## Background

Antiseizure medications (ASMs) fail to reduce symptoms of epilepsy in 1/3 of the children.

Early life microbiome is vulnerable to xenobiotics.

ASMs disturb early-life gut microbiome dynamics.

## Objective

Dissect reciprocal interactions between the gut microbiome species and ASMs under *in-vitro* conditions.

## Methods

Selection of the core children gut microbiome strains

(10 Bacteroidota, 14 Bacillota, 4 Actinomycetota, 1 Verrucomicrobiota, 3 Pseudomonadota)

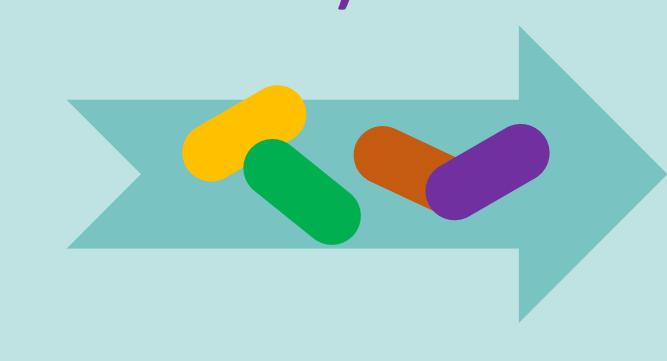

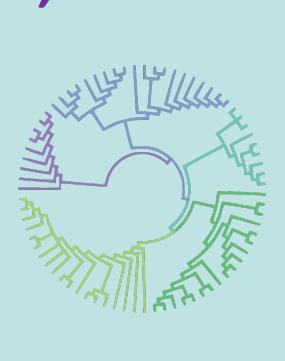

### Host response

HT-29

epithelial cells

○○○○

+ (carbamazepine or lamotrigine)

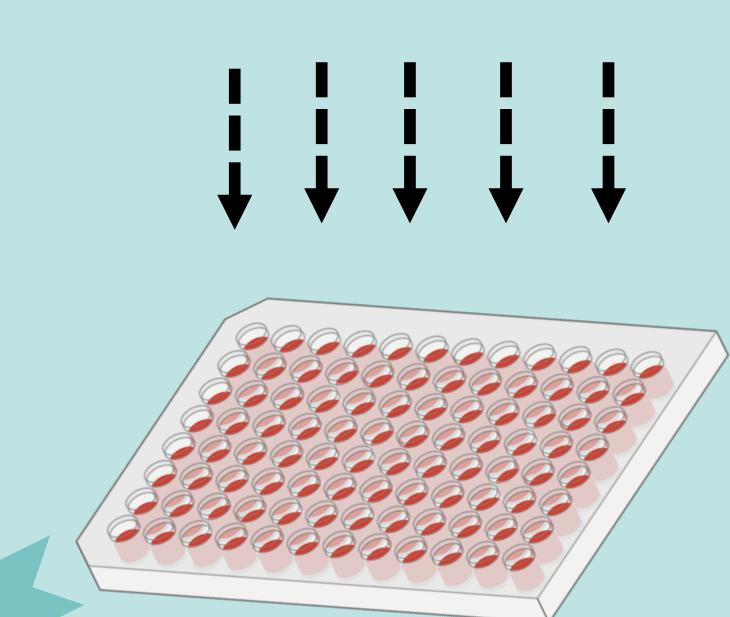

toxicity response drug response

ASMs = Levetiracetam, Gabapentin, Valproate, Ethosuximide, Topiramate, Carbamazepine, Lamotrigine, Lacosamide, Phenytoin

Excipients = Methyl-paraben, Propyl-paraben, Acesulfame K, Maltitol, Sorbitol, Aspartame

