Submitted on 24 Aug 2024

HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Plan :

- 1 - Introduction
- 2 - A Bios Overview
- 3 - Physical Ports Access : CMOS Phun
- 4 - Physical memory access applied to Keyboard buffer access
- 5 - Final considerations
- 6 - Greetings & References
- 7 - Appendix

--[1 - Introduction

About ten years ago, while I was a teenage student, I started programming at school. I used to study Turbo Pascal, and since I was a real beginner, I made several programming mistakes. I especially got a few segmentation faults which led to random memory dumps. No big deal at first sight. But one of the dumps was interesting : it showed the Bios password in plain text. So I knew this password was in plain text somewhere in memory. Knowing an attack is possible is one thing, exploiting it is much harder. Exploiting it using new techniques is even better : this is what this paper will describe.

Hence, the main goal of this article isn't to detail the Bios cracking methodology but to use Bios cracking as a pretext to introduce little known techniques to explore the content of a computer : physical ports interfacing and physical memory reading and writing among others, which are very little used today in the linux world.

After a Bios role overview describing the the Bios structure, we will focus on the main topic of this article : physical port communication applied to CMOS password tricks under Linux, and reading the password from physical memory in the following section.

I insist that this paper doesn't aim at helping kids in gaining access to computers : what matters here are the new techniques employed rather than the lame actions you could do applying those techniques.

Every single piece of code has been tested both on a Toshiba laptop (Toshiba Satellite Pro A60, 768 Mo RAM, Insyde Bios V190) running Debian Linux (kernel 2.6.11) and a Desktop Computer (p100 MHz, 40Mo RAM, AWARD Bios Modular 4.50pg) running Gentoo Linux (kernel 2.6.10). 99% of the code granted to compile and run fine under root privileges.

To illustrate this article, I will provide excerpts from the disasm of my own Bios (the toshiba laptop mentioned earlier : yeah, it's a cheap one, send me money ;). Keep in mind that many Bios operations are very model specific, so I encourage you to reverse your own Bios and to refer to your mother board's data sheet for more accurate informations concerning your own Bios ROM. I used sysodeco [1] to unpack my Bios and IDA 4.3 freeware edition [2] to disassemble the ROM. The ROM I used in this article is used as appendix. IDA generated asm code is also available on request.

--[2 - A Bios Overview

I will detail the role of Bios through a boot process overview. This explanation is not exhaustive. (I will give details about what is relevant for the rest of my paper), but you can refer to Intel volume III [3] to get more informations on this topic (the section detailing the Northbrige should answer your questions).

Informations contained in this section are a combination of my own experimentations along with four other sources : the "BIOS companion" book [4], which is merely a compilation of motherboards data sheets, for the figures, the "BIOS Survival Guide Version 5.4" [5] for additional infos concerning the CMOS role, "Award BIOS Reverse Engineering" article from Mappatutu Salihun Darmawan for code breakers[6], and of course Intel volume III [3].

Mappatutu Salihun Darmawan's article is very complete and attempts to explain how the Bios (which starts in protected mode) can switch to real mode, and even run 32b instructions...

At boot time, a computer starts thanks to a piece of software stored as ROM on the motherboard : the Basic Input Output System (BIOS). The BIOS configuration is stored in an other chip, called Complementary Metal Oxide Semi-conductor (CMOS). Since CMOS is not launched in RAM (your

computer RAM is not known by BIOS before a while anyway), accessing your CMOS requires you to perform physical ports communications through ports 70h and 71h (we will see this in detail later, since this is the core of this article).

The standard CMOS Map is provided below as figure 1 (based on infos from the "Bios Companion Book").

