

Spatially explicit trends in the global conservation status of vertebrates

Ana S. L. Rodrigues, Thomas M. Brooks, Stuart H.M. Butchart, Janice Chanson, Neil Cox, Michael Hoffmann, Simon N. Stuart

Supplementary Table S2. Key results per country. Countries include dependent territories. Values are calculated across the marine and land territory of each country combined (as in Figures 4 and S5, but unlike Figures 1-3 and S1-S4). Code: ISO 3166-1 country code. *E*: weighted endemism, a measure of each country's responsibility towards global species conservation (Equation 3; the sum across countries equals the total number of species in the group – amphibians, birds, mammals and all three taxa combined). *T*: weighted threat, a measure of the responsibility of each country towards the conservation of threatened species (Equation 4; the sum across countries equals the total number of threatened amphibians in the group). *W*: weighted Red List change per year, the net contribution of each country to the global change in species conservation status per year (Equation 11 the sum across countries is the net number of step changes per year in the group). GDP per capita: Gross Domestic Product based on purchasing-power-parity per capita, in 2009 (unit: current US dollars). GDP: Gross domestic product in 2009 (unit: current 1,000,000,000 US dollars). GEF5: allocations for biodiversity under the Global Environment Facility fifth replenishment (2010-2014), per country, under the System for Transparent Allocation of Resources (STAR) (unit: 1,000,000 US dollars). *H*, *I* and *AL*: relative importance of, respectively, hunting and trapping, invasive species, and agriculture and logging, to the deterioration in Red List status per country (see section 2.6). Threat code: code of the dominant threat (or combination of threats) responsible for the deterioration in Red List status in each country (used in Figures 4 and S5).

COUNTRY		Amphibians			Birds			Mammals			Combined			Economic data			Threats
