HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Simulation of the Carpiuc test with the Thick Level Set model

Abstract

The Thick Level Set model, introduced in [1, 2], is a non-local damage model embedding fracture mechanics discontinuity. By taking advantage of its damage driven capability this method is well adapted to branching and coalescence situation that appears in the Carpiuc benchmark.

Compare to all previous TLS publication this work adds a new loading control that intermix energy dissipation driven evolution with varying loading state. Many features of the TLS method have been tested with this benchmark and are presented in this work. Among them we can cite searching for initiation, branching, coalescence, tracking and analyzing the crack closure, ...
