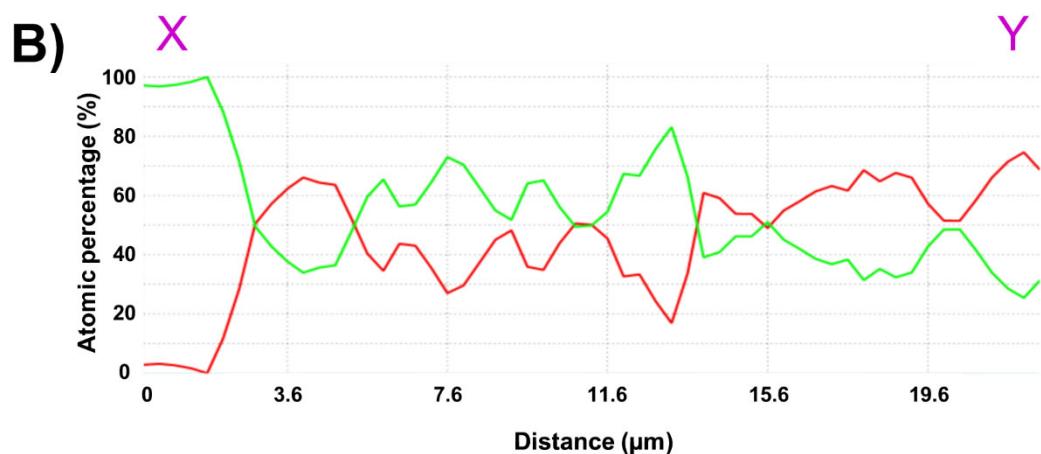

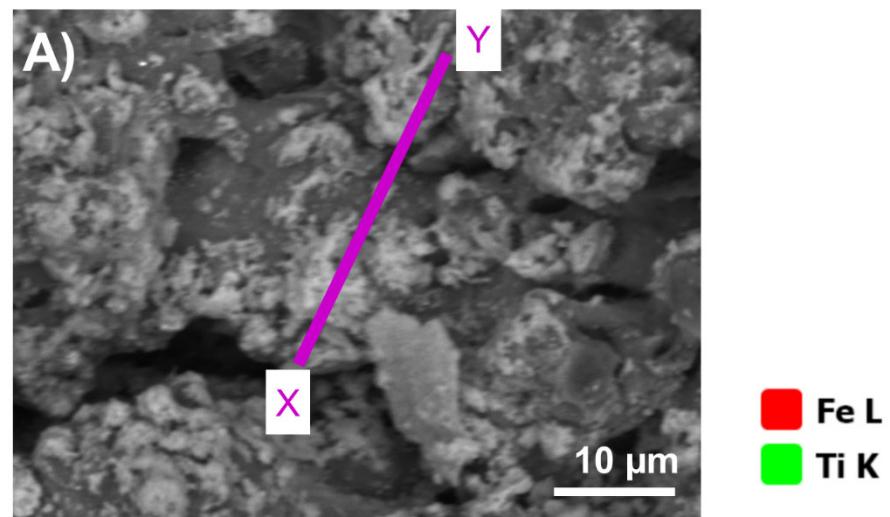

Figure S1: A) SEM image in BSE mode of the sample after reduction of the iron and titanium solution with sodium borohydride. B) The EDX analysis corresponding to the A-B line.

Table S1: All cycle sorptions performed for the TiFe@Carbo(HIPE) samples.

	Cycle 1 sorption (wt.%)	Cycle 2 sorption (wt.%)	Cycle 3 sorption (wt.%)	Average sorption (wt.%)
25 °C	0.47	0.51	0.40	0.46 ± 0.06
150 °C	0.17	0.31	0.23	0.25 ± 0.07

