HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

DROP MEDUSA

A quest to explore vibration-induced bursting

High amplitude acceleration at a frequency of 1040 Hz drives chaotic waves on a drop in zero gravity. We showcase the rich physics of a water drop bursting under radial vibrations using direct numerical simulations. The chaotic superposition of waves leads to craters of negative curvature that create localized jets. These complex jets and craters resemble the hair of the Greek goddess, Medusa, hence called, the *Drop Medusa*.

We invite the viewer to observe drop bursting at different angles to observe the analogies to numerous classical fluid-dynamical configurations: Rayleigh capillary pinch-off, Worthington jet formation and breakup.
