## ABSTRACT

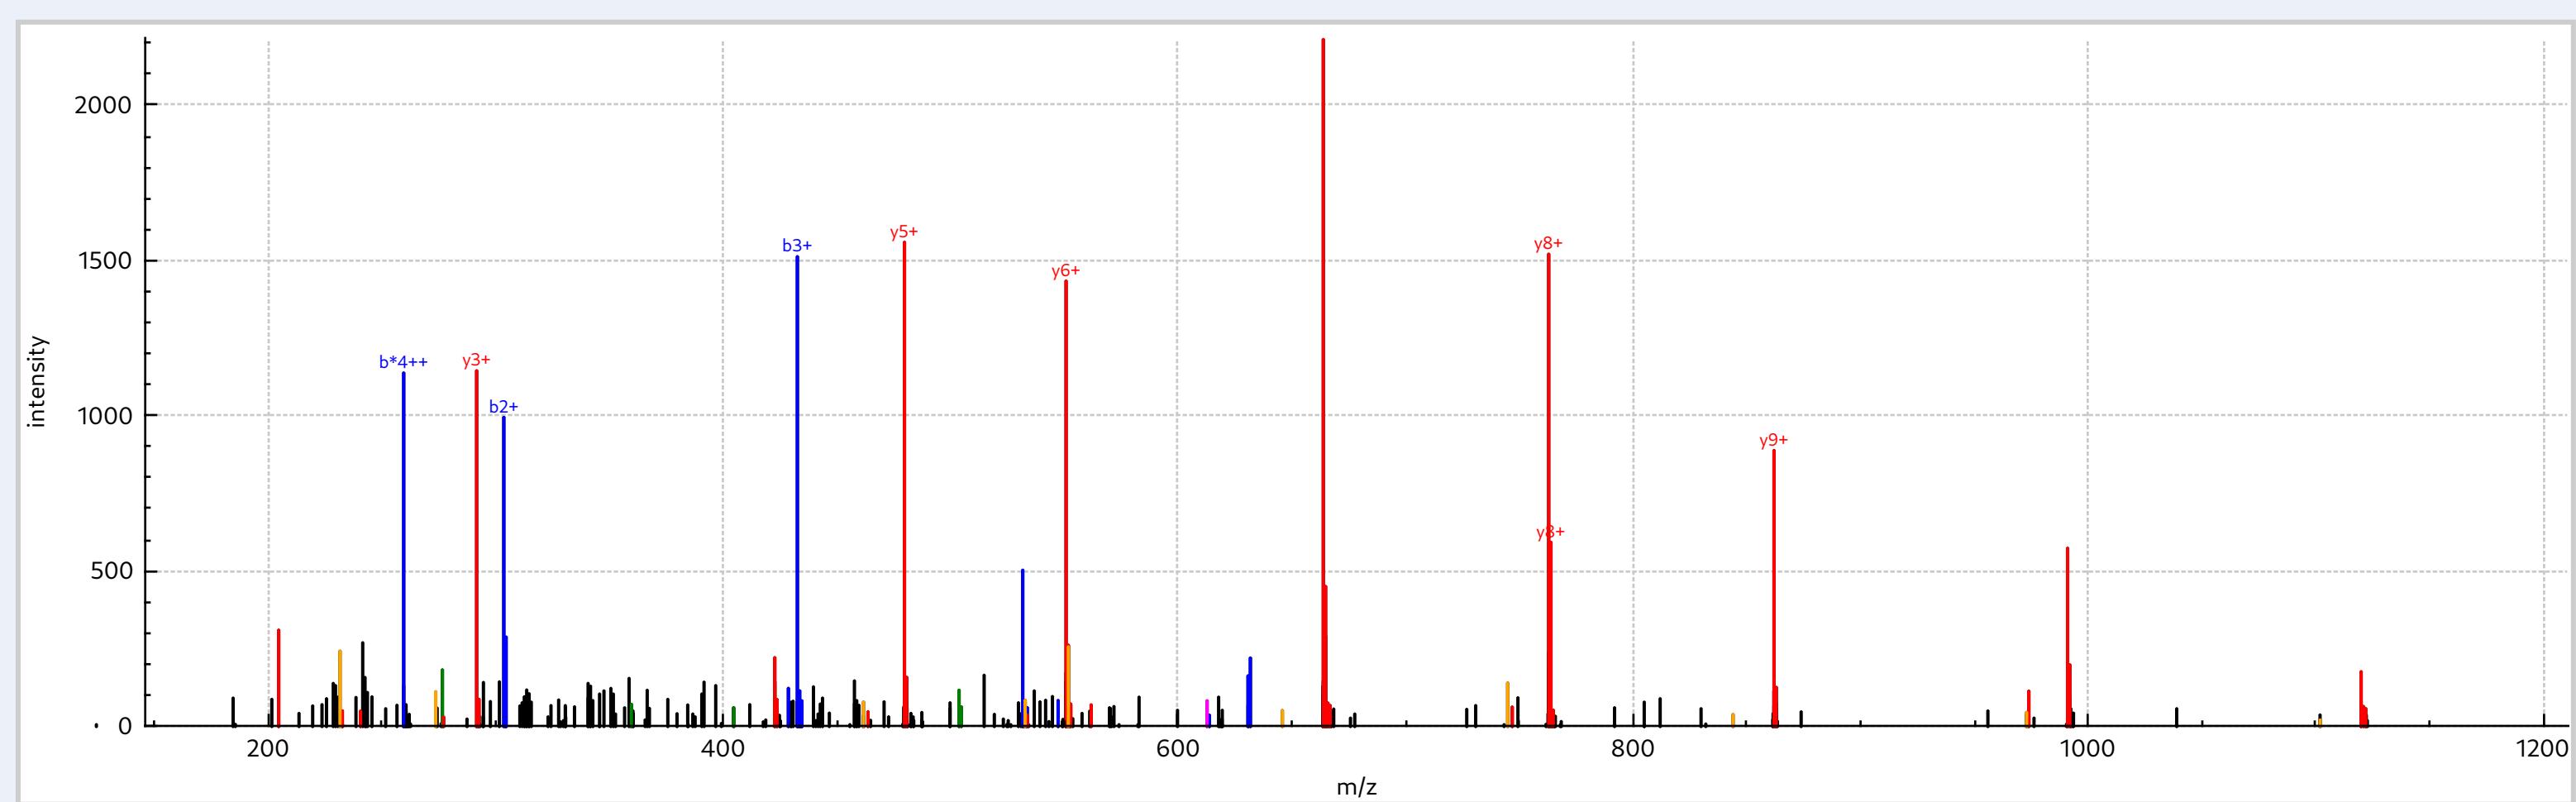

X!TandemPipeline (Langella et al. 2017) is a proteomics free and open source Java software program designed to filter and group peptide/protein identifications from MS/MS data that is used with the MassChroQ quantitative proteomics software (Valot et al. 2011). After a complete rewrite in C++17, the new software, named i2MassChroQ, now features native support for the timsTOF raw data format, peptide/protein quantification by merging the features initially in X!TandemPipeline and MassChroQ, and ultimately statistical analysis using either the MSstats or the MCQR GNU R package.

