## BACKGROUND

There is increasing evidence that **microbiome-based therapies** can correct dysbiosis and reduce inflammation associated with **Inflammatory Bowel Diseases** (IBD). In particular, the human commensal family of ***Christensenellaceae*** bacteria has been reported as missing in several cohorts of Crohn's disease patients, indicating that it **may have a role in maintaining microbial symbiosis** in this population. To assess its potential for IBD management, we used the reference type species *Christensenella minuta* DSM 22607 to examine its anti-inflammatory properties.

## METHODS

### *In vivo*

Two distinct independent preclinical colitis models: a moderate DNBS-induced colitis model in mice and a severe TNBS-induced colitis model in rats.

### *In vitro*

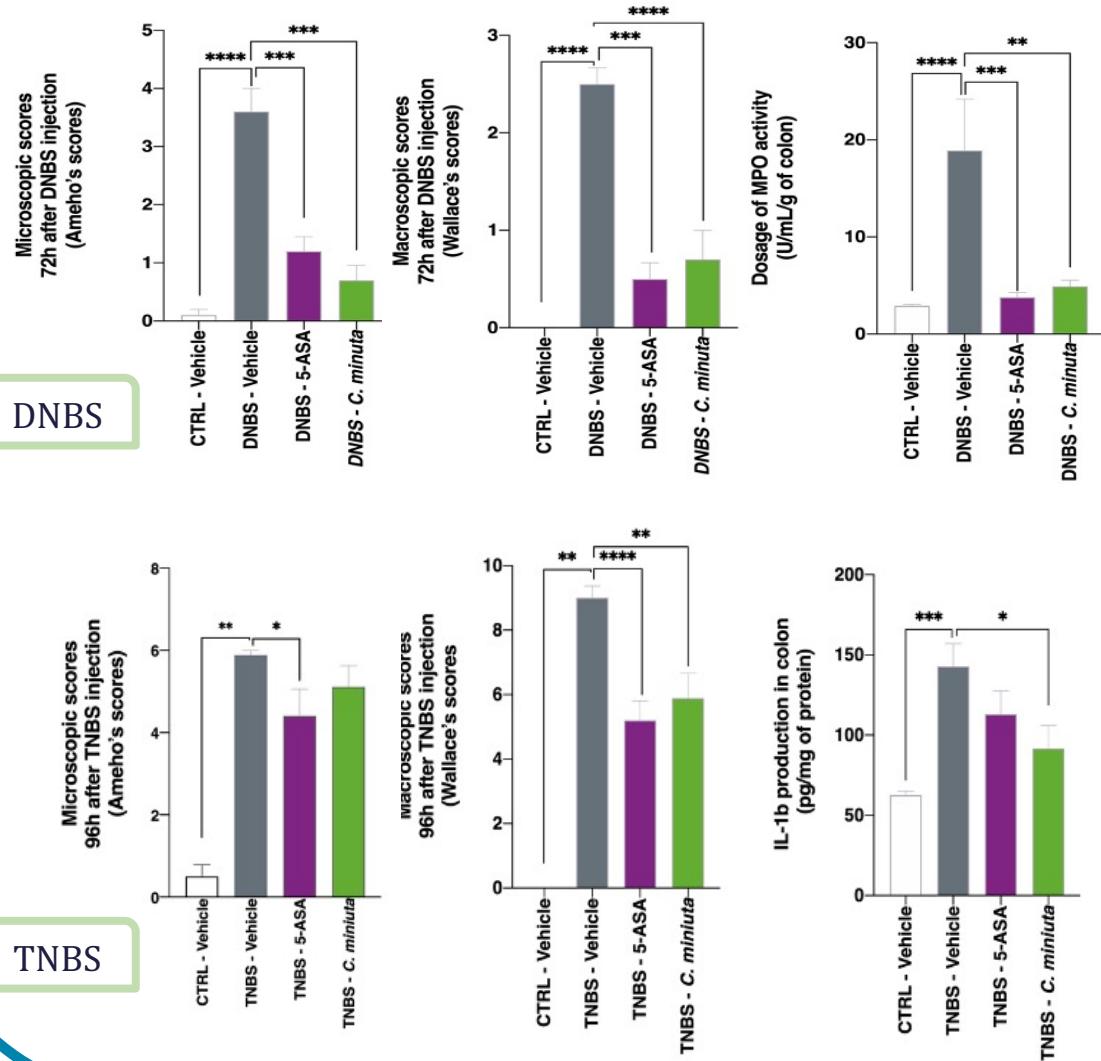

### Understand *C. minuta* mechanism of action

SCFAs determination using Gas chromatography

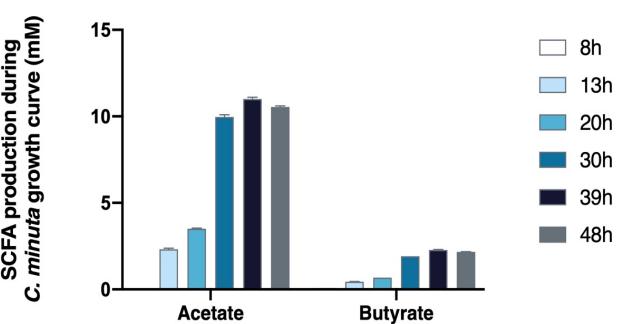

Immunomodulation in HT-29 cells

## RESULTS

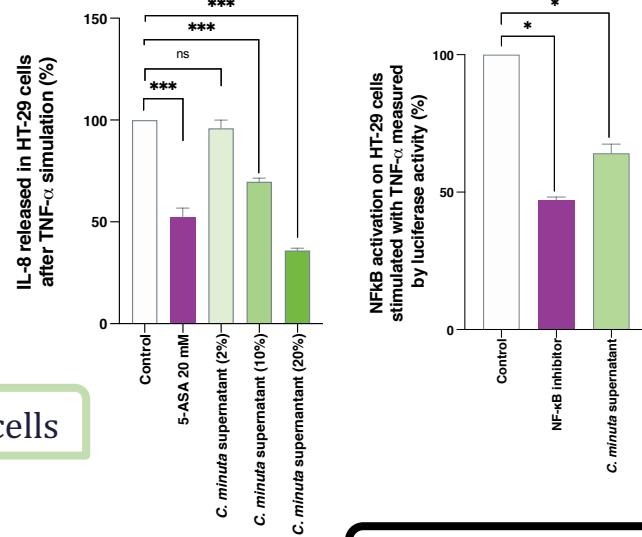

### *C. minuta* protects against DNBS and TNBS-induced colitis in mice and rats

### *C. minuta* is a high acetate and moderate butyrate producer

### *C. minuta* displayed anti-inflammatory properties by decreasing the secretion of IL-8 through NF-κB inhibition

## CONCLUSIONS

***C. minuta* displays strong immunomodulatory properties *in vitro* and *in vivo*.** Our findings open the door to intriguing new research questions. Although **additional research** is needed to **better understand the bacterium's effects and their underlying mechanisms**, our work underscores for the first time that *C. minuta* **holds promise for treating IBDs** and merits further study with a view to developing **single-strain biotherapies**.
