HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Influence of structural distortions on the optoelectronic properties of 2D multilayered perovskites : a DFT study

Used alone or associated with a 3D structure in a 2D/3D heterojunction, two-dimensional (2D) halide perovskites have recently emerged as a game changer in the field of perovskites solar cells thanks to their excellent optoelectronic properties combined with an enhanced material stability^{1,2}. Hence, we propose to explore the optoelectronic properties of various perovskites that could be used in 2D-3D multidimensional solar cells or LEDs. In particular, series of 2D Ruddlesden-popper perovskites will be explored as well as its intriguing methylhydrazinium 3D perovskite counterpart, CH₃NH₂NH₂PbBr₃³. Here, experimental and density functional theory (DFT) results, suggesting a substantial influence of polar distortions and long range incommensurate lattice instability on the electronic properties of this class of material⁴⁻⁶, will be described.

This work was supported within the framework of the Israeli-French scientific cooperation (Joint Research Projects 2019-2021 entitled: ALLPOA (From Atomic Level to layered Perovskite for Optoelectronic Applications)) by the Ministry of Science & Technology of the State of Israel (MOST) and France's Centre National de la Recherche Scientifique (CNRS).
