## INTRODUCTION:

Bioengineering of adeno-associated viral (AAV) vectors is a pivotal strategy for developing next-generation gene therapies for human disorders. In the present study, we assessed the efficacy of two novel AAV vectors, AAVMYO2 and AAVMYO3, which are composed of hybrid capsids and a small VP1 peptide insertion, in a mouse model of myotubular myopathy, a fatal pediatric disease affecting skeletal muscles that is caused by loss-of-function mutations in the MTM1 gene.

## METHODS:

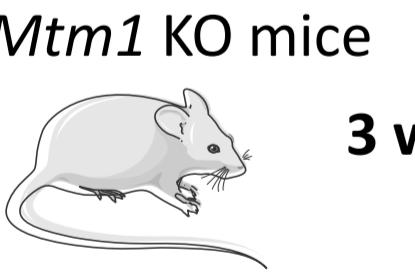

### Transgene:

### Dose-response:

1<sup>e</sup>14 vg/Kg  
2<sup>e</sup>13 vg/Kg  
4<sup>e</sup>12 vg/Kg

3 weeks      6 weeks      15 weeks

IV Injection

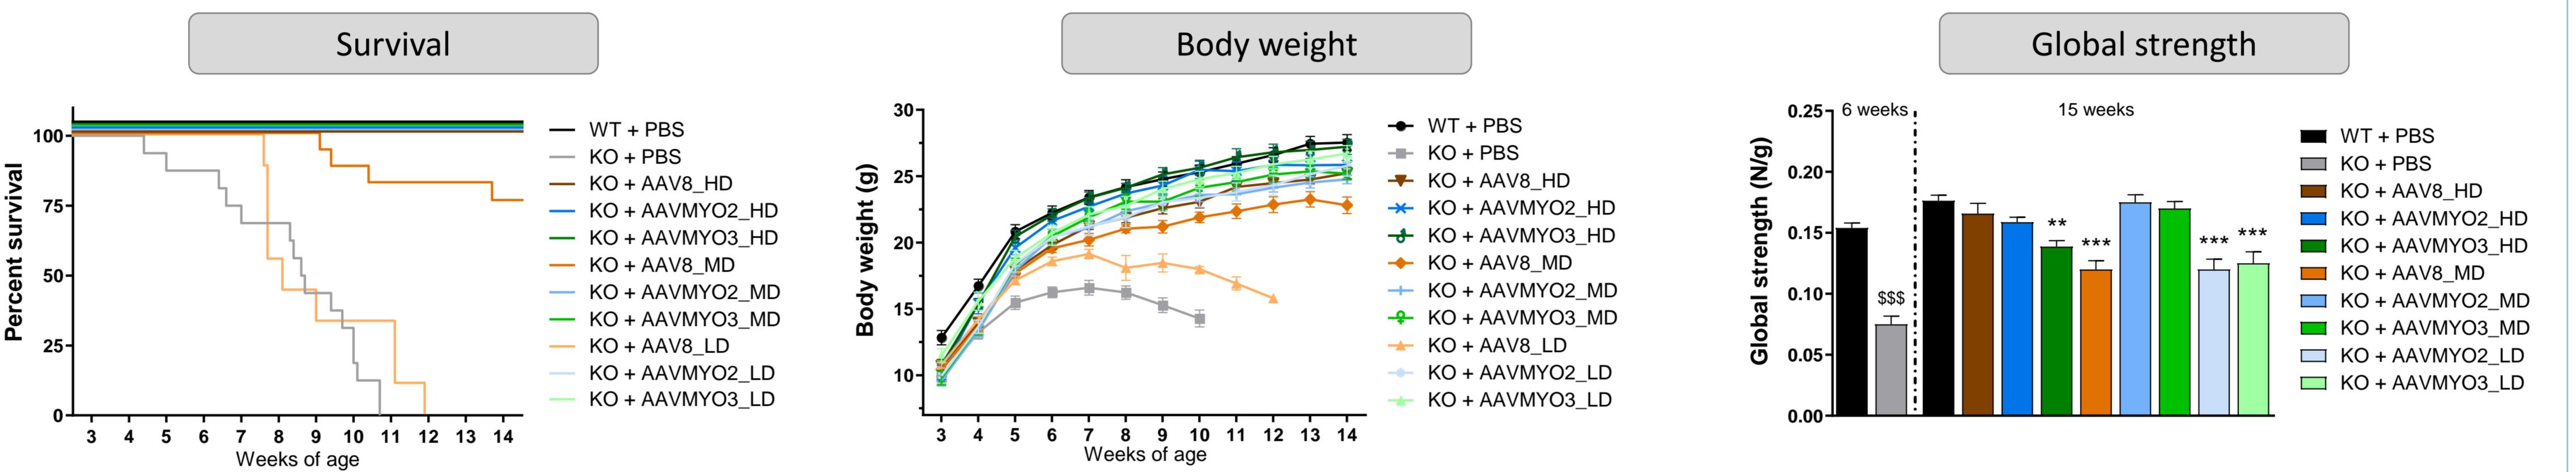

WT/KO  
Functional analysis

Functional analysis and tissue harvesting

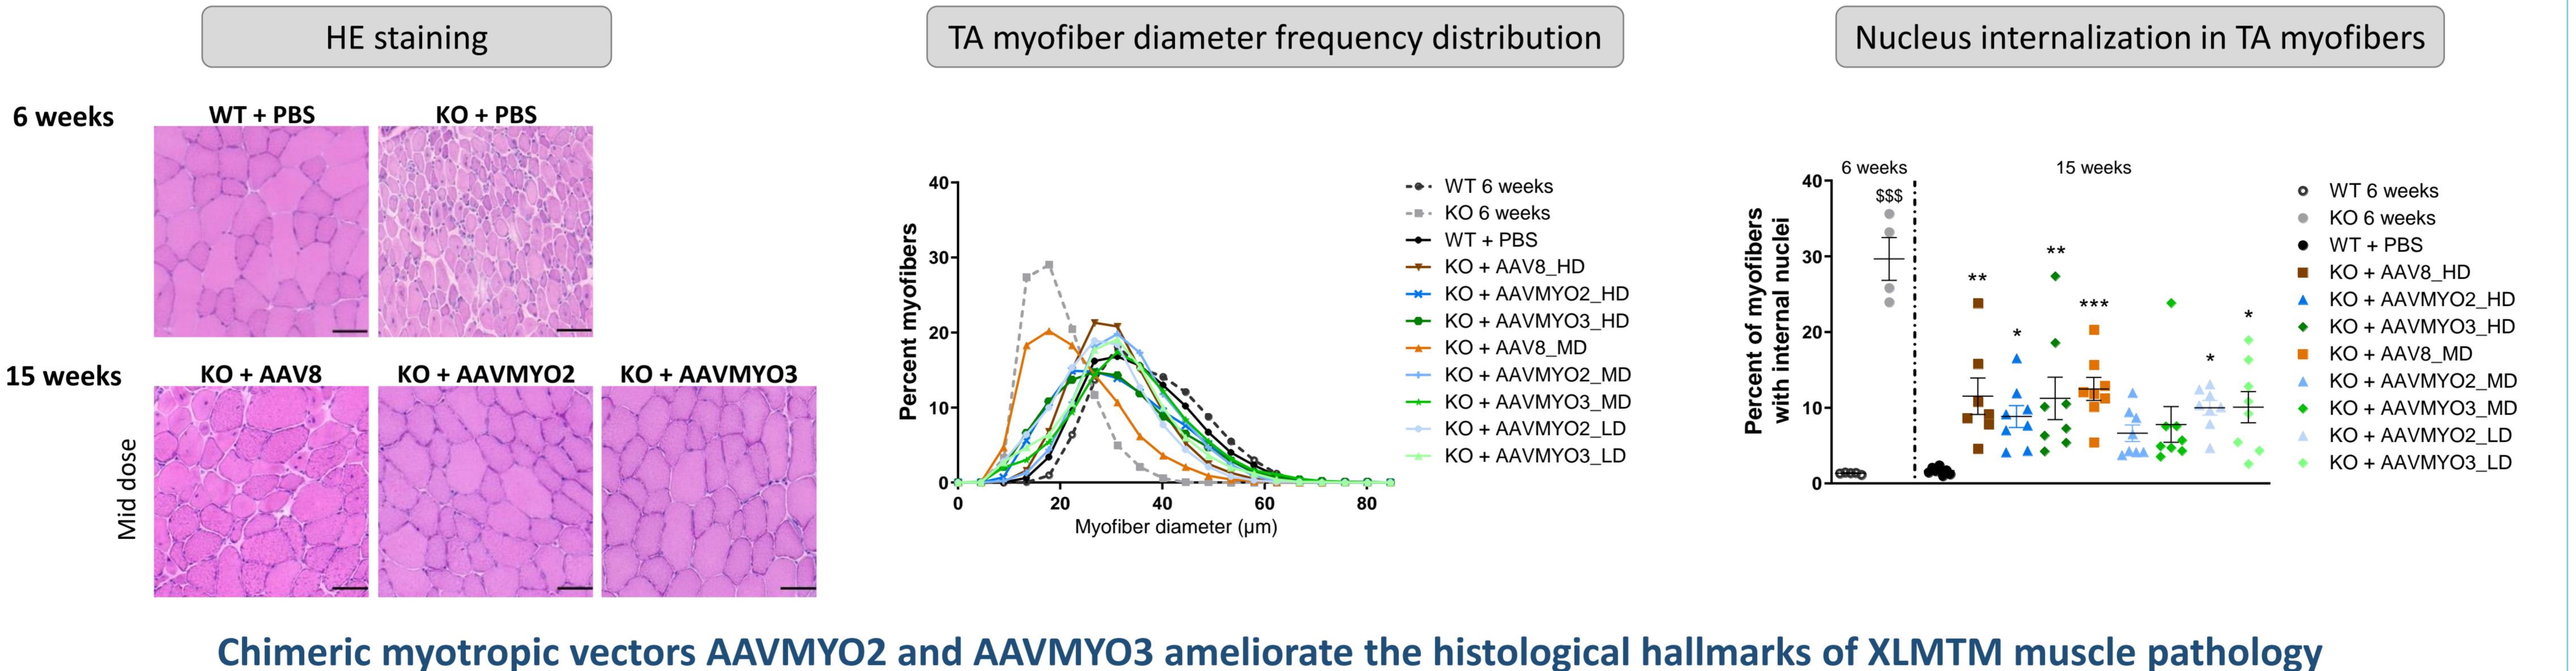

MYOCURE has received funding from the European Union's Horizon 2020 research and innovation programme under Grant Agreement number 667751

