HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L’archive ouverte pluridisciplinaire **HAL**, est destin  e au d  p  t et ´a la diffusion de documents scientifiques de niveau recherche, publi  s ou non, ´emanant des ´tablissements d’enseignement et de recherche fran  ais ou ´etrangers, des laboratoires publics ou priv  s.

Development of “LibrAAry”, a readily available database for amino-acid profiles from various protein sources. A pilot application on wheat

Objective

Knowing the amino acid (AA) profile and its variability from various protein sources is crucial, as it allows us to estimate the dietary intake of individuals, permits to design diets based on specific requirements, and to understand some factors influencing the protein quality.

Since the currently available databases are becoming old (FAO from 1970 and USDA from 1989 for raw wheat), and don't include information on the various factors influencing the profile, therefore, there is a need to develop an AA database of proteins profiles, including more information.

Thus, the aim of this work was the creation of the AA database “LibrAAry” and the assessment of the relative variation based on the AA profile.

Methods

AA composition of commonly consumed protein sources across the World
Jan. 1970 → Dec. 2022

Data were homogenized and converted into mg AA/g protein.

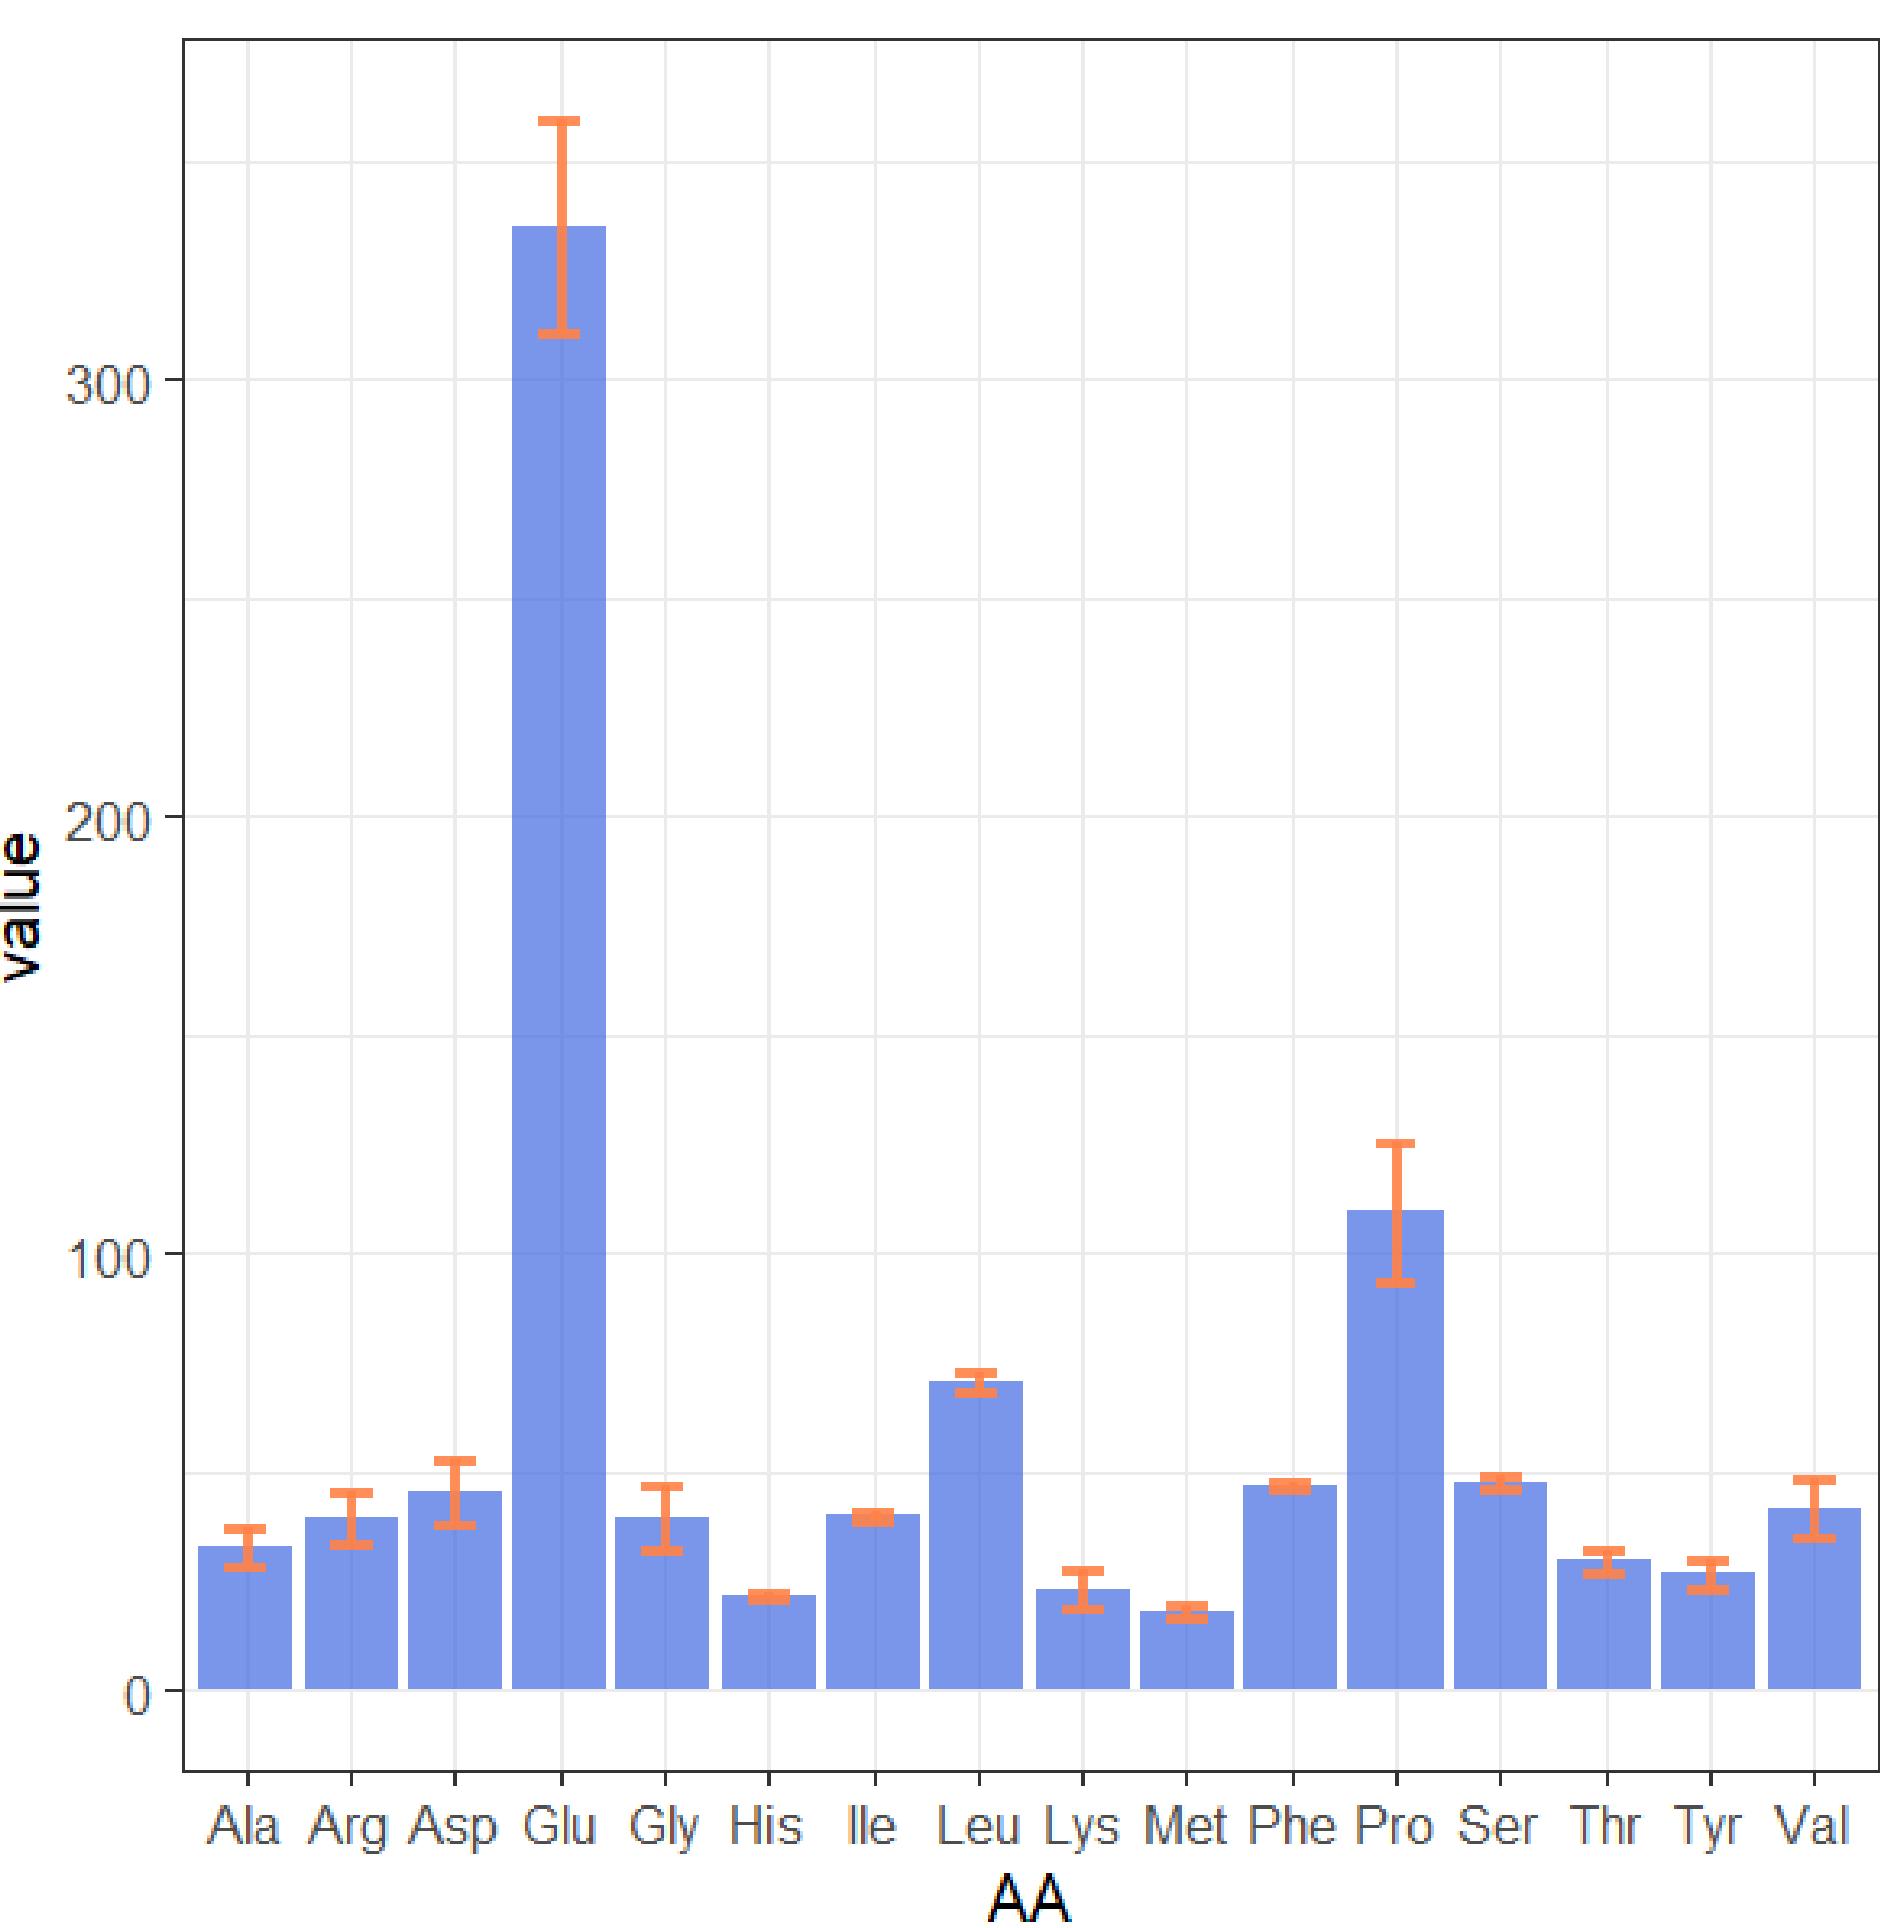

! 4 AA (Asn, Gln, Trp, and Cys) were rarely quantified among the 20 proteinogenic AA, and were thus excluded from the analysis to avoid bias of sampling.

