HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Introduction

Method

30 ASD (8,8 years; 11 girls) | **30 TD** (8,6 years; 17 girls)

Tasks

FMS : Writing Anticipation (WA)
2 digrams :
10 ll + 10 ln
Kandel & Perret (2015)

GMS : gait initiation, Anticipatory Postural Adjustments (APA)
3D motion-capture (Vicon)
2 force plates

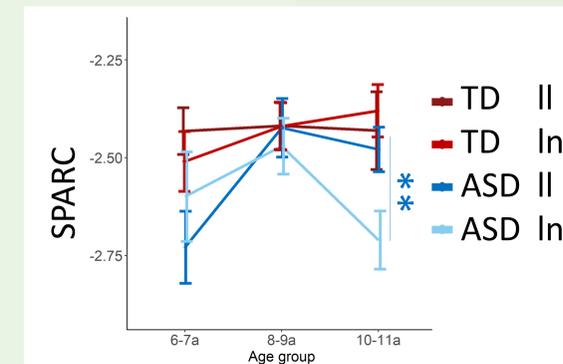

MoS : Margin of Stability (MoS = XcoMp - CoP) at Foot-Off (FO)
Hof et al. (2008)

Fluidity 1st L : SPARC (Balasubramanian et al., 2012)

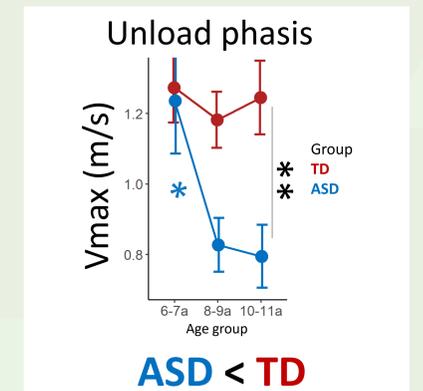

FMS + GMS: duration, velocity, length for the different task phases
Stats: ANOVA (FMS) ; Mann-Withney (GMS)

Results

WA: SPARC

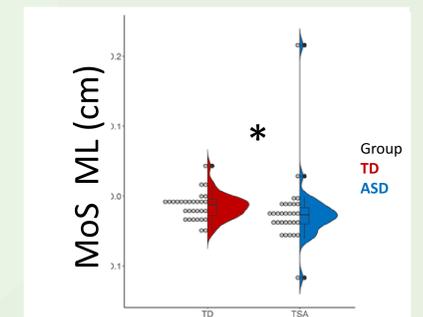

APA: Velocity max MedioLat

ASD < TD

MoS ML

ASD > TD

** p < .01

* p < .05

- **WA** : ASD children can anticipate the difficulty of the 2nd digram, but they produce less smooth gesture than TD children.
- **APA** : greater distance between the Centre of foot Pressure and the Centre of Mass = ASD children encountered greater instability at foot-off.
- ➔ **Anticipatory adjustments in FMS and GMS are atypical in ASD children.**

Since the cerebellum interferes with the execution of anticipated motor programs (Mosconi, 2015), might it be at the origin of the deficient anticipated control?