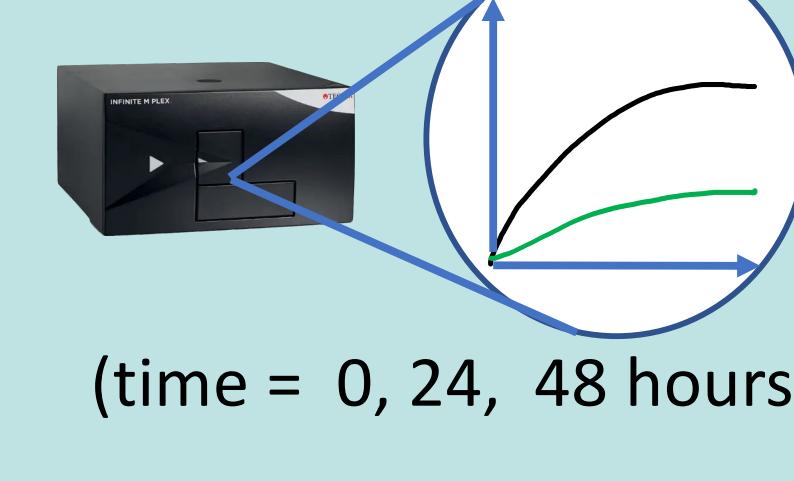

9 ASMs,  
6 excipients,

quantify ASM concentrations with HPLC

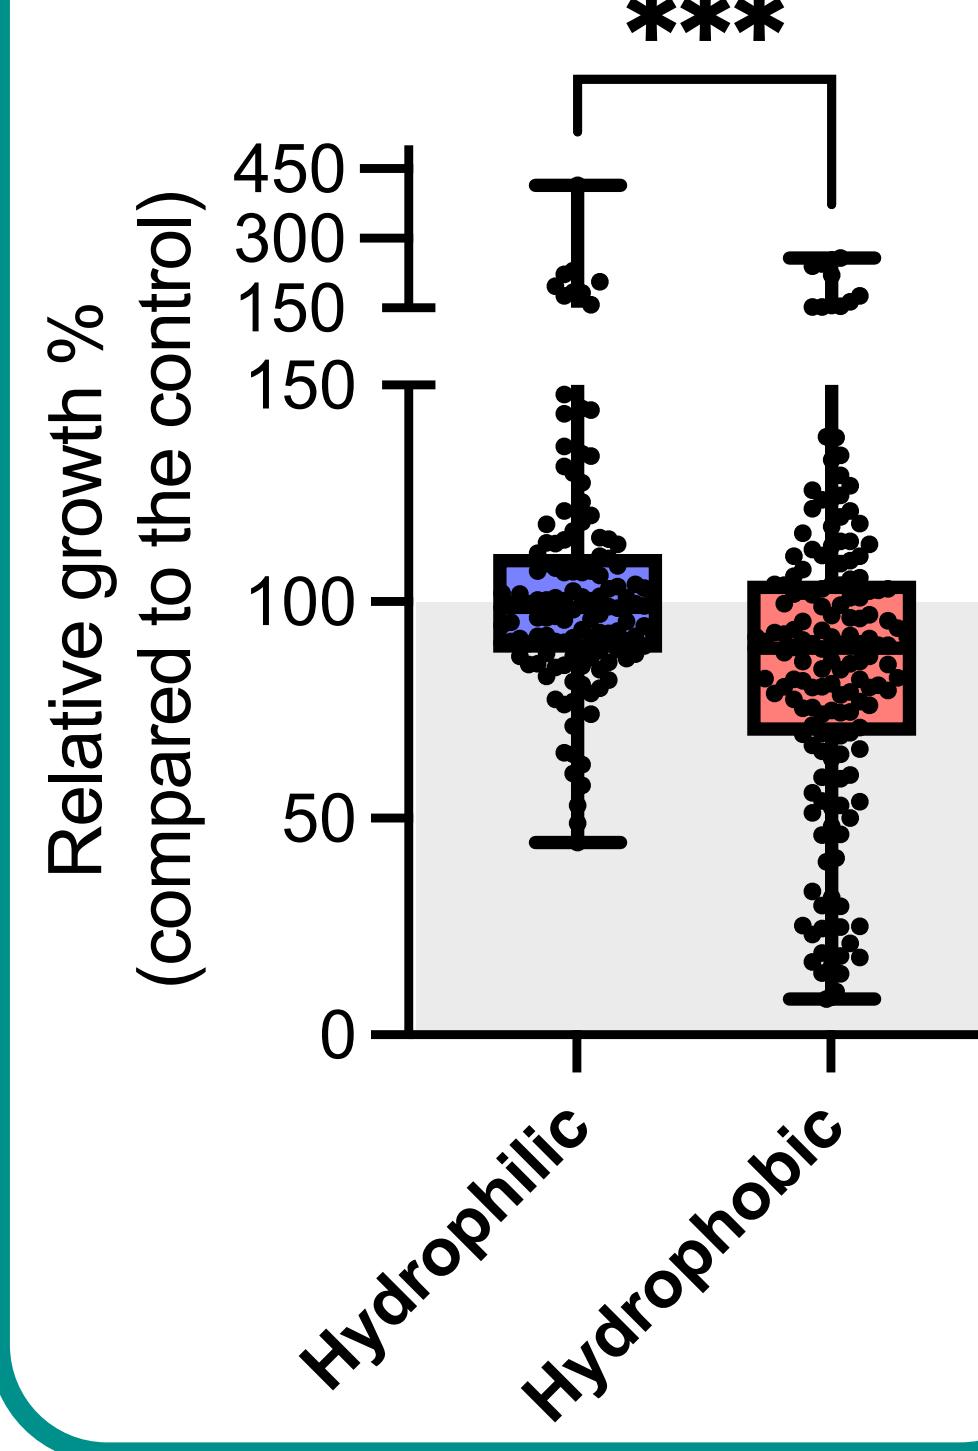

growth monitoring

