**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

# Ongoing developments at the Decay Data Evaluation Project

*S. Leblond*

# **1** ■ The Decay Data Project at LNHB

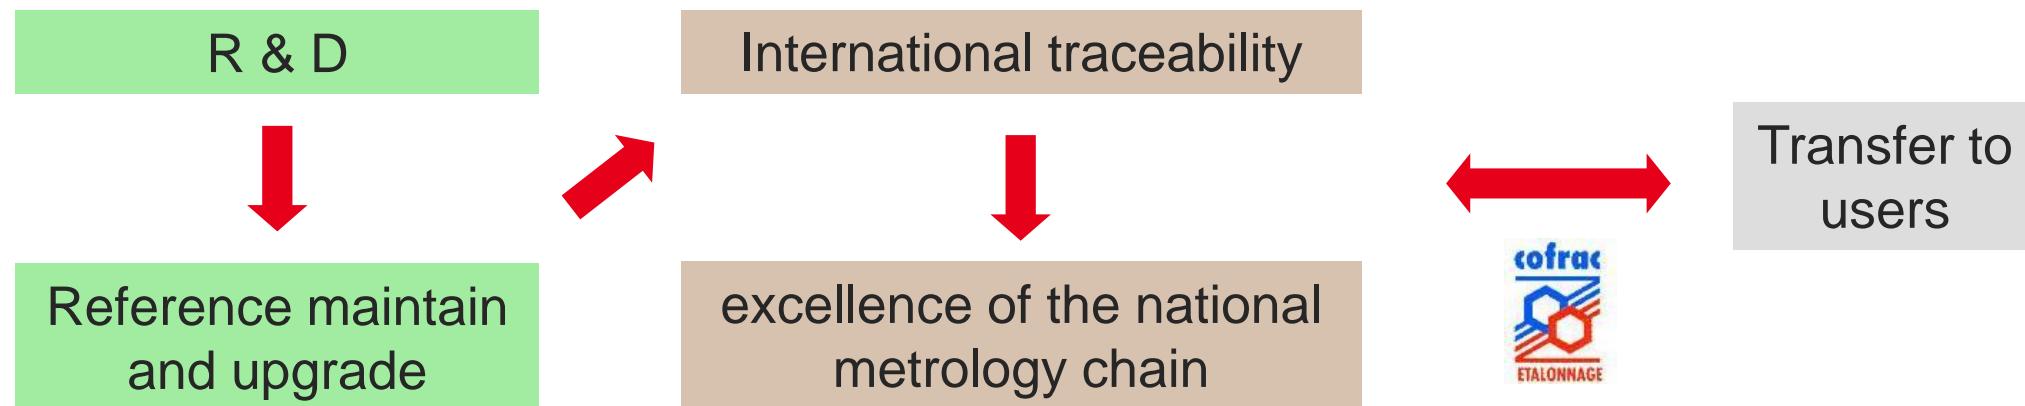

# Laboratoire National Henri Becquerel

- LNHB is the French national metrology laboratory for ionising radiation: radioactivity and dosimetry of photons and charged particles
- Provide metrological references to users through a strict traceability chain

LABORATOIRE NATIONAL  
DE MÉTROLOGIE ET D'ESSAIS

- Standards and measurements for:
  - Radiotherapy
  - Nuclear medicine
  - Diagnostics
  - Health protection
  - Nuclear industry
  - Environmental studies
- Defense
- Research

# At the origin of DDEP

- Within the metrology community, in the early 1990s, there was a specific need identified for evaluated decay scheme data for use in absolute activity measurements, including important atomic data, e.g. conversion electrons, X-rays, Auger-electrons.
- During international inter-comparison exercises, differences in recommended activity values were seen to be dependent upon the decay scheme data used.
- A group dedicated to decay scheme evaluation was formed in 1993 between LNHB (France) & PTB (Germany), quickly followed by USA and others in 1994
- Hence, the international DDEP group was established in 1995, in which a common evaluation methodology was defined and adopted, including a comprehensive review process.
- The Bureau International des Poids et Mesures (BIPM), which, through the Consultative Committee on Ionising Radiation, oversees the international metrology community inter-comparison exercises recommended that the DDEP evaluated decay scheme data should be used by all metrology institutes.

# At the origin of DDEP

- Within the metrology community, in the early 1990s, there was a specific need identified for evaluated decay scheme data for use in absolute activity measurements, including important atomic data, e.g. conversion factors.
- During initial discussions, it was decided that the data should be deposited in a central location.
- A group of experts from various countries (Germany, France, UK, USA, Canada) were appointed to develop the methodology.
- Hence, the Decay Data Evaluation Project (DDEP) was born, using a modular methodology.
- The Bureau International des Poids et Mesures (BIPM), which, through the Consultative Committee on Ionising Radiation, oversees the international metrology community inter-comparison exercises, recommended that the DDEP evaluated decay scheme data should be used by all metrology institutes.

