# G-SWAF - Global SWAF - (J' soif)

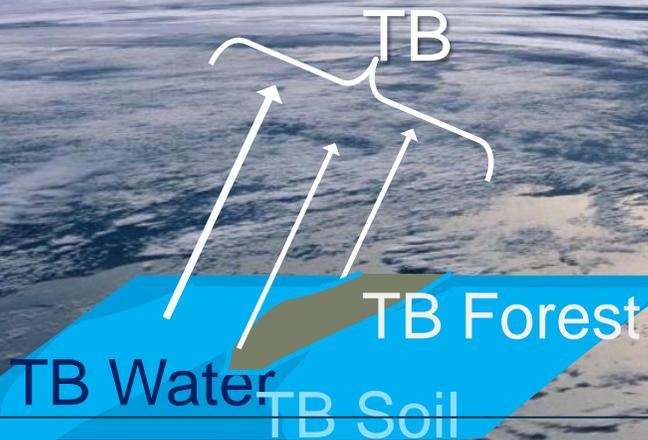

Multiple elementary surface contributions, exploitation of polarisation and multi-angular acquisitions

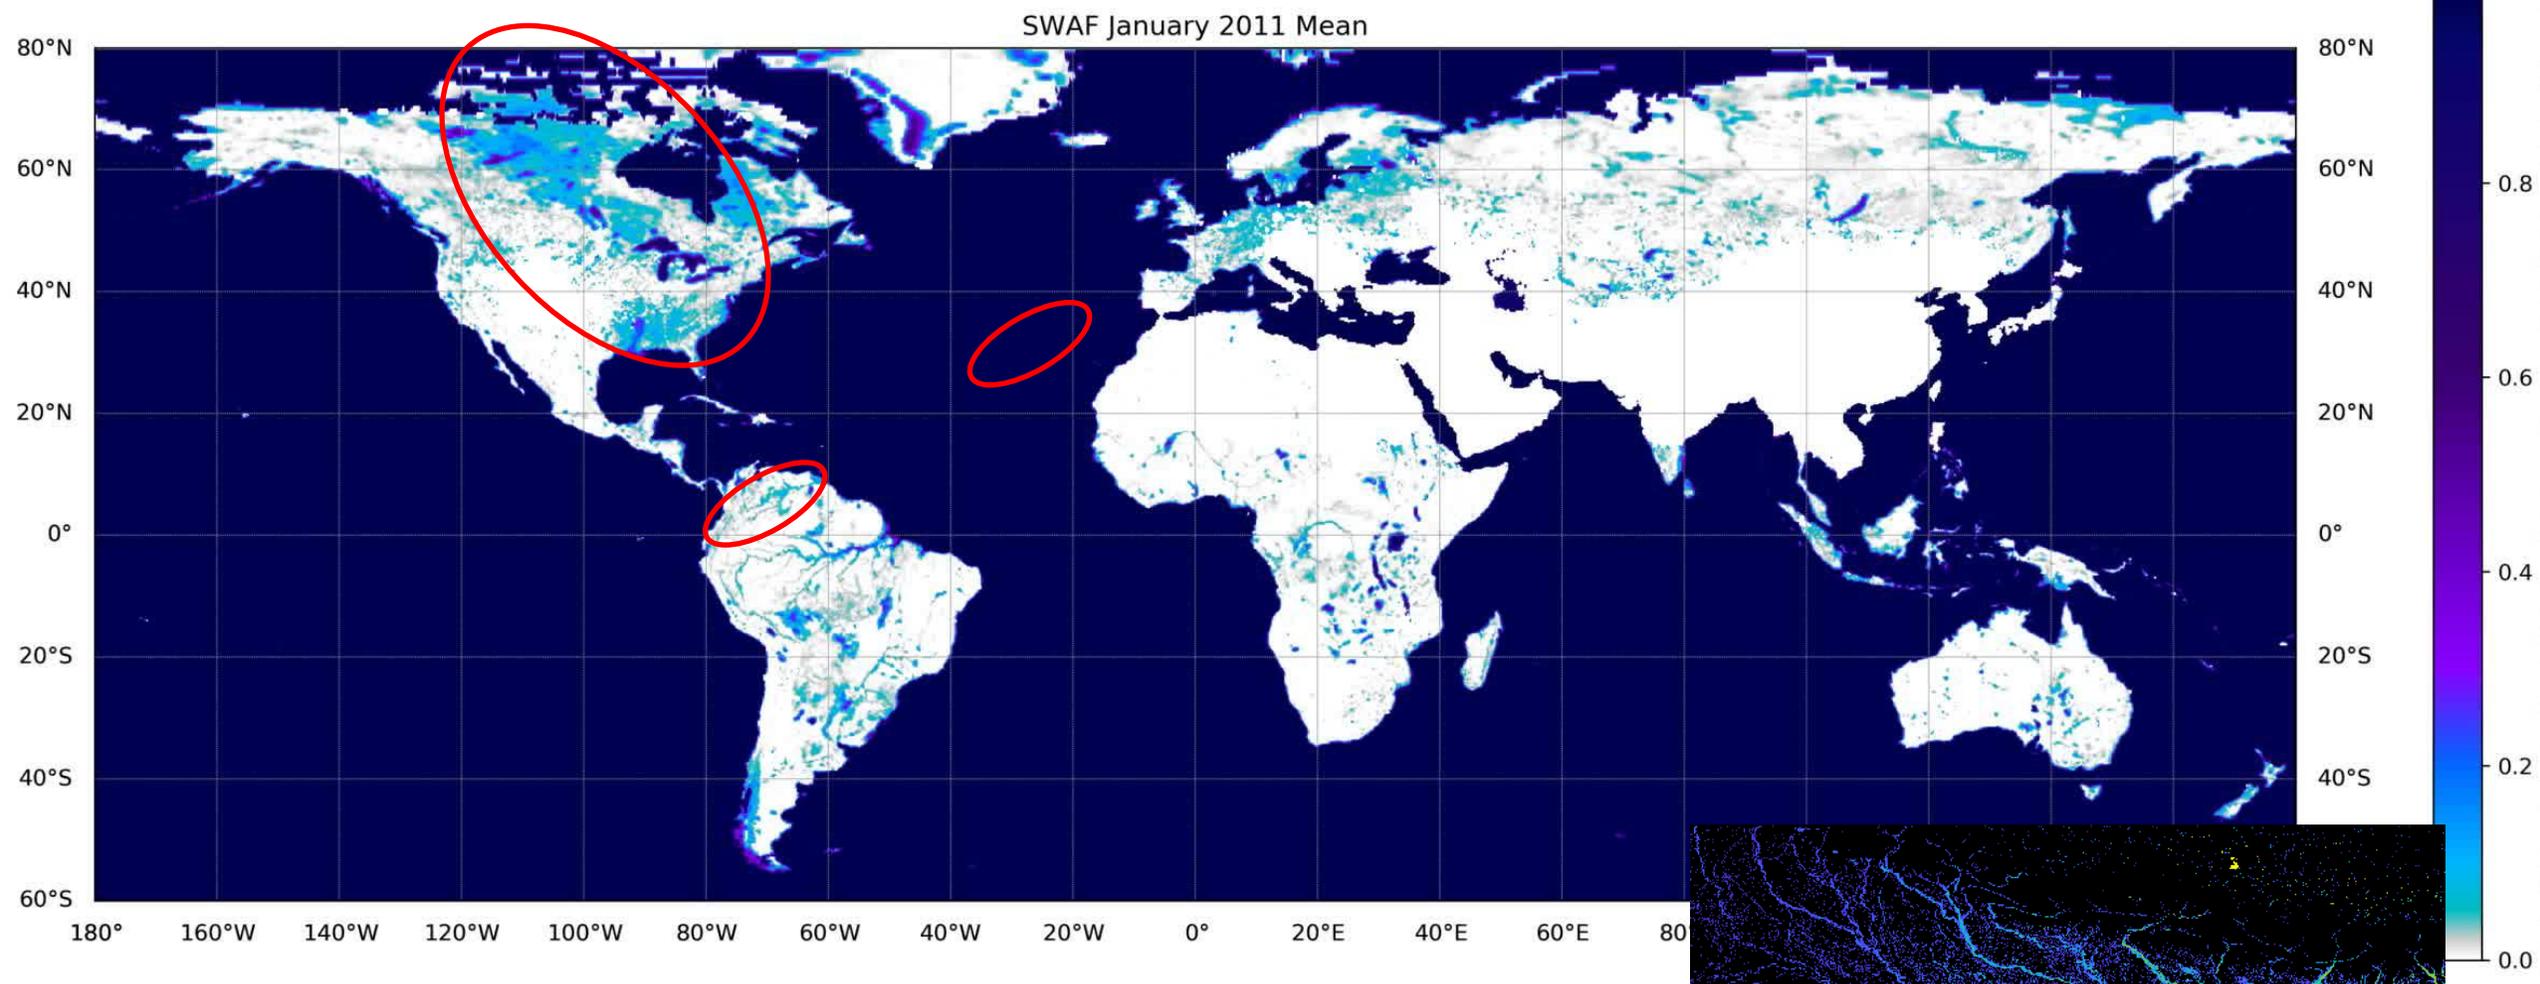

$$TB(\theta_i, P_i) = TB_w(\theta_i, P_i) * F_w + TB_f(\theta_i, P_i) * F_f + TB_s(\theta_i, P_i) * F_s$$

- Surface fractions (Fw, Fs and Ff) are retrieved
- TB water is modeled.
- TB forest and TB soil are forced based on spatio-temporal constraints.
- An iterative inversion is applied.

# CRB - Congo River Basin floods

## Hydrological indicators over the CR

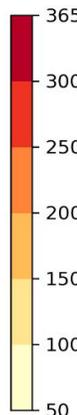

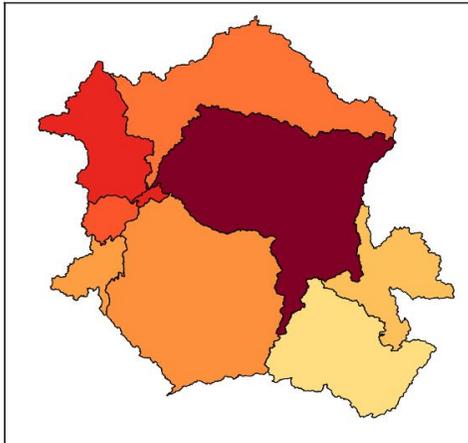

a) Lag between rainfall and flood (days)

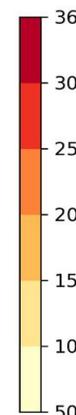

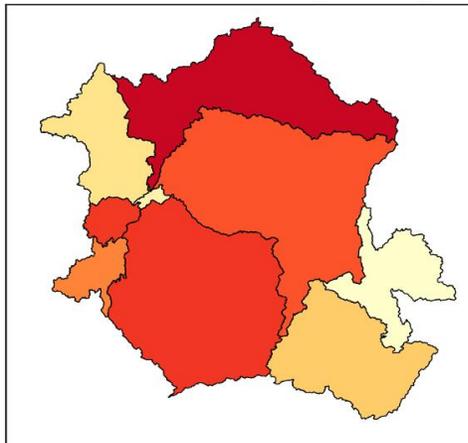

b) Lag between flood and outlet water height (days)