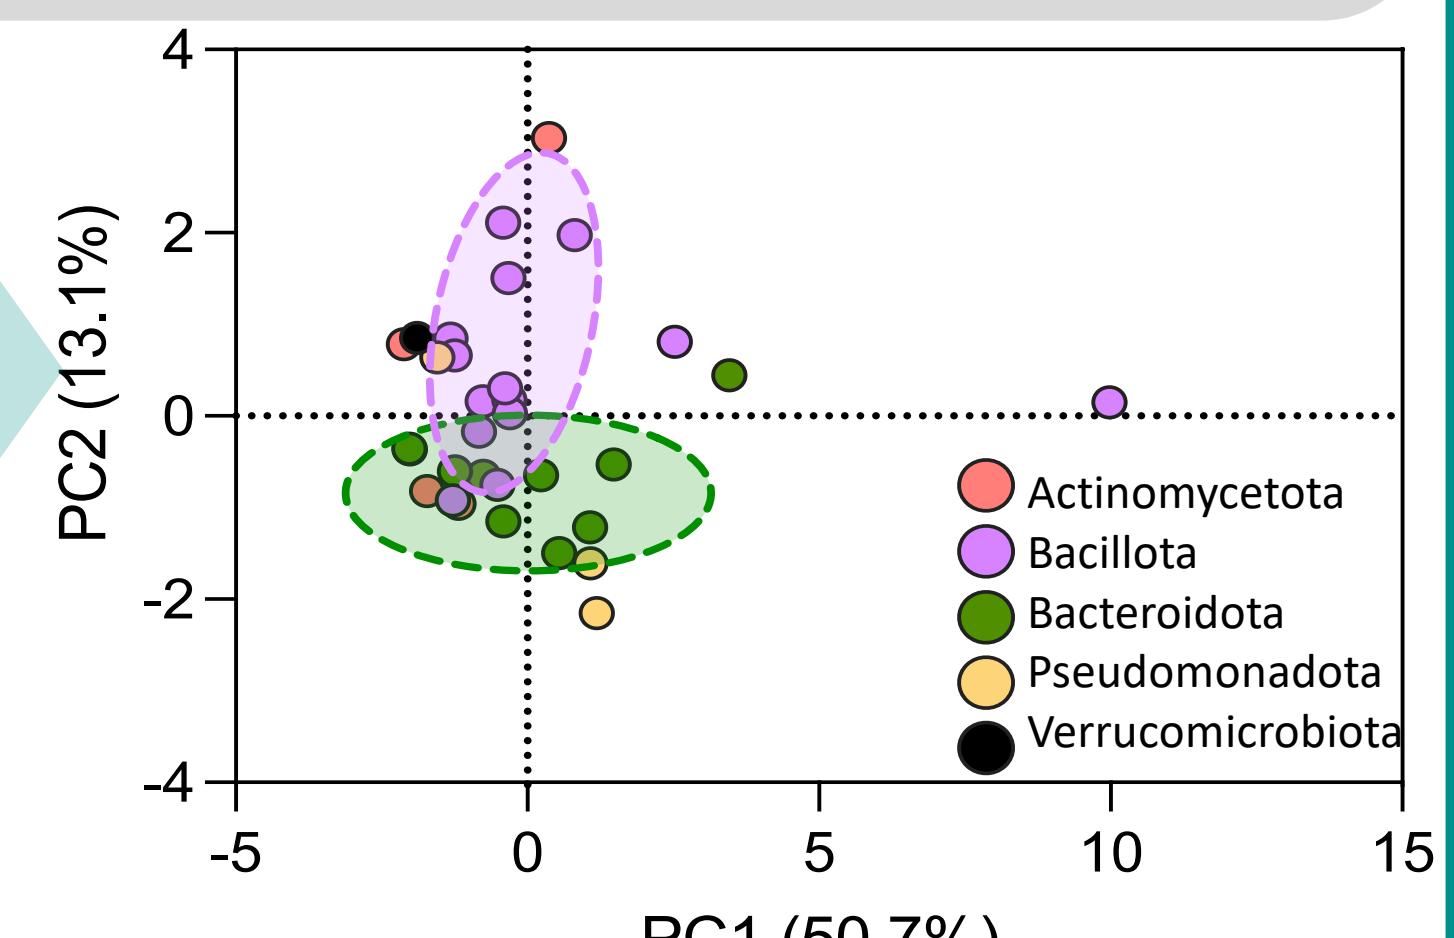

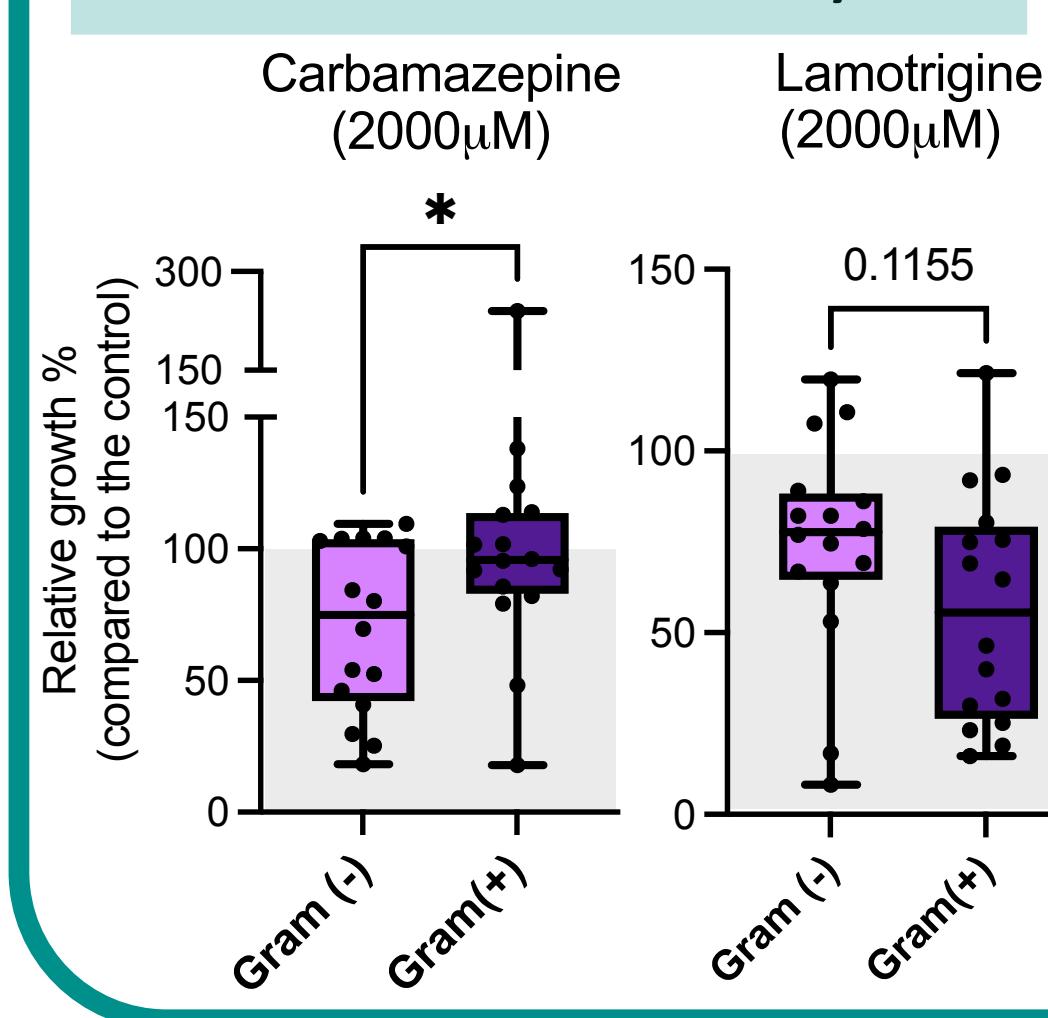

(time = 0, 24, 48 hours)

Hydrophobic ASMs were more inhibitory towards gut strains.

Bacterial growth in presence of ASMs depended on bacterial physiology.

Bacillota and Bacteroidota species were differently impacted by the ASMs based on PCA analysis.