**DDEP is complementary to ENSDF decay data**

# DDEP missions

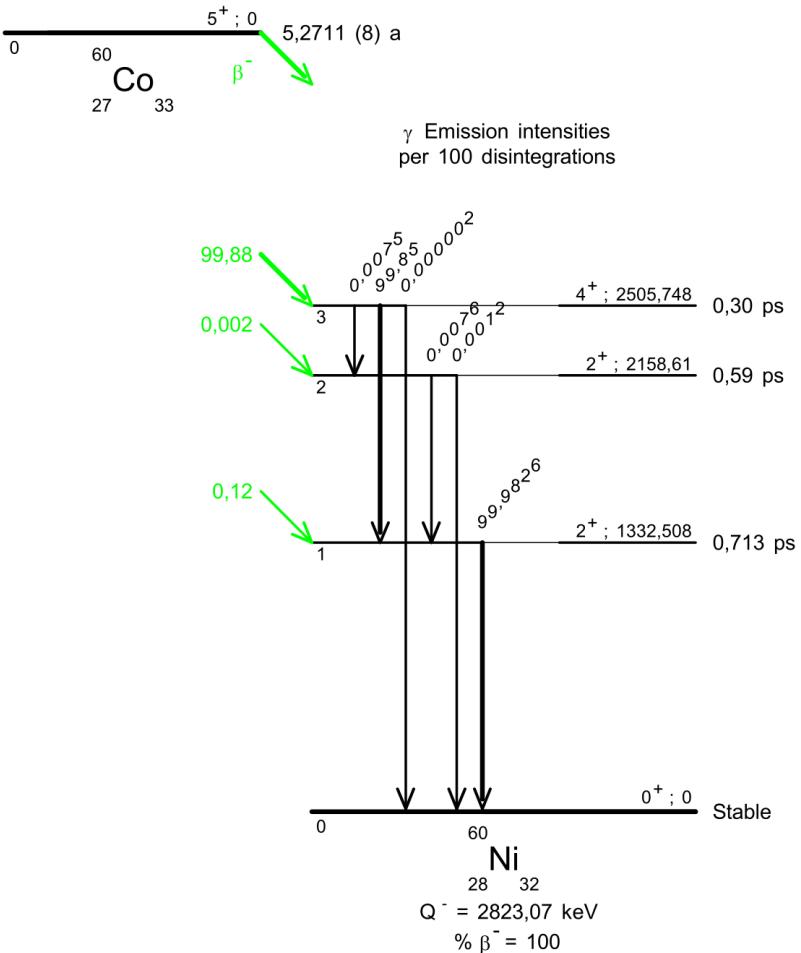

- Provide recommended decay data to non-specialists
  - Metrology
  - Fundamental physics (detector calibration)
  - Nuclear medicine
  - Nuclear industry

# DDEP missions

- Provide recommended decay data to non-specialists
    - Metrology
    - Fundamental physics (detector calibration)
    - Nuclear medicine
    - Nuclear industry
  - Main information of interest:
    - Half-life, Q-value
    - Decay scheme
    - Intensity and energies of
      - Alpha / beta / electron capture
      - Gamma and internal conversion
      - X-rays & Auger electrons

## Decay properties

## Emitted particles

# DDEP members

- DDEP Coordination: Xavier Mougeot
- LNHB Local team (evaluation, review, edition, publication)
  - Sylvain Leblond
  - Xavier Mougeot
  - Mark A. Kellett (Special advisor)
  - Christophe Dulieu (IT support)
- Decay data evaluators
  - Alan L. Nichols  
(Surrey University, UK)
  - Aurelian Luca  
(IFIN, Romania)
  - Brian E. Zimmerman  
(NIST, USA)
  - Rob Shearman  
(NPL, UK)
  - Xialong Huang  
(CIAE, China)
  - Nikolai Kuzmenko  
(KRI, Russia)
- Additional support
  - Tibor Kibédi (Brlcc and BrlccMixing codes)
  - Balraj Singh (ENSDF collaboration)

<sup>6</sup><sub>2</sub>He<sub>4</sub>

Comments on evaluation

<sup>6</sup>He - Comments on evaluation of decay data  
by X. Mougeot  
Université Paris-Saclay, CEA, List, Laboratoire National Henri Becquerel (LNE-LNHB),  
91120 Palaiseau, France

This evaluation was completed including the available literature by October 2022.  
The simplicity of the <sup>6</sup>He beta decay makes its spectrum shape a sensitive probe of the electroweak standard model, and of some of the possible new types of interaction beyond the standard model. Such analyses require a high-precision half-life, what motivates the most recent experiments.

The Limitation of Relative Statistical Weights Experimental Method (LWM) was applied to average the decay data when appropriate. All uncertainties are given as the combined uncertainty to one standard deviation.

**Comments on evaluation**

**${}^6\text{He}$  - Comments on evaluation of decay data**  
by X. Mougeot  
Université Paris-Saclay, CEA, List, Laboratoire National Henri Becquerel (LNE-LNHB), 91120 Palaiseau, France

This evaluation was completed including the available literature by October 2022.

The simplicity of the  ${}^6\text{He}$  beta decay makes its spectrum shape a sensitive probe of the electroweak standard model, and of some of the possible new types of interaction beyond the standard model. Such analyses require a high-precision half-life, what motivates the most recent experiments.

The Limitation of Relative Statistical Weights Experimental Method (LWM) was applied to average the decay data when appropriate. All uncertainties are given as the combined uncertainty to one standard deviation.

**1 Decay Scheme**

Nuclear structure pointwise,  ${}^6\text{He}$  nucleus is best described as a halo nucleus, with an alpha core and two neutrons. The  $0^+$  ground state of  ${}^6\text{He}$  decays to the  $1^+$  ground state of  ${}^6\text{Li}$  through an allowed, pure Gamow-Teller beta minus transition (100%). The spins and parities have been adopted from [2002T10].