## Native support for timsTOF raw data format

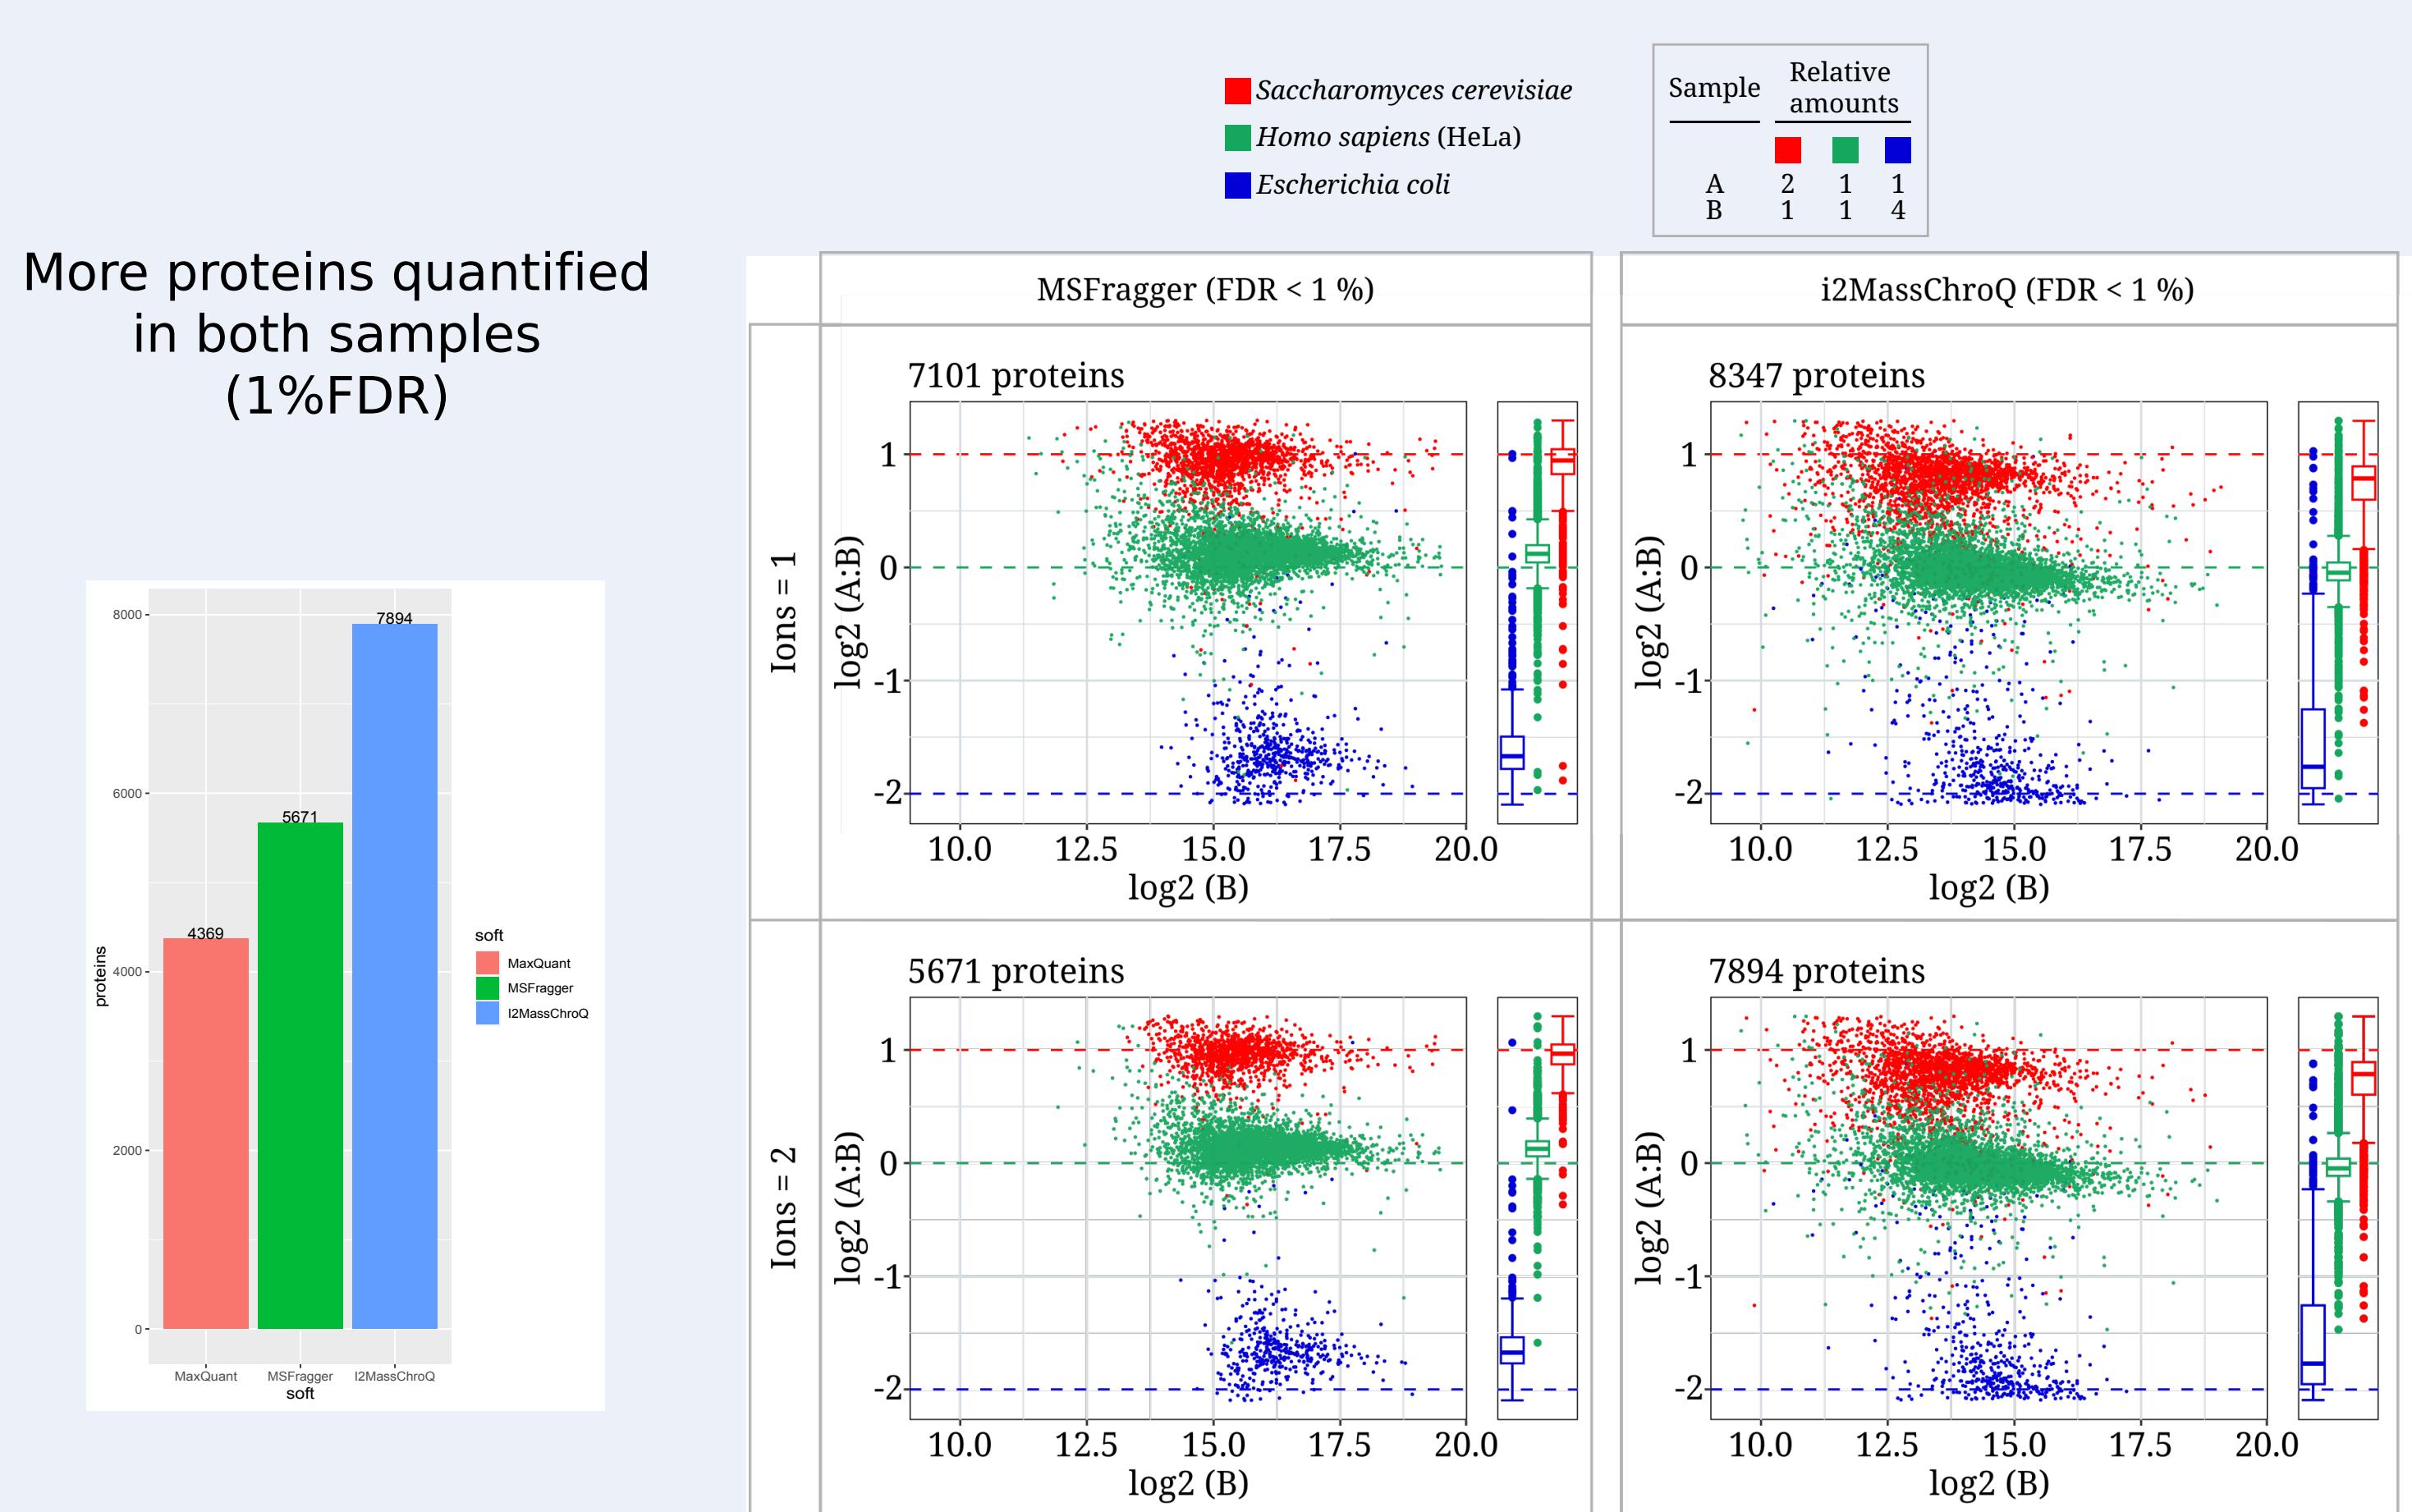

The complete control over raw data with our parser allows for optimizations at each stage, e.g. from input/output cache (very efficient over the network), polynomial solving, multi-tasking, MS<sup>2</sup> data-specific filters depending on the identification engine.

