the provenance of artworks, a gallery plays an important role in the longevity of Time-based Media Art. When considered as a critical part of the program, a gallery is well positioned to experiment with new forms of contracts, documentation, presentation, display and

other concerns crucial to the archival integrity of an artwork. This is especially salient in the case of Time-based Media Artworks as these works often just consist of licensed rights to collectors and archives, along with the acceptable variations of display and conditions for care and maintenance.

The three examples in this section of the lightning talk referenced in the introduction were facilitated by TRANSFER an experimental gallery focusing on net art and simulation in contemporary art spanning the years 2013–2021. Two of the dominant topics touched upon across these examples are how standardizing display can create both positive outcomes and limitations for the longevity of diverse formats of Time-based Media Art, and how peer-coordinated exhibitions create lasting context for artworks and artist studio practice that is both resilient and precarious.

The Gallery

The Current Museum tested an experimental model for the patronage and stewardship of Time-based Media Art with the aim of reforming power structures inherent to contemporary art collecting, and expanding access and appreciation and archiving of art to a new generation of collectors. This model was tested in three acquisition salons installed in a SoHo loft in 2018, and resulted in a collection of 15 complex variable media artworks safely maintained in a preservation-grade decentralized storage network.

In this portion of the lightning talk the pillars of this model will be explained, to illustrate how ‘Participatory Preservation’ might perform meaningfully at a local level, while at the same time connecting ‘nodes’ of stewardship globally as an alternative to a centralized archival approach of contemporary art institutions.

Author Biography

Kelani Nichole is a technologist, collector and founder of TRANSFER, an experimental gallery focused on simulation in contemporary art since 2013. In addition to founding and running a leading digital art gallery, Kelani has spent 15 years in UX research and product development. In 2018 she invented a new model for distributed cultural infrastructure with The Current, a non-profit museum collection rethinking patronage and access for Time-based Media Art. Her work over the past ten years has focused on expanding an understanding and practical application of conservation and preservation through applied research and experiments with a global community of artists, collectors and institutions.

IMAI Play: The video art channel of the Inter Media Art Institute

Darija Šimunović, Dr. Linnea Semmerling

IMAI–Inter Media Art Institute
Düsseldorf, Germany
Contact Email: ds@stiftung-imai.de

Abstract

The Düsseldorf Inter Media Art Institute (IMAI) is a non-profit foundation that archives, exhibits, and distributes time-based media art. The archive boasts more than 3,000 works that document the international history of video art from the 1960s until today. More than 1,000 of these videos can be viewed in full in the catalogue on the foundation's website. Since September 2021, this website also hosts the foundation's participatory video art channel: IMAI Play. IMAI Play invites users to create video art playlists, publish them on the foundation's website, and share them on social media. Through social tagging every playlist is accompanied by user-defined metadata to facilitate new readings of the archive. Users can also create their personal watch lists and comment on the playlists of other users. With IMAI Play, the Inter Media art Institute aims to stimulate communication about video art and create a space for new perspectives, discoveries, and unexpected connections.

Keywords

Video art, art history, participatory curating, digital archive, citizen science, social tagging

IMAI Play – A participatory video art channel

The Düsseldorf Inter Media Art Institute (IMAI) is a non-profit foundation that archives, exhibits, and distributes time-based media art. The archive boasts more than 3,000 works that document the international history of video art. A permanent exhibition at NRW-Forum Düsseldorf makes this history come to life in an interactive display. The distribution program circulates videos from more than 120 international artists. More than 1,000 of these videos can be viewed in full in the catalogue on the foundation's website. Since September 2021, this website also hosts the foundation's participatory video art channel: IMAI Play.

IMAI Play invites users to create playlists from more than 1,000 works of video art from the 1970s up until today. The works include the international canon of video art history, underground music videos as well as performance documentations. To find videos, users can search the catalogue by artist name, work title, medium, date, as well as search terms related to topic or style. Any of these videos can be added to a playlist.

To compile their own playlists, users have to create a personal account free of charge. The account allows them to create a playlist and add videos, texts, and a minimum of three user-defined tags. The playlist can be kept private, or it can be published on the foundation's website as well as shared on social media. A published playlist can be commented upon and put on other users' personal watch lists.

With IMAI Play, the Inter Media Art Institute strives to liberate video art history from the confines of the strictly thematic and stylistic taxonomies of professional art historians and embrace the rich and unexpected folksonomies that emerge among the wider community of video art enthusiasts instead. The platform can thus be understood as a tool for user-defined metadata collection that provides new possibilities for citizen science in the humanities. By drawing on the expectations that users have developed during everyday interactions with commercial audiovisual platforms and streaming services, the participatory channel seeks to combine a pleasant viewing experience with a lasting contribution to art history.

IMAI Play hopes to make the archive of the Inter Media Art Institute accessible to more diverse audiences from all over the world by inviting them to view video artworks, create their own programs, discuss them with a dedicated community, and challenge art historical paradigms with new perspectives and unexpected connections.

Author Biographies

Darija Šimunović is a cultural studies scholar (MA) and has been responsible for the video art collection and its distribution at the IMAI since 2010. She was a research associate at the Institute for Visual Media of the ZKM Karlsruhe and worked as a visiting lecturer in video art history at the Düsseldorf University of Applied Sciences and the Paderborn University.

Linnea Semmerling is director of the Düsseldorf Inter Media Art Institute (IMAI). She has developed programs and exhibitions for various museums including ZKM Karlsruhe, IKOB Eupen, Marta Herford and TENT Rotterdam. She holds degrees in Cultural Studies, Art Studies and Technology Studies from Maastricht University and the University of Amsterdam.

MEMODUCT posthuman.archive: The Site-specific Media Art History

Violeta Vojvodić Balaž and Eduard Balaž

<https://memoduct.org>

Belgrade, Serbia

violeta.artstudio@gmail.com

Abstract

MEMODUCT *posthuman.archive* is a repository of media art practices in the field of digital humanities, site-specific media art history and cyber-anthropology. The major contributions of the project are: 1) Archiving of media art from the underrepresented regions, i.e., *The Global Margin*, initiatives that were recent and as such exhibited in the most important exhibitions and festivals, but which have not yet been explored in depth and systematically processed as a cluster, or a scene; 2) Documentation of the new media artworks that became “inaccessible” due to the instability of the Internet media and the rapid obsolescence of computer technology; 3) Modeling of new methodology in relation to the question: *How to write European history of tactical media and environment art, the conjuncture of New Europe 1988-2022?*

Keywords

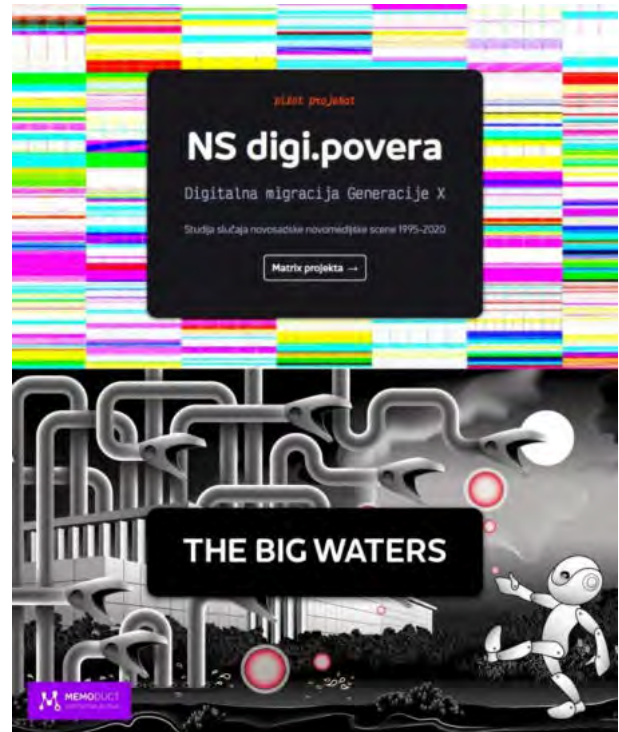

Memex, site-specific media art history, information art, environmental art, tactical media, New Europe

Introduction

MEMODUCT builds on Vannevar Bush’s concept of the memex—how technology can help to capture marginalized creation/innovation. Its goal is to enable future researchers to study evolution of the environmental complexity and the genesis of site-specific media art phenomena: the employment of tools, the development of iconography, the formation of professional identities and the emergence of personal epistemology of an artist.

