HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Introduction

Quantification of growth parameters and extracellular uptake and production fluxes is central in systems and synthetic biology. Fluxes can be estimated using various mathematical models by fitting time-course measurements of the concentration of cells and extracellular substrates and products. A few tools are available to calculate extracellular fluxes, but they are hardly **interoperable** and include **specific, hard-coded** growth models. We present an updated version of our open-source flux calculation software, PhysioFit, which can be used with any growth model and is interoperable by design.

Implementation

Conclusion

PhysioFit is a **flexible** tool allows calculating fluxes using **any model of growth**. A **user-friendly graphical interface** is included for biologists, while a **command line interface and Python package** enhances integration of extracellular flux calculation into metabolomics and fluxomics workflows. As proof of concept, the tool is available on the Workflow4Metabolomics galaxy instance. PhysioFit's **modularity** makes it an ideal tool for quantitative studies of microbial metabolism.