figure 1 : CMOS MAP

| Offset | Size | Function |
|--------|--------|--|
| 0x00 | 1 byte | RTC seconds. Contains the seconds value of current time. (BCD*) |
| 0x01 | 1 byte | RTC seconds alarm. Contains the seconds value for the RTC alarm (BCD*) |
| 0x02 | 1 byte | RTC minutes. Contains the minutes value of the current time (BCD*) |
| 0x03 | 1 byte | RTC minutes alarm. Contains the minutes value for the RTC alarm (BCD*) |
| 0x04 | 1 byte | RTC hours. Contains the hours value of the current time (BCD Format*) |
| 0x05 | 1 byte | RTC hours alarm. Contains the hours value for the RTC alarm (BCD*) |
| 0x06 | 1 byte | RTC day of week. Contains the current day of the week (1 .. 7, sunday=1) |
| 0x07 | 1 byte | RTC date day. Contains day value of current date (BCD*) |
| 0x08 | 1 byte | RTC date month. Contains the month value of current date (BCD*) |
| 0x09 | 1 byte | RTC date year. Contains the year value of current date (BCD*) |
| 0x0A | 1 byte | Status Register A Bit 7 = Update in progress 0 = Date and time can be read 1 = Time update in progress Bits 6-4 = Time frequency divider Bits 3-0 = Rate selection frequency |
| 0x0B | 1 byte | Status Register B Bit 7 = Clock update cycle 0 = Update normally 1 = Abort update in progress Bit 6 = Periodic interrupt 0 = Disable interrupt (default) 1 = Enable interrupt Bit 5 = Alarm interrupt 0 = Disable interrupt (default) 1 = Enable interrupt Bit 4 = Update ended interrupt 0 = Disable interrupt (default) 1 = Enable interrupt Bit 3 = Status register A square wave frequency 0 = Disable square wave (default) 1 = Enable square wave |

```

    Bit 2 = 24 hour clock
        0 = 24 hour mode (default)
        1 = 12 hour mode
    Bit 1 = Daylight savings time
        0 = Disable daylight savings (default)
        1 = Enable daylight savings

0x0C    1 byte  Status Register C - Read only flags indicating system
          status conditions
          Bit 7   = IRQF flag
          Bit 6   = PF flag
          Bit 5   = AF flag
          Bit 4   = UF flag
          Bits 3-0 = Reserved

0x0D    1 byte  Status Register D - Valid CMOS RAM flag on bit 7
          (battery condition flag)
          Bit 7 = Valid CMOS RAM flag
          0 = CMOS battery dead
          1 = CMOS battery power good
          Bit 6-0 = Reserved

0x0E    1 byte  Diagnostic Status
          Bit 7 = Real time clock power status
          0 = CMOS has not lost power
          1 = CMOS has lost power
          Bit 6 = CMOS checksum status
          0 = Checksum is good
          1 = Checksum is bad
          Bit 5 = POST configuration information status
          0 = Configuration information is valid,
          1 = Configuration information in invalid
          Bit 4 = Memory size compare during POST
          0 = POST memory equals configuration
          1 = POST memory not equal to configuration
          Bit 3 = Fixed disk/adapter initialization
          0 = Initialization good
          1 = Initialization bad
          Bit 2 = CMOS time status indicator
          0 = Time is valid
          1 = Time is invalid
          Bit 1-0 = Reserved

0x0F    1 byte  CMOS Shutdown Status
          00h = Power on or soft reset
          01h = Memory size pass
          02h = Memory test pass
          03h = Memory test fail
          04h = POST complete; boot system
          05h = JMP double word pointer with EOI
          06h = Protected mode tests pass
          07h = protected mode tests fail
          08h = Memory size fail
          09h = Int 15h block move
          0Ah = JMP double word pointer without EOI
          0Bh = Used by 80386

0x10    1 byte  Floppy Disk Drive Types

```

Bits 7-4 = Drive 0 type
 Bits 3-0 = Drive 1 type
 0000 = None
 0001 = 360KB
 0010 = 1.2MB
 0011 = 720KB
 0100 = 1.44MB