The first pilot project was *NS digi.povera*, an ongoing research on media art scene in *Novi Sad* which originated in the war conjuncture on the periphery of New Europe (1988–2022), after the opening of the Internet for citizens, in a hybrid environment shaped by the scarce resources of fundamental economy and virtual economy.

MEMODUCT core topics are: Control, Infowar, Cyber Ecosystem, Construction of the Future.

©Memoduct 1) Site-specific media art history, e.g. *Novi Sad digi.povera*; 2) Artists’ socio-biographies, e.g. *The Big Waters*.

MEMODUCT case studies of artworks were/will be formatted according to categories: 1) *Conjuncture*, state of the social system, its economic, political and other aspects; 2) *Context*, autopoietic system of science, history and theory of art. 3) *Concept*, an idea of artwork and an artist statement; 4) *Iconography*, visualization of ideas and symbolic representation; 5) *Technical description* of the setting and technologies used. Biography of the artists are/will be made in a form of socio-biography since an artist performs as a witness of the paradigm change, i.e., technological, environmental and social transformation.

elian.carsenat@namsor.com, eveline.wandl-vogt@oeaw.ac.at, dario@metabolab.harvard.edu

Abstract

This lightning briefly introduces the conceptual aspects of uncopied.art, an endeavour with the mission to make ORIGINAL truly UNIQUE, with physical and digitally immutable certificates of authenticity, expertise, inventory that will outlive us. In the tal the authors discuss the core values, offering a closer view to the workflow of certification. The authors focus on the opportunities, UNCOPIED may offer for archiving and aim to jointly discover potential risks and pitfalls going along with implementing this emerging technology for the long run in archives. Furthermore, the audience will be introduced to the recent case study that relies on a collaboration with LCMA, the Los Angeles County Museum of Art.

As a byproduct of securing art works on a transparent blockchain, UNCOPIED makes available its own dataset to scientists interested to work with open data for research purpose. UNCOPIED aims to provide innovative methods to secure digital collections by making metadata public. A scientific committee is in charge of making the dataset accessible in the respect of stakeholders interests, privacy and ethical concerns. The authors briefly discuss the current non-hierarchical organizational setting of UINCOPIED and outline it's necessity against the background of Open Innovation and it's meaning in the progress of innovation.

Keywords

Unique Art, Blockchain, NFT, Emerging Technologies, New Technologies for Archiving, New Directions in Archiving, Sustainability, Certification, Ethical Concerns, Open Innovation

Introduction

Blockchain technologies become more dominant in the art market and in data systems and protocols.

The mission of UNCOPIED is providing certificates to guarantee original artifacts a longer life. UNCOPIED was founded in 2020, with the aim to make originals truly unique, with physical and digitally immutable certificates of authenticity, expertise, inventory that can outlive us. The objective was to find a solution to distribute the digital

image freely as Creative Commons, yet make limited edition physical prints which could be proved to be limited. So the idea gradually became a mission statement : creating an open source solution to certify the authenticity of both physical and digital objects, combining the physical chirograph with QR code, blockchain, IPFS and a reverse search engine.

Uncopied is an open source solution built on other open source solutions or industry standards. The service shall include a 10-year 'promise' for digital conservation and technical suitability. Algorand blockchain technology is an important part of our architecture. Algorand solves the blockchain trilemma (security, scalability, and decentralization) without any compromise and it can not fork, which is an important feature for a NFT platform. At this point, we see IPFS and GitHub as our key technology for long term storage. We collaborate actively with AIS (the Art ID standard consortium) which aims to create shared ownership of the artwork identifiers, by leveraging the new W3C standards for decentralized identifiers (DIDs) and self-sovereign identity. Applied to the art market, it allows the different actors and stakeholders to make verifiable claims about an artwork about its provenance and authenticity.

Regarding metadata, we follow the work done by schema.org for linked open data. We also keep close watch on linked.art, as an emerging metadata standard to describe cultural heritage.

Engaging a wide community of stakeholders can be complex and we refer to risks, inherent to a field of innovation which challenges countries and traditional legal systems with its motto 'the code is the law'.

The UNCOPIED tokens represent an immutable proof of provenance for a physical or digital object. As such, they are non-tradable and inalienable. But the token can be moved to a different UNCOPIED wallet to represent the artwork's status, for example, to document a case of legitimate censorship.

Another bold choice we made is to tie the UNCOPIED certificate not just with metadata, but also with a plain-

Archiving Twitter Database & Visualization from Artwork

Jiayi Young

University of California, Davis
Davis, USA
jdyoung@ucdavis.edu

Abstract

In 2020, I created an artwork on the state of truth-telling crisis during the 2020 U.S. Presidential Election. The project is titled *Project Echo*. [1] It is a multi-modality and multi-disciplinary new media artwork involving Twitter data and took two and a half years of extensive research collaboration with a political scientist and a computer engineer to develop. When the project concluded shortly after the Capitol insurrection, we realized that we had compiled a significant database of Tweets. It has become a valuable historical record of Twitter disinformation activity relating to the 2020 U.S. Presidential Election. As an artist unfamiliar with how archives are established, I am interested in figuring out how to provide public access to the database and its associated visualizations. I look to cultural institutions to help establish an archive of the database and provide the public with the opportunity to access this piece of American History.

Keywords

archiving strategies, database, Twitter data repository, 2020 election disinformation, social media, astroturfing, truth-telling, historical artifact, public access, American history

The Artwork

Project Echo [1] is a multi-modality and multi-disciplinary new media artwork on the state of the truth-telling crisis during the 2020 U.S. Presidential Election. Through two and a half years of extensive research collaboration with a political scientist and a computer engineer, situated in an expanded field of new media art, the artwork — functioning as an apparatus — provided legibility into the black box of astroturfing efforts on Twitter; at the same time, enacted a platform for voices of protest and expressions of lived experiences in a post-truth society.

The project took place in the critical eight-months-period preceding the 2020 election. It consisted of two components that worked in tandem: an online disinformation tracking and visualization interface and a temporary public art social intervention that took to billboards, bus shelters, and grocery stores in critical swing states. Specially developed for the project, the team created a process to curate disinformation, combine the query of historical and real-time Twitter data, set up a backend database, and materialized real-time frontend visualization of disinformation spread.

The Database

The database consists of 204 disinformation topics from April 28, 2020, to February 20, 2021, 2,623,792 Tweets, 1,030,066 users, and 2,365,660 incidences of user interactions. There are 103,879 accounts found displaying a high probability of being fully automated social bots carrying out astroturfing efforts designed to deceive and create the appearance of a grassroots movement. Ninety percent of the dataset retained the full original data fidelity of the Twitter landscape at the time. We captured these Tweets before Twitter performed mass deletion of major disinformation spreaders in January 2021 after the Capitol insurrection. The record contains the now-deleted @realdonaldtrump and 70,000 QAnon accounts.