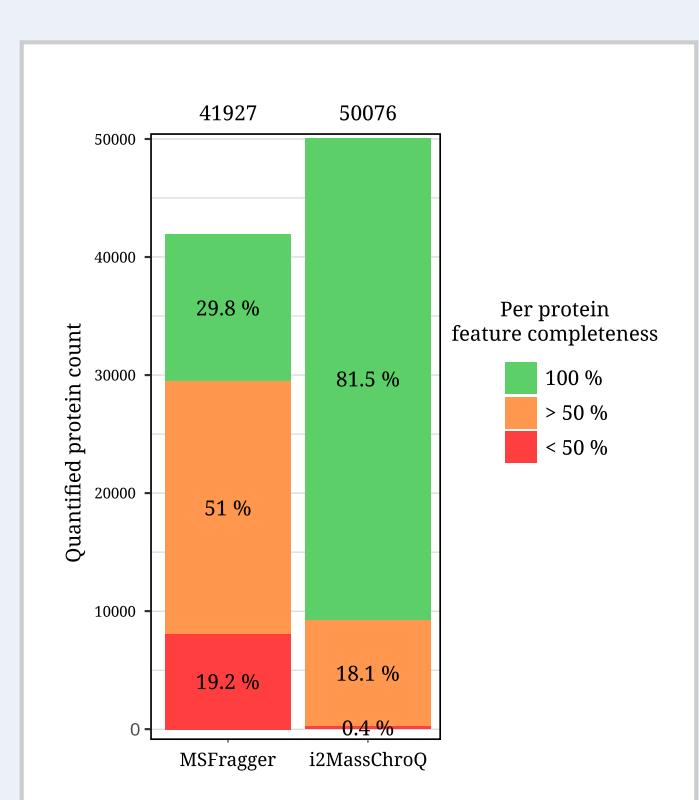

## Benchmarking software with timsTOF dataset PXD014777

Two samples, A and B, containing a mix of protein extracts from three different organisms. 3 replicates each.

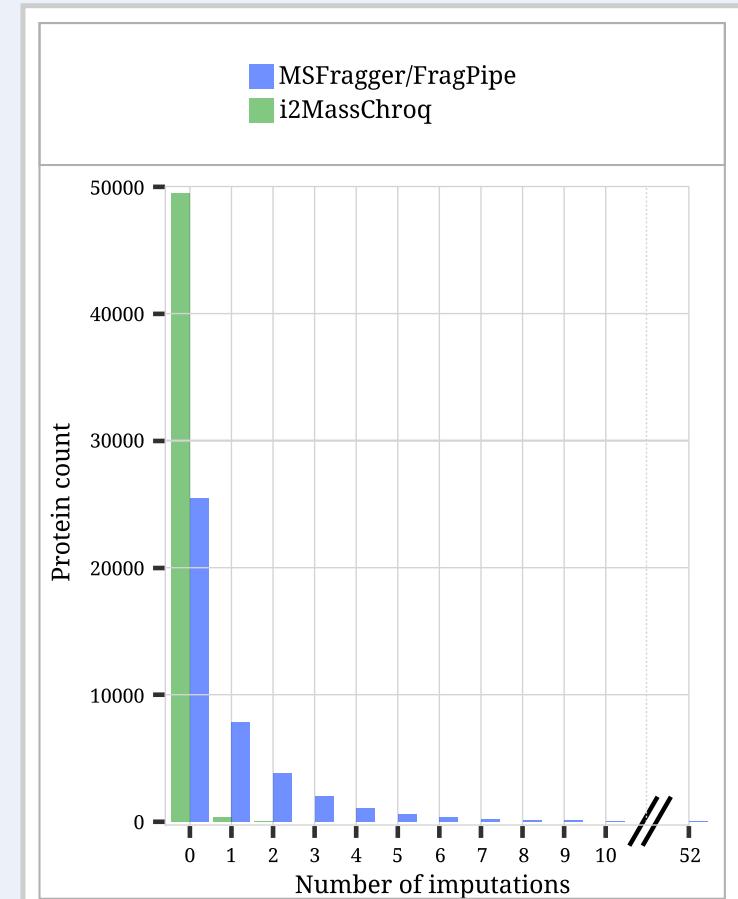

i2MassChroQ quantifies more proteins and on a wider dynamic range.

Data completeness : MSFragger 72%, i2MassChroQ 96%

MassChroQ quantifies more features (area-under-the-curve from extracted ion current chromatogram) than MS-Fragger and a large proportion of quantified proteins (81%) has a complete feature set across all 6 samples.

