HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

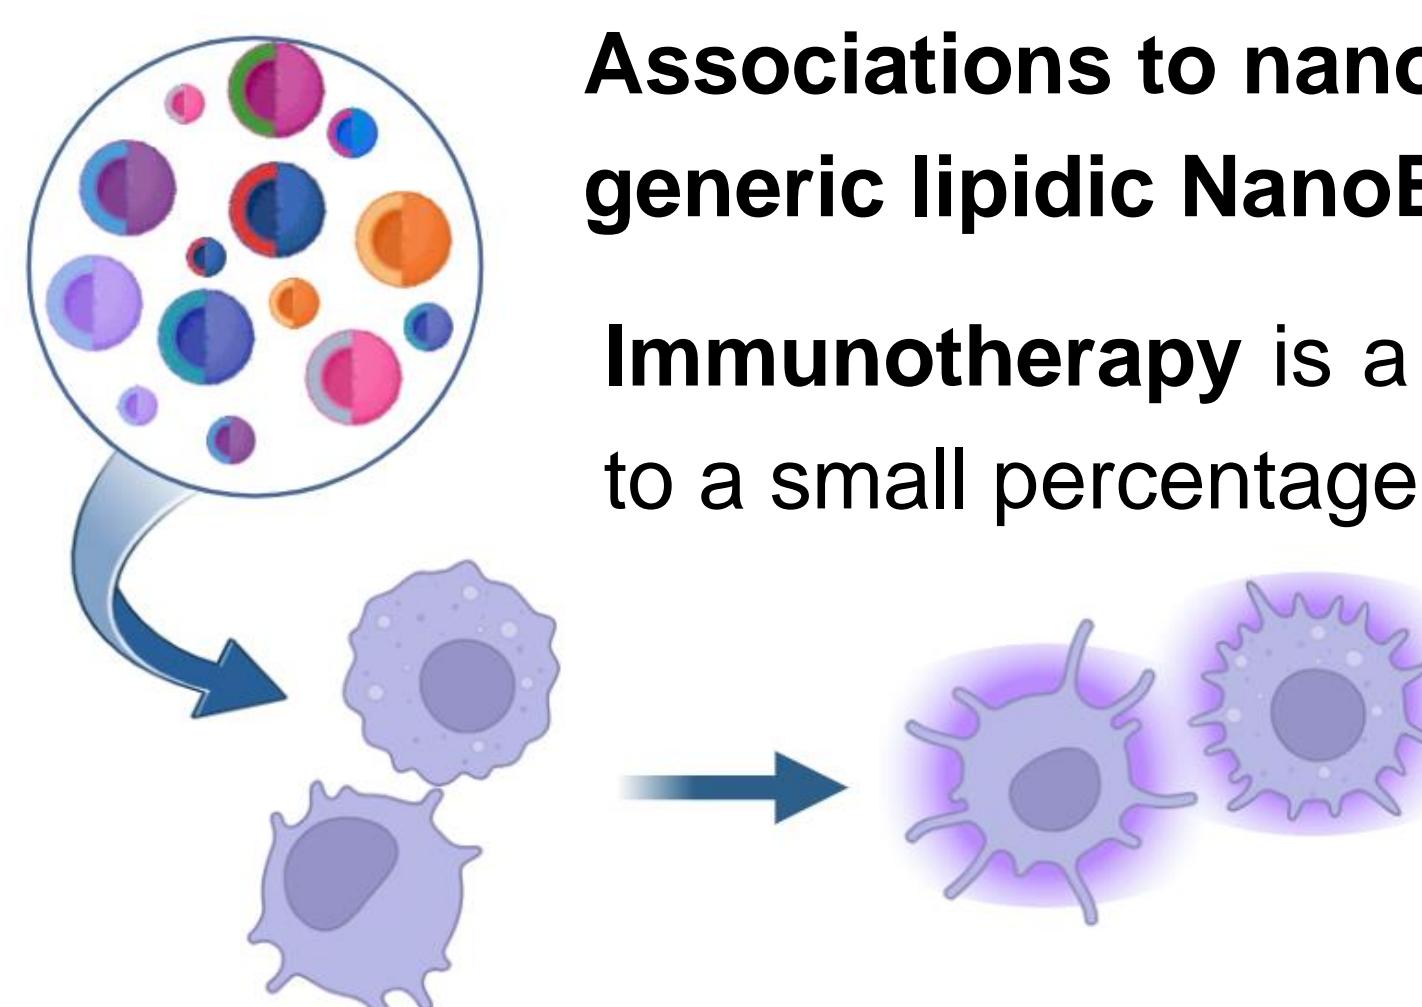

SCREENING OF LIPOSOME FEATURES FOR IMMUNOMODULATION

MOTIVATIONS & OBJECTIVES

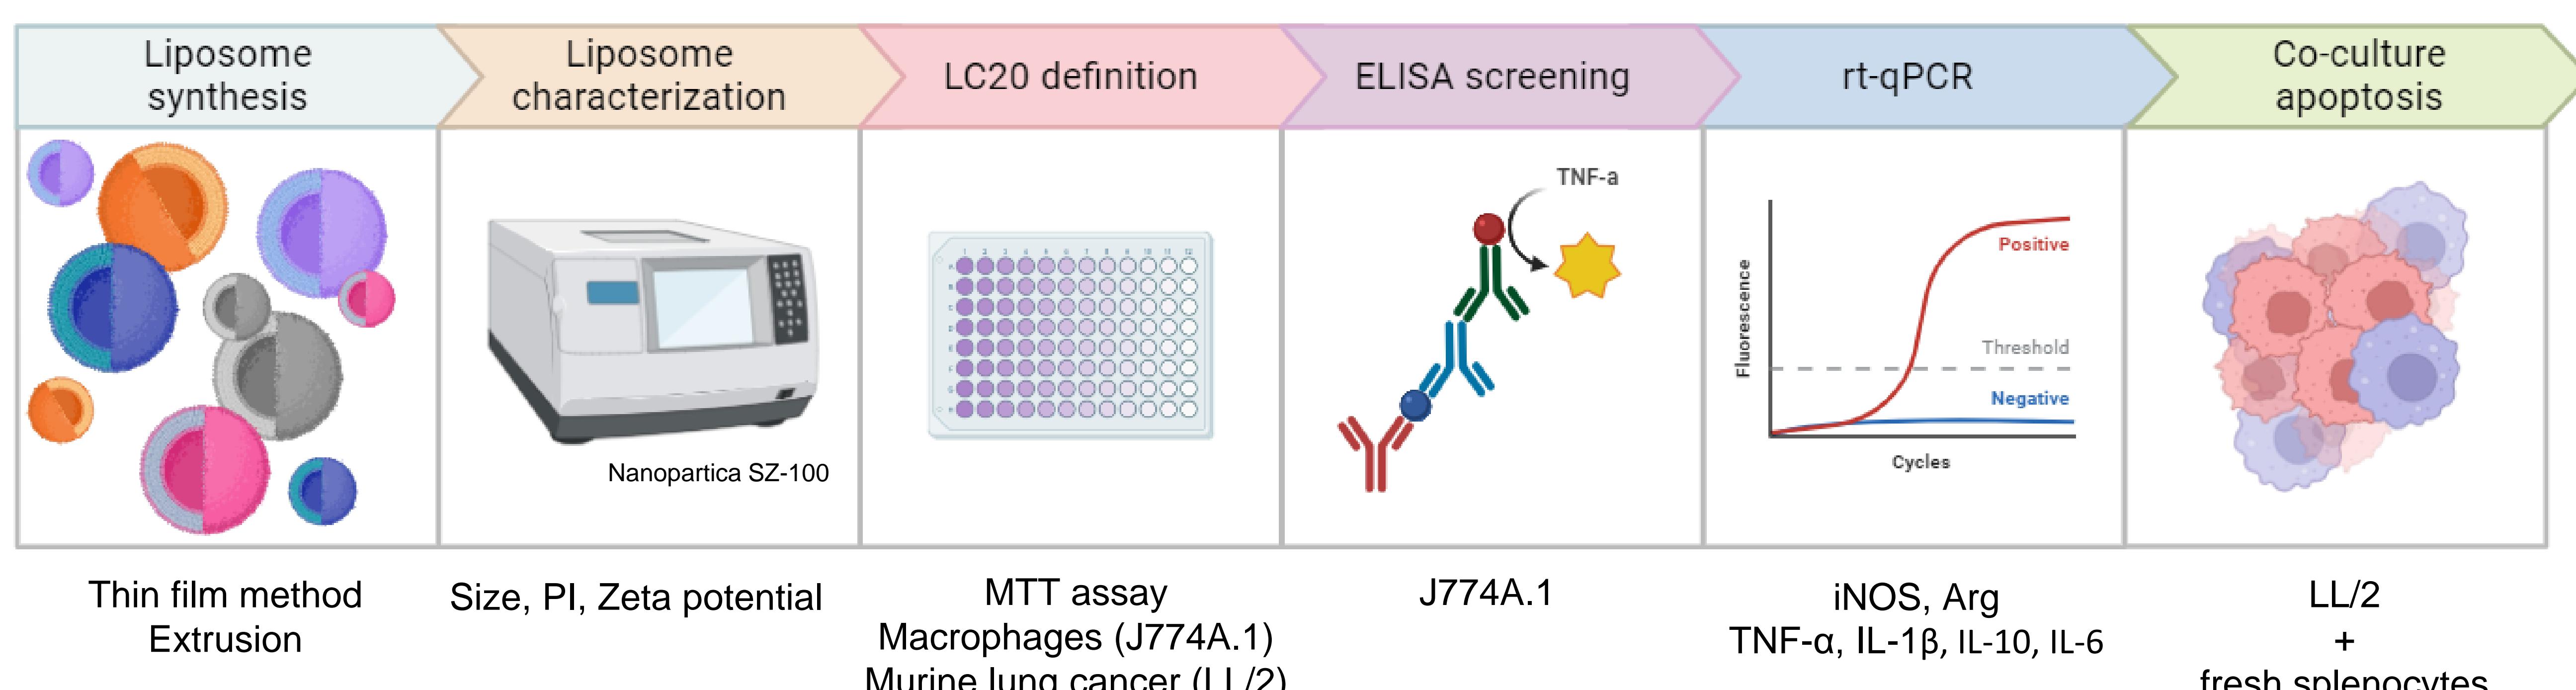

Associations to nanoparticles have been explored, mostly focusing on preexisting or complex nanosystems. Thus, we want to propose a **generic lipidic NanoBooster** that can **easily be transposed in the clinic**.

Immunotherapy is a major innovation in cancer drug. However, because of limited immunogenicity, these treatments are only beneficial to a small percentage of patients.

Impact of composition (DOTAP, DOTMA, DDA, DC-chol PC), size (Small (S) and Large (L) population) and zeta potential of liposomes were investigated.

METHODS

Two population size:
90 nm (S) and < 250nm (L)
Homogenic batches PI<0,3
Cationic and neutral
formulations