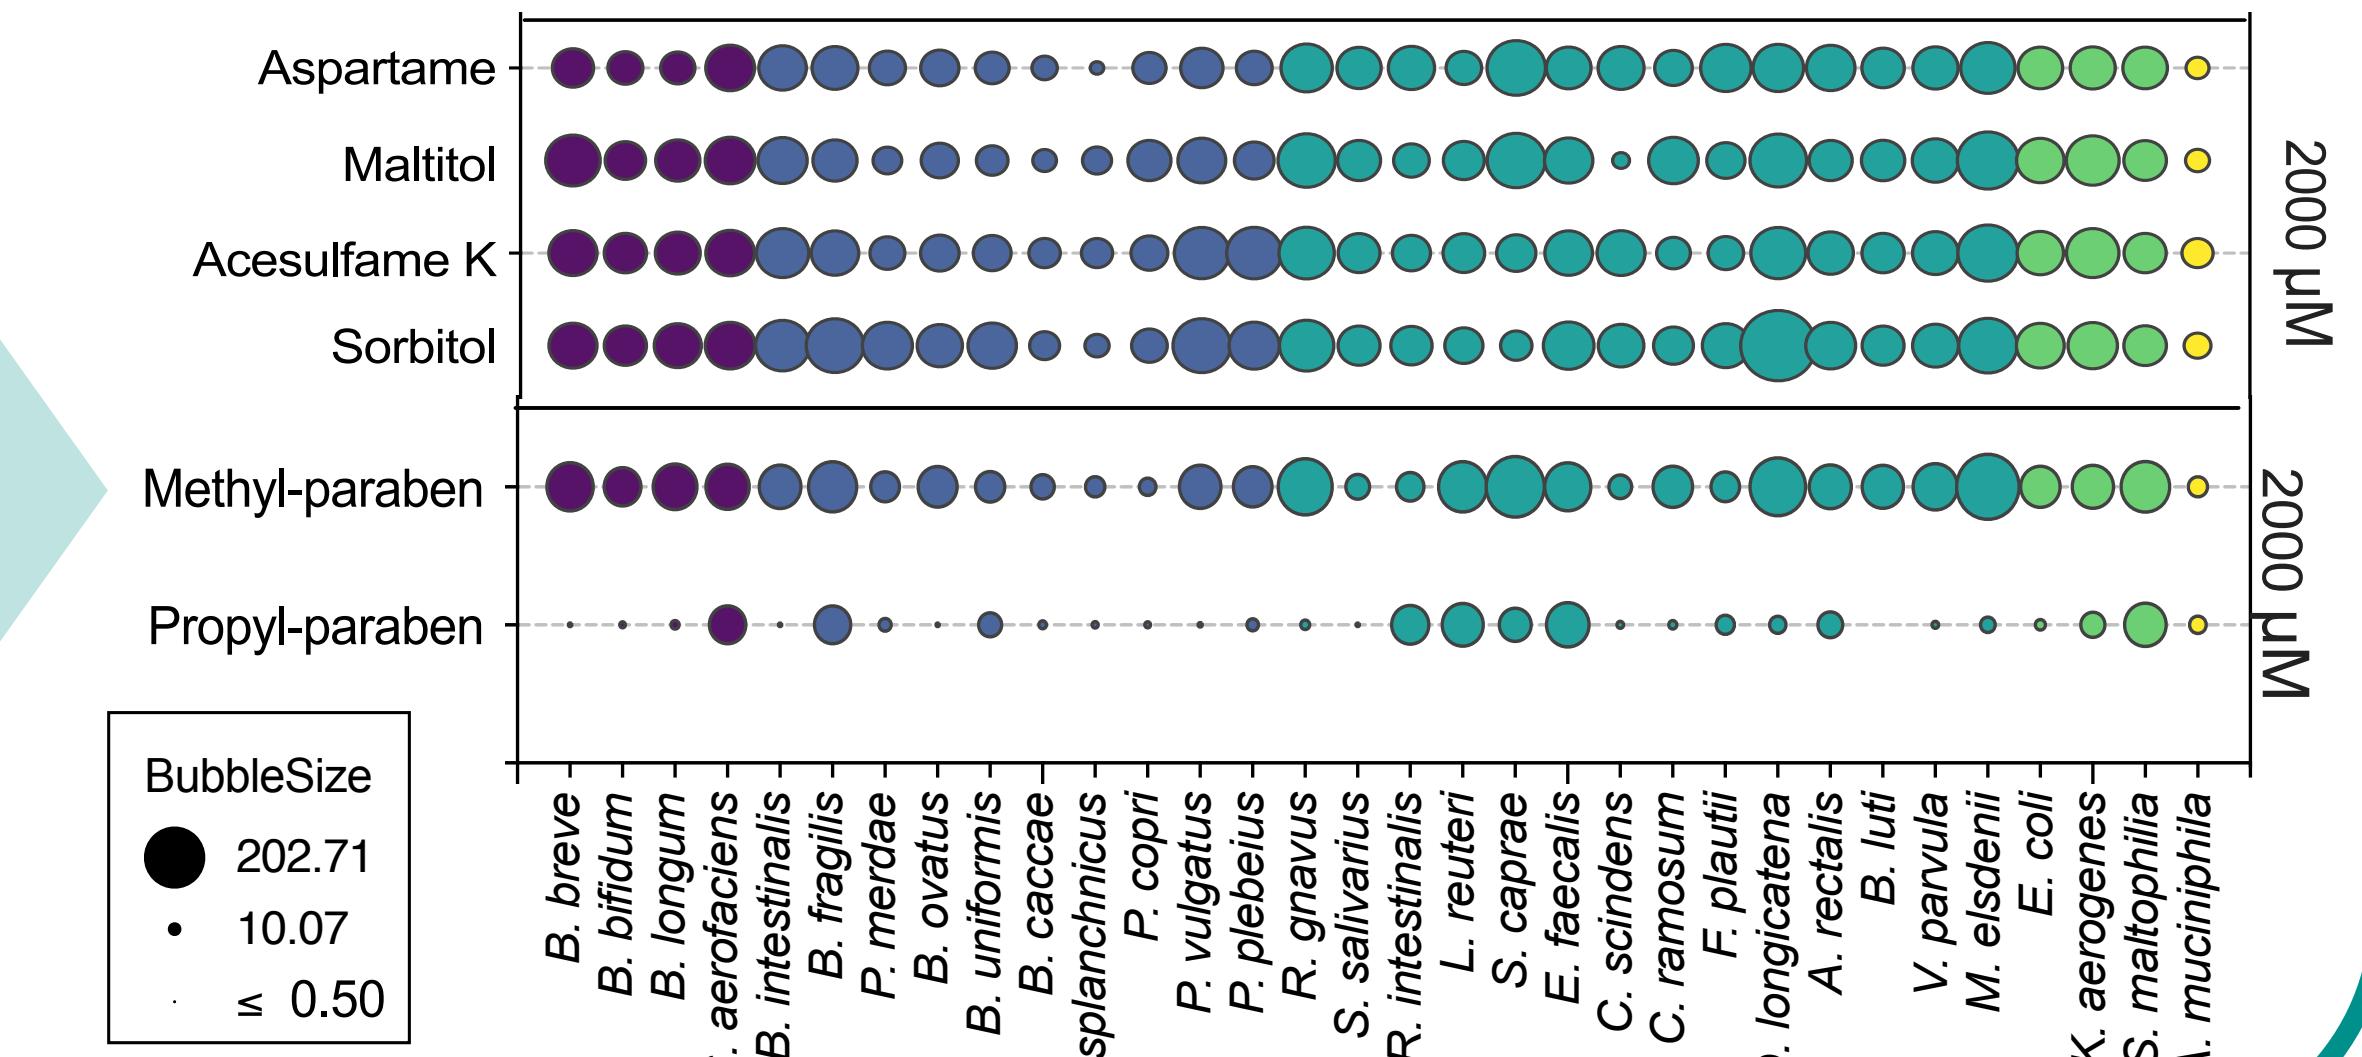

Carbamazepine and lamotrigine impaired the growth of Gr (-) and Gr (+) bacteria, respectively.