Data were analysed and visualized by Principal Component Analysis (PCA). Non-essential AA were less reported compared to the essential AA.

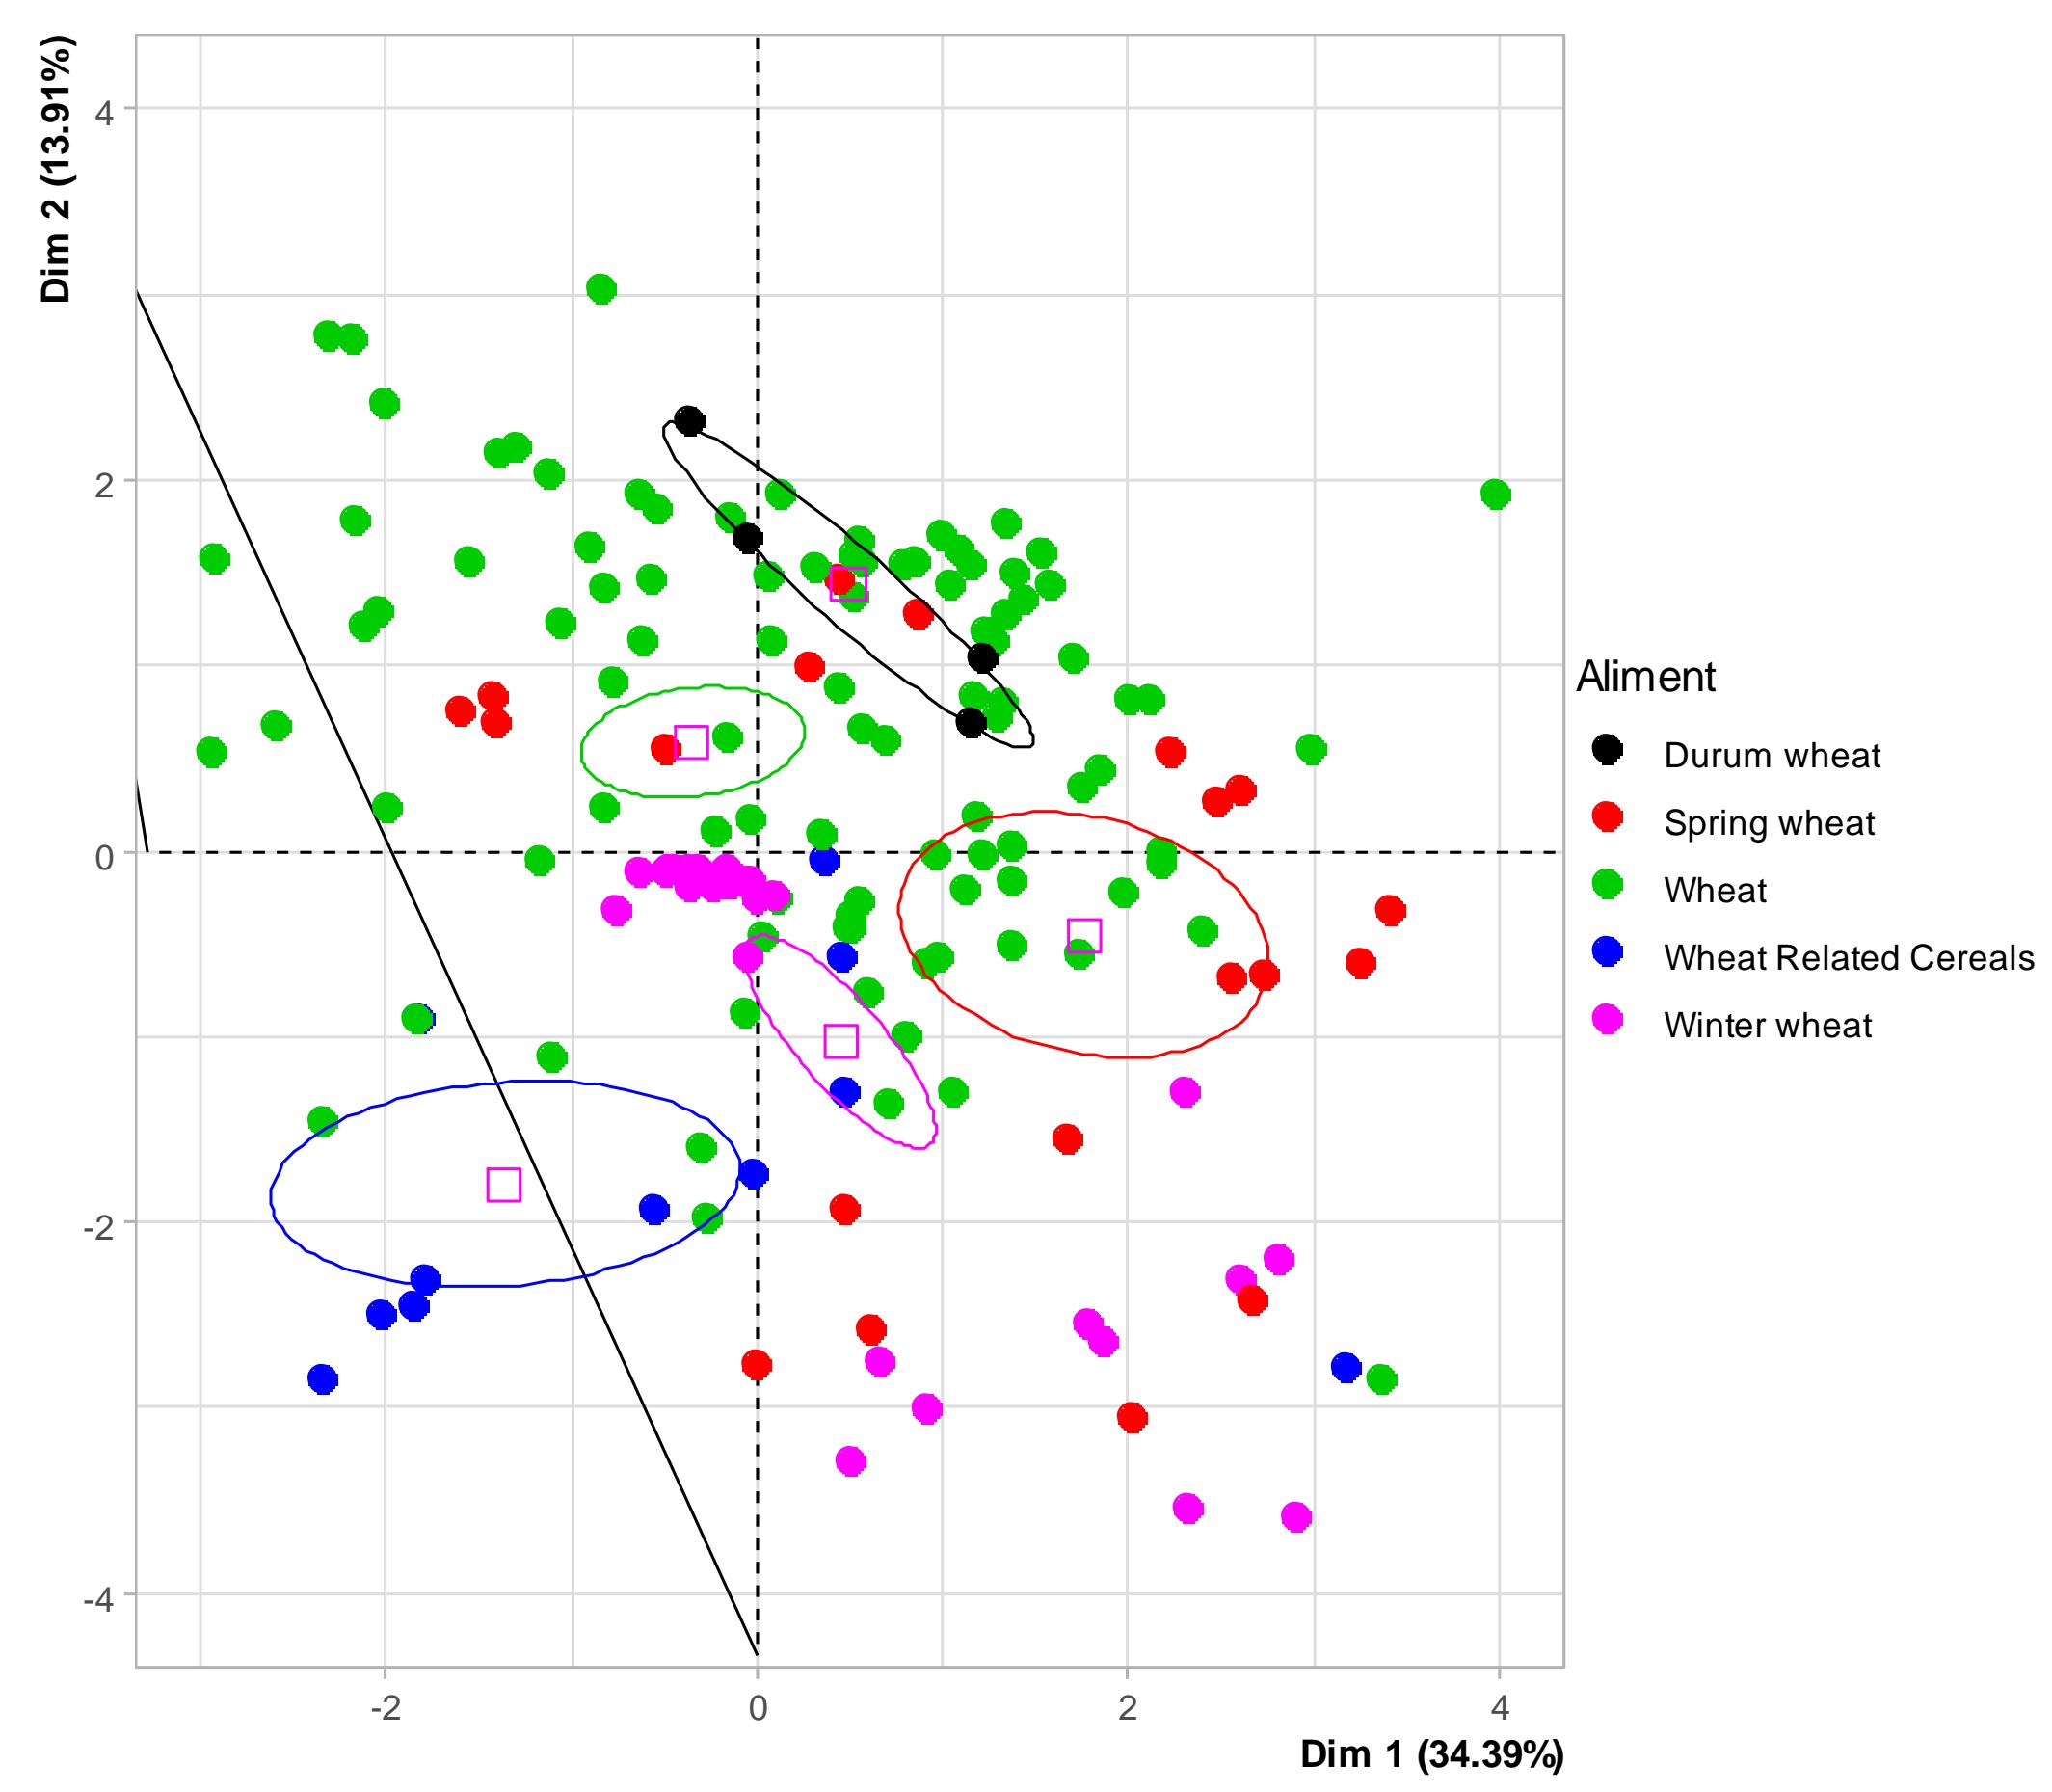

This work have been the subject to a declaration of Invention