- 0x11 1 byte System Configuration Settings
 Bit 7 = Mouse support disable/enable
 Bit 6 = Memory test above 1MB disable/enable
 Bit 5 = Memory test tick sound disable/enable
 Bit 4 = Memory parity error check disable/enable
 Bit 3 = Setup utility trigger display disable/enable
 Bit 2 = Hard disk type 47 RAM area
 Bit 1 = Wait for<F1> if any error message disable/enable
 Bit 0 = System boot up with Numlock (off/on status)
- 0x12 1 byte Hard Disk Types
 Bits 7-4 = Hard disk 0 type
 Bits 3-0 = Hard disk 1 type
 0000 = No drive installed
 0001 = Type 1 installed
 1110 = Type 14 installed
 1111 = Type 16-47 (defined later in 19h)
- 0x13 1 byte Typematic Parameters
 Bit 7 = typematic rate programming disable/enabled
 Bit 6-5 = typematic rate delay
 Bit 4-2 = Typematic rate
- 0x14 1 byte Installed Equipment
 Bits 7-6 = Number of floppy disks
 00 = 1 floppy disk
 01 = 2 floppy disks
 Bits 5-4 = Primary display
 00 = Use display adapter BIOS
 01 = CGA 40 column
 10 = CGA 80 column
 11 = Monochrome Display Adapter
 Bit 3 = Display adapter installed/not installed
 Bit 2 = Keyboard installed/not installed
 Bit 1 = math coprocessor installed/not installed
 Bit 0 = Always set to 1
- 0x15 1 byte Base Memory Low Order Byte - Least significant byte

```

NOTE : (*) The BCD format is used by Bios to store numbers. Numbers are stored in hex format, but the upper nibble contains the 10-digits, while the lower one contains the 1-digits.

If you dump your Bios ROM or simply download a new one from your Bios manufacturer and try to disassemble it, you will see that some parts of your Bios are packed. Actually, if you launch such a ROM with IDA, you'll see that the only non packed parts are unpacking routine. Start by looking at the ASCII strings in your Bios and look for an unpacker, or build a simple unpacker using those routines (as opposite to ELF unpacking, you already know where to find those routines : they are the only one you'll see as code :). Since I'm lazy, I first looked at the strings in my ROM using the linux 'file' and 'strings' commands. The interesting one for Toshiba Bioses is this one :
 "all rights reserved Insyde software Corp."
 Insyde Software is a Bios manufacturer anciently known as System Soft. So I searched for an unpacker (I told you, I am lazy) and found sysodeco unpacker here [1]. If you plan to unpack yours, looking at "Advanced Bios logo reader" (<http://www.kaos.ru/biosgfx/index.html>) [7] first can be time saving : it contains unpackers for many Bioses.

When pushing the button, BIOS will perform an analysis of the system components (I'll explain this point later) and initialize the video system. In my Bios, this is done this way :

```

push    bp
mov     bp, sp
push   ax
push   bx
push   cx
pushf
cli
mov     cx, 1
mov     ax, 4F05h
xor     bx, bx
int     10h                ; - VIDEO - VESA SuperVGA BIOS - VESA SuperVGA
BIOS - CPU VIDEO MEMORY CONTROL
                        ; BL = 00h window A, 01h window B
                        ; Return: AL = 4Fh function supported
                        ; AH = 00h successful, 01h failed
                        ; BH = subfunctionselect video memory window

cmp     ah, 4Fh
jz      near ptr 45DDh
loop   near ptr 45CCh

```

```

mov    cx, 1
mov    ax, 4F05h
mov    bx, 1
int    10h                ; - VIDEO - VESA SuperVGA BIOS - VESA SuperVGA
BIOS - CPU VIDEO MEMORY CONTROL
                        ; BL = 00h window A, 01h window B
                        ; Return: AL = 4Fh function supported
                        ; AH = 00h successful, 01h failed
                        ; BH = subfunctionselect video memory window

cmp    ax, 4Fh
jz     near ptr 45ECh
loop   near ptr 45DDh
popf
pop    cx
pop    bx
pop    ax
leave

retn

```

This process is known as POST (Power-On Self Test). This operation is a crucial for your system since the BIOS will initialize important peripherals. I realized that the BIOS gets those informations through CMOS queries, as shown below, or through physical ports queries on port 72h and 73h, which are used to access the extended RAM following "Award BIOS Reverse Engineering" from Mappatutu Salihun Darmawan [6].

Here is how the Toshiba Bios accesses CMOS configurations :

```

push   bp
mov    bp, sp
mov    al, [bp+4]
out    70h, al          ; CMOS Memory:
                        ; used by real-time clock
in     al, 71h         ; CMOS Memory
leave
retn

```

And how it can access extended RAM to get Northbrige infos :

