HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Introduction

Researchers have turned to the Semantic Web to integrate, summarize, and interpret disparate knowledge. Ontologies provide the domain knowledge to drive such data integration and information retrieval, on the Semantic Web. The successful creation of semantic applications in the health and life sciences requires services that provide software applications with access to ontologies over the Web. The National Center for Biomedical Ontology (NCBO), one of seven National Centers for Biomedical Computing created under the NIH Roadmap, has developed BioPortal, which provides access to one of the largest repositories of biomedical ontologies both via Web browsers and Web services (via RESTful services). The BioPortal Ontology Web services allow programmatic access, download and traversal of ontologies in software applications, the NCBO Annotator Web service "tags" text automatically with terms from BioPortal ontologies, and the NCBO Resource Index provides an ontology based search of public data resources.

The Ontology Web services provide access to ontologies, their characteristics, information about different versions, ontology downloads, navigation of the class hierarchy and details of each class. Developers can to embed this functionality in software applications, such as the Microsoft Word 2007's Ontology Add-in, used to mark up a research article at the time of writing or ISAcceptor, used to annotate experimental metadata.

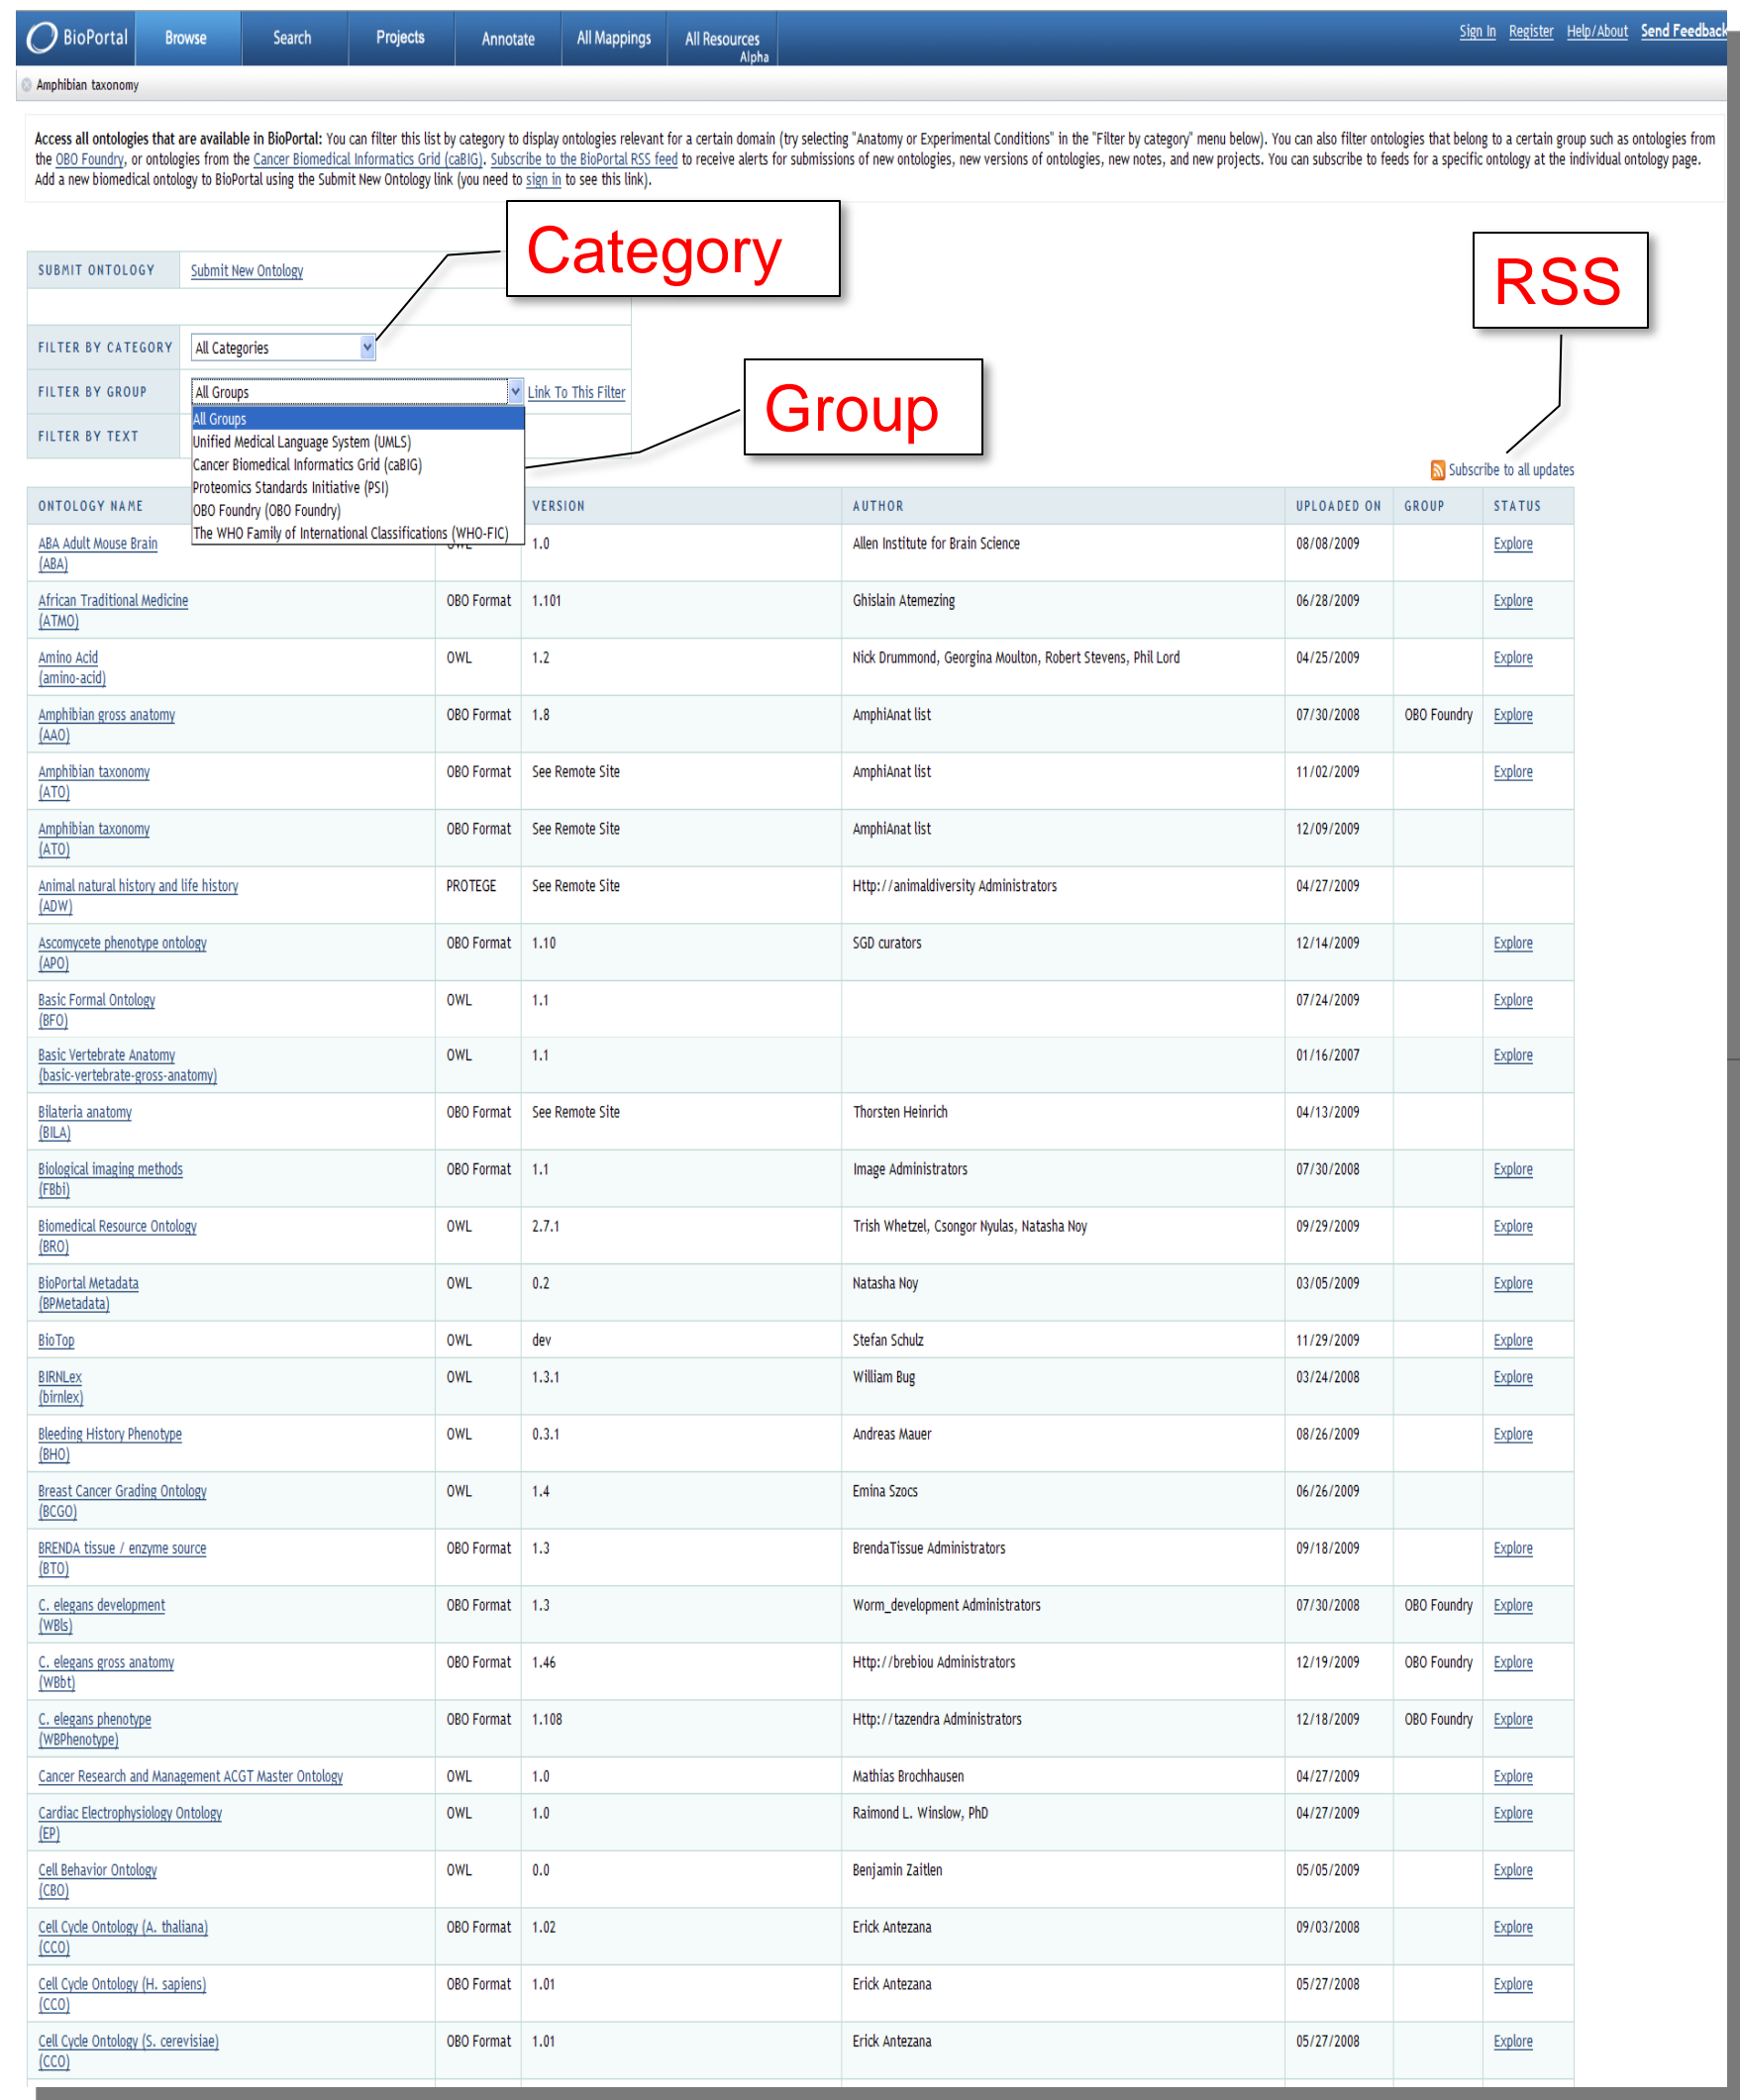

The NCBO Annotator Web service processes text to recognize relevant biomedical ontology terms. Users can customize the Web service to limit results to a particular ontology (e.g. SNOMED CT) or to a certain UMLS semantic type (e.g. T017 for 'Anatomical Structure'). The concept recognition engine, MGREP, was developed by the National Center for Integrative Bioinformatics and is combined with BioPortal Ontology Web services to create the NCBO Annotator service to make the task of creating ontology-based annotations accessible for any biomedical researcher.

BioPortal indexes several biomedical data repositories available online (e.g., GEO, ClinicalTrials.gov, PharmGKB) on the basis of their textual metadata, and links their records to ontology terms. These linkages take advantage of the semantic relationships in BioPortal, including subsumption relationships among ontology entities and mappings between entities in different ontologies. The NCBO Resource Index Web service allows biomedical investigators to use ontology terms to search programmatically the resulting index of online public repositories. For example, one can search for all experiments and clinical trials corresponding to 'malignant melanoma' from GEO and ClinicalTrials.gov.

BioPortal offers researchers a one-stop shop on the Web for biomedical ontologies. The Web services provided by BioPortal are available at www.bioontology.org/wiki/index.php/NCBO_REST_services and the BioPortal technology is open-source and domain-independent.