This information is currently stored in a database and maintained on Amazon AWS. The following diagram (Figure 1) illustrates the structure of the database. The visualization is currently running using AWS Lightsail.

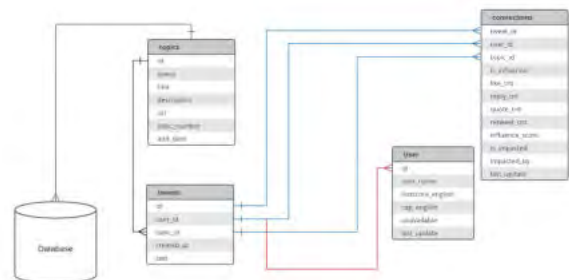

Figure 1. Project Echo Database Diagram. ©Jiayi Young Studio.

“Right-Click To Save: Preservation, NFTs, and Distributed Ledgers”

John P. Bell¹, Regina Harsanyi², Jon Ippolito³

¹Dartmouth College, Hanover, NH, USA; john.p.bell@dartmouth.edu

²Independent Curator, New York City, NY, USA; regina.harsanyi@gmail.com

³University of Maine, Orono, ME, USA; jippolito@maine.edu

Abstract

Artists have experimented with cryptocurrency incentivized distributed ledgers such as blockchains since the advent of Bitcoin. In parallel, crypto advocates frequently claim that distributed ledger protocols will ensure an accessible and immutable record of anything registered to it, including artwork. This panel examines this idea with nuance, neither buying into the mass deception around NFT marketing tactics nor rejecting the reality that a subset of artists are creating significant, challenging works that inherently utilize these technologies. Preserving the asset may seem to be in the regular wheelhouse of preservation professionals, who have decades of experience developing guidelines for saving software-based art, but ledger-based technologies have their own preservation promises and challenges.

Keywords

Non-Fungible Tokens, Preservation, Distributed Ledger, Blockchain, Digital Art, Emulation, Variable Media

Distributed Ledgers and Preservation

A claim frequently repeated in the last year by advocates of blockchains and NFTs is that distributed cryptographic ledgers will ensure an accessible and immutable record of born-digital and digitized art for posterity. This panel examines this idea in a nuanced way that neither buys into the hype around NFTs nor rejects the reality that artists are experimenting with these technologies. The analysis draws on cutting-edge experiments such as archival packages prepared for artworks that utilize distributed ledgers, as well as historical precedents such as net art collected by museums. While the field is still in its infancy, the presenters forecast the viability of the most promising proposals for preserving, and being preserved by, the blockchain.

Media coverage and competing narratives around NFTs have clouded collective understanding of these concepts so it is important to clarify what is meant by these terms:

A **distributed ledger** is a database that is consensually shared and synchronized across multiple nodes. Unless specially encrypted, the participant at each node of the network can access the recordings shared across that network and can own an identical copy of it. Any changes or additions made to the ledger are reflected and copied to all participants in a matter of seconds or minutes.

A **blockchain** is the most popular example of a distributed ledger, using a block data structure with the primary objective to record verifiable transactions.

An **NFT (Non-Fungible Token)** is a set of electronic instructions called a “smart contract,” with a unique cryptographic hash published to a distributed ledger that can reference virtually any object, tangible or digital.

A **distributed storage protocol** is peer-to-peer network for storing and sharing data, distributed on multiple file servers or multiple locations. It allows programs to access or store isolated files redundantly, allowing programmers to access files from any network or computer.

Myths and reality

This discussion will not assess the aesthetic quality of artwork registered to a blockchain, nor directly tackle the economic and environmental benefits and costs of NFTs. Nevertheless, we will start by separating fact from misperception in claims made by crypto enthusiasts that impact new media preservation.

NFT standards were created to store artwork on chain

False. Although the ERC-721 and 1155 standards were created, in part, with artwork in mind[1], the blockchains in which artists are minting NFTs can only practically store small amounts of data. To store 1GB on the Ethereum blockchain could cost over four million dollars[2], and the entire chain currently stores less than 5TB due to the complexity required to validate the entire ledger. For NFTs, the solution has been to point to large media files like JPEGs and MPEGs on other servers or networks. When you buy an NFT, you are typically buying the pointer, not the asset. This is why crypto enthusiasts mock skeptics who claim to be able to steal their NFTs by right-clicking to save; this may download the image of a bored ape, but its token is bound to the blockchain.

NFTs transfer copyright

False. In most cases, buying an NFT does not convey any public rights to the asset to which it points.[3]

NFTs establish a transparent provenance for digital art

Maybe. In theory, every blockchain transaction is public; unfortunately, some intermediary marketplaces obscure collector information[4] due to privacy concerns or technical expedience. Transactions often also take place off-chain or separate from the transfer of the NFT. Recent efforts by blockchains such as Secret Network, third party encryption such as Pinata's Submarine[5], and the promise of zero knowledge proofs put transparency at increased risk.

Digital art can finally be collected thanks to NFTs

False. Museums have collected digital art since at least 1995[6], and at this point many have explored thoughtful protocols for conserving digital media. NFTs add new options but do not solve all the challenges of collecting bits.

Positives and Negatives

Myths aside, does the blockchain at least preserve digital art for posterity? We can examine this claim in by examining the potential and pitfalls of NFTs as a preservation tool.

Benefits: On-chain preservation

For those works concise enough to store on the blockchain, it offers more secure storage than the typical archival hard drive or cloud service. This can be true for a selection of artists who create code-based works, such as John F. Simon Jr, and for conceptual works by artists who use the blockchain as a medium, such as Rhea Myers.[7] However, as long as the visual or sonic aspects of the work need to be rendered, even these genres require external dependencies.

Benefits: Distributed storage solutions

For the vast majority of works too large to store on the blockchain, platforms built around NFTs often automatically upload assets either to their own centralized server or a distributed storage solution like IPFS (InterPlanetary File System). Technologically, peer-to-peer networks like Protocol Labs' IPFS and Filecoin, which also break down data into blocks, are more resilient than traditional storage options maintained by a single organization or company, though they depend on community upkeep to sustain. In principle, such networks can also preserve conservation-related documentation as well as the works themselves.

Benefits: Financial incentives

While traditional collecting institutions depend on grants or donations, blockchain-based preservation systems like Filecoin and Arweave leverage their intrinsic cryptocurrencies to pay anyone willing to maintain a node in their networks.[8] This automated protocol provides a potential income to support community preservation.

Challenges: Limited media

Storage on the blockchain can be very limited due to the high cost of verification. This leaves out the majority of visual, sonic, and time-based media that can't exist as a single files containing a low-resolution bitmap, simple SVG, or a few lines of unminified code for generative outputs.

Challenges: Links to metadata

NFTs include a token URI that acts as a pointer, but rarely do they point to artworks directly. Instead tokens typically link to a JSON metadata file off-chain, whether it be stored by a node operator on a distributed storage protocol or a centralized server. These JSON files in turn point to the singular object file and preview image and rarely a complete archival package. Access to these JSON files are in themselves vulnerable to loss or corruption.

Challenges: Dependence on crypto currency value

Services like Filecoin aim to get around the dependence on volunteer labor by paying contributors in a dedicated cryptocurrency. The impact of such financial incentives rise and fall with notoriously volatile cryptocurrency values.

