HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Advanced Optimization Technique for Robust and Multiobjective Metasurface designs

Abstract

This poster emphasizes the paramount importance of employing optimization techniques to effectively address nonlocal resonance phenomena, accomplish multiobjective optimization, and seamlessly integrate uncertain quantification methods

Classical approach

- I- Lookup table: phase shift vs dimensions
- II- Synthesizing based on the required phase
- III- Low performance & neglect coupling

Inverse design approach

- I- High performance
- II- Nonlocal interactions
- II- Difficult for multiobjective & Fabrication error

Rigorous fullwave solver

- I- DIscOntinuous GaErkin Nano Solvers
- II- 3D Time-Domain & Frequency-Domain
- III- Complex geometry & Large-scale designs
- III- Efficient for strong near-field coupling

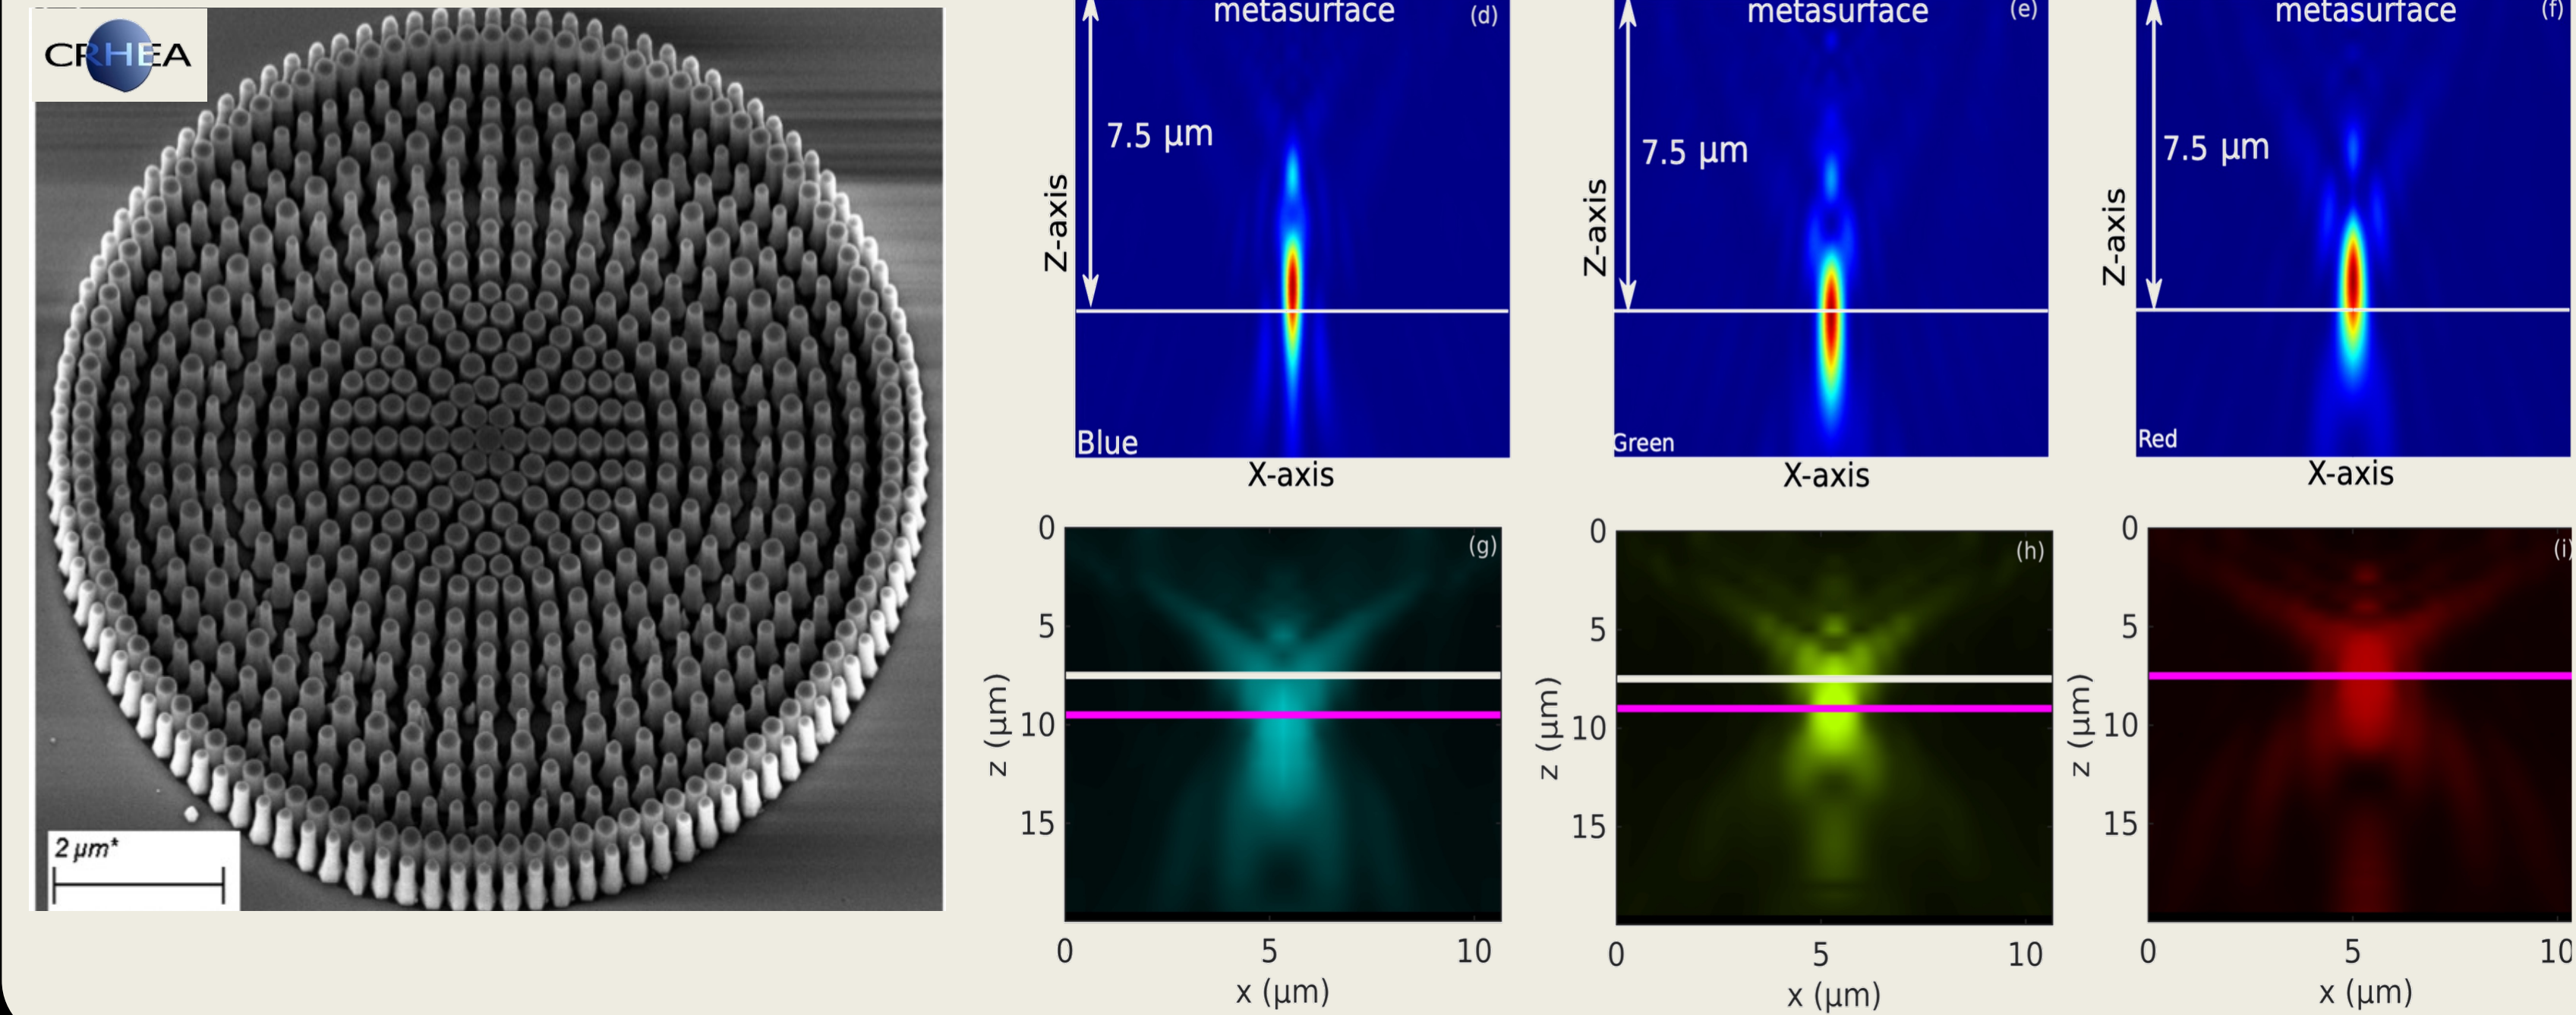

Multiobjective optimization

- i) Different surrogate models
- ii) Expected Hypervolume improvement
- iii) x1 will be simulated in next iteration