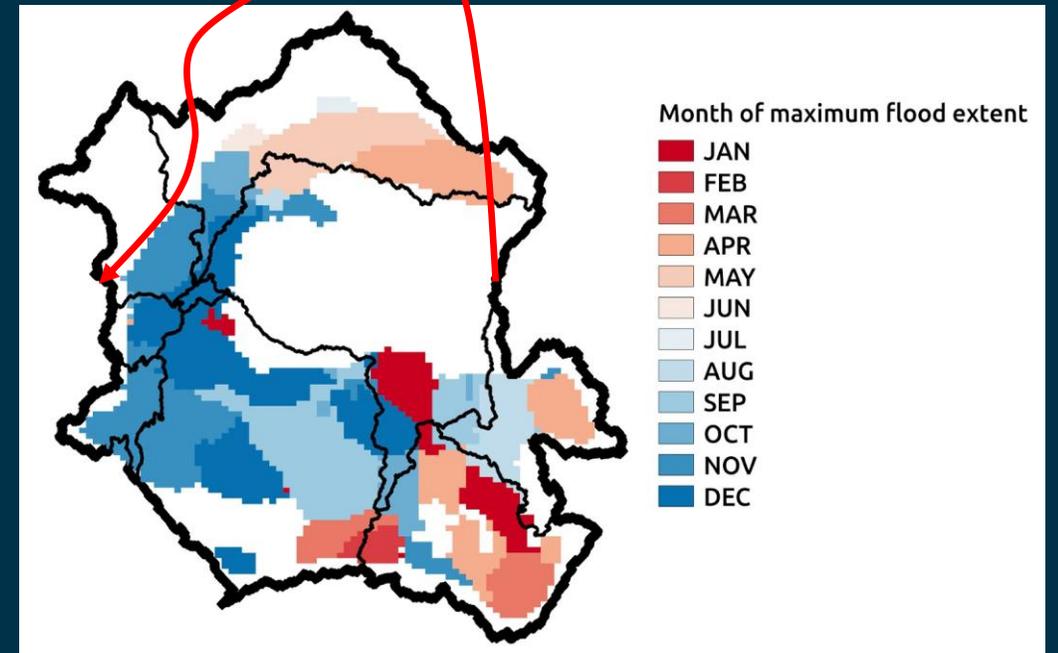

c) Rainy season length (days)

d) Flood season length (days)

Map of the month corresponding to the maximum flooded areas over the CRB after the application of a majority filter of size 9.

# Denitrification rate of Amazonian wetlands

In wetlands, during inundation periods denitrification processes nitrates ( $\text{NO}_3^-$ ) into atmospheric dinitrogen ( $\text{N}_2$ ).

This process is not well quantified. A method utilizing SWAF is applied to derive denitrification.

$$D_{\text{NO}_3} = R_{\text{NO}_3} \cdot \text{SWAF} \cdot Q_{\text{wa}}, \quad (2)$$