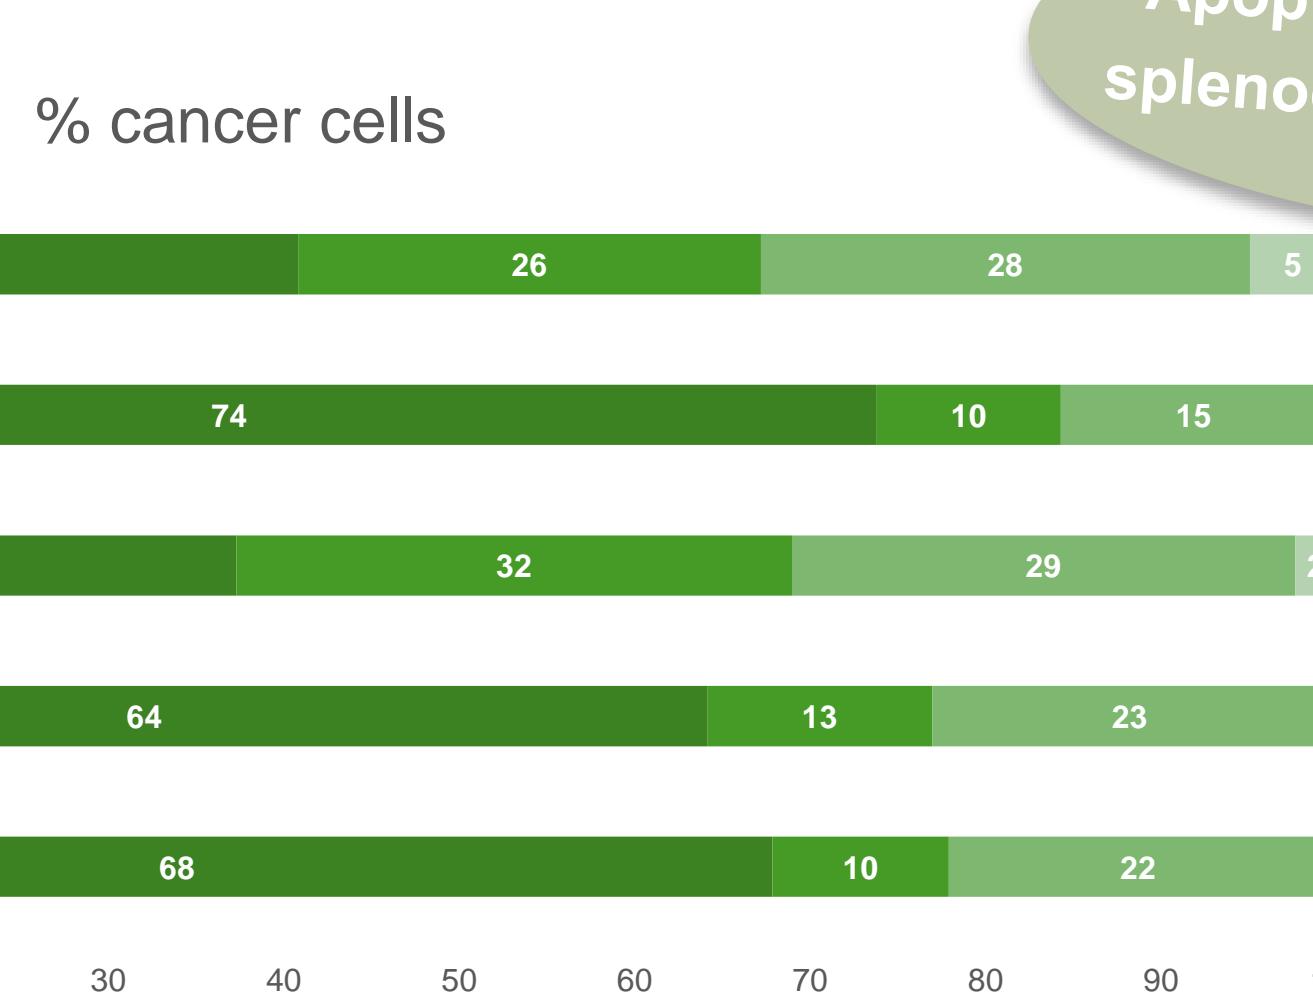

RESULTS

Liposome characterization and LC20 definition

PC and DDA formulations
are much less cytotoxic