```

push   bp
mov    bp, sp
mov    al, [bp+4]
or     al, 80h
out    72h, al
in     al, 73h
leave
retn

```

There is a Checksum at 0x2E in the CMOS that certifies it as not been corrupted. The Bios will recalculate this checksum and set a flag in CMOS at 0x0E if the checksum is wrong, then the CMOS is set back to its default configuration.

The Bios will then ask you for a password. This password will be compared with the one stored in CMOS at 0x38 (as shown in figure 1). How is this done in detail ? To understand this magic, I need to introduce one more structure, the Bios Data Area (BDA). (figure 2 is also based on informations from the "Bios Companion Book").

figure 2 : Bios Data Area MAP

| Offset | Size | Description |
|--------|---------|--|
| 0x00 | 2 bytes | Base I/O address for serial port 1 (communications port 1 - COM 1) |
| 0x02 | 2 bytes | Base I/O address for serial port 2 (communications port 2 - COM 2) |
| 0x04 | 2 bytes | Base I/O address for serial port 3 (communications port 3 - COM 3) |
| 0x06 | 2 bytes | Base I/O address for serial port 4 (communications port 4 - COM 4) |
| 0x08 | 2 bytes | Base I/O address for parallel port 1 (printer port 1 - LPT 1) |
| 0x0A | 2 bytes | Base I/O address for parallel port 2 (printer port 2 - LPT 2) |
| 0x0C | 2 bytes | Base I/O address for parallel port 3 (printer port 3 - LPT 3) |
| 0x0E | 2 bytes | Base I/O address for parallel port 4 (printer port 4 - LPT 4) |
| 0x10 | 2 bytes | Equipment Word Bits 15-14 indicate the number of parallel ports installed 00b = 1 parallel port 01b = 2 parallel ports 03b = 3 parallel ports Bits 13-12 are reserved Bits 11-9 indicate the number of serial ports installed 000b = none 001b = 1 serial port 002b = 2 serial ports 003b = 3 serial ports 004b = 4 serial ports Bit 8 is reserved Bit 7-6 indicate the number of floppy drives installed 0b = 1 floppy drive 1b = 2 floppy drives Bits 5-4 indicate the video mode 00b = EGA or later 01b = color 40x25 10b = color 80x25 11b = monochrome 80x25 Bit 3 is reserved Bit 2 indicates if a PS/2 mouse is installed 0b = not installed |

```

    1b = installed
    Bit 1 indicated if a math coprocessor is installed

The BDA is usually 255 bytes long and is created by BIOS in RAM at 0x0040000.

As you can see above, there is a keyboard buffer at 0x1E, which is ruled thanks to two flags at 0x1A and 0x1C which point to the next and last characters in this buffer. By dumping this buffer (see section 3), I realised that this buffer is filled with the character and then its scan code.

Assuming the password is correct, the booting process will go on. If you press a spacial key, (usually the <F1> or key), you will enter in the so called 'Bios Setup', which is actually a CMOS configuration. Otherwise, the BIOS will be in charge of loading your Os... Let's give a few details on this next step.

The BIOS is carried of offering basic input/output operations mainly through the following interrupts : (ripped from www.bioscentral.com [8]).

figure 3 : Bios Services.

| Int | Adress | Type | Description |
|------|------------|-----------|-------------------------------|

The BIOS interrupts are very basic but sufficient for the OS to be launched by reading the boot sector of the selected bootable device in memory at 0x7C00. Then, code execution is set to that address and the OS takes control.

Ok, now kids, here is what you've been waiting for : a quick summary of available techniques to bypass the CMOS password. Note those techniques are obvious once you understand how the whole process works... The following methods are taken from Christophe Grenier's page [9]. I would like to thank him for helping me by mail in my researches concerning Bios disassembly.

Bypassing a Bios password if the computer is off can't be done with software : until the password is entered correctly, the computer will simply not boot. Therefore, a first method is to replace the CMOS chip (which contains the password) by a new (passwordless one). The CMOS can also be reset by switching off a battery on the mother board that supplies its power. All those methods, along with more sophisticated ones consisting in short-circuiting the CMOS are described on Christophe Grenier's Home Page [9].

Software based methods to recover a CMOS password or generate one

that has the same checksum can therefore only be done if the computer is on. Appart from manufacturers backdoors [10], finding such a password is technically very difficult, time consuming and moreover, those decyphering techniques are very model specific. But in the case of Toshiba laptops, there is an other way to reset the password... If you perform a 'string' command on a Toshiba Bios ROM, or disassemble it, you'll notice the following string :

```
db 44h ; D
db 6Fh ; o
db 20h ;
db 79h ; y
db 6Fh ; o
db 75h ; u
db 20h ;
db 77h ; w
db 61h ; a
db 6Eh ; n
db 74h ; t
db 20h ;
db 74h ; t
db 6Fh ; o
db 20h ;
db 63h ; c
db 72h ; r
db 65h ; e
db 61h ; a
db 74h ; t
db 65h ; e
db 20h ;
db 61h ; a
db 20h ;
db 70h ; p
db 61h ; a
db 73h ; s
db 73h ; s
db 77h ; w
db 6Fh ; o
db 72h ; r
db 64h ; d
db 20h ;
db 64h ; d
db 69h ; i
db 73h ; s
db 6Bh ; k
db 65h ; e
db 74h ; t
db 74h ; t
db 65h ; e
db 3Fh ; ?
```