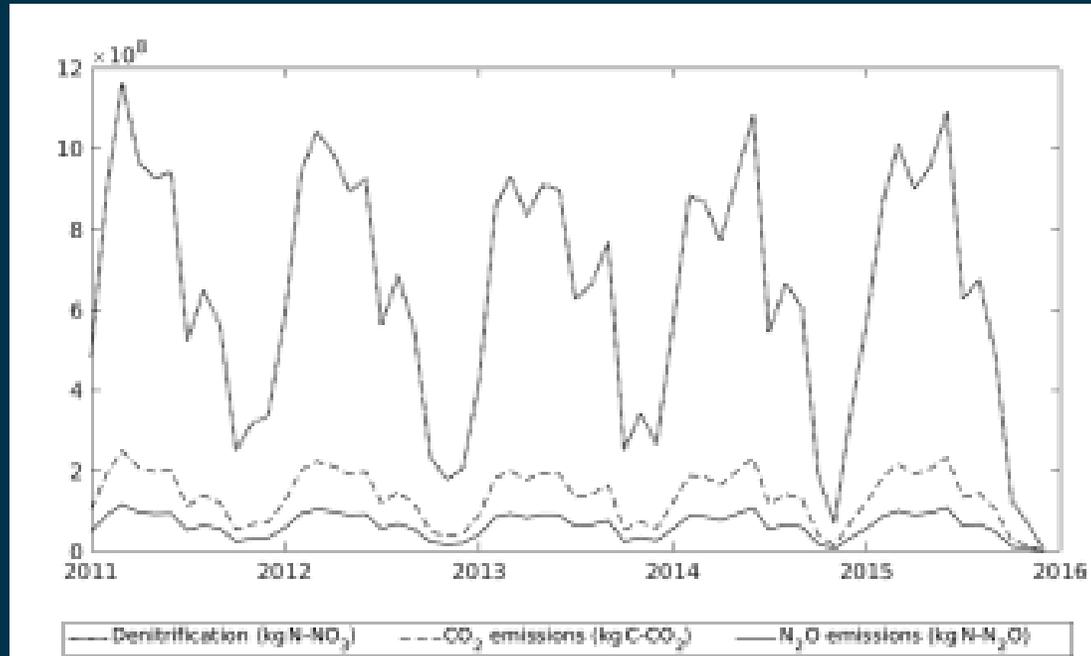

where  $D_{\text{NO}_3}$  is the net denitrification in moles per month,  $R_{\text{NO}_3}$  is the denitrification rate in moles per month per litre, SWAF is the fraction of land covered with open waters and  $Q_{\text{wa}}$  is the water storage capacity for each type of soil (L) retrieved from the FAO soil database.

$$R_{\text{NO}_3} = -0.8 \cdot \alpha \cdot \left( \rho \cdot \frac{1 - \phi}{\phi} \cdot k_{\text{POC}} \cdot [\text{POC}] \cdot \frac{10^6}{M_C} + k_{\text{DOC}} \cdot [\text{DOC}] \right) \cdot \frac{[\text{NO}_3^-]}{[k_{\text{NO}_3} + \text{NO}_3^-]}, \quad (1)$$

where  $R_{\text{NO}_3}$  is the denitrification rate ( $\mu\text{mol L}^{-1} \text{d}^{-1}$ ),  $0.8 \cdot \alpha$  represents the stoichiometric proportion of  $\text{NO}_3^-$  consumed in denitrification compared to the organic matter used with  $\alpha = 5$  as mentioned in Peyrard et al. (2010),  $\rho$  is the dry sediment density ( $\text{kg dm}^{-3}$ ),  $\phi$  is the sediment porosity,  $k_{\text{POC}}$  is the mineralization rate constant of POC ( $\text{d}^{-1}$ ), POC refers to the POC in the soil and the aquifer sediment (%),  $M_C$  is the carbon molar mass ( $\text{g mol}^{-1}$ ), DOC refers to the DOC in the aquifer water ( $\mu\text{mol L}^{-1}$ ),  $k_{\text{DOC}}$  is the mineralization rate constant of DOC ( $\text{d}^{-1}$ ),  $k_{\text{NO}_3}$  is the half-saturation constant for  $\text{NO}_3^-$  limitation ( $\mu\text{mol L}^{-1}$ ), and  $\text{NO}_3^-$  is the nitrate concentration in the aquifer ( $\mu\text{mol L}^{-1}$ ).