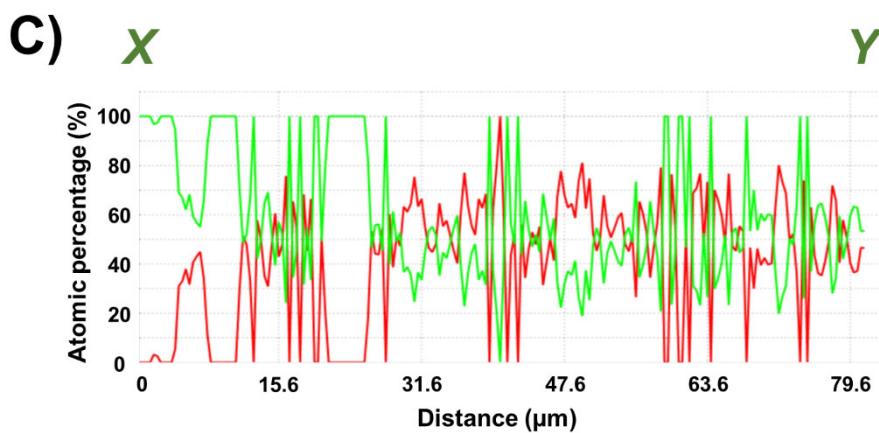

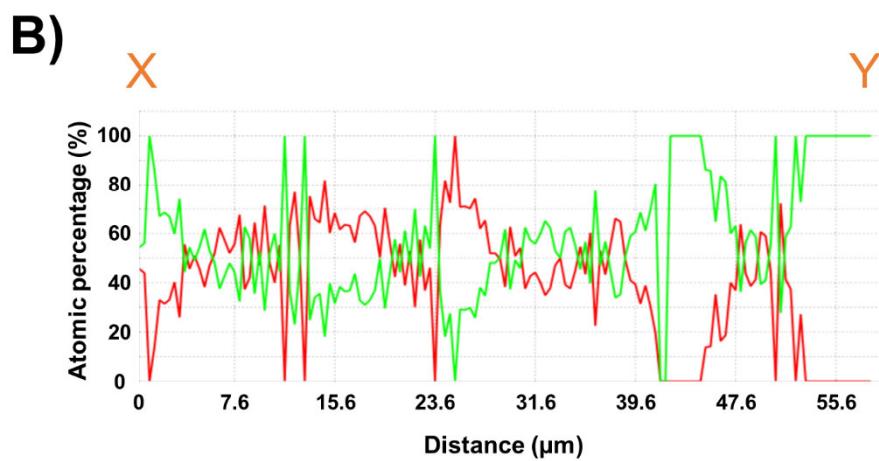

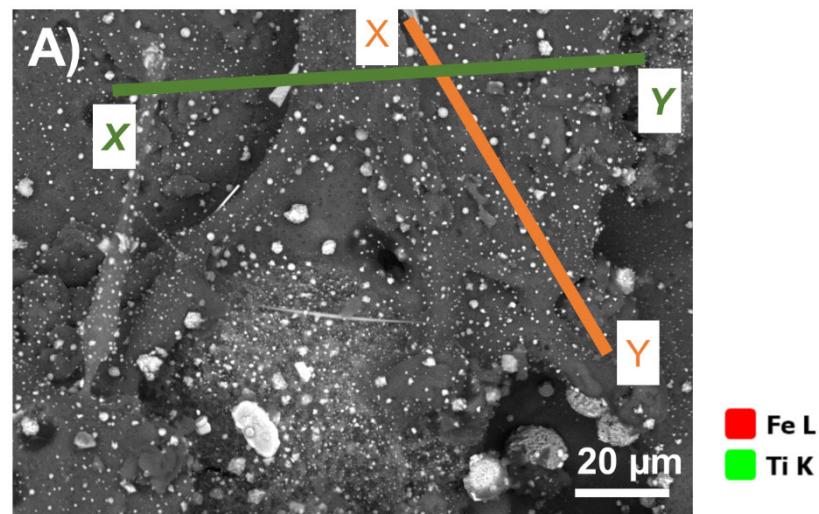

Figure S2: A) SEM picture of the sample “post-mortem” (*i.e.* after hydrogen absorption) recorded on BSE mode with enclosed B) and C) EDX study of the remnant structure at the surface, corresponding to their respective lines on the SEM image.