What is this ?? Well, as mentioned on Bugtraq mailing list [11], there is a way to reset the CMOS password by creating a boot disk whose first sectors contains the string "KEY" followed by 0x0000.

This is it for my brief description of the Bios. If you look back at the figures mentioned above, you'll realise that most informations concerning your hardware is stored inside the CMOS or the BDA. Well, there is an even much complete way to gather informations on a computer. It is called SMBIOS. SMBIOS is a standard defined by DMTF [12], which is an aliance of major hardware manufacturers to create a powerfull way to deal with hardware. You can download a nice utility to get a detailed report on your system thanks to DMIDECODE you can get at freshmeat web site [13]. Describing the SMBIOS structure is off topic since we won't use it in this paper, refer to those links for more infos.

Enough description, let's move to a more practical point of view...

--[3 - Physical Ports Acss : CMOS Phun

We will first focus on physical ports manipulation : the Bios can do it, so why couldn't we ?

The two following techniques were pretty common under MS DOS several years ago (see the "Bios Companion" [4] for instance). It made use of debug to access physical ports. Under Linux, this requires special permissions that are given using ioperm.

As seen earlier, CMOS is not loaded on memory : it is set on a different chip. Interraction with the CMOS is done through physical ports 0x70 and 0x71.

All physical ports operations follow the same scheme only the port numbers change. The first one is used to seek a pointer within the chip, and the other one is used to read or write at this position.

Here is how to interract with a CMOS chip :
Writing to 0x70 with a given value will in return allow us to read the actual content of the CMOS chip at this offset on physical port 0x71.

```
-----  
--  
/*  
*                               CMOS DUMPER  
*       Endrazine endrazine@pulltheplug.org  
*  
*  
* compiling : gcc cmosd.c -o cmosd.o  
* usage : #cmosd > cmos.dump  
*  
*/  
#include <stdio.h>
```

```

#include <unistd.h>
#include <asm/io.h>

int main ()
{
    int i;

    if (ioperm(0x70, 2, 1) //Ask Permission (set to 1)
        { //for ports 0x70 and 0x71
            perror("ioperm");
            exit (1);
        }

    for (i=0;i<64;i++)
    {
        outb(i,0x70); // Write to port 0x70
        usleep(100000);
        printf("%c",inb(0x71));
    }

    if (ioperm(0x71, 2, 0) // We don't need Permission anymore
        { // (set permissions to 0).
            perror("ioperm");
            exit(1);
        }

    exit (0); // Quit
}

```

--

CMOS has a crc checksum stored at offset 0x2e on the CMOS chip, as shown earlier in the CMOS Map. The way this checksum is calculated depends on the model of the CMOS.

The main idea to reset CMOS is to make the checksum fail. This will allow Bios to reset the CMOS to its defaults settings since the flag at 0x0E (in CMOS) will be set to false, resulting in a CMOS flush. Hence, this will remove the BIOS Password. To do so, we will use a trick from the "Bios Companion" [4] : writing on port 0x70 with a value of 0x2e corresponding to the CMOS checksum offset and then writing on port 0x71 with an arbitrary value which will replace the actual checksum. Christophe Grenier (www.cgsecurity.com) noticed that setting the checksum to any value between 0x10 and 0x2F will result in a wrong checksum (I can't explain why since the algorithmes used to calculate those checksums are - as far as I know - not standard. I can only suppose Bios manufacturers decided that the algorithmes would have to be made so that such values are impossible in any CMOS configuration).

```
-----  
--  
/*  
*           Reset CMOS  
*           Endrazine endrazine@pulltheplug.org  
*/  
#  
#include <stdio.h>  
#include <unistd.h>  
#include <sys/io.h>  
  
int main ()  
{  
    ioperm(0x70, 1, 1); //Ask Permission (set to 1)  
    ioperm(0x71, 1, 1);  
  
    outb(0x2e,0x70); // Write to port 0x70  
    usleep(100000);  
    outb(0xff,0x71);  
  
    if (ioperm(0x70, 3, 0))  
    {  
        perror("ioperm");  
        exit(1);  
    }  
    exit (0); // Quit  
}  
  
-----  
--
```

--[4 - Physical memory access applied to Keyboard buffer access

Let's now focus on raw memory access : reading and writing to /dev/mem...