Challenges: Obstacles to migration

Artworks with digital components frequently need to migrate over space (as in the case of an installation loaned from one museum to another) as well as over time (as in the case of an obsolete format converted to a newer, supported format). It's unclear how such changes would be compatible with artists that mint with immutable URIs to the blockchain. Blockchain advocates tout the immutability of content on the chain, not realizing that variability is important to digital preservation and display.[9]

Challenges: Dependence on platforms

In part due to the learning curve of writing smart contracts, most artists rely on centralized NFT marketplaces and lookup tools with simple interfaces for uploading and displaying assets.[9] These platform interfaces do not tend to take metadata fields into account that are used elsewhere in the contemporary fine arts. Although institutions have developed several metadata for documenting born-digital and digitized components, none of these approaches are addressed in existing NFT publishing platforms. This means that in some cases if the platform goes down, the metadata accessible via the ledger could be missing essential information, including even the name of the artist. Platform-imposed file sizes, meanwhile, require artists to upload compressed file formats whose resolution and bitrate may not properly scale to exhibition dimensions and create bigger problems for conservation efforts.

Challenges: Dependence on external code

Storing codebases for certain software-based works has become a niche model, championed by platforms like fxhash or Art Blocks, the latter of which asks artists to limit their dependencies to one third-party library such as p5.js. While promising, this is far from a surefire solution for preservation; apart from the lifespan of the blockchain or library itself, access to the code does not guarantee knowledge of how its output should be displayed as technologies and viewer expectations change over time.

Challenges: Vulnerability of blockchain “culture”

Some of the most interesting developments in NFTs aren't files like pixelated profile cartoons but the communities that have sprung up around them. Loot, for example, started as a generated list of items from a Dungeons and Dragons-style game in a smart contract. Fans wrote lore about these virtual objects and even fabricated tangible versions. None of this lore is captured by a blockchain.

Approaches to preserving NFTs and their assets

Archival packages

The first and only cross-chain models in practice for preserving non-fungible token data and associated assets were created and put into practice by Protean, a variable media art conservation initiative for educating, practicing, and publishing novel standards for emerging technologies in both the public and private sector. Protean is a work in progress that aims to draw expertise from a global working group of digital conservators. Other projects with preservation-inspired methods include Club NFT and Kanon 21, but neither addresses preservation through the lens of media art conservation ethics. Both Club NFT and Kanon 21 in their current state also have distinct points of failure, such as a broken APIs or unnecessary tool layers that obscure the preservation process instead of educating the end user.

The Protean method, on the other hand, dodges platform impediments by preparing archival packages off-chain first and working with artists to generate URIs for long-term maintenance plans, which are then referenced in the smart contract metadata. They often hold multiple files, including uncompressed, lossless archival copies, README.txt files, detailed manuals, technical artist questionnaires that emphasize media-specific assessment, and supplemental documents.

In comparison with the 100MB restrictions afforded by a majority of platforms, Protean file sizes would depend on needs specific to the artist or subsequent collectors, and only limited by the available hardware, software, and finances. These packages can be hundreds of GB, and discoverable at either a web domain maintained by the artist studio or an IPFS-generated hash for a directory without recording a

specific gateway URL, which would be a platform dependency.

The history of net-based art conservation has exposed many tales of link rot. Protean takes this into account by educating artists and art custodians on generic digital strategies such as migration, but also newer tactics such as becoming Filecoin and IPFS node operators themselves, inherently incentivized to redundantly store each other's encrypted assets in perpetuity.

This process also takes into account the reality that immutability is antithetical to media art preservation. Unlike the singular asset associated with typical NFTs, a Protean link might point to a range of releases that are added to an artist's server or an IPFS directory as the work is updated over time.

Emulation

The above strategies are useful for access and preservation of associated assets that do not inherently require the chain in which they were minted but do not address preservation of works that do treat any aspect of the particular distributed ledger technology as an essential aspect of medium or performative behavior. Blockchain verification depends on node operators, who are normally driven by the promise of crypto-currency rewards. These ledgers may lose their current cohort of node operators to more exciting incentives and systems in the future. At this time there are over 5,000 publicly known full node operators on Ethereum,[10] which has already fluctuated wildly since February 2021 when there had been over 12,000.

Though it may seem a counterintuitive approach to preserving a distributed system, it is possible to emulate on a centralized system an entire set of blockchain nodes to preserve a distributed ledger. Emulation may be appropriate once the original chain or supporting dependencies become unavailable or somehow in dispute: a particular ledger system may lose popularity and not have enough participating nodes to continue, the ledger itself may fork for technical or social reasons, or external links stored in the ledger may go stale.

Since node management software for many chains is commonly available as containerized packages—for example, Docker containers describing Ethereum nodes—a single node will often be running in emulation even before any preservation efforts. Running several containerized nodes together on a single machine is simply a matter of launching multiple iterations of the same container. The container nodes can then be connected with internal networking to create a multi-node private network on a single computer that mirrors the public system currently distributed across hardware around the globe. If given a copy of the current state of the ledger, the entire system can be treated as a self-contained backup that recreates both the stored data and active behaviors of that network.

Technical convenience does not imply emulation is always the best solution, however. An emulated private node network only preserves data in the ledger itself; since ledger data is often a pointer to outside media, code, or assets, those outside resources may also need to be emulated. A work may depend on the activity of public users or new data being added to a ledger that is now isolated from the outside world. In cases where such considerations are not critical to the work, though, emulation offers the ability to simply reproduce a complex technical ecosystem.

Media-independent assessment

Another integration of crypto art into current conservation practices would be to take the approach of the Variable Media Questionnaire,[11] which records opinions about how to preserve creative works when their current medium becomes obsolete. Its users can compare these opinions as they vary by work, by interviewee, and by date.

The current version of the Questionnaire looks at artworks as ensembles of Parts, though its purpose is less to track sundry gadgets like cables or disk drives than to understand the key elements of a work that are critical to its function, such as source code or media display. Acknowledging the relational character of much contemporary art, these Parts extend beyond hardware to include environments, user interactions, motivating ideas, and external references. Structuring the Questionnaire in this way makes it easier to compare different artworks created with similar parts.

The Variable Media Questionnaire could be leveraged to help preserve blockchain art by creating a dedicated Package. A variable media Package is an ensemble of Parts that might be used in common creative formats, from paintings to video installations to websites. Some of the questions in a blockchain Package would overlap with other formats, such as the resolution or color depth of a digital image, or what happens to user contributions when a work is loaned. Others might be specific to the blockchain, such as what to do when a chain forks and how critical a given cryptocurrency is to the work's function.

Conclusion

The vulnerabilities of distributed ledgers suggests that such systems are unlikely to suffice as a preservation solution, including works created on the blockchain itself for art in the future, and in fact may make a preservationist's job more difficult. Nevertheless, the authors believe that a significant slice of artworks using these technologies are worth saving for the future. Emulation offers a promising strategy for re-creating the content and technical functions of an extinct blockchain, but it is less suited to re-creating the social dimensions of a blockchain-based artwork. Rather than a one-size-fits-all preservation solution for these works, we recommend a case-by-case analysis of the best way to

translate the artistic qualities of the work into future scenarios in which the original chains and associated services are defunct.

Abstract

It has always been the case that artistic and cultural practices transform with new technologies. As technology constantly evolves, contemporary artistic practices have increasingly engaged with non-traditional media. Museums, galleries, and art institutions are adapting their approaches to the presentation, dissemination and preservation of new media art. While media artworks and exhibitions are ubiquitous nowadays, archiving plays an important role in preserving history and generating knowledge of art. What are the needs and challenges of developing a media art archive? How can art archives encourage interdisciplinary collaboration to facilitate contextualization, preservation and presentation of artworks?

As a media art archive based in Hong Kong since 2008, Videotage Media Art Collection (VMAC) has continued its development with the expansion of its collection of artworks from Hong Kong to China, Taiwan and Macau in recent years. Esteemed curators from nearby regions are invited to collaborate for the acquisition. Local researchers are invited to study and write about the VMAC archive, providing reflections and new perspectives in media art archiving. This panel brings together art professionals, researchers and scholars to share their collaboration experiences and look at the issues of archiving media art in Hong Kong and China, and beyond.