The available energy for the decay is  $Q_0 = 3505.21$  (5) keV, which is the latest recommended value from the Atomic Mass Evaluation (AME) 2020 [2021WA16].

Only the first excited state of  ${}^6\text{Li}$  at 2186 (2) keV [2002T10] could be populated by this decay. However, this state is  $3^+$ , which would correspond to a second forbidden unique transition of a lower transition energy. The probability of such a transition compared to the allowed transition would be extremely low and has never been observed.

A very weak branch due to beta-delayed deuteron decay, i.e. the direct decay of  ${}^6\text{He}$  nucleus to unbound final state consisting in a deuteron and an alpha particle, was first observed in [1990R01] and was also reported in [2002AN06]. It has been studied both experimentally and theoretically since then (see e.g. [2018TU02] for a recent compilation of literature). The probability of this process is of about  $(2 \cdot 10^{-6})$ . It has been ignored in the present evaluation.

The decay scheme is thus considered as complete.

**2 Nuclear data**

**2.1 Half-life**

The  ${}^6\text{He}$  half-life has been intensively studied for more than 70 years. The list of published measurements is given in Table 1. The whole dataset is discrepant and this longstanding inconsistency has been discussed in the literature. Two high-precision measurements have been performed in the last 10 years that definitely solve this discrepancy.

# Decay data for Monte-Carlo

- Monte-Carlo simulations
  - Rely on many databases
  - Strongly dependent on the quality of the latter
  - Need for a complete inclusion of DDEP data
- PENELOPE
  - PENNuc module
- GEANT4
  - Nuclide++ module

Computer Physics Communications 245 (2019) 106849

Contents lists available at [ScienceDirect](#)

# 3 ■ Ongoing developments

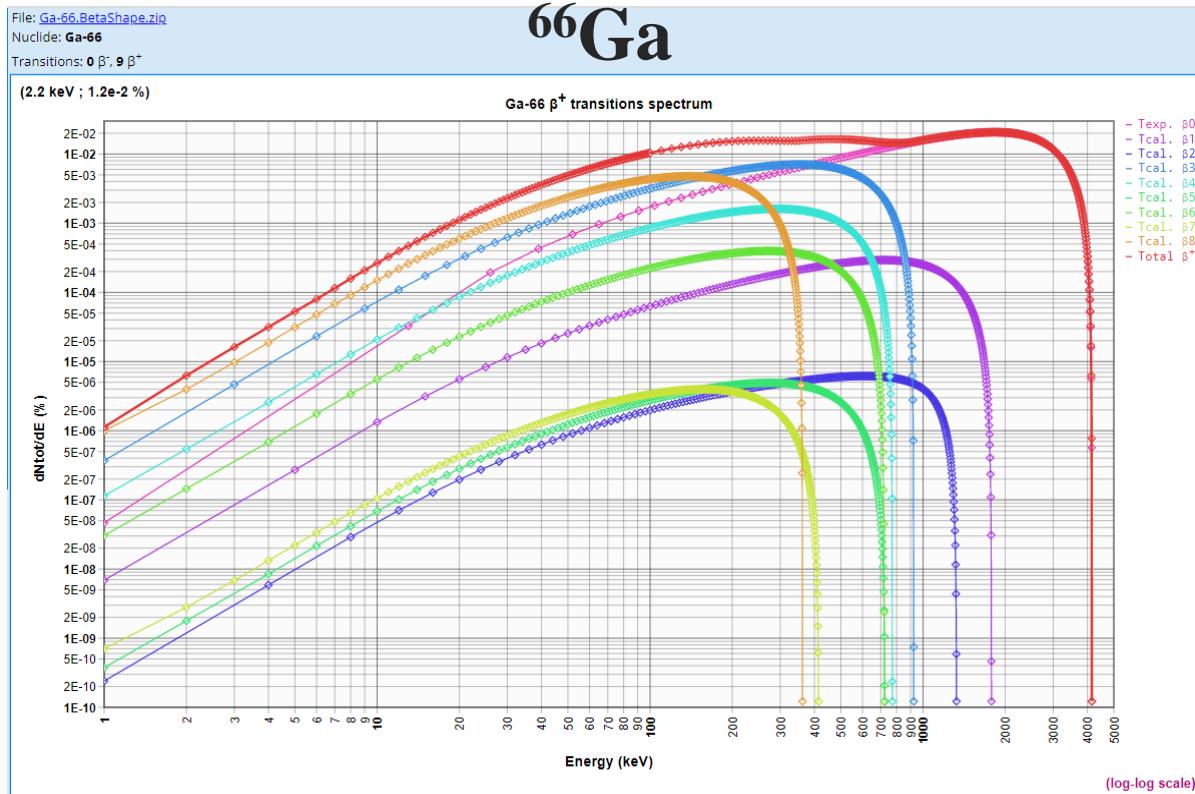

# Laraweb continuous development

- Decay chain tools
  - Parent / Daughters activity calculation
  - Calculation of radiation emission intensities
  - Decay chains visualisation (in process)
- BetaShape on the web (released recently)

[http://www.lnhb.fr/Laraweb/BetaShape\\_web/](http://www.lnhb.fr/Laraweb/BetaShape_web/)