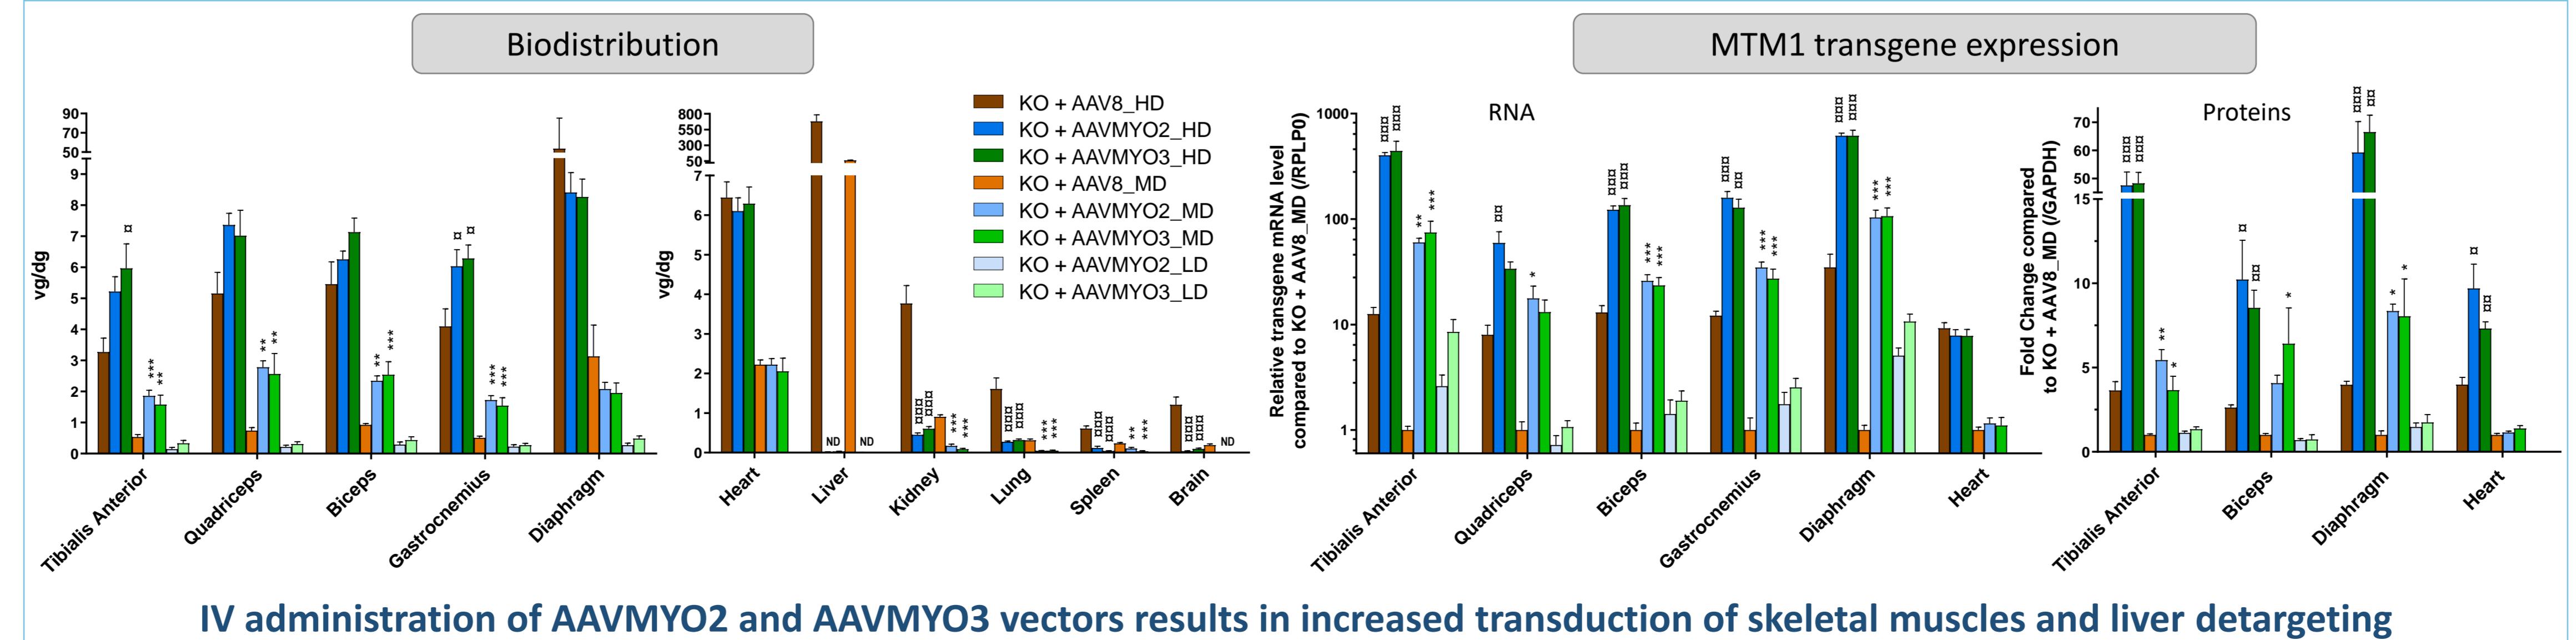

## RESULTS - Gene therapy of myotubular myopathy:

Intravenous administration of AAVMYO2- or AAVMYO3-MTM1 vectors prolongs lifespan and increases body weight and strength of *Mtm1*-KO mice