Keywords

Media Art, Art Archives, Collaborative Preservation, Contemporary Art, Hong Kong, Asian

Introduction

In the panel, media art curator and researcher Kyle Chung will share his experience of Minecraft residency and NFT art project and their related preservation challenges. Joel Kwong, programme director of Microwave International New Media Arts Festival, will talk about her selected media art projects and the challenges during the pandemic.

Su Wei, curator of VMAC's China Collection, will share his collaboration with Videotage in driving forward the video art collection in the Greater China Region.

Biography

Videotage:

Founded in 1986, Videotage is a leading non-profit organization in Hong Kong focusing on the presentation, promotion, production and preservation of video and media art, serving artists in the expanding technological art and culture network. Dedicated to nurturing emerging media artists and developing the local media arts community, Videotage has organized numerous media arts events and programs while developing an extensive offline and online video art archive, Videotage Media Art Collection (VMAC).

Kyle CHUNG:

Kyle Chung is a curator and researcher whose recent exhibitions explore the dynamics between technologies, materiality and human agency. Selected exhibitions include *2³ or Not 2³: East Kowloon is on Minecraft in New Vision Arts Festival*, Hong Kong; *Ellen Pau: Time After Time Will Tell at 1961*, Singapore; *#YOU #ME #ourSELFIES* at Hong Kong Visual Arts Centre; *One World Exposition 2.1: #like4like* at chi K11 art space, Hong Kong; *Carla Chan: To Outland* at SMAC, Berlin, Germany; *Conjunctions and Disjunctions: International Symposium on Electronic Art 2016*, Hong Kong; *Bright Shadow at The Morgue*, London, UK. With a PhD in Creative Media, Chung is currently an independent curator; Curator at Videotage, Hong Kong; and Lecturer at School of Creative Media, City University of Hong Kong.

Joel KWONG:

Joel Kwong is an international media art curator, writer, producer and educator based in Hong Kong. She is currently the Programme Director for Microwave International New Media Arts Festival, as well as the founder of SIBYLS – a creative consultation and production agency. Kwong has a strong belief in the power of art and technology, and her curated projects have been shown in many different cities around the globe. Her most recent projects in 2021 includes Future Media Art Festival in Taiwan, Microwave Festival edition 2021, Glow Shenzhen online media art showcase “Fireflies: The Glowing Dots”, Connecting the Dots – a media art archaeology online exhibition & website etc.

She has years of experience in doing education and on international jury panels, such as Siggraph Asia 2020(South Korea), ISEA 2019 (Gwangju), 2015 Taiwan Golden Pin Awards, Siggraph Asia in 2011 & 2013, and ISEA (HK) in 2016. She has also given talks and lectures at many different festivals and institutions, including Ars Electronica in Linz, Transmediale in Berlin, Shenzhen Media Art Festival; ACT Festival in Gwangju, South Korea; the University of Electro-Communications in Tokyo; and FILMART in Hong Kong.

SU Wei:

Su Wei (born in Beijing) is an art writer, art history researcher and curator based in Beijing. He is currently Researcher at the Tsinghua University Art Museum. He participated in the 2012 Curatorial Intensive at Independent Curators International (ICI) in New York. In 2014, he was awarded first place at the first International Awards for Art Criticism (IAAC). He worked as the Senior Curator of Beijing Inside-Out Museum between 2017 and 2021.

Su Wei's work in recent years focuses on re-constructing the narrative—and radical imagination—of contemporary Chinese art history, and explores the roots of the legitimacy and rupture of contemporary Chinese art history in a global context. Pivotal to his work is the attempt to take the “post-1949” as the key in understanding artistic production in a contemporary situation, and in so doing he seeks to re-define the stance and possibilities of art in nowadays China. He thus engages in an anti-establishment critical practice by mapping the limits, contextual clues and unconscious energies of the post-1949 art production, which figures the dual presence of decay and emptiness.

Multi-Generation Digital Stewardship: XR Art & Technology Archives

Moderator: Rhonda Holberton

Assistant Professor of Digital Media Arts, Department of Art & Art History San José State University

Panelists

Don Hanson, Founder of New Art City (USA)

Amanda Helton, Manager of Digital Strategy, San José Museum of Art (USA)

Dr. Timothy C. Summers, Board Member of the enterprise think tank Leonardo/ISAST (USA)

Nick Szydowski is the Scholarly Communications & Digital Scholarship Librarian at San José State University (USA)

Location: San José California, USA

Contact Email: rhonda.holberton@sjsu.edu

Abstract

Panelists will discuss their roles in a collaborative inter-institutional project funded by the Knight Foundation to create an XR & blockchain certificate enabled digital database that will archive, index, lend, and exhibit complex digital objects using a web-based platform that expands the current capabilities of the virtual 3D exhibition platform New Art City.

The panel will offer perspectives on collections management, blockchain certificates, artist contracts, and best practices for reauthoring. The team will provide insights from the first 6 months of the beta test of this collaborative project which archives and exhibits Creative New Media Projects produced in San José from 1984-2014 on New Art City. The Art & Technology Archive beta test will allow the technical and digital design upgrades to follow the material, social, and archival process; ensuring that necessary upgrades to New Art City are designed holistically and inclusively with integrated feedback from Museums, Librarians, Archivists, & Curators.

Digital Archives, XR Archives, Blockchain Certificates, NFTs, Controlled Digital Lending, Cross-Platform Compatibility, Digital Stewardship, XR Accessibility, Publicly Accountable Cross-Sector Partner Service Organizations, Durable Code

Introduction

Rhonda Holberton, Assistant Professor of Digital Media Art, San José State University (SJSU), is leading an initiative with the panelists to preserve and archive several important bodies of digital media produced within the Silicon Valley in 1984-2014. The archive will focus on complex digital objects (with special attention to XR and 3D files), and collaborative research from the CADRE Media Lab at San José State University, SWITCH Journal, Leonardo/ISAST, ZERO1, and the San José Museum of Art archive/collections.

The entries will be archived on New Art City, a virtual exhibition toolkit originally developed by Don Hanson (once an MFA candidate in the CADRE program at SJSU) in response to the loss of physical exhibition opportunities for our community. New Art City utilizes web stable languages (HTML, JS, & CSS) which will ensure the longevity and accessibility of new media works that were originally produced to run on esoteric or out of date platforms. Students currently enrolled in the Digital Media Art program at San José State University will work directly with the original artists & digital creators to identify processes for rebuilding original artworks and/or archiving components for future researchers.

User experience of the archive will be grounded in interactive engagement with the region's rich history of collaborative new media art production utilizing an archive built on the New Art City web-based 3D platform. Unlike traditional digital archives, the SJSU XR Archive will integrate collection management databases, blockchain security certificates, digital lending, and exhibition

services. Users of the lending and exhibition services will experience spatial proximity, temporal texture, and architectural aggregation rather than overlapping windows or the long scroll to help researchers, exhibition designers, and public visitors make deep connections to and between digital entries.

Dr. Darra Hofman's research focuses on the intersection of archives, technology, and law. Her research and teaching interests are in investigating the impact of emerging technologies such as blockchain technology and artificial intelligence on archiving practices. She will oversee database integration metadata and hashing systems for blockchain certification of provenance and integrated fair use contracts. The interface will be set up to provide multilayered accessibility, and community facing features that will log specific dynamic feedback through the exchange of personal, regional, and associate knowledge tied to a sharable digital entry that accumulates new user contributions every time it is curated into an exhibition.