Results

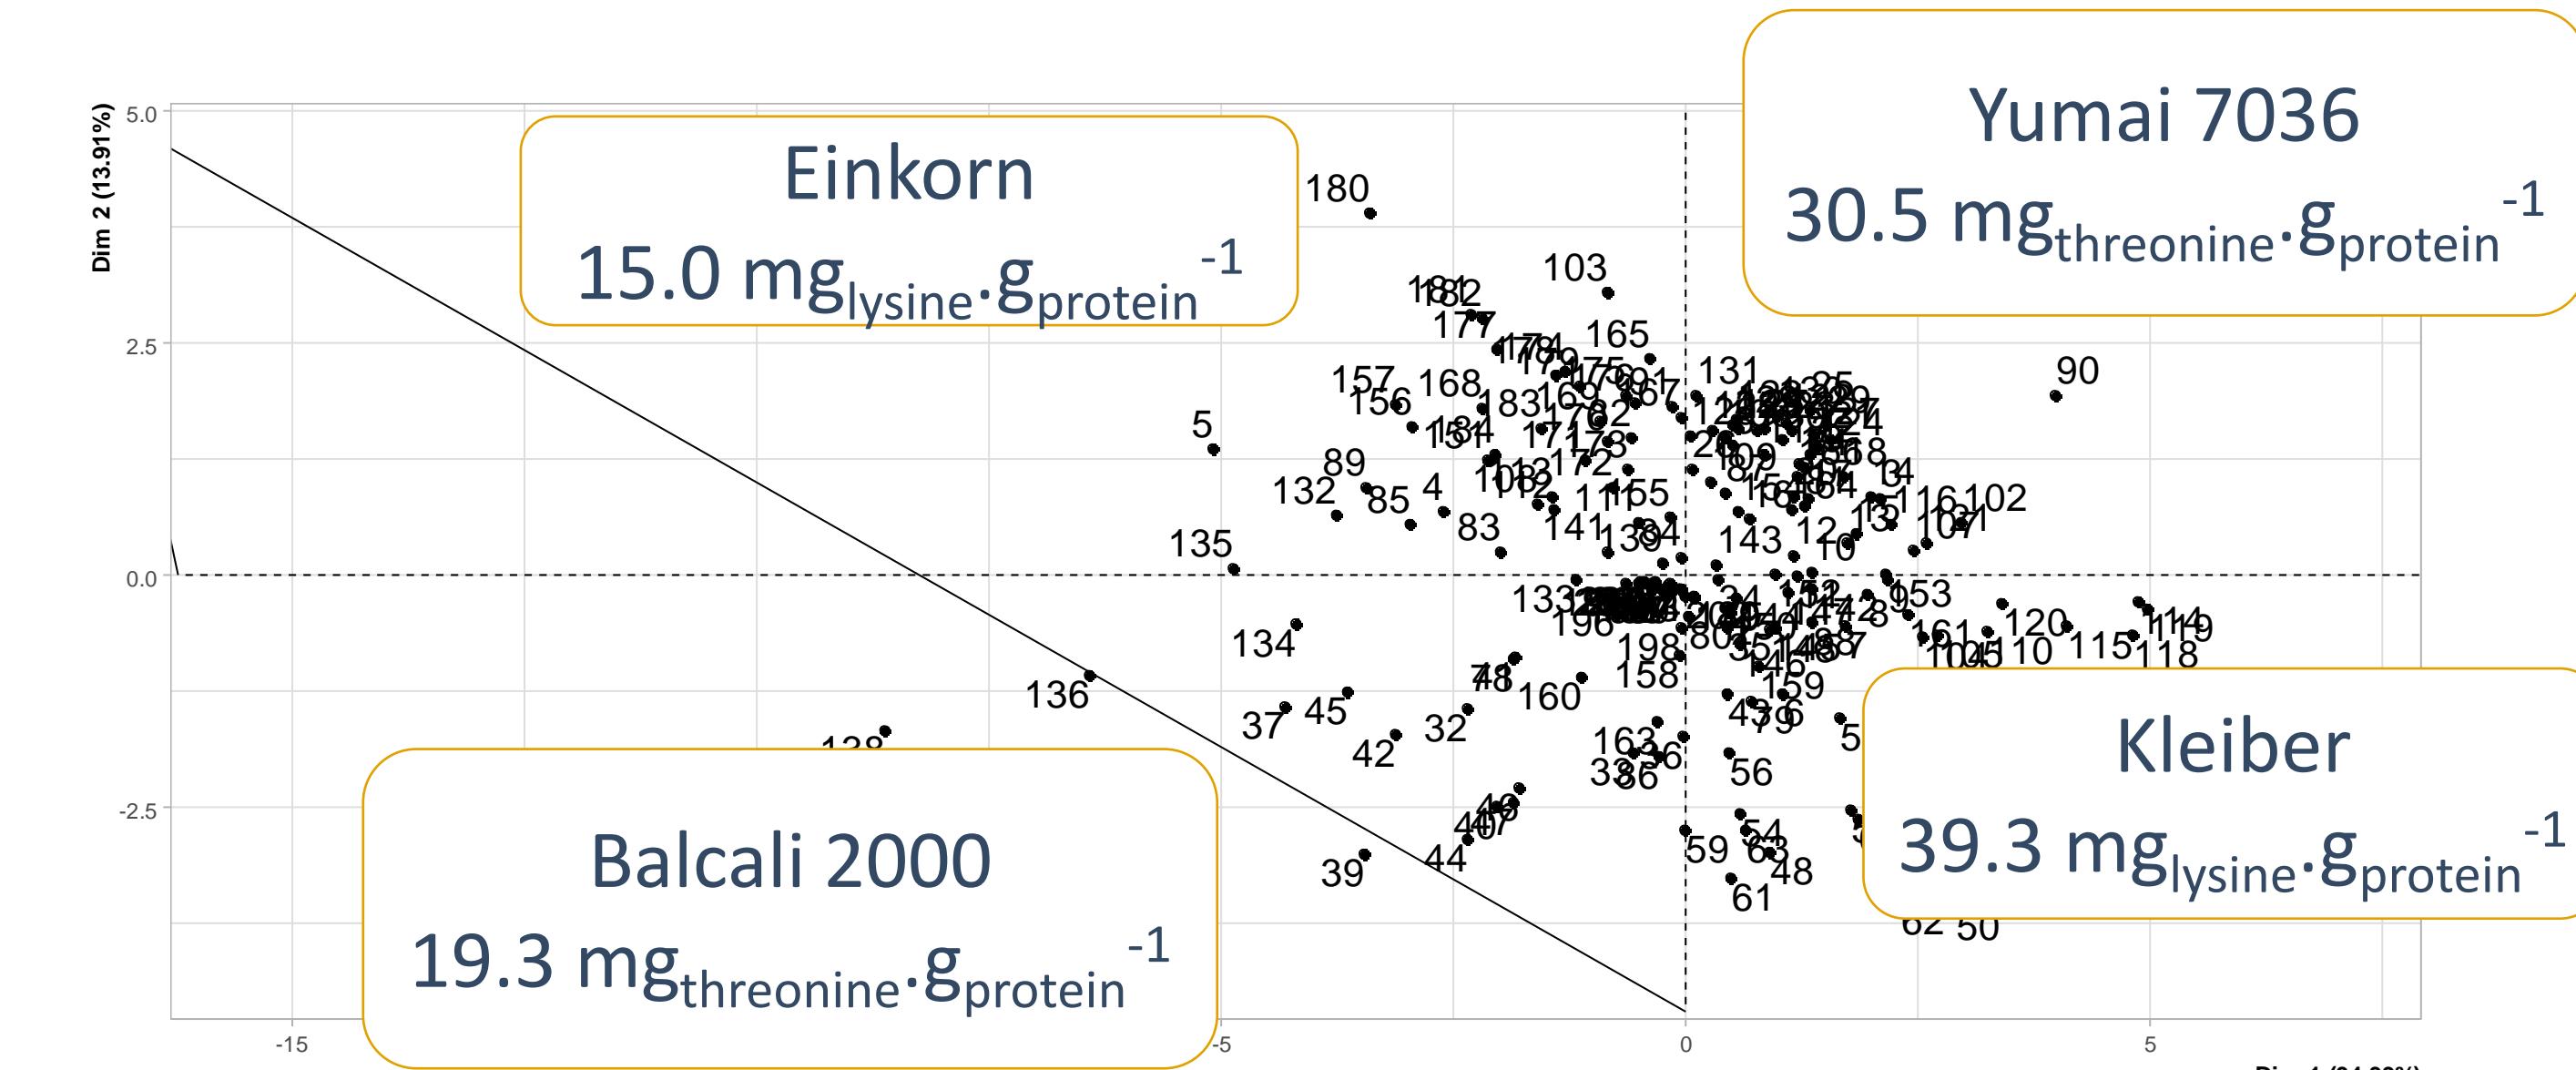

The database ‘LibrAAry’ led to draw the AA profile of different food items with related variability for each AA, from 204 observations for wheat.

The PC1 and PC2 demonstrated 35 and 14% of the variability.

PC1:PC2 shows a clear distribution of different wheat types.
We can also separate each observation based on the quantification method used.

In addition, the database could also compare the low vs high content of specific AA among reported cultivars, such as Einkorn and Yumai 7036 for Lys, or Balcali 2000 and Kleiber cultivars for Thr.

Conclusion

The librAAry database can be used for understanding the AA profile of specific food items and diets, and for designing targeted AA intake-based diets taking into account a prespecified variability. Moreover, it can help to choose wheat varieties and cultivars.