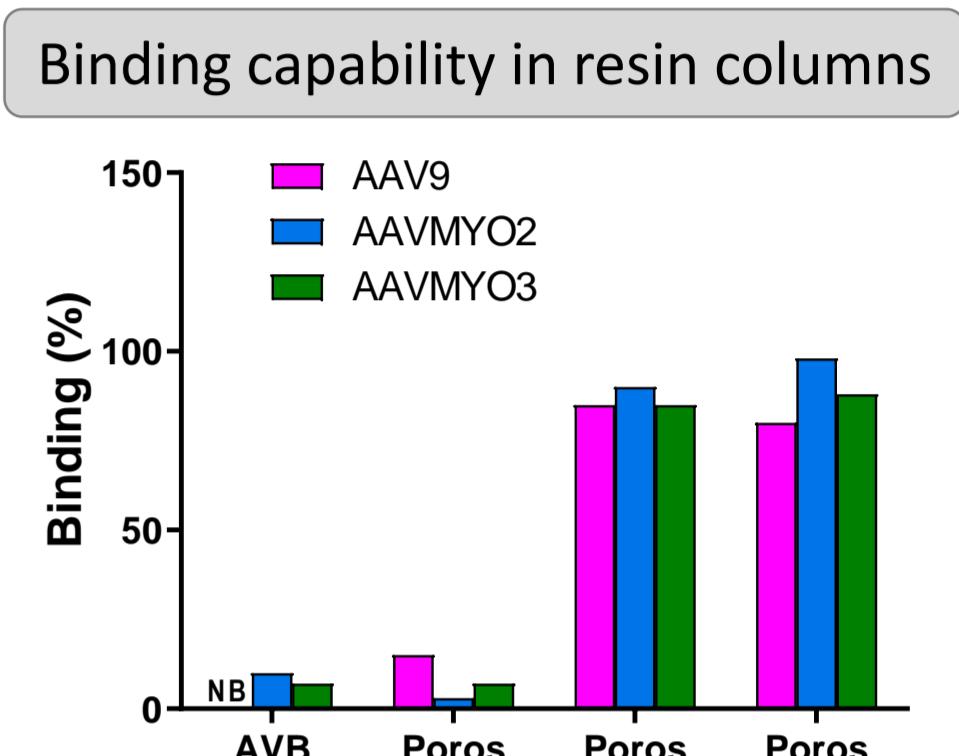

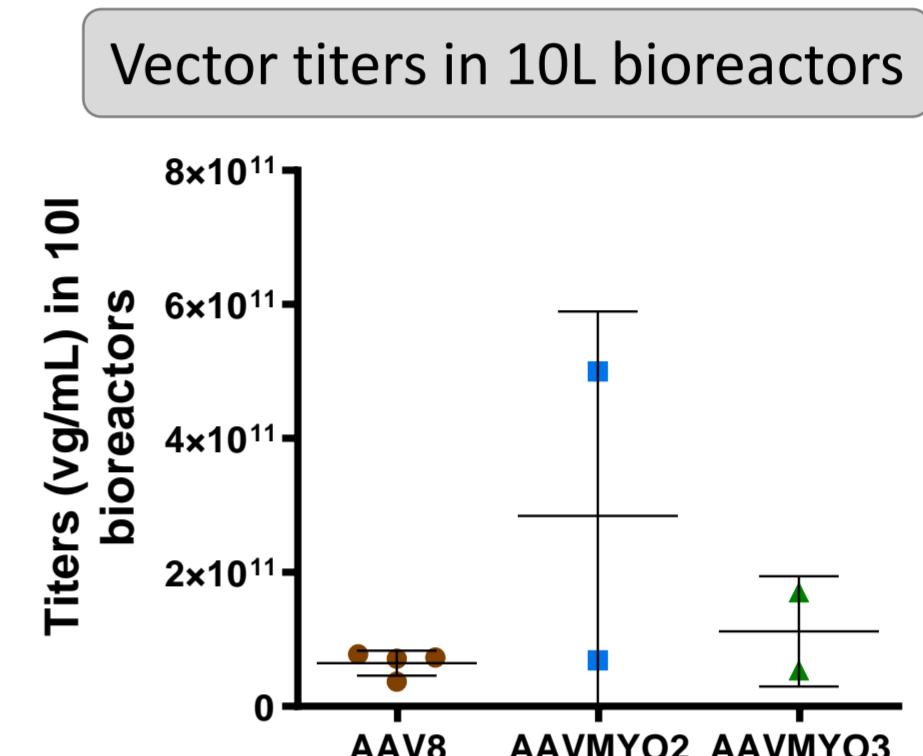

Chimeric myotropic vectors AAVMYO2 and AAVMYO3 ameliorate the histological hallmarks of XLMTM muscle pathology