(Guilhen et al., Biogeosciences, 2020)

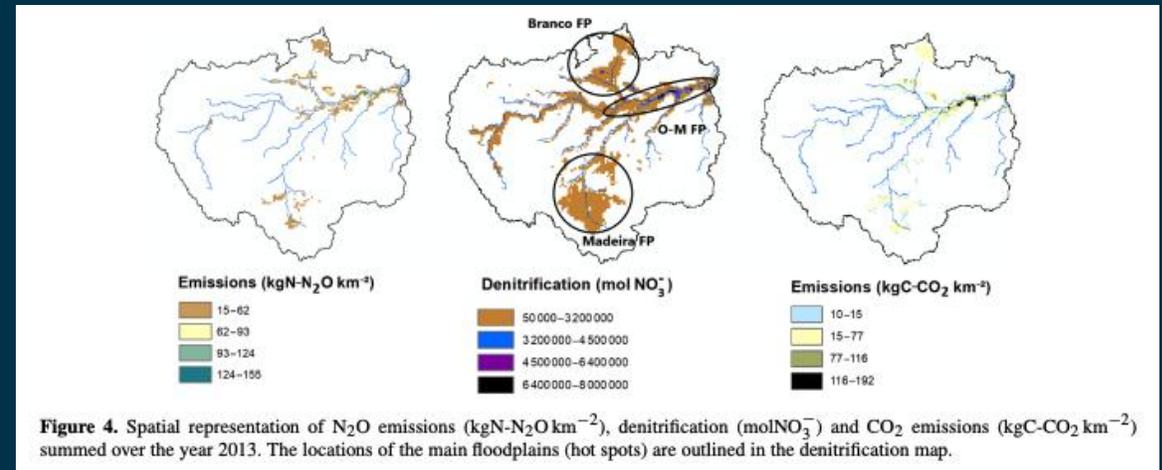

# First estimates of Denitrification over Wetlands from satellite observation

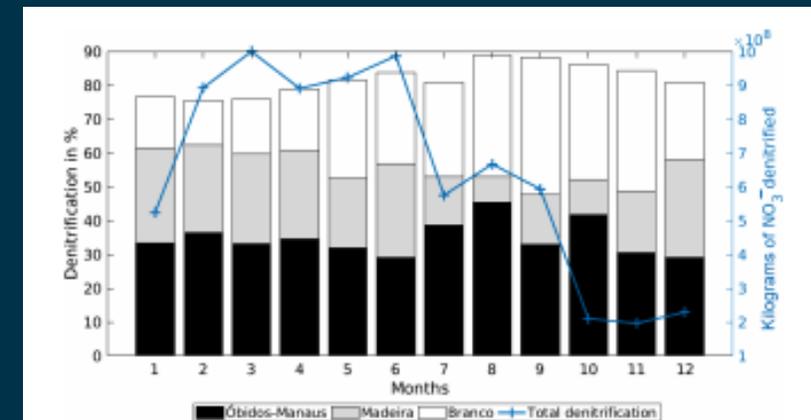

**Figure 5.** Monthly denitrification (kgN-NO<sub>3</sub>) and CO<sub>2</sub> (kgC-CO<sub>2</sub>) and N<sub>2</sub>O (kgN-N<sub>2</sub>O) emissions over the entire Amazon watershed for the period 2011–2015.

(Guilhen et al., Biogeosciences, 2020)

Towards global estimates (Martinez-Espinoza et al., Sci. Tot., 2020)