- Any suggestion?
  - Contact: [Christophe.DULIEU@cea.fr](mailto:Christophe.DULIEU@cea.fr)

# Increasing the number of evaluators

- DDEP workforce remains limited
  - 7<sup>th</sup> to 9<sup>th</sup> of March 2022: Organisation of a DDEP workshop dedicated to evaluator training
    - Vanessa VALLET  
(CEA Cadarache)
    - David BERNARD  
(CEA Cadarache)
    - Muriel FALLOT  
(SUBATECH)
    - Amanda PORTA  
(SUBATECH)
    - Lydie GIOT  
(SUBATECH)
    - Alejandro ALGORA  
(Instituto de Física Corpuscular)
    - Philippe CASSETTE  
(Sofia University)

# Increasing the number of evaluators

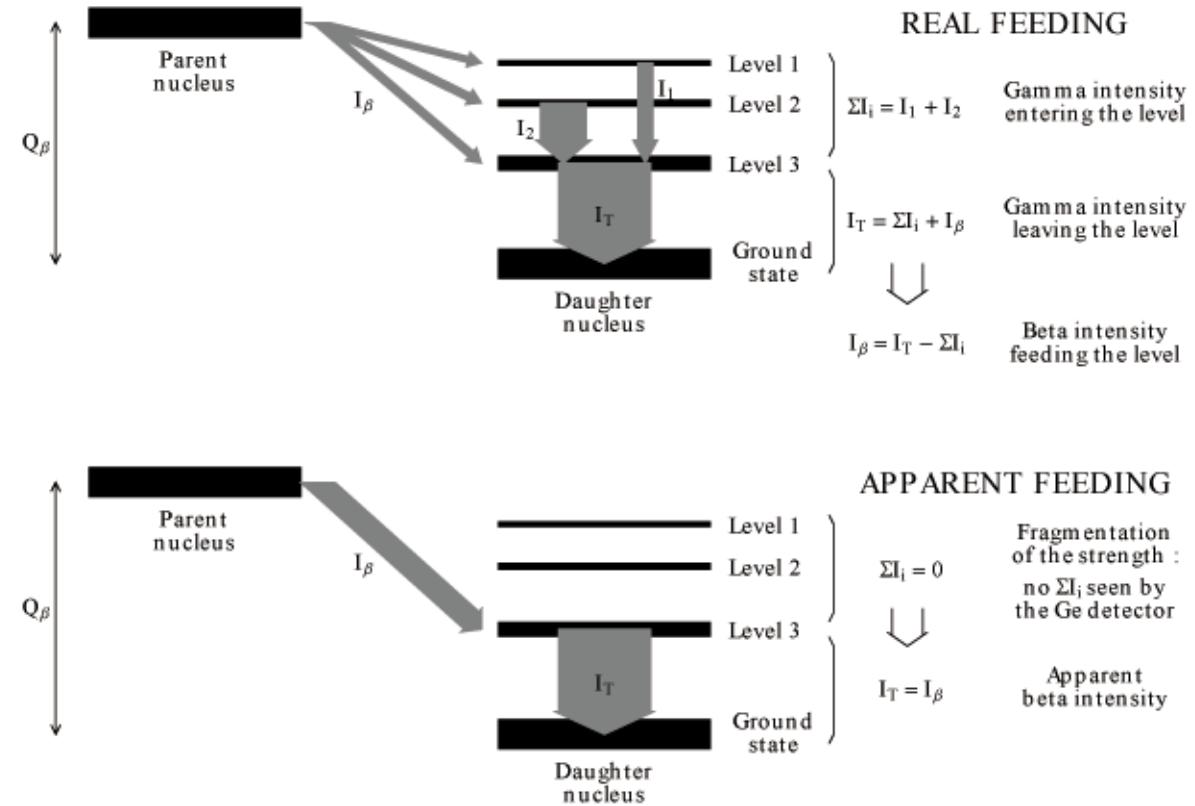

## Enroll today !

orkshop dedicated to evaluator training

# TAGS measurements

- Pandemonium effect
  - First discover by J. Hardy in 1977
  - Lead to inaccurate estimation of beta feeding
  
- TAGS measurements
  - Gamma calorimeters
  - New level scheme including pseudo levels
  
- Inclusion of TAGS data in DDEP
  - Discussions with TAGS community
  - Procedure to be defined
  - Requires support and expertise

# JEFF 4

- Historical link between DDEP and the JEFF database
  - Inclusion of DDEP decay data in JEFF 3.3 by M.A. Kellett

Eur. Phys. J. A (2020) 56:181  
<https://doi.org/10.1140/epja/s10050-020-00141-9>

Yu. Konobeyev<sup>16</sup>, S. Kopecky<sup>1</sup>,

- Possible involvement of DDEP in JEFF 4
  - Update of the decay data library
  - Addition of the BetaShape calculations
    - Beta decay electrons spectra
    - Antineutrino spectra
    - LogFT value
- Limited by available manpower

# 4 Conclusion

# DDEP project at LNHB

- Evaluations of decay data
  - Since 1993
  - For non-specialist
- Recommendations available
  - Online on LNHB website
  - Through LNHB web tool
  - For Monte-Carlo simulation
- On-going evolutions
  - Software & website
  - Recruitment of new evaluators
  - Inclusion of TAGS data ?
  - Update of JEFF 4?

