HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

In vivo and in vitro pinnatoxins A and G reversibly block transmission at the skeletal neuromuscular junction.

The dinoflagellate *Vulcanodinium rugosum*, first isolated from Ingril, a French Mediterranean lagoon, is known to produce the pinnatoxins (PnTXs) and the portimines. PnTXs (A-H) constitute an emerging family of phycotoxins belonging to the cyclic imine group. Interest has been focused on these fast-acting highly-potent toxins because they are widely found in contaminated shellfish. Despite their highly complex molecular structure, PnTXs have been chemically synthesized by the Zakarian's group, and demonstrated to act on various nicotinic acetylcholine receptors (nAChRs). To the best of our knowledge, neither PnTX-A nor PnTX-G and analogs, obtained by chemical synthesis with high degree of purity (> 98%), have been studied *in vivo* or *in vitro* on adult mouse and isolated nerve-muscle preparations expressing the mature muscle-type (α1)2β1δ nAChR. Our results show that PnTX-A and PnTX-G acted on the neuromuscular system of anesthetized mice and blocked the compound muscle action potential (CMAP) in a dose- and time-dependent manner with similar ID50 values (dose required to block 50% of the CMAP), as determined using an *in vivo* minimally invasive electrophysiological method. The decrease of CMAP induced by both toxins *in vivo* was reversible within 6-8 h. PnTX-A and PnTX-G, applied to isolated *extensor digitorum longus* (EDL) nerve-muscle preparations, blocked reversibly isometric twitches evoked by nerve stimulation. Both toxins exerted no direct action on the contractile machinery of muscle fibers, as revealed by direct muscle stimulation. In addition, PnTX-A and PnTX-G blocked synaptic transmission at mouse neuromuscular junctions. PnTX-A aminoketone analog (containing an open form of the imine ring) had no effect on neuromuscular transmission. These results indicate the importance of the cyclic imine for interacting with adult mammalian muscle-type nAChR.

Supported in part by NIH/NIGMS grant GM R01-077379 (to A.Z.) and by the CNRS/CEA.

Mots-Clés: pinnatoxin A, pinnatoxin G, neuromuscular system, in vivo, muscle contraction, synaptic transmission, nicotinic acetylcholine receptors