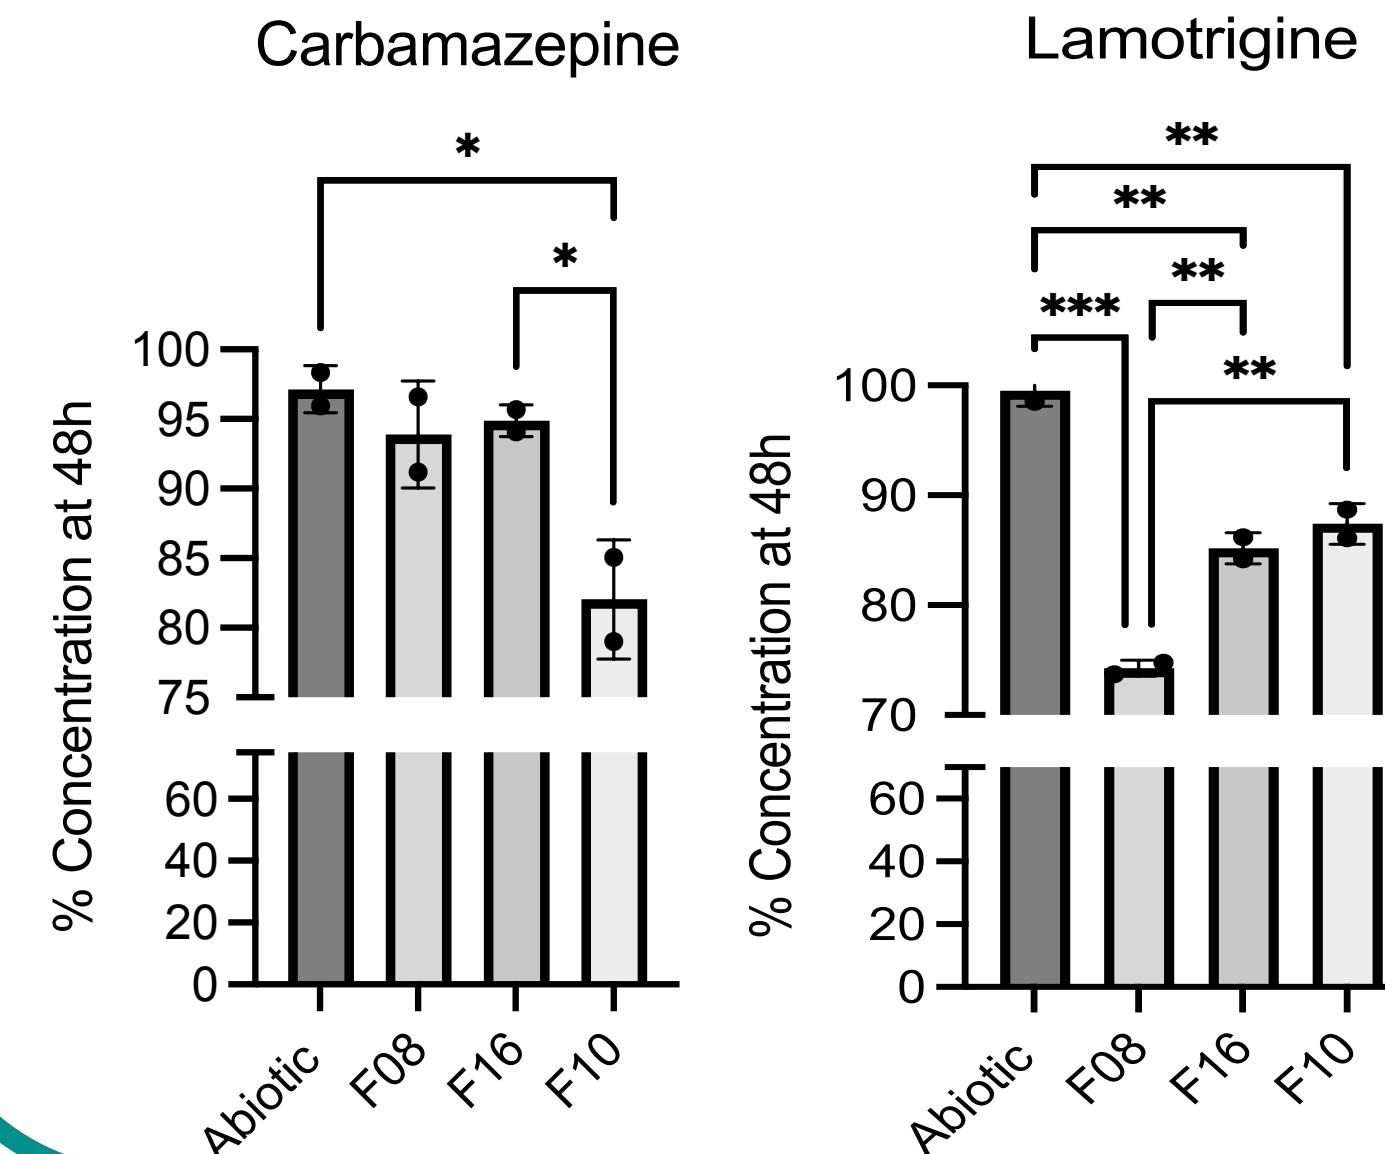

Drug excipients greatly influenced gut bacterial growth.

Propyl-paraben inhibited growth of 26 strains out of 32.

Sweeteners stimulated the growth of majority of the strains.

Gut microbiota reduces bioavailability of ASMs.