RGB Metalens Design & Fabrication

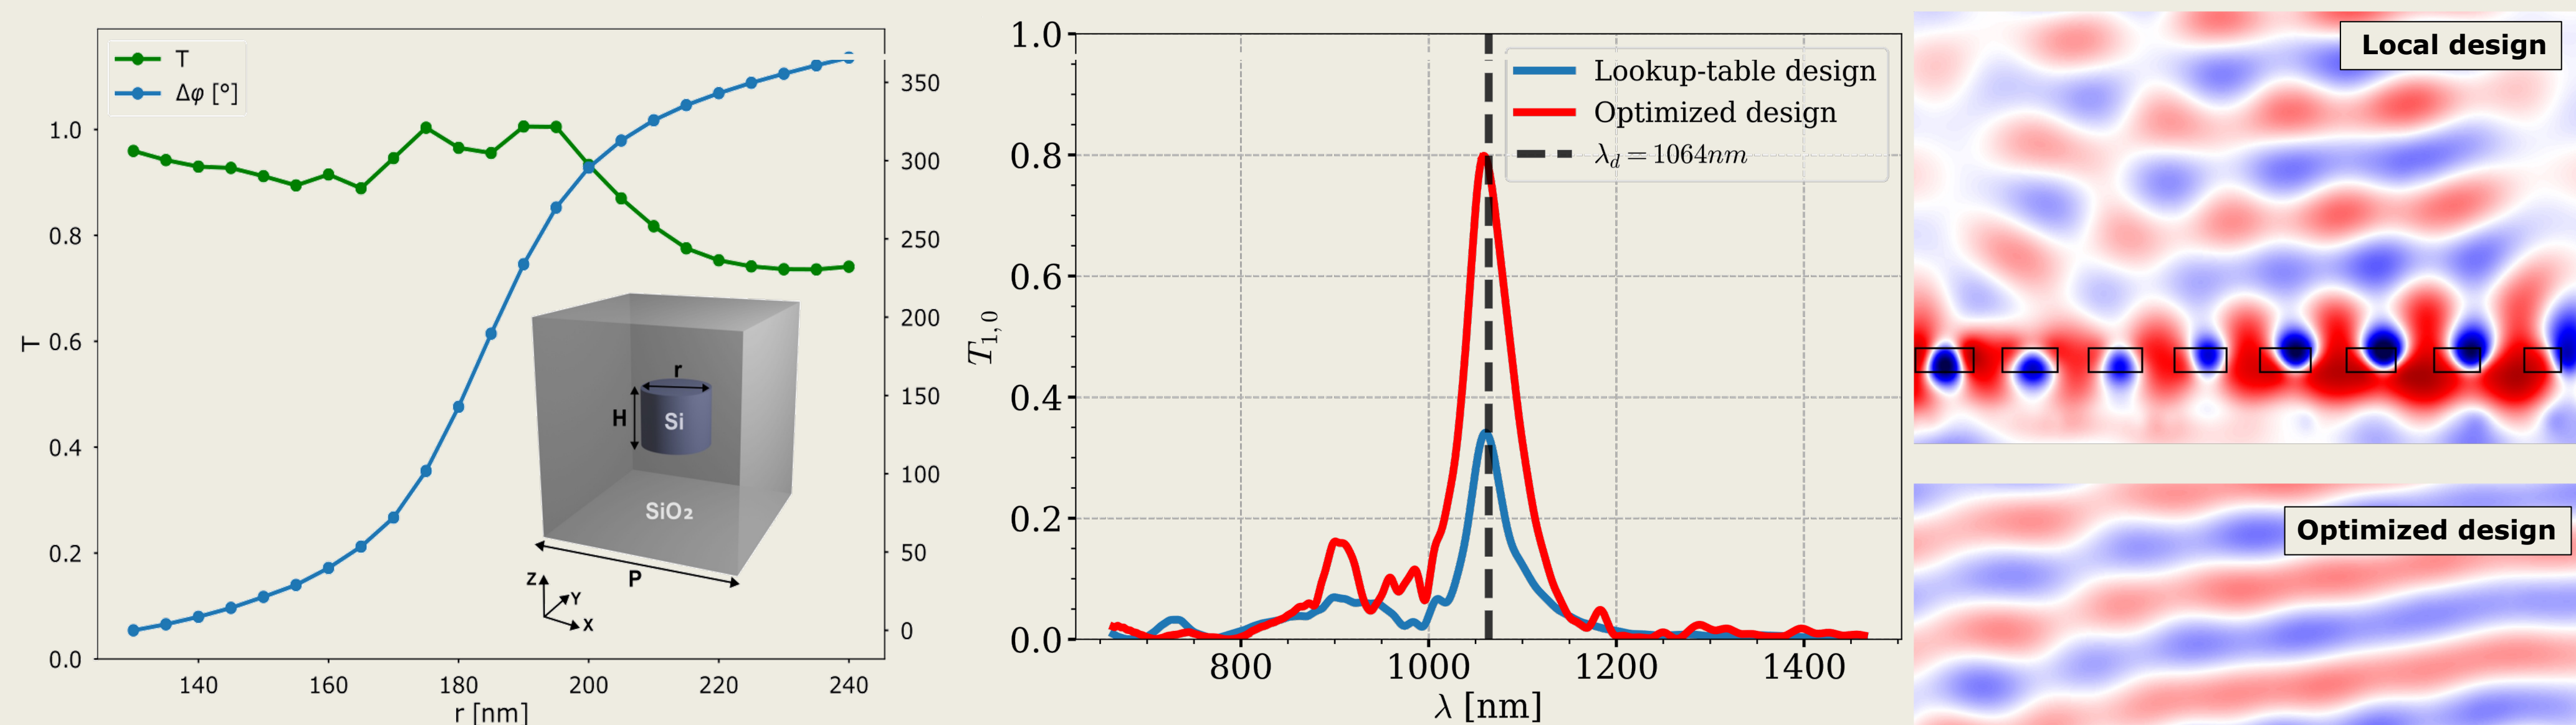

Statistical learning optimization

- Design of experiments (DOEs)
- Construct a surrogate mode
- $y(x)$ with standard deviation σ (orange curve)
- $Y(x) = N(y(x), \sigma^2)$
- Expected improvement: $E(\max(y_{best} - Y(x), 0))$