As explained in the first section of this paper :
When entering a Bios Password at command prompt, the input is stored at adress 0x41e. It is then compared to the cyphered one stored in CMOS for validation. Older attacks against Bios passwords were merely attempts to decypher the CMOS hash (see Christophe Grenier's page for exemples of such tricks). As Christophe Grenier explained me (by mail), reversing the BIOS ROM is unecessary : one can build a conversion table by using a diffing approche (ie : entering a password and dump the CMOS, then change one letter in the password and see what has changed and so on... Christophe even told me this was the methodology he used to build his password cracking tools).

But the keyboard Buffer is a circular one, which means that once a character is read it is flushed. At least it should be... In fact, I realized that Bioses did not flushed this buffer after use. In other terms, the flags at 0x1A and 0x1C in DBA are not updated after the user enters the password. Hence, the buffer used by the password is never flushed...
 Therefore, the password remains in plain text at physical adress 0x41e. Note that this done by Bios functions and is OS independant.

If you experiment the code below, you will notice that other softwares do not always use those flags correctly. For instance, I noticed that grub and lilo did not read the 0x1A flag and use the whole buffer, even if it has not been flushed ! I've not been able to find out any way to use this fact, but if you do, please send me a mail.

We will now create a piece of code to read the content of this buffer. This task isn't as easy as it may seem, since most OSes will not allow any program to perform direct physical memory reading. In fact, modern OSes do not work with physical but virtual memory and therefore, we cannot use any function part of the API handling memory adresses : they simply won't point to the rignt place. I've choosen to write an exemple under MS Dos because it is such a basic OS that no particular rights are equired to perform physical memory reading (MS Dos is not a mutliuser OS anyway and doesn't use virtual memory at all). I thought porting the code under Windows would be a very hard task since MS Dos and recent Windows (since Windows 2000) are not supposed to be compatible since Windows now as its own kernel. Furthermore, passing from a 16 bits architecture to a 32 bites one is usually difficult, and I thought running the exploit might need ring 0 privilege (ie system privilege). Well, I was wrong and porting the code under Windows was no big deal, as you will below. This code as been tested on the Toshiba computer used since the very beginning of this article under Windows XP Pro, and with the p100 MHz one under Windows 98 SE. It has also been tested under Windows Server 2000 (P4, 512 RAM).

```

end start

```

end

Here comes the most interesting part (well, I find it interesting ;) :

Now, what about a Linux version ? Linux offers a way to access physical memory : /dev/mem. In the following snippet, we will see how to read the keyboard buffer, and even how to clear this buffer. Replacing the real password with a fake one will also be shown. Therefore, writing a patch under the form of a loadable kernel module by copying the clear_bios_pwd function shouldn't be too hard. This will be your homework ;)

Of course, this code was meant to be run as root.

```

            clear_bios_pwd();

        if (choiceval=='3')
            change_pwd();

    }
    return 0;
}
```

-- [5 - Final considerations

We've seen how low level access through physical ports and physical memory can reveal interesting informations on the BIOS and CMOS chips. Those techniques are not 'new' in themselves since OSes rely on them, but the lack of publications on this topic made me feel this could be of some interest to potential readers. Feel free to mail me if you experiment those techniques and discover other applications of those. I couldn't expose Bios ROM modifications in this article. I will sublit a second paper later conserning those points. I will particullary try to figure out how to fix the vulnerabilities exposed in the present article by patching the Bios ROM.

-- [6 - Greetings & References

* Greetings :

Thanks to Christophe Grenier for his mails and patience. Thanks a lot to m and Benoit for their support and relecture. I would also thank phrack's staff and contributors for those 20+ years of intellectual stimulation and endless source of creativity : this is what hacking is all about. Readers that only read this article to figure out how to dump passwords should go back to counter strike and msn messenger. Those who liked the new ideas and methods can send me some feedback through mail :)