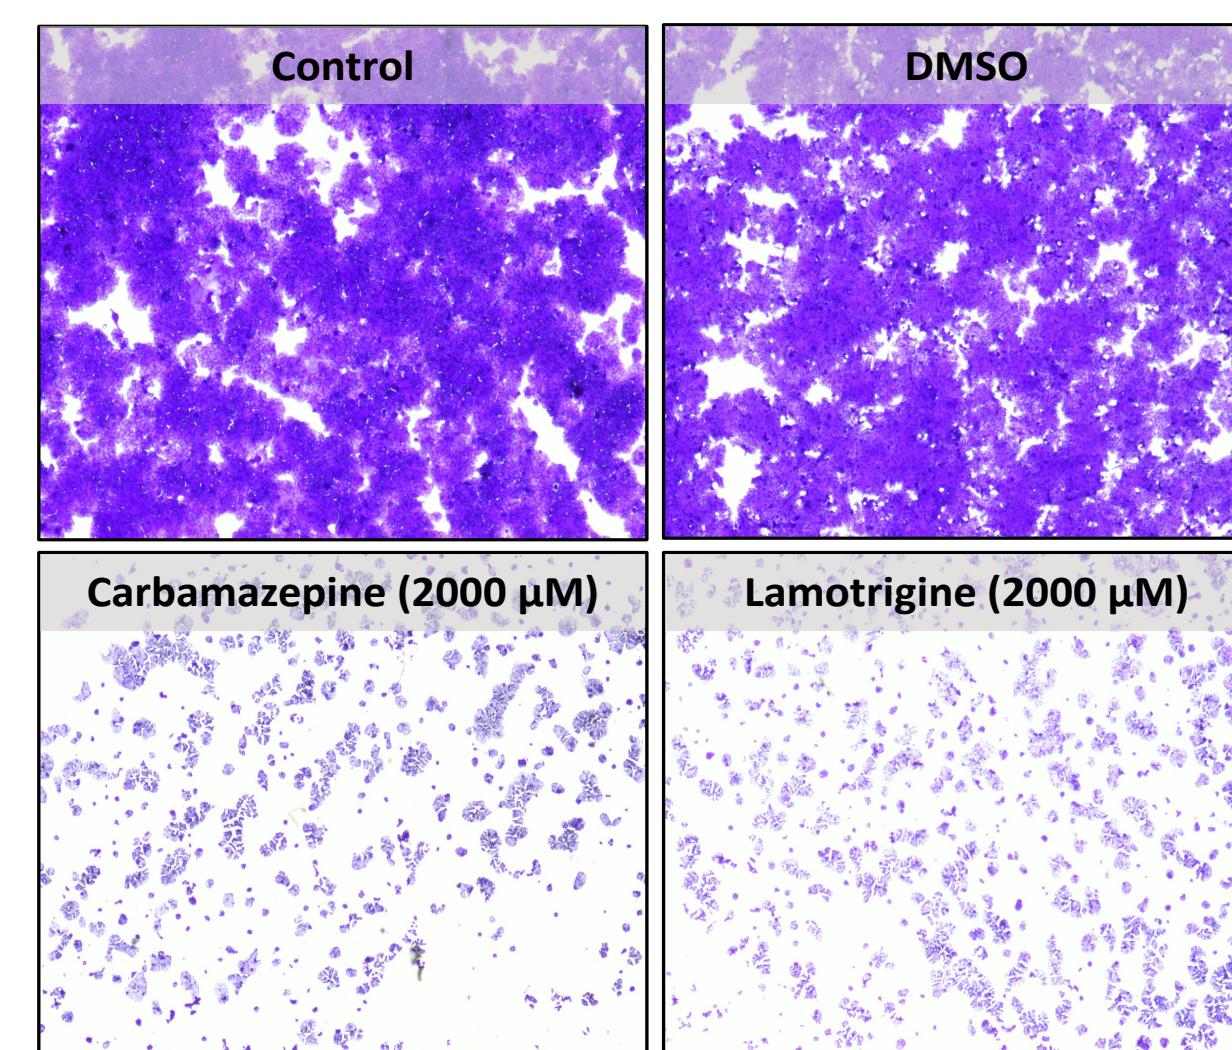

Feces-derived microbial communities reduced carbamazepine and lamotrigine concentration up to 26% ( $\approx 100$  mM).

Inoculum composition had significant impact on the rate of carbamazepine and lamotrigine dissipation.

## Summary

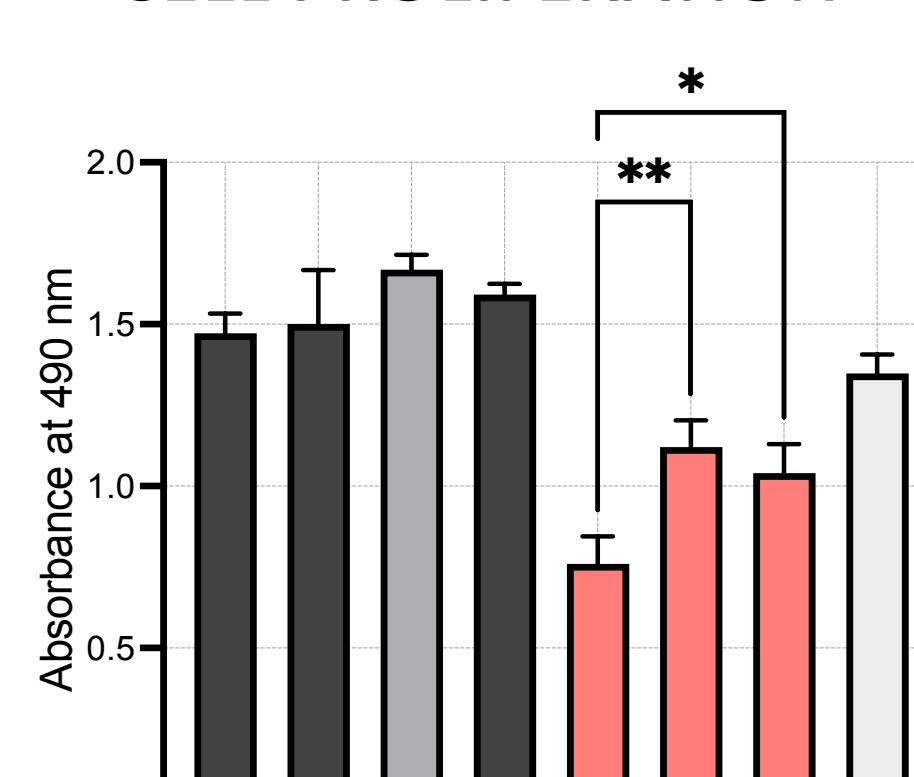

- Hydrophobic ASMs were more inhibitory towards the growth of gut bacterial strains.
- Artificial sweeteners and parabens, positively and negatively impacted the growth of gut strains, respectively.
- Mixed microbial communities reduced the bioavailability of lamotrigine and carbamazepine (mechanisms under investigation).
- Host cells were impacted by ASMs and this effect could be modulated by gut bacterial supernatants (e.g. for drug resistance gene expression).

Carbamazepine and lamotrigine were toxic towards HT29 cells.

Supernatants of *B. longum* and mixed communities reduced carbamazepine-induced toxicity and drug resistance in host epithelial cells.