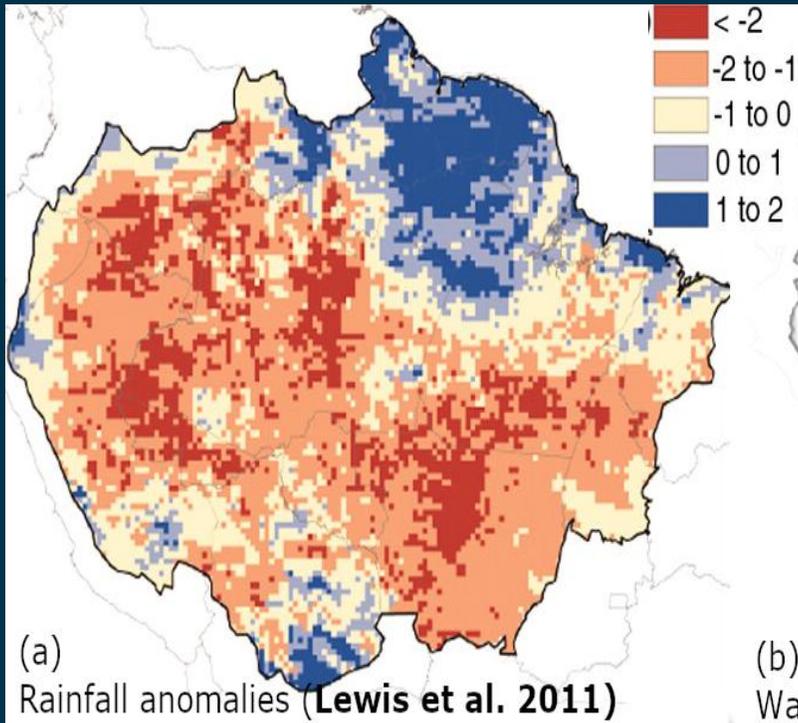

**Figure 4.** Spatial representation of N<sub>2</sub>O emissions (kgN-N<sub>2</sub>O km<sup>-2</sup>), denitrification (molNO<sub>3</sub><sup>-</sup>) and CO<sub>2</sub> emissions (kgC-CO<sub>2</sub> km<sup>-2</sup>) summed over the year 2013. The locations of the main floodplains (hot spots) are outlined in the denitrification map.

**Figure 7.** Average monthly contribution of each floodplain – the O-M FP (black), the Madeira FP (grey) and Branco FP (white) – to the Amazon total denitrification. The residual contribution to make up 100 % is associated with the other wetlands in the basin. The blue line represents the average monthly denitrification for the period of the study, and it shows the main trend observed over the Amazonian watershed.

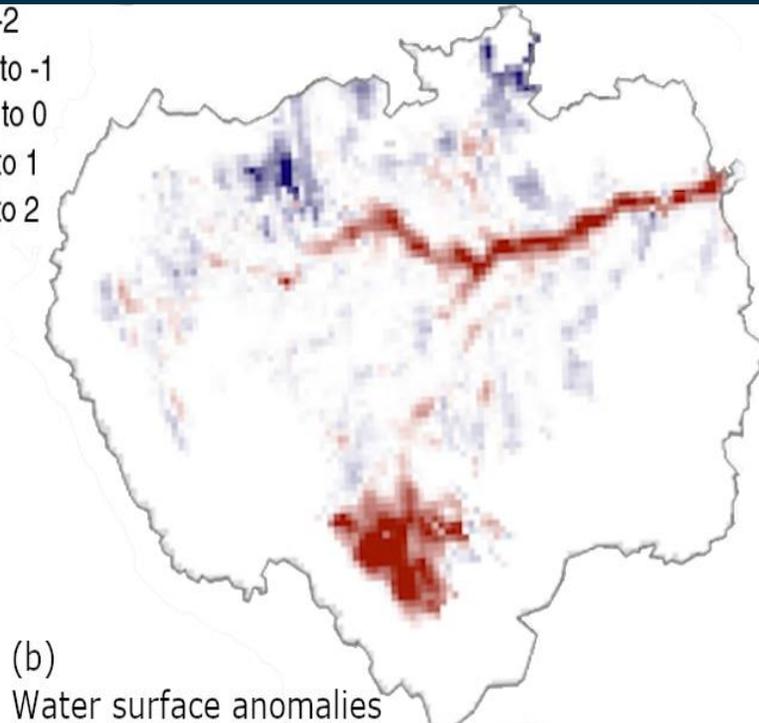

# Hydrological Drought in 2010

## Rainfall Anomalies

## Anomaly of water fraction

Jul. – Sept. 2010

Drought depicted for the South amazon but also for the inundation plains, which can not be detected using the Clim. Water Index which is based on optical data.