Digital Stewardship As envisioned, the archive is the first of 3 discrete phases of development that fit into a longer-term vision; the instantiation of the Center for Creative Digital Production & Stewardship at SJSU. Within the center, Faculty and Students will collaborate with digital creators and partner institutions to develop best practices and documentation for digital stewardship of technology-centered artist practices and create standards for artist contracts for institutional acquisition of digital work using blockchain technology applied in concert with controlled digital lending via the Martin Luther King Library.

Digital stewardship brings together the concepts of both digital preservation and digital curation and provides a framework for long-term thinking to ensure that preserving and managing digital content for the long-term is not merely an afterthought, but baked into the production process.

New Art City (NAC) Platform

Originally developed as an online exhibition solution for Digital Media Art BFA exhibition at SJSU, the New Art City platform has since expanded to host international art exhibitions with institutions like Gray Area SF, Bitforms Gallery NYC, Lumen Prize, Format Festival and several solo and group shows for individual artists & digital creators. The platform will allow designers to spatialize the visitors' experience of media entries in the archive using architectural orientation to present oral histories and contextual information alongside primary resources that take the form of websites, video, 3D animations, image, text, and soon; VR projects.

Works shown (left to right): Caroline Sindere: Femenist Data Set, German Lavroskii: Reborn, Otrus Extraviadus: parallel chaosmosis, Eva Davidova: Global Mode, Jeremy Diamond: Datura ©Artist Retain Copyright

NAC & Accessibility In Fall 2020 Professor Holberton worked with NAC founders to help complete a Voluntary Product Accessibility Template (VPAT) for New Art City. In Spring 2021 the California State University System certified NAC for systemwide use after determining the platform met Federal Accessibility requirements. In addition to the 3D environment, NAC now provides a 2D view optimized for Screen Readers. In their [Accessibility Statement](#), NAC provides standards for accessible 3D environments, and is excited to work with the team to define new standards for accessibility in Mixed Reality environments including sound triggers/guidance, guided tours in 3D & XR environments, and new forms of translation between XR, 3D, and 2D web designs

Audience & Impact

The project leads of the Multi-Generation Digital Stewardship project believe the practice of citation is a political act that shapes the future as much as it contextualizes the past. With this framework in mind, it is important to recognise preservation as a political act as well; and to understand that all archives suffer from intersecting and overlapping biases, limited accessibility, and data rot. San José State University (and public universities more broadly) can play an important role as a publicly accountable cross-sector partner service organization in the production and long-term preservation of tech-centered artist practices. Toward this goal, the Multi-Generation Digital Stewardship project team is currently:

- Working with librarians & archivists to expand the capabilities of research databases that determine what is citable in the first place
- Collaborating with artists & digital creators to create best practices for the digital stewardship of ephemeral technology dependent projects

- Connecting communities from public institutions with students and faculty at San José State University in the production creative projects that make meaningful technological advancements while at the same time expanding public understanding the social impacts of technology
- Providing support to technology platforms to develop accessible standards in-line with Section 508 of the Rehabilitation Act published in the Federal Register to ensure the technology we use in our projects is available to the broadest community possible

Inter-Institutional and Community Collaborations

Through collaborations between SJSU, SJMA, NAC, Leonardo/ISAST, and ZERO1, the Multi-Generation Digital Stewardship project will build bridges between SJSU students, the San José Public, and contemporary Digital Media Artists & Digital Creators. This is an exceptional opportunity to celebrate the rich legacy of interdisciplinarity at SJSU and our legacy of collaboration with art institutions in the South Bay while at the same time creating standards and best practices for the production & preservation of tech-centered artworks for generations to come.

As one of California State University's Hispanic Serving Institutions (HSI) and Asian American Native American Pacific Islander Serving Institutions (AANAPISI) as recognized by the United States Department of Education, the San José State University community represents a diverse set of perspectives. The Multi-Generation Digital Stewardship project team and organizational partners integrate the student body and communities within the city in the design of the archive and the curation of the entries within it to advance a broad and socially responsible approach to integrating artistic expression within historical contexts.

Panel Biographies

[Rhonda Holberton](#), Assistant Professor of Digital Media Arts, Department of Art & Art History San José State University. Holberton's interdisciplinary research and art practice illuminates the politics of the corporeal body navigating through virtual space. Recent projects utilize networked VR designed to trigger subtle interactions of electrons between biological and digital systems through biofeedback & reiki, a speculative cosmetic company whose mission is focused on the potential of products to create distributed performative action ritualizing the Anthropocene, and a collaborative choreography with Neural Networks. rhonda.holberton@sjsu.edu

[Don Hanson](#), Founder of New Art City. Don is an interdisciplinary/internet artist producing web-based interactive work and digital artmaking tools since 2008. As founder of New Art City he aims to provide an accessible toolkit to all types of artists and create an online home for born-digital artifacts. As an active member of the arts and technology community in the Bay Area, Don has served as technical director for Codame Art+Tech and B4BEL4B Gallery, and now focuses full-time on the operations and development of New Art City. don@newart.city

Amanda Helton, Manager of Digital Strategy, a position created as part of the San José Museum of Art's (SJMA) 2018 strategic plan, Helton works closely with the curatorial and public programs teams to develop innovative digital engagement tools that expand access to the Museum's programs and permanent collection. At SJMA since 2017, she served as project database registrar for 50X50: Stories of Visionary Artists from the Collection, a major grant-funded digital publication designed to share the Museum's permanent collection with a wide audience. Subsequent ongoing projects support efforts to shape the technological vision for the Museum's future and to support its strategic ambition to be a borderless museum. Helton is also deeply committed to accessibility issues in both the physical and virtual realms and is a member of the Museum's Equity Task Force. ahelton@sjmusart.org

[Dr. Timothy C. Summers](#), Board Member of the enterprise think tank Leonardo/ISAST, is a seasoned, high-impact executive with broad strategic perspective and a proven track record in growing businesses, delivering solutions to problems, and developing and executing sound internal processes from the ground up. He is an ethical hacker, professor, frequent media commentator, TED

speaker, and consulted expert internationally recognized as one of the world's leading experts on cyber strategy, blockchain, normal chaos, and how hackers think. He is a trusted adviser and executive consultant to Fortune 500 companies, academic institutions, and governments worldwide. Timothy specializes in the scholarship and practice of hacker cognitive psychology (the hacker's mindset) and normal chaos paradigm enabling him to advise on building and sustaining organizations during times of uncertainty. Abstract

This panel aims to discuss some artistic and research projects that explore new methodologies of working with digital museum archives and User Generated Content (USG) to 'demusealize' some established institutional practices. In a moment when the role of museums and their very definition are strictly problematized, how Artificial Intelligence (AI) systems and collaborative hashtags on social media can be used to dismantle museum discourses? In which way these digital tools are able to be explored as a new kind of institutional critique? Could these systems also be used as a way to expand poetic layers of art beyond its marketing and productivist focus? From these raised questions, the researcher and curator Nathalia Lavigne will moderate a discussion with the artists and researchers Dr. Giselle Beiguelman, Dr. Bruno Moreschi and Rafael Pagatini, whose artistic projects are questioning traditional museological narratives and problematizing the colonialist gaze in museum collections using digital tools.

Keywords

Digital archives, digital agency, Artificial Intelligently, social media, Internet Studies, Museum Studies, Decolonial

Introduction

What is the future of the museum? This very question reappears whenever we go through moments of great historical and social transformations. For the first avant-garde movement at the beginning of the 20th century, the future of museums was their destruction. Incinerating the past was the only way to open the path to a new form of truly living art, created from its ashes that would be accommodated on a pharmacy shelf, as Kazimir Malevich defended in "On the Museum" (1919). His idea is the antithesis of the memorial discourses that emerged in the memory boom of the 1980s: at that moment, the question gave way to a statement - and the future seemed to be in the museum. These spaces were seen as a solution to the temporal fragmentation of the present and a way of dealing with a traumatic past, marked by wars and destruction.