This [introduction](#) presents a brief description of the radioactivity physical processes, the enumeration of the evaluation rules leading to the recommended values, and a summary of the symbols and terms used in all the publications.

Explanation on recommended data and their evaluation (in various languages):

# Decay overview of $^{137}\text{Cs}$

- A  $\beta^-$  decay to  $^{137}\text{Ba}$ 
  - Populates ground & excited states
  - Half-life around 30 years
  - Total Q-value close to 1176 keV
- Emissions
  - Two main  $\beta^-$  branches
    - Ground state      ( $E_{\max} \sim 1176 \text{ keV}$ )
    - Second excited state      ( $E_{\max} \sim 514 \text{ keV}$ )
  - Iconic 662 keV gamma

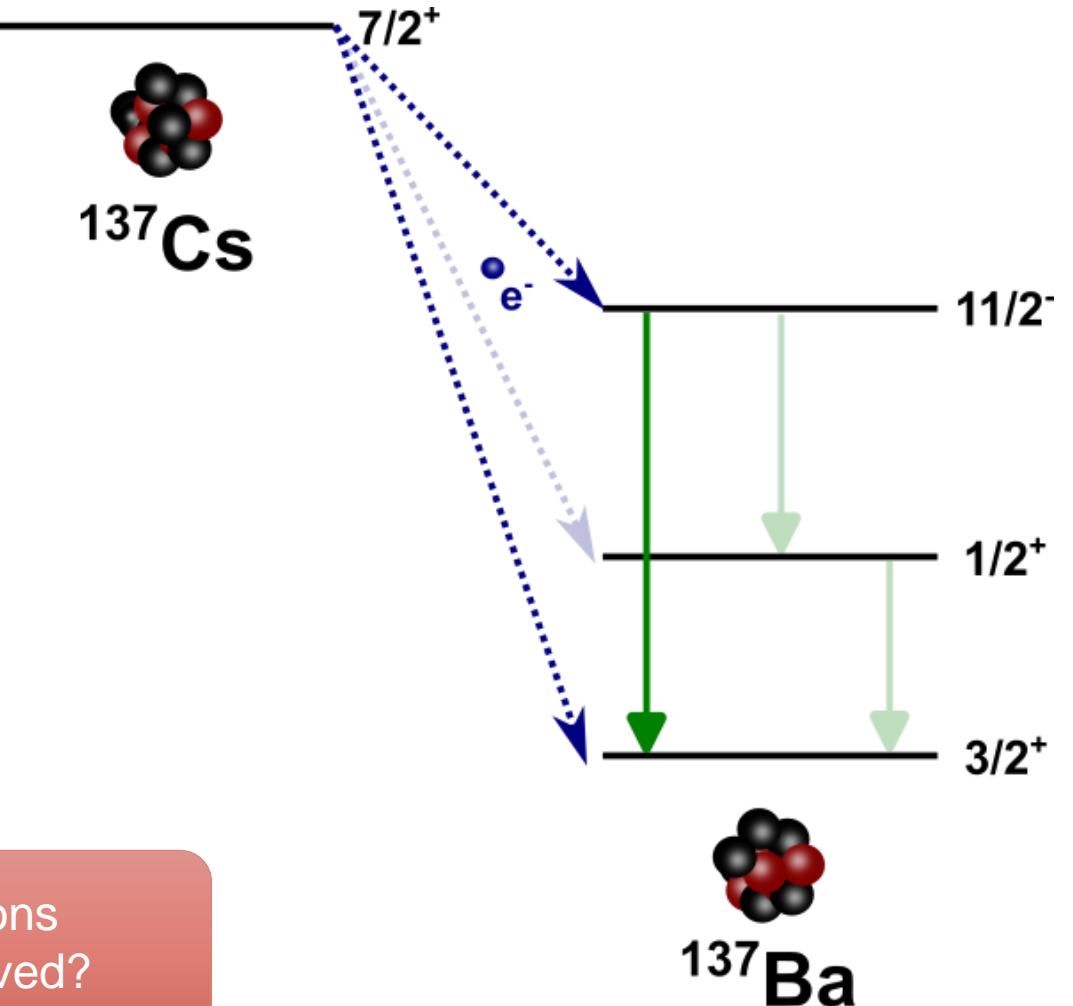

Surely decay data are well known...

# Decay data status

- Latest  $^{137}\text{Cs}$  decay data evaluations
  - DDEP
    - R.G. Helmer and V.P. Chechev (2006)
  - ENSDF
    - E. Browne and J.K. Tuli (2007)

	DDEP	ENSDF
$T_{1/2}$ (y)	30.05 (8)	30.08 (9)

New publications  
Can it be improved?

# Half-life of $^{137}\text{Cs}$ : overview

- Abundant bibliography
  - More than 75 publications
  - From 1948 to 2016
  - Different experimental methods
  - Many languages
- How to select a meaningful dataset?

**NATURE** April 3, 1948 Vol. 161

DECAY HALF-LIFE OF  $\text{Cs}^{137}$

M. P. Glazunov, A. I. Grivkova, B. A. Zaitsev, and V. A. Kiselev

Translated from Atomnaya Energiya, Vol. 10, No. 6, pp. 622-623, June 1961

Original article submitted January 9, 1961

R. NEWBERRY  
E. WILLSHAW

In  $\text{U}^{232}$  fission the groups have a similar shape to those for  $\text{U}^{235}$  but are one unit lower on the mass scale. The maxima of the fission-yield curves are approximately the same in all cases, being approximately  $6 \times 10^{-2}$ . A detailed account of the investigation is to be published.