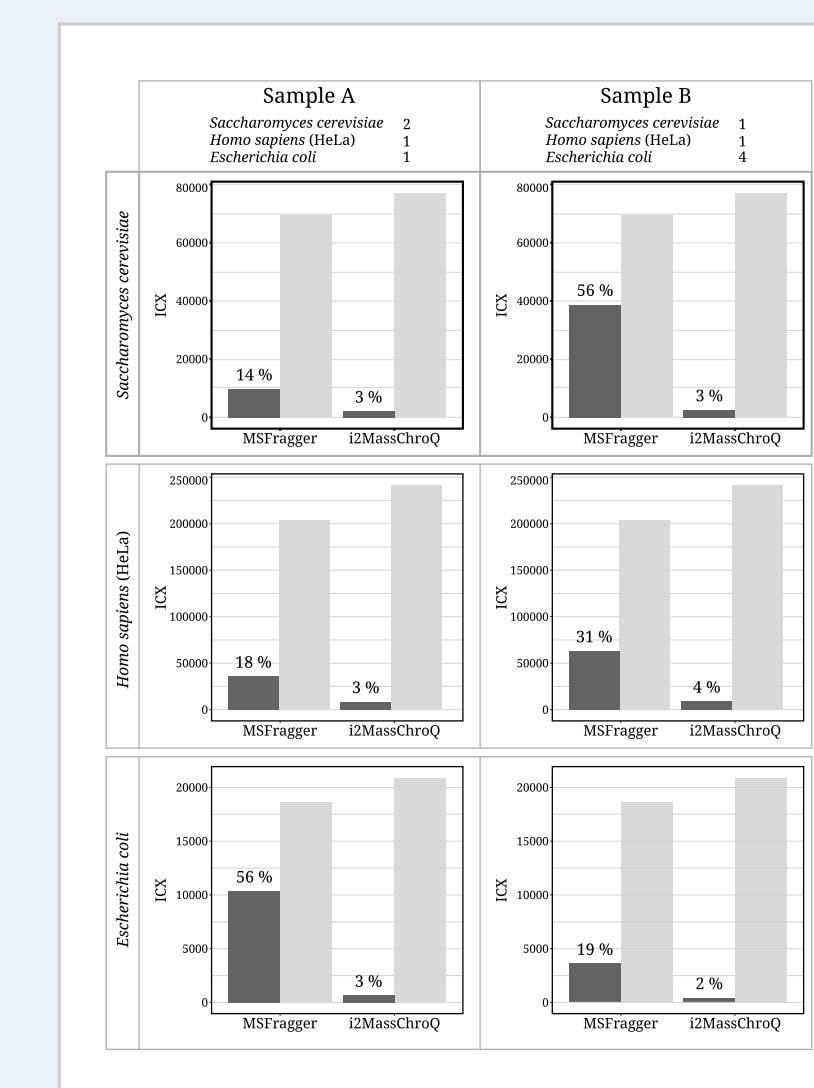

### MSstats imputation:

For each protein quantification in all 6 samples, the feature set may be incomplete and MSstats need to recourse to imputations. This is the case for more than 50% of the protein quantification values in the case of MS-Fragger, compared to less than 1% for MassChroQ

## User interface

i2MassChroQ has a complete graphical user interface to handle your proteomics projects, from raw MS data to statistical analysis (MSstats and MCQR).

## CLI tools

### mzxmlconverter

Fast conversion with customisable settings from timsTOF raw data directory to mzXML standard file to use with any identification engine.

### tandemwrapper

Transparent use of the X!Tandem identification engine on timsTOF data repository or using non supported mzML encoded files. It first transcodes timsTOF data to mzXML, runs X!Tandem and rewrites results as if X!Tandem had been used in the first place.

### xicextractor

Single xic extraction tool using customisable settings, working on any MS data file, including timsTOF directory (ion mobility enabled).

i2MassChroQ and its user manual are available as Free Software, licensed under the GNU General Public License (v3 +). The user manual is available in PDF or HTML format. i2MassChroQ is developed on Debian GNU/Linux. Binary packages are built for GNU/Linux and MS Windows.