BioPortal Ontology Library

- Total number of ontologies: 173
- Number of classes/types: 1,438,792
- Ontology formats: OWL, OBO format, Rich Release Format, Protégé frames

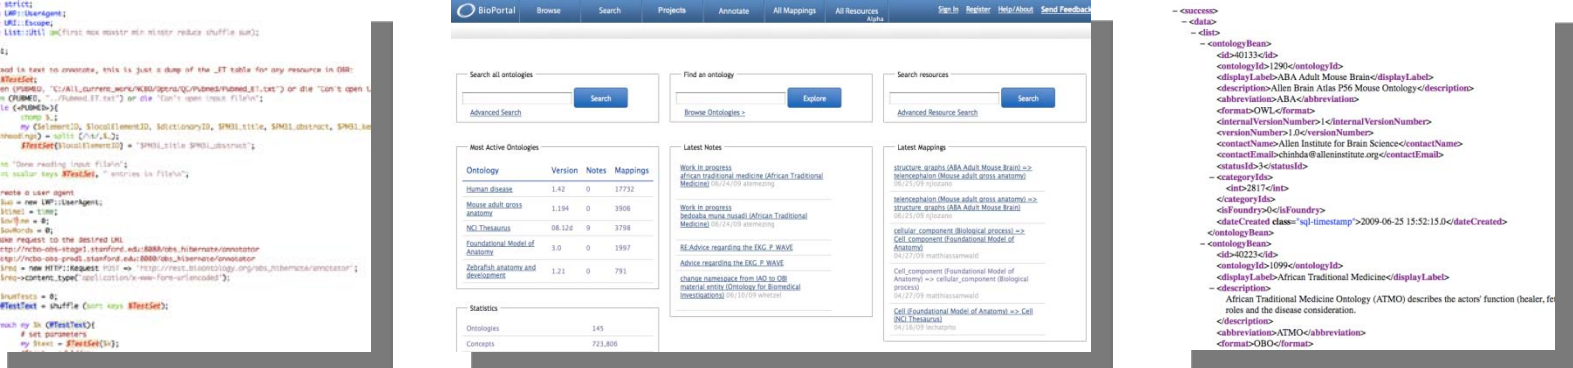

RESTful Web Services

- Representational state transfer (REST) is a software architecture style
- Uses HTTP methods
- Each URL represents an object
- Operations include
 - GET – to retrieve a resource
 - POST – to create a resource
 - PUT – to update a resource
 - DELETE – to remove a resource
- Lightweight, easy to develop

Web Service Access

- Prefix for NCBO Web Services:
<http://rest.bioontology.org/{application}>
- List of Web Services
http://bioontology.org/wiki/index.php/NCBO_REST_services
- Access via Code (Perl, Java, Flash, Ruby, etc.), User Interface, Browser, or Widget