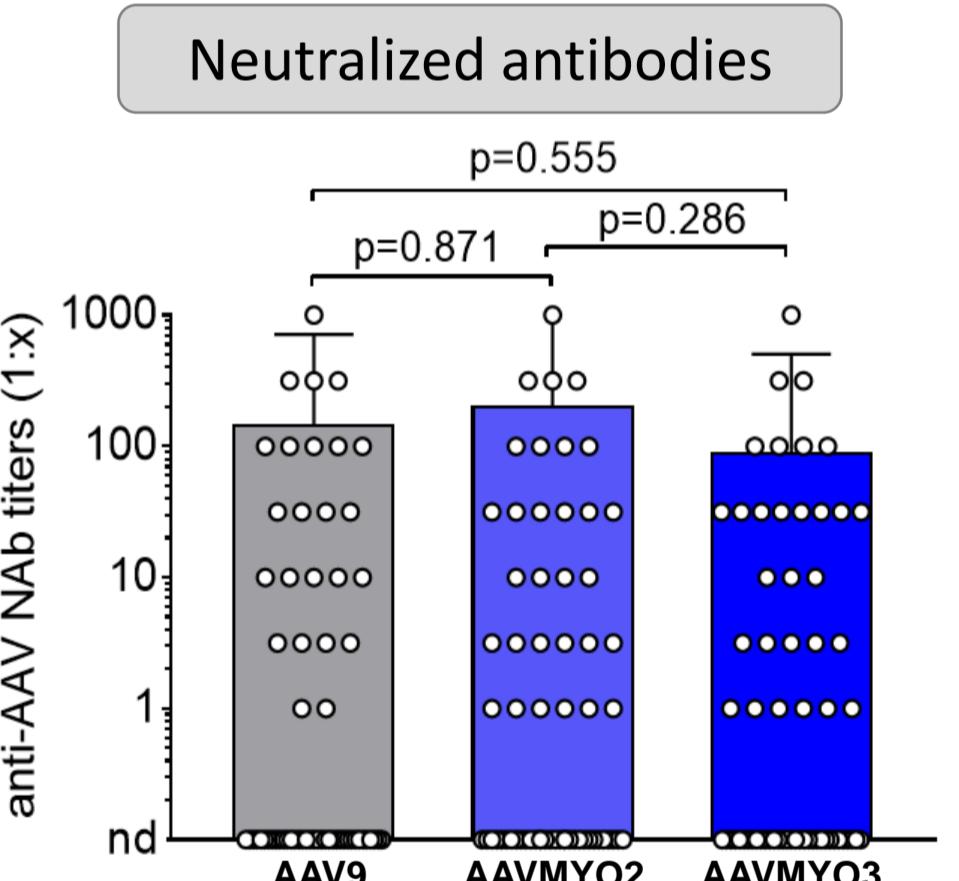

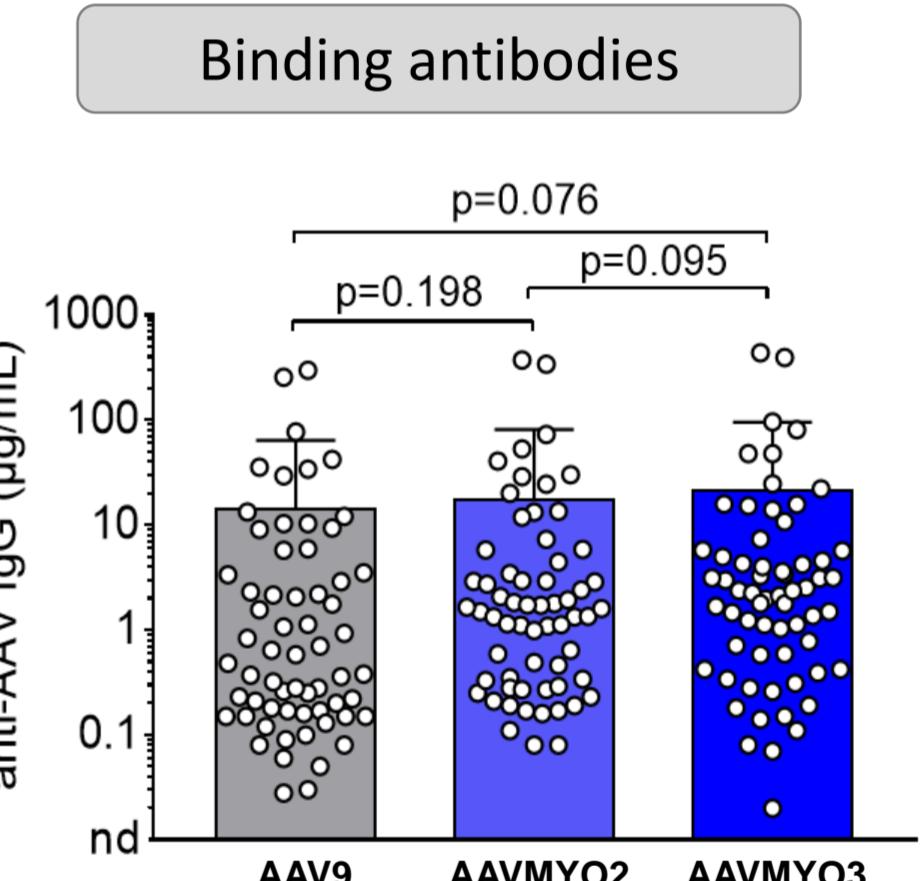

IV administration of AAVMYO2 and AAVMYO3 vectors results in increased transduction of skeletal muscles and liver detargeting

## RESULTS - AAV production:

Efficient large-scale production and purification of chimeric AAVs

## RESULTS – AAV seroprevalence:

The serologic profile of the new capsid variants is equivalent to AAV9 and compatible with clinical translation

## CONCLUSIONS:

- Intravenous administration of either AAVMYO2- or AAVMYO3-MTM1 vectors at 2x10<sup>13</sup> vg/kg in *Mtm1*-KO mice prolonged their lifespan and resulted in increased muscle mass and strength, and in liver transduction detargeting.
- We show efficient large-scale production and purification of AAVMYO2 and AAVMYO3, and data on their seroprevalence in a cohort of human sera.
- Our findings indicate that these novel vectors are potent in rescuing the phenotype of myotubular myopathy in mice, and hold great potential for gene therapy of other inherited disorders affecting skeletal muscles.