    - Behrens *et al.* (1983)      NPL       ~~$I_{\gamma} = 85.21 (7) \%$~~
  
- Consistent dataset but an issue with *Behrens et al.*
  - Estimated using magnetic spectrometer
  - Usage of discrepant  $\alpha_T$  conversion coefficient
  - Replaced by Goodier *et al.* (1975)       $I_{\gamma} = 86 (1) \%$

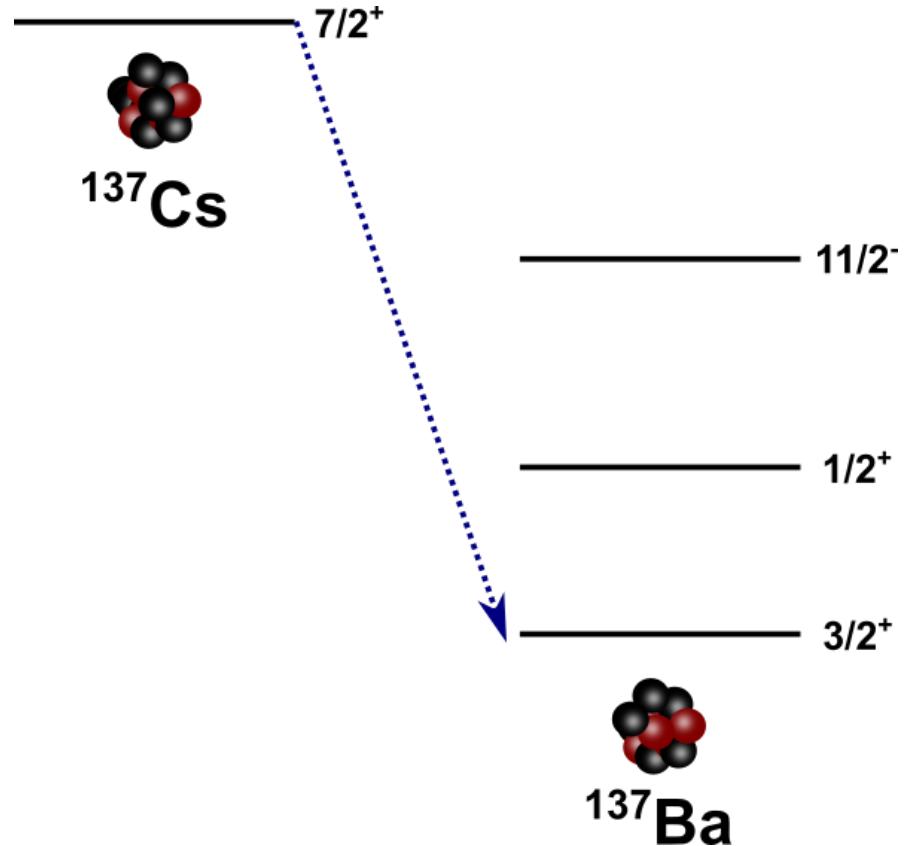

# Intensity of the 662 keV gamma emission

- A limited dataset
  - Only six publication (from 1965 to 1983)
  - Three remains after applying DDEP criteria
    - Legrand et al. (1973) CEA  $I_\gamma = 85.3(3)\%$
    - Merritt et al. (1978) CRNL  $I_\gamma = 84.7(7)\%$
    - Behrens et al. (1983) NPL  ~~$I_\gamma = 85.21(7)\%$~~
- Consistent dataset but an issue with *Behrens et al.*
  - Estimated using magnetic spectrometer
  - Usage of discrepant  $\alpha_T$  conversion coefficient
  - Replaced by Goodier et al. (1975)  $I_\gamma = 86(1)\%$
- Weighted mean  $I_\gamma = 85.26(30)\%$ 
  - Weight of Legrand et al. 78 %