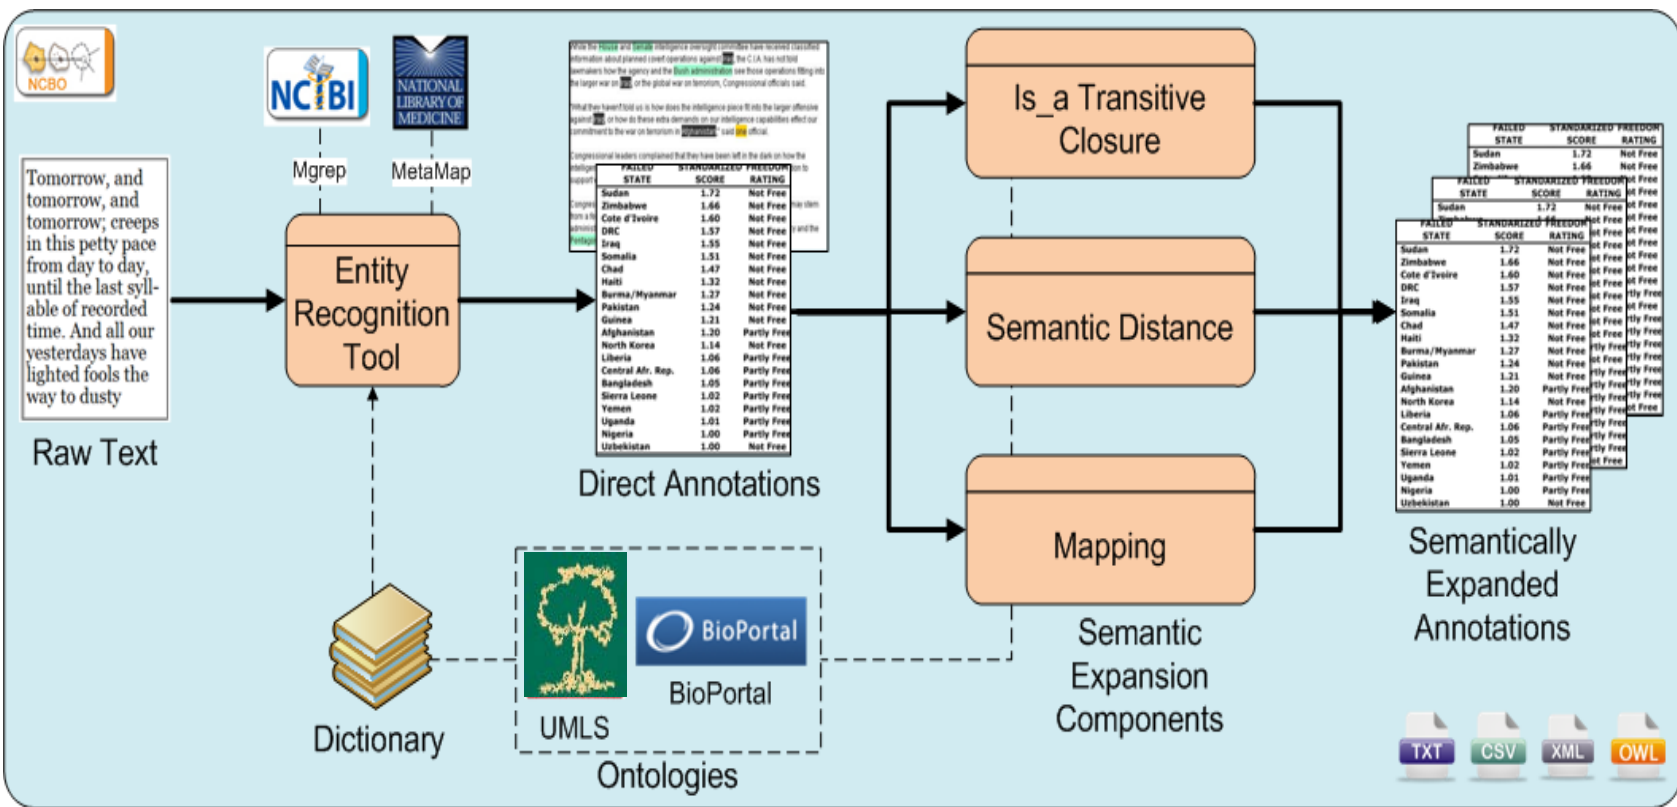

BioPortal Web Services

- Prefix for BioPortal Web Services
<http://rest.bioontology.org/bioportal/>
- Ontology Web services
 - List metadata for all ontologies
 - List all versions of an ontology
 - Download ontologies
 - List all ontology categories
 - List all ontology groups
- Search Web service
 - Search for terms from all BioPortal ontologies
 - Search for term within a subtree of an ontology
- Term Web services
 - Get term by id
 - Get all root terms for an ontology
 - Get all terms from an ontology
- Hierarchy Web services
 - Get parents/children of a term
 - Get path to roots/leaves of a term
 - Get siblings of a term
- RDF Generation Web service
 - Generate a N3 RDF file
- Notes Web service
 - Get comments for a term
 - Get all comments for an ontology
- Mapping Web service
 - Get mappings for a term
 - Get all mappings for an ontology