This very debate has resurfaced since the beginning of the COVID-19 pandemic. In *The Future of the Museum* (2021),

András Szántó presents the same question to 28 directors from institutions around the world. For Marc-Olivier Wahler, director of the Musée d'Art et d'Histoire (MAH) in Geneva, the ideal "post-museum" should work more like software than hardware. As with a computer, Wahler imagines a future for museums in which they can be molded into different formats without losing their identity, not limited to a single space or experience.

This reading resonates with the questions that we aim to discuss: How to elaborate methodologies using digital tools and the audience's digital agency to dismantle museum discourses, a process that we call the *demusealization of the museum*? If museums are on the spotlight again in this "third memory boom" (Hoskins, 2017), when a more participative and effervescent digital modes of circulation and connectivity has transformed previous modes of memory representation, in which way these spaces could still be relevant in a context where institutions are deeply implicated in the debate about decolonial, restitution and reparation? Having this in mind, this round panel, moderated by Nathalia Lavigne, will discuss artistic projects by Dr. Giselle Beiguelman, Dr. Bruno Moreschi and Rafael Pagatini that are questioning traditional museological narratives and problematizing the colonialist gaze in museum collections using digital tools.

The notion of institutional critique 2.0 was devised by Bruno Moreschi and Gabriel Pereira after a research project conducted at the Van Abbemuseum collection (Eindhoven, NL), in which they created a reading process of their artworks through six commercial image-recognition Artificial Intelligences systems. Among their aims of this experimental methodology was denaturalizing AI's gaze, looking at these systems as a way to expand poetic layers of art beyond its marketing and efficiency-focused logic.

A similar methodology has also been developed by Moreschi, Giselle Beiguelman and Bernardo Fontes in the ongoing project *Demonumenta*. It proposes a debate on the coloniality that is embedded in several public institutions and collections, developed by students and faculty members at FAUUSP in dialogue with other institutions and research centers. In this panel, Beiguelman and Moreschi will focus on one artistic investigation presented in the context of the ZKM's

intelligent.museum residency. In *(De)composite Collections*, they analyzed the collections of two Brazilian museums throughout AI reading systems using these datasets algorithmically processed with GANs to question what other art histories might emerge from AI's readings of the images, and how these systems could contribute to understand the gaze as a historical construct.

Rafael Pagatini will present his research on the importance of digitalization in cultural institutions, focusing on his own experiences on the access to infrastructural information in museum archives. Documents and photographs about the institution can contribute to new ways of resignifying the museum and its collection by creating dialogues with the socio-historical-cultural conflicts that have permeated the museum over time. This study will also discuss how these dynamics are reproduced in the access to documents about the relationship between these cultural institutions and the civil-military dictatorship in Brazil (1964-1985).

Lastly, Nathalia Lavigne will present some results of the field research at the Humboldt Forum, in Berlin, in which she analyzes both some audience participation initiatives on social networks and programs led by this institution that can be seen as examples of demusealization of the museum. It includes, for instance, a comparative analysis between the hashtag #HumboldtForum on Instagram and the museum official account, trying to find points of convergence and differences between de-musealization practices carried out by the audience and by the institution itself.

Authors' Biographies

Nathalia Lavigne

Art writer and curator, a Ph.D. Candidate at Architecture and Urbanism College, University of São Paulo (FAUUSP) and a former visiting scholar at The New School. She is a contributor to Artforum International Magazine, Contemporary And (C&), Folha

de São Paulo, among others; and has an MA in Cultural and Critical Studies from Birkbeck, University of London. Among the exhibitions she curated are "Against, Again: Art Under Attack in Brazil" (2020), at the Anya and Andrew Shiva Gallery, New York; and *Disappearance Tactics* (2021), at Paço das Artes, São Paulo. She is currently a visiting researcher at Humboldt-Universität zu Berlin, and have been awarded a DAAD scholarship in 2021.

Bruno Moreschi

Researcher and multidisciplinary artist. Postdoctoral fellow at the Faculty of Architecture and Urbanism at the University of São Paulo (FAUUSP), PhD in Arts at the State University of Campinas (Unicamp), with a Capes scholarship, and exchange at the University of Arts of Helsinki (Kuva Art Academy), Finland, via CIMO Fellowship. Projects recognized by scholarships, exhibitions and institutions such as ZKM, Van Abbemuseum, 33rd Bienal de São Paulo, Rumos Award, Funarte, Capes and Fapesp. He is currently a researcher on the Histories of AI: Genealogy of Power / Mellon Sawyer Seminar (Cambridge University), senior researcher at the Center for Arts, Design and Social Research (CAD+SR) and one of the coordinators of GAIA /C4AI/Inova USP. <https://brunomoreschi.com>

Giselle Beiguelman

Artist and Professor at the School of Architecture and Urbanism at the University of Sao Paulo, Brazil. She is also a member of the Laboratory for OTHER Urbanisms (FAUUSP) and co-coordinator of GAIA (Grupo de Arte e Inteligência Artificial – INOVA USP). Her interests include the aesthetics of memory and contemporary nomadism. Among her recent works are the Portuguese-language *Hateland*, covering online reactions to violence against vulnerable groups in Brazil; a co-authored book about the storage and preservation of digital artworks; and an on-going investigation of the colonialist imagination in 20th century artworks using artificial intelligence. Author of many international award-winning projects, her artworks are part of museums collections worldwide, such as ZKM (Germany) and Pinacoteca de S. Paulo (Brazil). <https://desvirtual.com>

Rafael Pagatini

Artist, researcher and assistant professor at the Federal University of Espírito Santo, Brazil. Pagatini is currently a PhD candidate in Visual Arts at the State University of Campinas, São Paulo. In 2020, he was a guest researcher at the Hannover University of Applied Sciences and Arts, Germany. He has held individual and collective exhibitions in Brazil and abroad: Shiva Gallery, New York (2020), European Center for Constitutional and Human Rights, Berlin (2019); Leipziger Baumwollspinnerei, Leipzig (2019); Columbia University, New York (2018); 20th Contemporary Art Festival Sesc_Videobrasil, São Paulo (2017); Paço das Artes, São Paulo (2016); Rumos Itaú Cultural, São Paulo (2013). <https://rafaelpagatini.com>

ROUND TABLES

Roundtable on Ethics and New Media Art Archiving

Lisa Deml

Birmingham City University
Birmingham, United Kingdom / Berlin, Germany
lisa.deml@mail.bcu.ac.uk

Nathalia Lavigne

Universidade de São Paulo
São Paulo, Brazil / Berlin, Germany
nlavigne@usp.br

Abstract

In recent decades, new media art archives have multiplied and diversified across digital networks and online platforms, contributing to the creation of instant and unruly archives that often emerge in unforeseen and involuntarily ways. Concomitantly, our relationships with archival documents, new media, art institutions, and the historical, social, and political realities they pertain to have changed. Based on case studies discussed in previous panels, this roundtable addresses participants, first and foremost, as viewers themselves to think about how visual and archival literacy can be disseminated in order to respond to this unprecedented proliferation of new media art archives in more critical and engaged ways. Beyond questions of authorship, ownership, copyright, and consent, we will address issues around responsibility, authority, dignity, colonialism, and care to draw out the differences between performing and practicing ethics in and of new media art archives. Encouraging self-critical and self-reflexive perspectives, this roundtable invites users, artists, curators, and scholars to confront the complex and often ambiguous ethics vis-à-vis the subjects of new media art archives and to recognise our agency as well as complicity in ethical transgressions as equally responsible viewers and listeners.