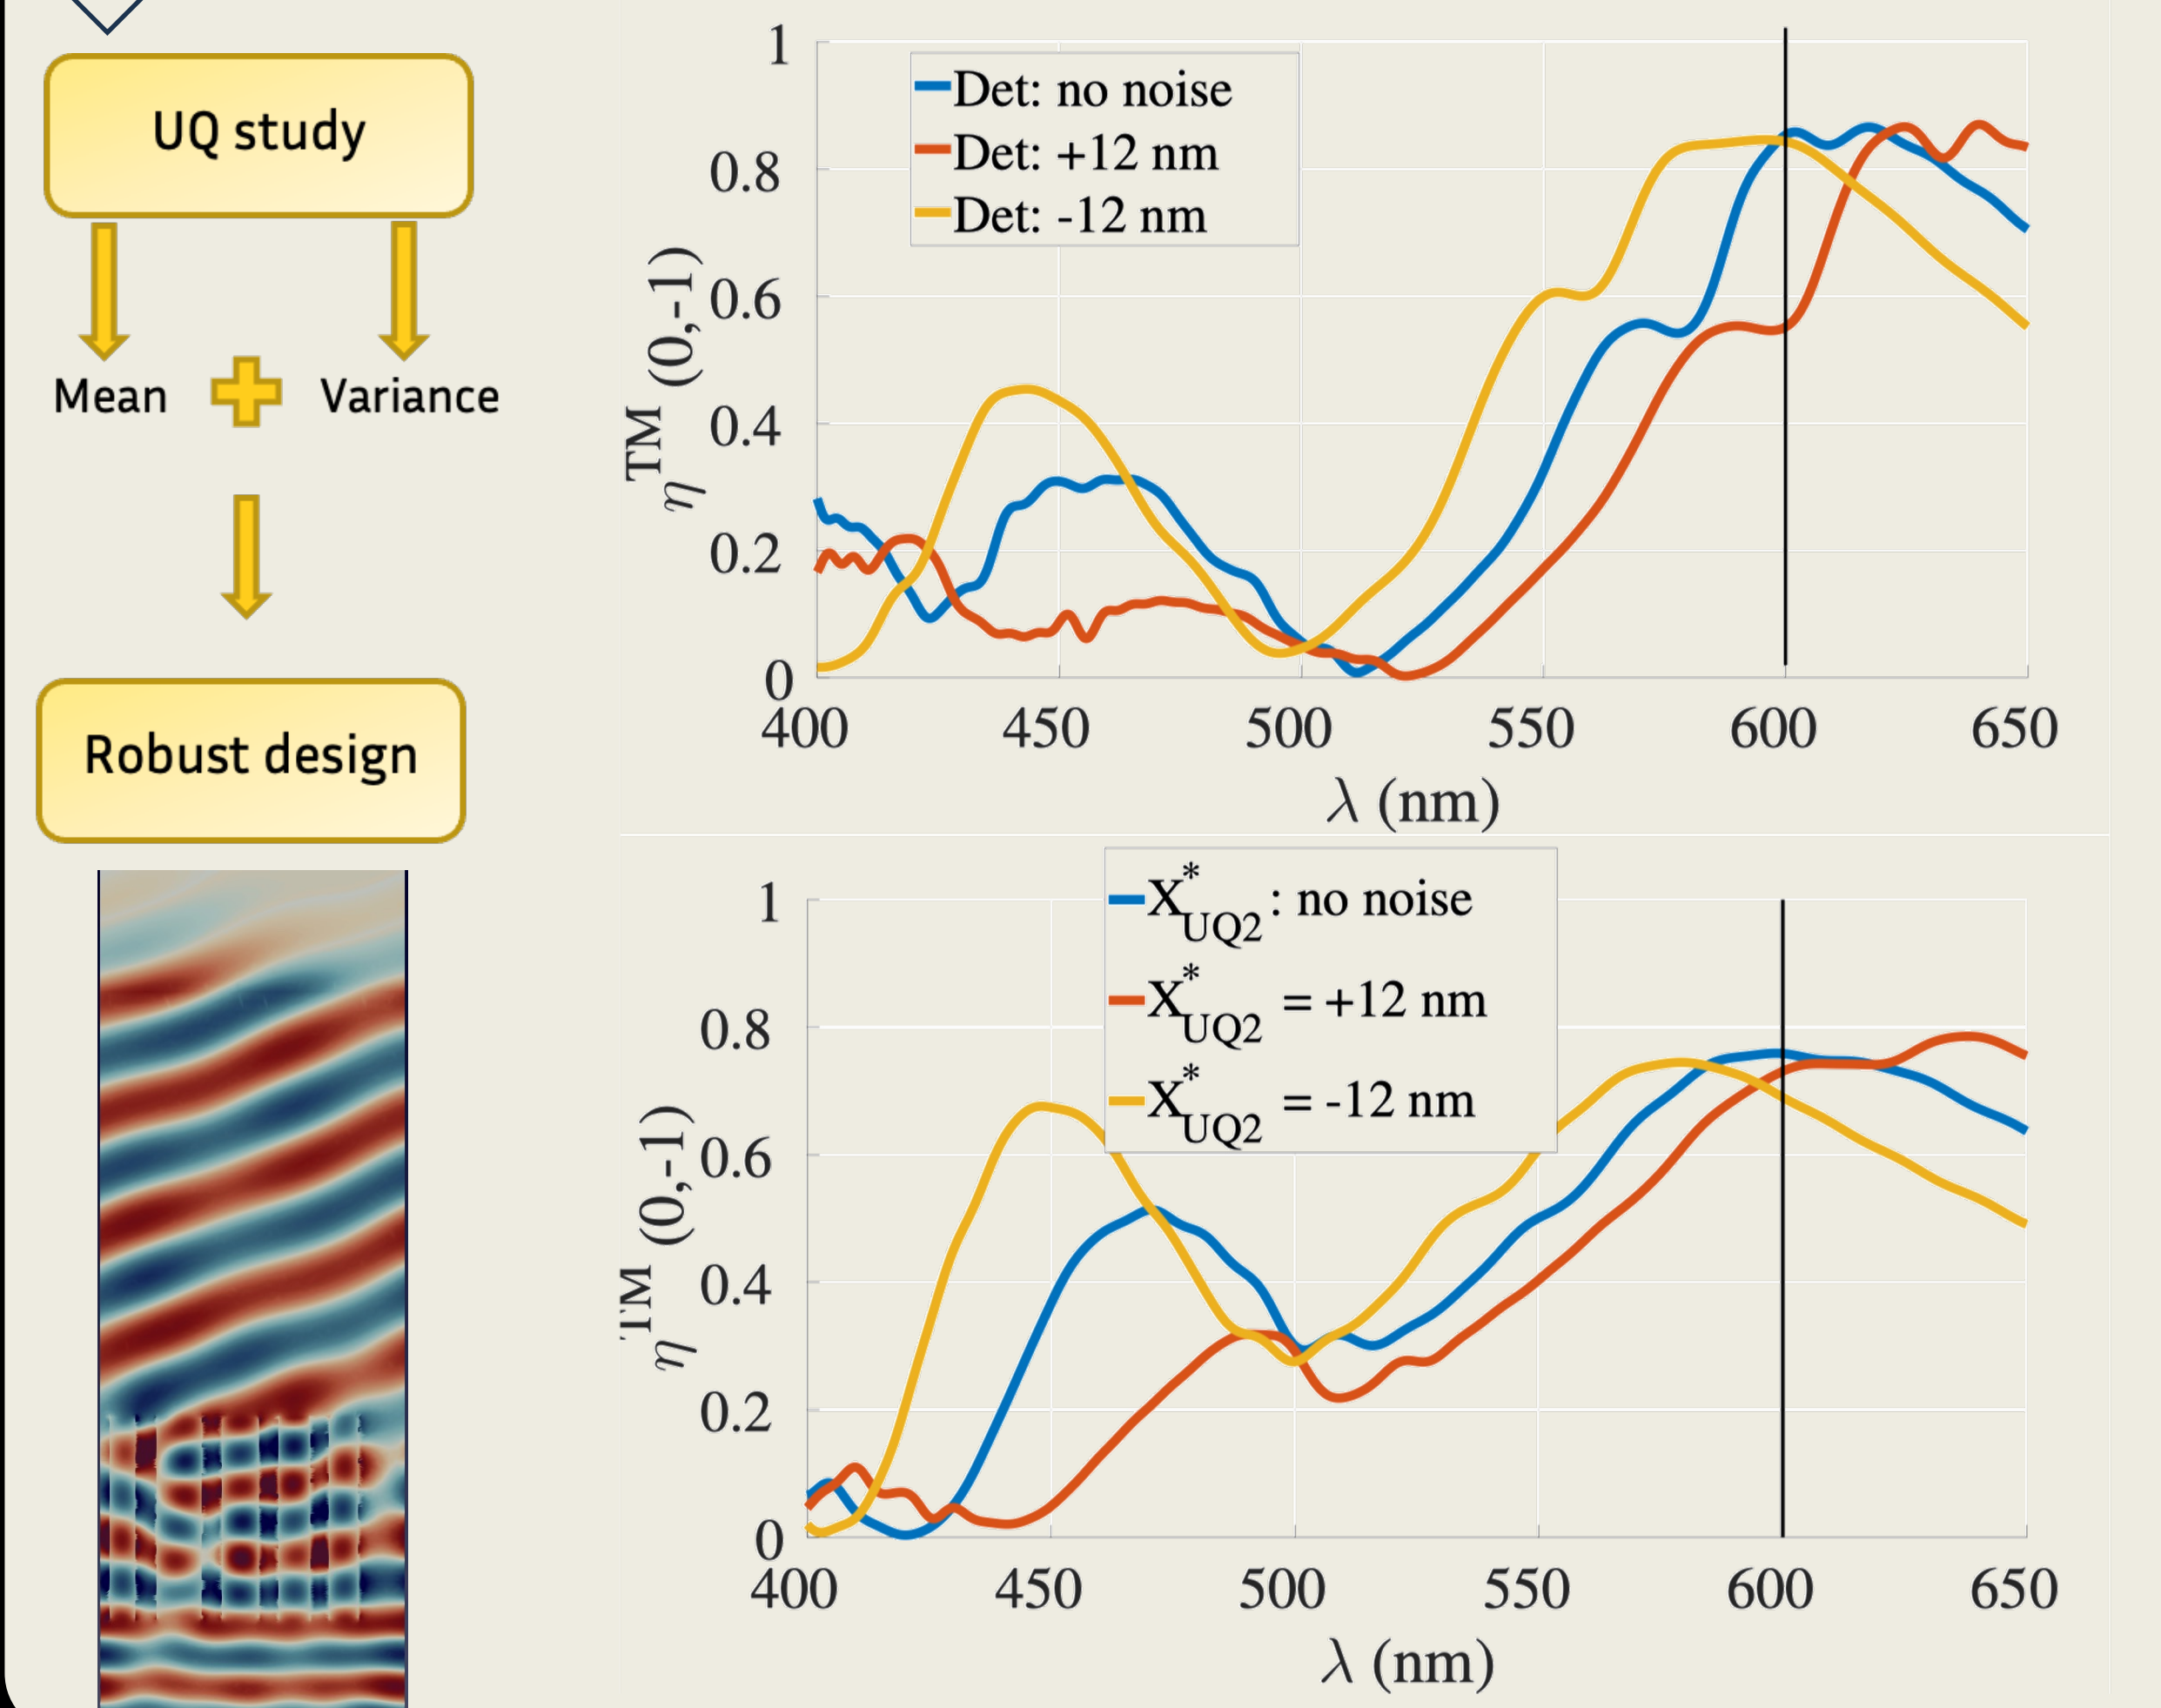