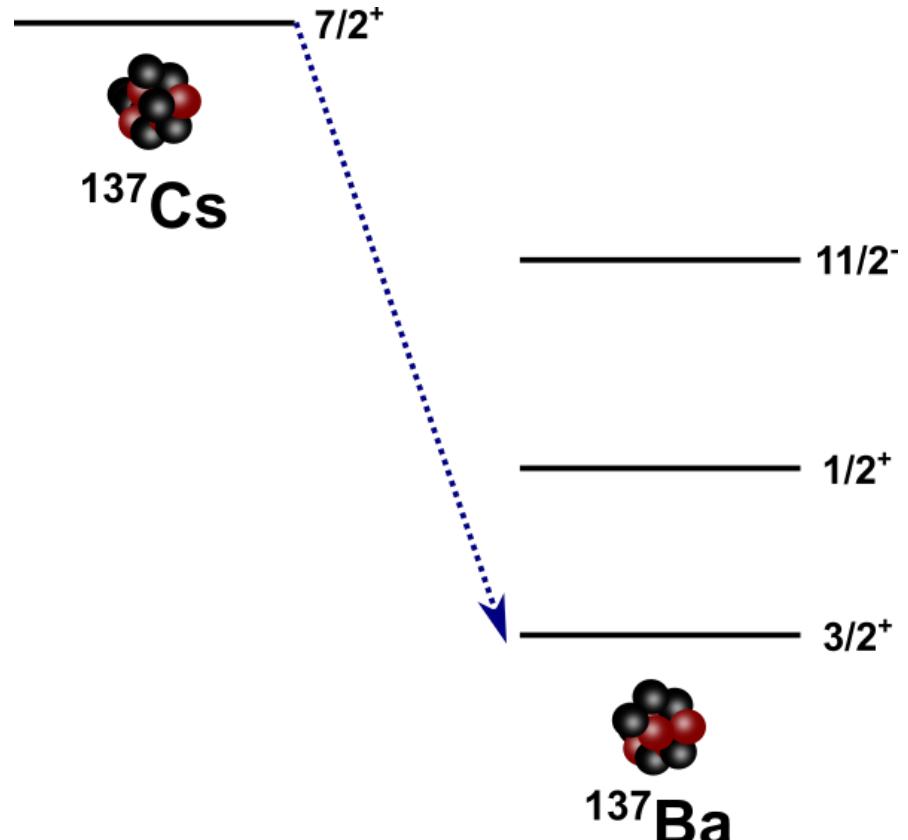

# Intensity of the beta to ground state transition

- Another limited dataset
  - Only six publications (from 1957 to 1983)
  - Four of them are discarded after analysis
  - Only two measurements available
    - Hansen et al. (1969)      CBNM       $I_\beta = 5.4 (3) \%$
    - Behrens et al. (1983)      NPL       $I_\beta = 5.57 (7) \%$

# Intensity of the beta to ground state transition

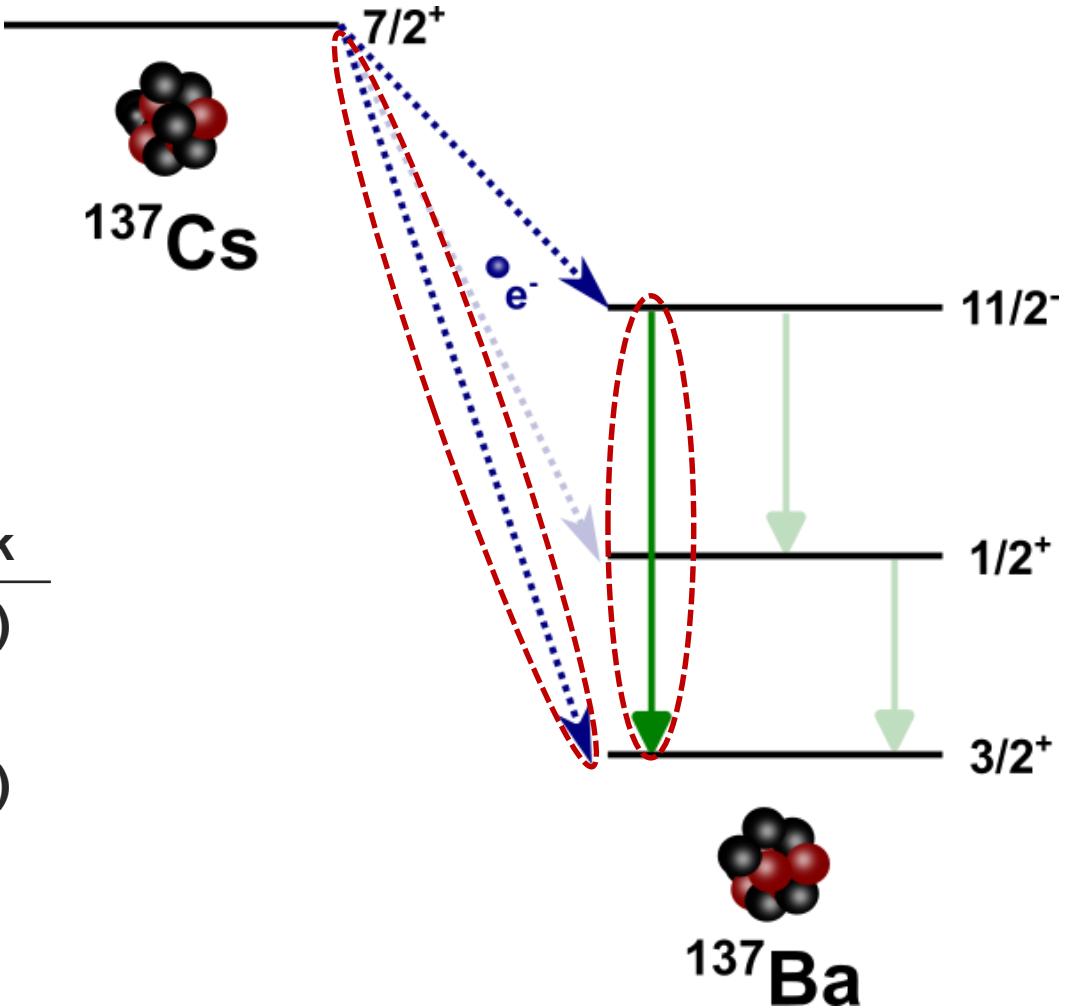

- Another limited dataset
    - Only six publications (from 1957 to 1983)
    - Four of them are discarded after analysis
    - Only two measurements available
      - *Hansen et al.* (1969) CBNM  $I_\beta = 5.4 (3) \%$
      - *Behrens et al.* (1983) NPL  $I_\beta = 5.57 (7) \%$
  - Question regarding the measurement of *Behrens et al.*
    - Inaccurate measurement of  $\alpha_T$  conversion coefficient
    - Limitation of weight of *Behrens et al.* to 50 %
      - *Behrens et al.* (1983) NPL  $I_\beta = 5.57 (30) \%$
  - Average  $I_\beta = 5.48 (30) \%$