Keywords

Ethics, archives, public domain, agency, responsibility, authority, dignity, care, gaze, visual literacy

Introduction

New media art archives have multiplied and diversified across digital networks and online platforms. Within them, temporal as well as geographical distances collapse, and the role of the 'archon' or 'gatekeeper' is distributed among algorithms, content moderators, curators, researchers, and a multitude of users. The dissemination of social networks in recent decades has brought about new issues for archival practices which take place in a grey zone between social

interaction and communication, contributing to the creation of instant and unruly archives that often emerge in unforeseen and involuntarily ways. Concomitantly, our relationships with archival documents, new media, art institutions, and the historical, social, and political realities they pertain to have changed. Against this background, this roundtable invites users, artists, curators, and scholars to address the complex and often ambiguous ethics vis-à-vis the subjects of new media art archives and encourages us to recognise our agency as well as complicity in ethical transgressions as equally responsible viewers and listeners. Rather than a means to an end or a predetermined code of conduct, we consider ethics as a practice, a means in and of itself. As such, an ethical practice in and of new media art archiving must continually be redefined and situated within particular material contexts and intersubjective relations. The point of departure for this discussion is the network of relations that unfolds between producers, subjects, archivists, mediators, and viewers, as well as the various forms of responsibility and agency that are inherent and negotiated therein. Based on case studies discussed in previous panels, we intend to deepen the debate from the spectator's point of view to think about how visual and archival literacy can be disseminated in order to respond to this unprecedented proliferation of new media art archives in more critical and engaged ways. Crucially, while this roundtable draws on individual fields of expertise, it seeks to engage participants, first and foremost, as viewers and to delineate their realms of agency and response.

Beyond questions of authorship, ownership, copyright, and consent, this roundtable raises issues around authority, dignity, colonialism, and care to draw out the differences between performing and practicing ethics in and of new media art archives. How can we address the absences within new media art archives, transcend the taxonomic structures that pervade them, and subvert the ideological frameworks that surround them? And how might our own patterns of

recognition and representation be complicit in perpetuating neocolonial narratives and neoliberal economies? What is the responsibility of the artist, curator, scholar, and, by extension, the viewer in relation to the people whose recorded images or voices are being recontextualised and repurposed through acts of archiving? Who is speaking to and for whom—and how can we, as viewers, respond in ways that disrupt and intervene in prevailing hegemonic hierarchies and historiographies?

Encouraging self-critical and self-reflexive perspectives, participants will be invited to question their own patterns of recognition to confront the agency as well as complicity in seeing, listening, and engaging with new media art archives. In doing so, the roundtable aims to untangle the complex correlations between the public domain, artistic and moral rights, and the ethical concerns and responsibilities inherent therein. Ultimately, an ethics in and of new media art archives falls on the given viewer; hence, how can each of us take responsibility for our own gaze?

Author Biographies

Lisa Deml is a Midlands4Cities funded doctoral researcher at Birmingham City University. She holds degrees in Art History and Philosophy from the Courtauld Institute of Art, London, and the Ludwig-Maximilians-University, Munich. Initially trained as a journalist, she subsequently worked for public cultural institutions and non-profit organisations internationally, including Haus der Kulturen der Welt (HKW), Berlin, Haus der Kunst, Munich, and Ashkal Alwan, Beirut. Her research interests focus on visual articulations of citizenship, particularly in the framework of documentary and new media practices in the Middle East and North Africa.

Nathalia Lavigne is an art writer and curator, a Ph.D. Candidate at Architecture and Urbanism College, University of São Paulo (FAUUSP), and a former visiting scholar at The New School. She is a contributor to *Artforum International*, *Contemporary And (C&)*, *Folha de São Paulo*, among others; and has an MA in Cultural and Critical Studies from Birkbeck, University of London.

Among the exhibitions she curated are *Against, Again: Art Under Attack in Brazil* (2020) at Anya and Andrew Shiva Gallery, New York; and *Disappearance Tactics* (2021) at Paço das Artes, São Paulo. She is currently a visiting researcher at Humboldt-Universität zu Berlin, and has been awarded a DAAD scholarship in 2021.

Towards a Global Distributed Network of New Media Art Archives

Bonnie Mitchell, Oliver Grau

Bowling Green State University; University for Continuing Education
Ohio, USA; Krem, Austria
bonniem@bgsu.edu; oliver.grau@donau-uni.ac.at

Abstract

Online new media art archives exist throughout the world and contain a rich history of the research, events, artifacts, and people that helped to define the field of new media art. The purpose of this round table discussion is to brainstorm the idea of developing a world-wide network of online new media art archives. This distributed connection among archives would enable easy access to related information and benefits both users and archive administrators. This effort raises many questions and presents unique challenges but through the input of the new media art archiving community, solutions and a path forward will be forged.

Keywords

archive, digital art, new media art, connection, world-wide network

Introduction

The need to preserve artifacts and information related to the history of new media art has fostered the development of numerous physical and web-based archives throughout the world. Although the physical preservation of new media art is both essential and a topic worthy of in-depth discourse, this round table discussion focuses on the on-line archiving of documentation of new media art and related research, events, and contributors. The vision is to establish a world-wide network of online new media art archives, and this round table presents an opportunity for members of the archiving community to contribute their ideas, concerns, and solutions.

History

The conversation regarding creating connections between new media archives began with the Liverpool Declaration which specified that global networked collaboration between media art organizations, archives, and individuals was essential. A round table discussion was organized by Wim van der Plas for the ISEA2019 symposium which attracted over 50 attendees. It became clear that the time was right to begin work on a systematic approach to connect new media archives. The first Summit on New

Media Art Archiving was held online during ISEA2021 and featured 16 presentations from 12 different countries along with 3 parallel round table discussions focusing on connecting new media archives, creating ties to museums, and funding for new media archives. Representatives from ISEA, SIGGRAPH, ADA, Ars Electronica and the FILE Festival archives also met throughout the year to discuss goals, challenges and implementation methods. Programmers from the SIGGRAPH archive met with programmers from FILE to create code to begin the process of connecting the archives. In 2022, the ISEA and SIGGRAPH archive teams organized the Second Summit on New Media Art Archiving. With 52 presentations from 17 countries including paper presentations, panels, round table discussions, artist talks and a virtual exhibition of artwork, the summit advances the conversation and paves a way forward in our efforts to create this global network.

Connecting Archives

To enable access to information in online new media art archives, one must first know they exist and how to navigate unique user interfaces and information architectures. The effort to establish a distributed network of new media art archives aims to provide a way to easily traverse the broad range of archives containing related information. This effort raises questions related to funding, technology, shared data resources, unique name authority files, on-going support, and more. Connecting archives throughout the world poses unique challenges, and this discussion addresses these concerns and also invites innovative ideas to move forward with this initiative.

Co-Moderators

Bonnie Mitchell is a co-director of the ACM SIGGRAPH History and ISEA Symposium archives. She currently is a member of the ISEA International Advisory Committee and the SIGGRAPH History and Digital Arts Committees.

Oliver Grau is the director of the Archive for Digital Art (ADA) and author of *Mediale Emotionen, Imagery in the 21st Century*, *Digital Art through the Looking Glass*. He is also the founding director of the MediaArtHistories conference.

Founded in the Netherlands in 1990, ISEA International (formerly Inter-Society for the Electronic Arts) is an international non-profit organization fostering interdisciplinary academic discourse and exchange among culturally diverse organizations and individuals working with art, science and technology

ISEA International is responsible for the ISEA annual symposium, one of the most important international events at the intersection of art and science..
