HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Efficient unstructured mesh deformation using randomized linear algebra in Fluid Structure Interaction

W. Bader, A. Parret-Fréaud, S. Da Veiga, Y. Mesri*

ABSTRACT

Mesh deformation is a key point in fluid structure interaction problems. The efficiency of such simulations relies on the efficiency of the mesh deformation algorithms used for as long periods of time as possible without degenerating the mesh. Many solutions are well described in the literature, from those based on the solutions of elliptic PDEs to those based on both explicit and implicit interpolations [3]. The approach considered here is based on the solution of an algebraic linear system raised from Radial Basis Function (RBF) interpolation. At an extreme scale, the resolution of such linear systems is very expensive [1]. The present work aims to speed-up the solving of such systems by using randomized linear algebra [2]. Over the past decade, a new paradigm has emerged introducing randomization to speed-up linear algebra operations [2]. The efficiency of such an approach can reach linear complexity $O(N)$ regarding the problem size and this has been confirmed on several dense linear systems from integral equations, statistics, and machine learning. This talk investigates the extension of this approach to complex systems resulting from Fluid-Structure interaction problems that are sparse and ill-conditioned [3, 4, 5]. The focus will be on how to speed-up the algebraic solvers used to deform the mesh in FSI simulations. 2D and 3D applications will be presented to assess the new paradigm.