Annotator Web Service

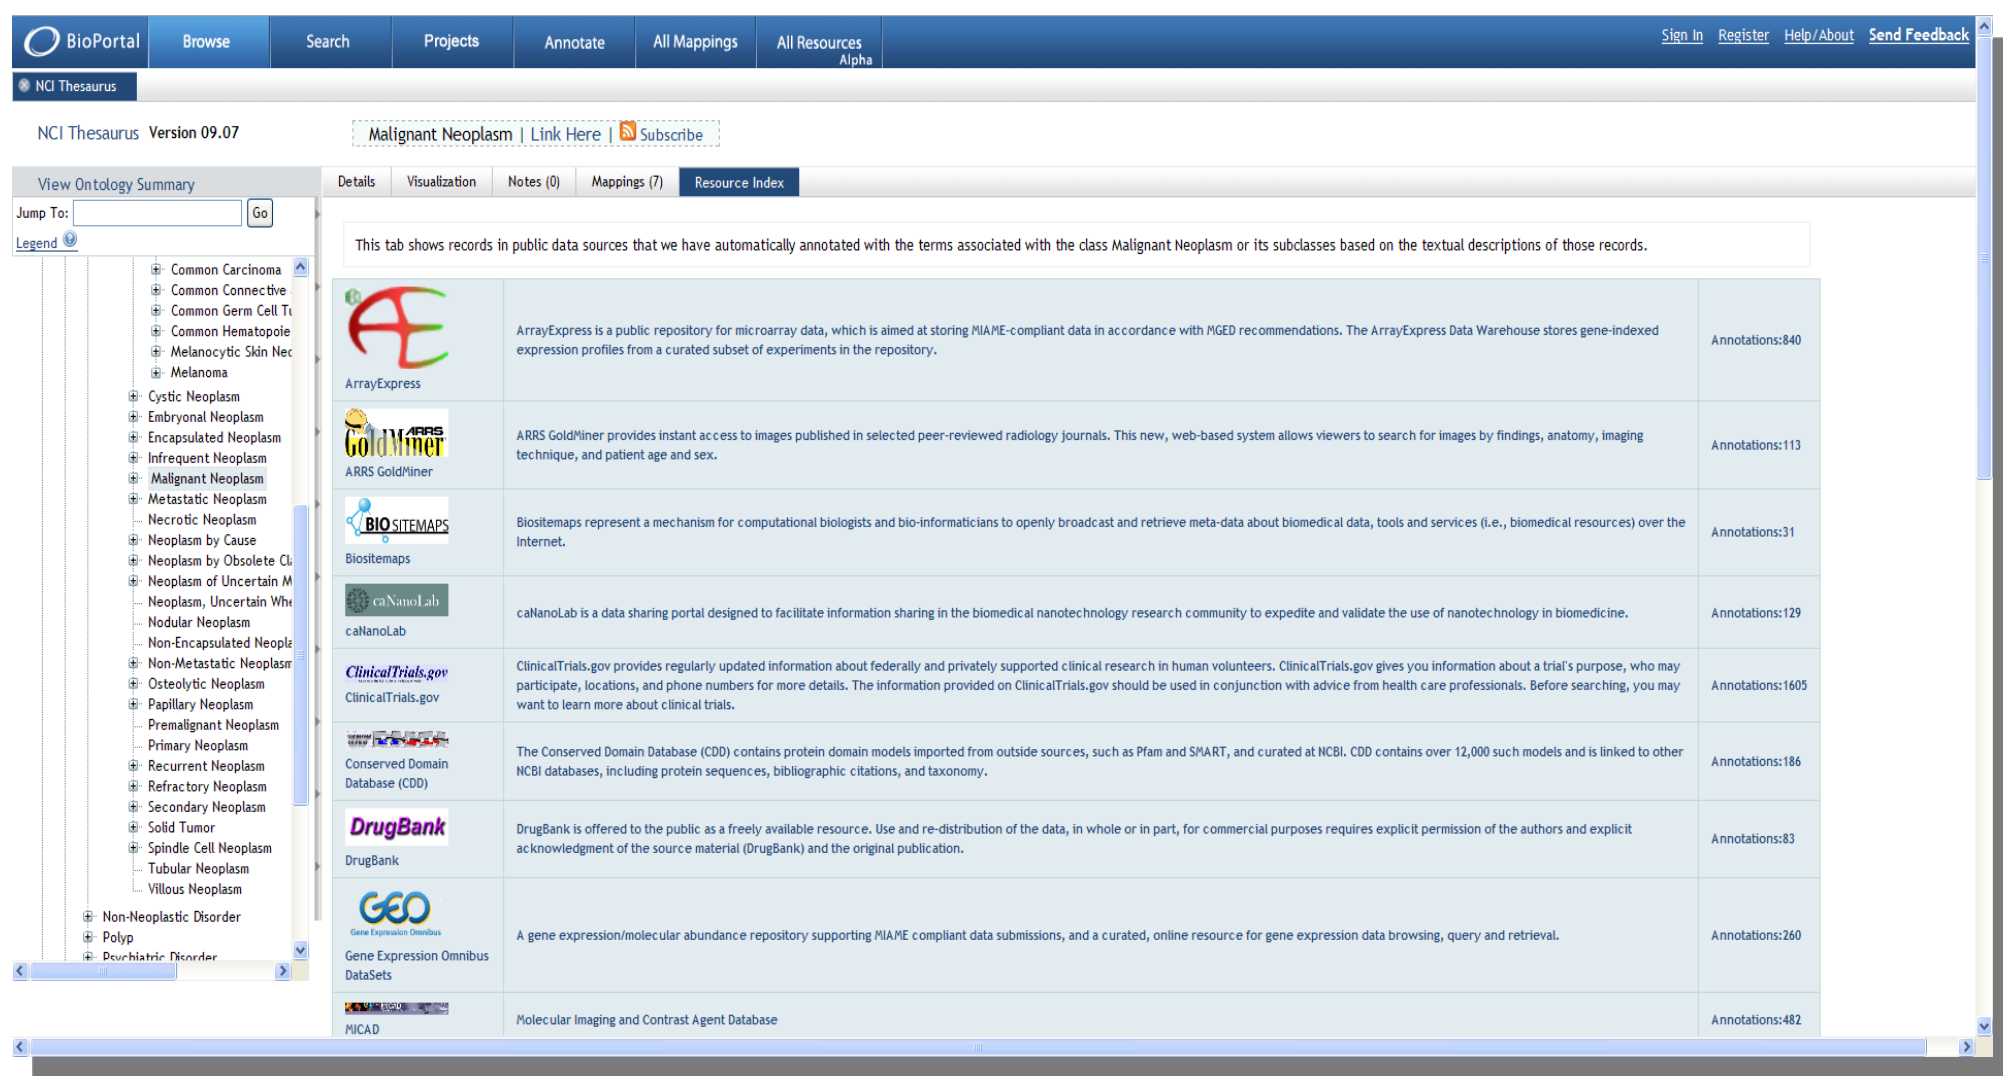

- Prefix for Annotator Web Service
<http://rest.bioontology.org/obs/annotator/>
- Description
 - The NCBO Annotator annotates or "tags" free-text data with terms from BioPortal and UMLS ontologies. The current entity recognizer used by the Annotator is Mgrep, developed by the National Center for Integrative Biomedical Informatics. Plans are underway to include an additional entity recognizer, MetaMap from the National Library of Medicine. The annotation is performed in two steps; direct annotations via matching the input text with the preferred name or synonyms of ontology terms and expanded annotations taking into account the ontology hierarchy and mappings.
- Documentation
 - For more information and sample clients, see:
http://www.bioontology.org/wiki/index.php/Annotator_Web_service

Annotator Web Service Workflow

Resource Index Web Service

- Prefix for Resource Index Web Service
http://rest.bioontology.org/resource_index/
- Description
 - Provides an ontology-based index of publicly available biomedical resources.
 - Currently indexed resources include: Array Express, ARRS Goldminer, Biositemaps, caNanoLab, ClinicalTrials.gov, Conserved Domain Database, DrugBank, Gene Expression Omnibus, Molecular Imaging and Contrast Agent Database, NextBio, OMIM, Pathway Commons, PharmGKB, PubChem, Reactome, Research Crossroads, Stanford Microarray Database, UniProt, and WikiPathways
- For more information see:
http://www.bioontology.org/wiki/index.php/Resource_Index