# Decay scheme reconstruction

- Two main possibilities
  - From 662 keV gamma intensity
    - $I_\gamma = 85.26 \text{ (30) } \%$
  - From the beta decay to the ground state of  $^{137}\text{Ba}$ 
    - $I_\beta = 5.48 \text{ (30) } \%$  corresponds to  $I_\gamma = 84.97 \text{ (29) } \%$
  - Final recommendation: weighted average of both

	DDEP	ENSDF	This work
$I_\beta(11/2^-) \text{ (%)}$	94.36 (28)	94.7 (2)	<b>94.65 (30)</b>
$I_\beta(3/2^+) \text{ (%)}$	5.64 (28)	5.3 (2)	<b>5.35 (30)</b>
$I_\gamma \text{ (%)}$	84.99 (20)	85.1 (2)	<b>85.09 (29)</b>

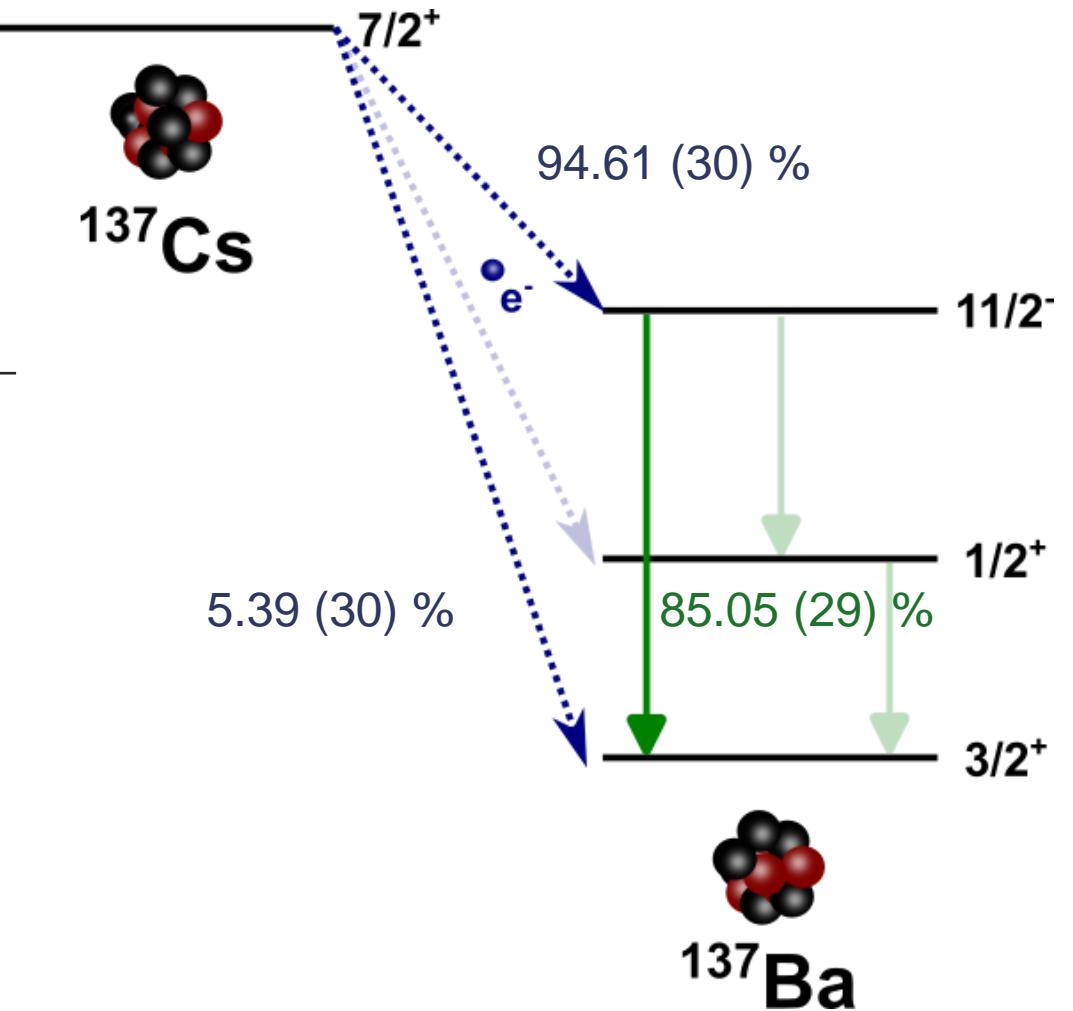

# Conclusions & outlooks

$T_{1/2} = 30.018 \text{ (22) a}$

- A new evaluation of  $^{137}\text{Cs}$  has been performed
- Recommendations are consistent with previous evaluations

	DDEP	ENSDF	This work

Analysis of datasets has shown the need for additional measurements for both half-life and transition intensities