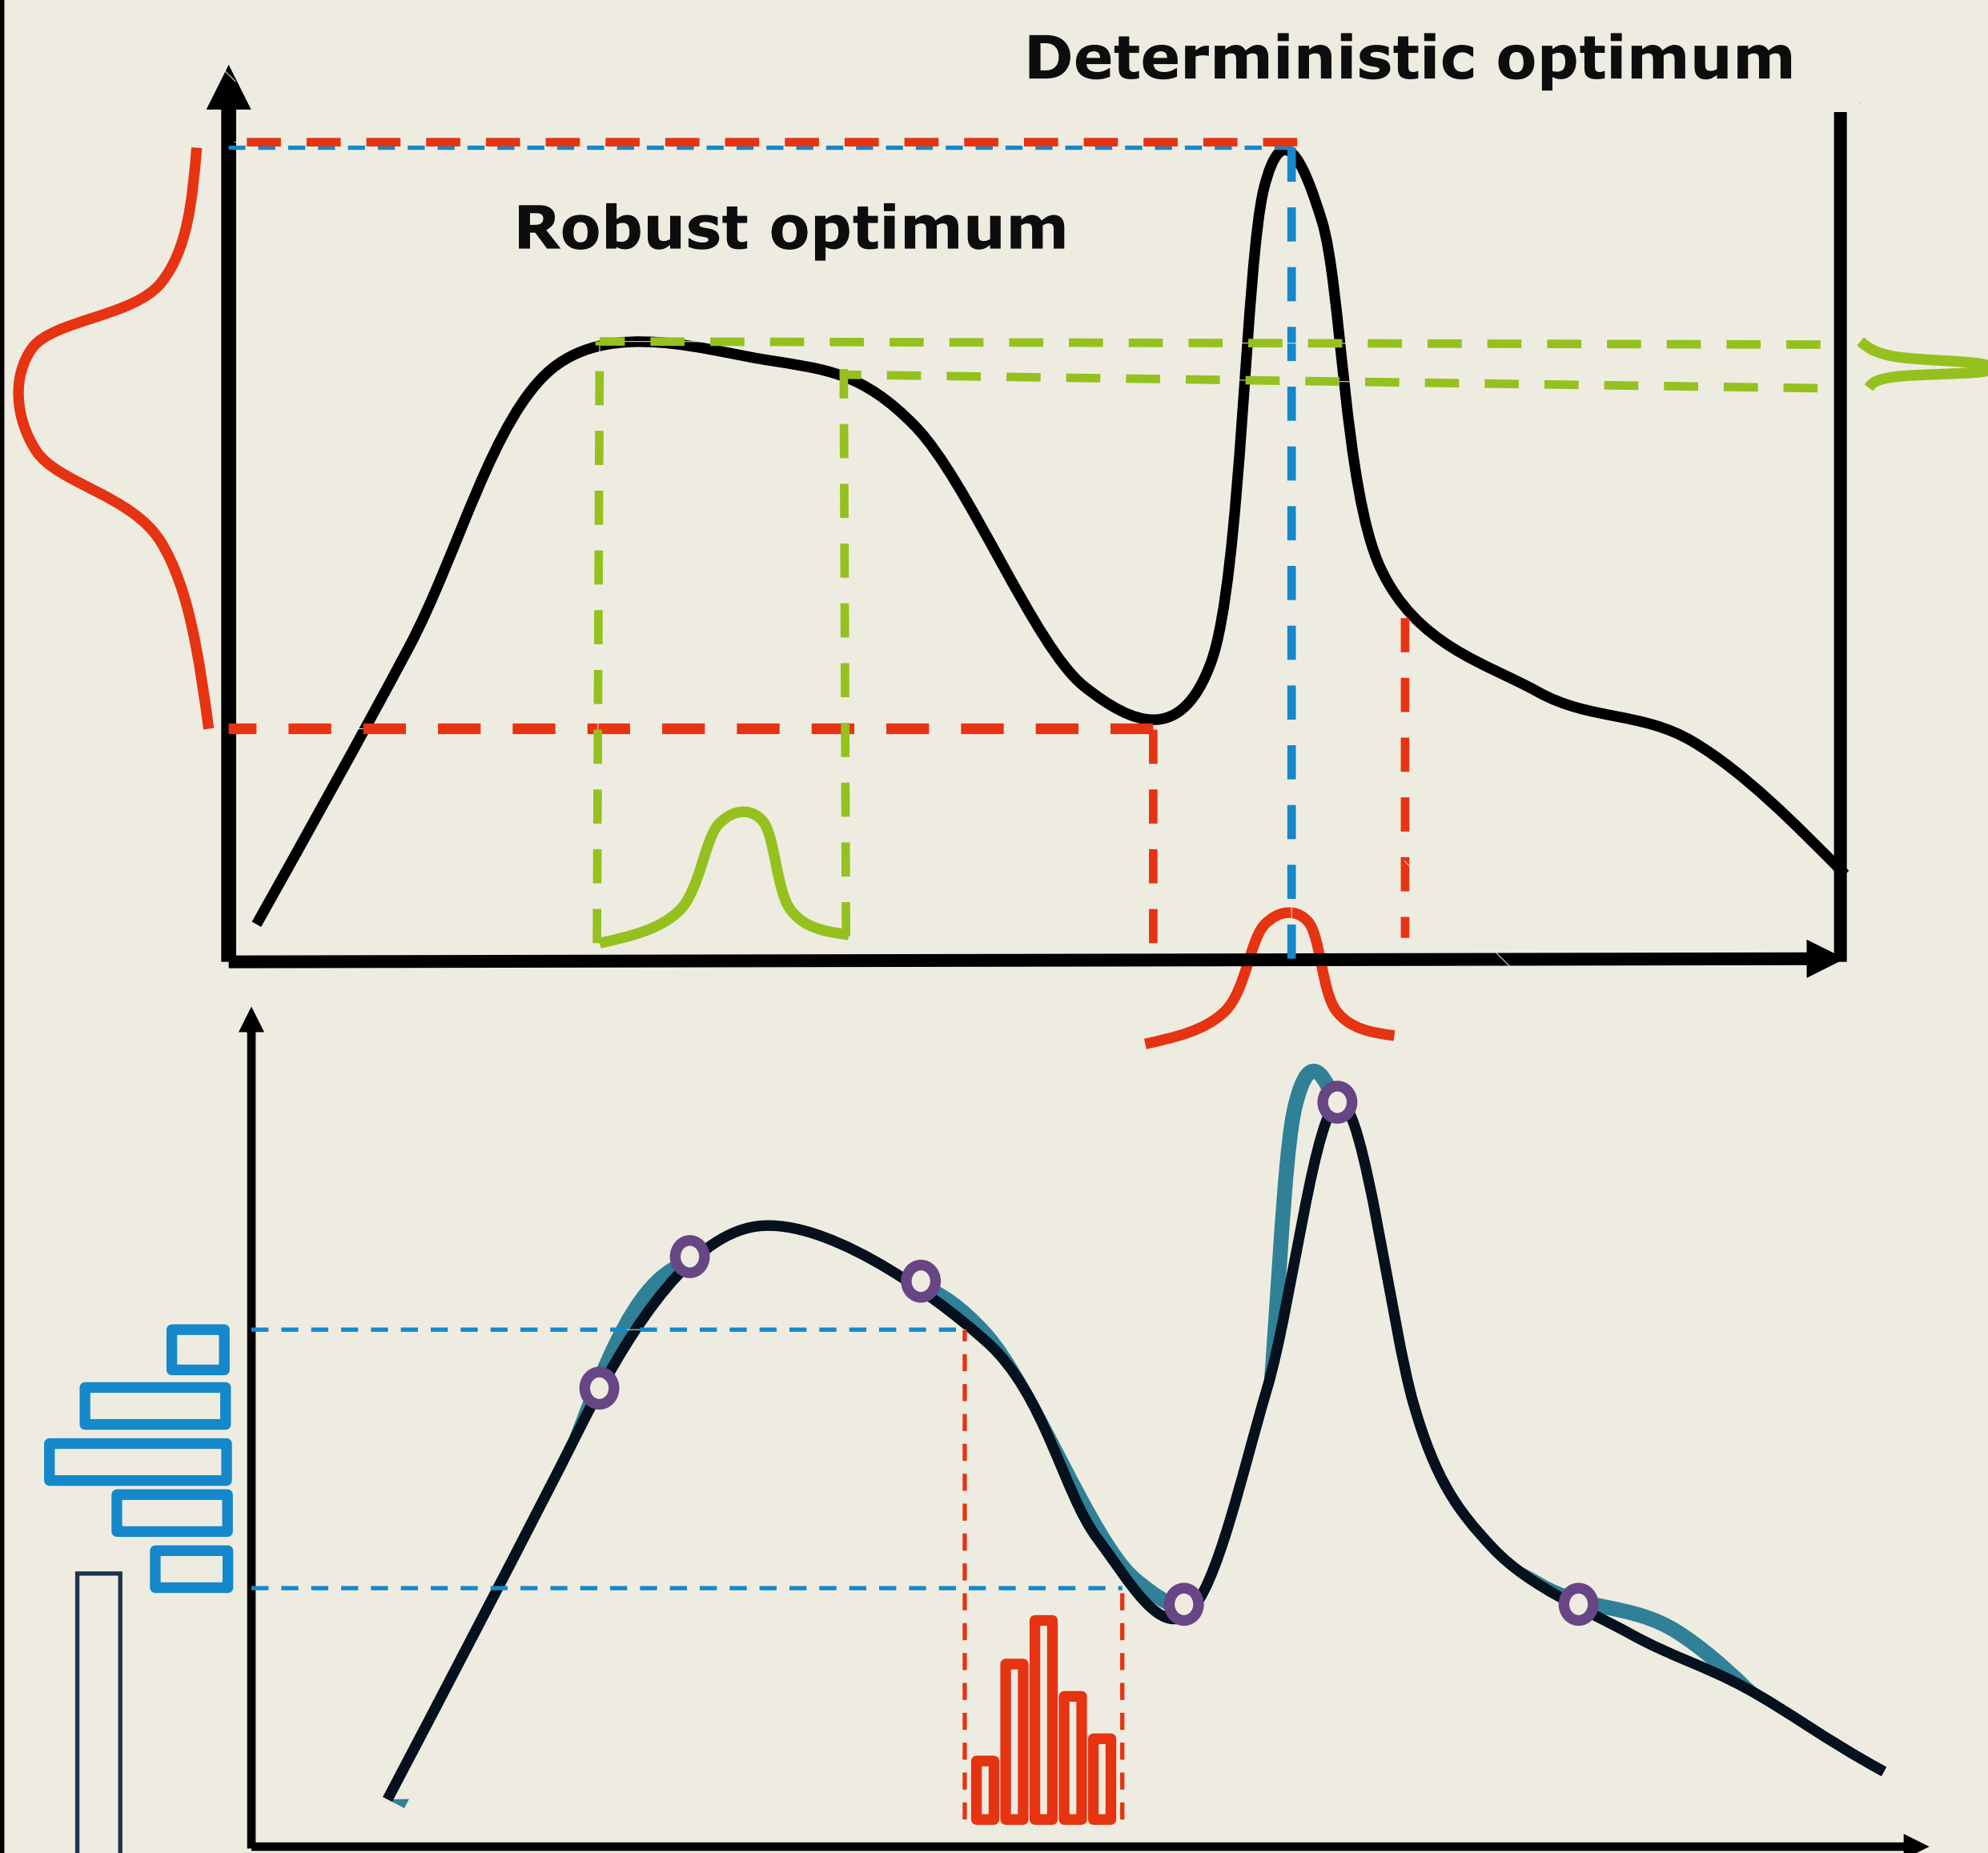

i) Nonlocal Huygens resonant metasurface

ii) Nonlocal Gires-Tournois resonant metasurface