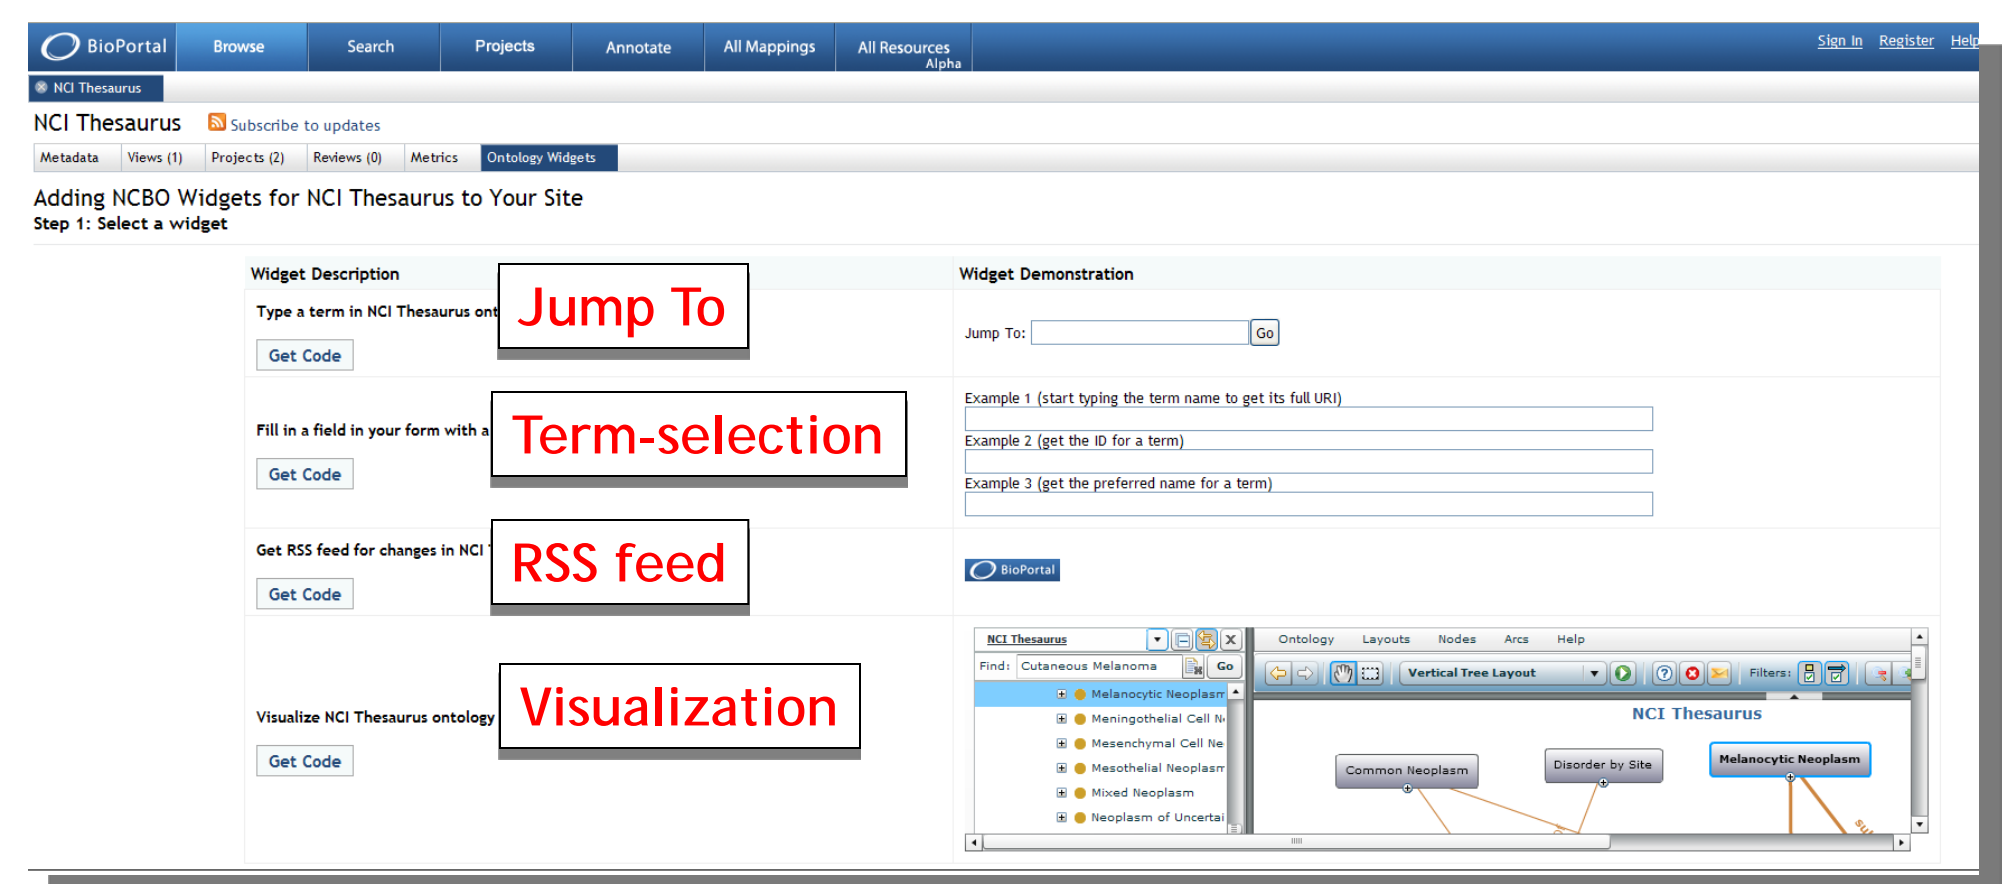

Ontology Recommender Web Service

- Description
 - The Ontology Recommender helps users identify biomedical ontologies or terminologies that are most relevant to their data based on analysis of free text or keywords. The underlying method uses annotations generated with the NCBO Annotator Web service to score the ontologies. Higher scores correspond to ontologies with the highest number of annotations.
- For more information, see:
http://www.bioontology.org/wiki/index.php/Ontology_Recommender_Web_service

Ontology Widgets

- Ontology widgets provide ready-to-use code to access your ontology of interest from your Web site
- For more information, see:
http://www.bioontology.org/wiki/index.php/Ontology_Widgets

Applications Using NCBO Web Services

- Partial listing of applications using NCBO Web Services:
 - BioLit
 - Biositemaps Editor
 - BioPortal
 - caNanoLab
 - ECG Gadget
 - ISAcceptor
 - Jinx
 - Microsoft Word Add-in
 - NCBO Term Retriever
 - Protégé
 - Rat Genome Database
 - SysMO

Acknowledgements

BioPortal is developed by the National Center for Biomedical Ontology (NCBO), one of seven National Centers for Biomedical Computing under the NIH Roadmap. BioPortal is developed in conjunction with partners at the University of Victoria and the Mayo Clinic. For more information on NCBO and working with the Center, visit <http://www.bioontology.org/> or email support@bioontology.org.
