**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

## INTRODUCTION

### Objectives

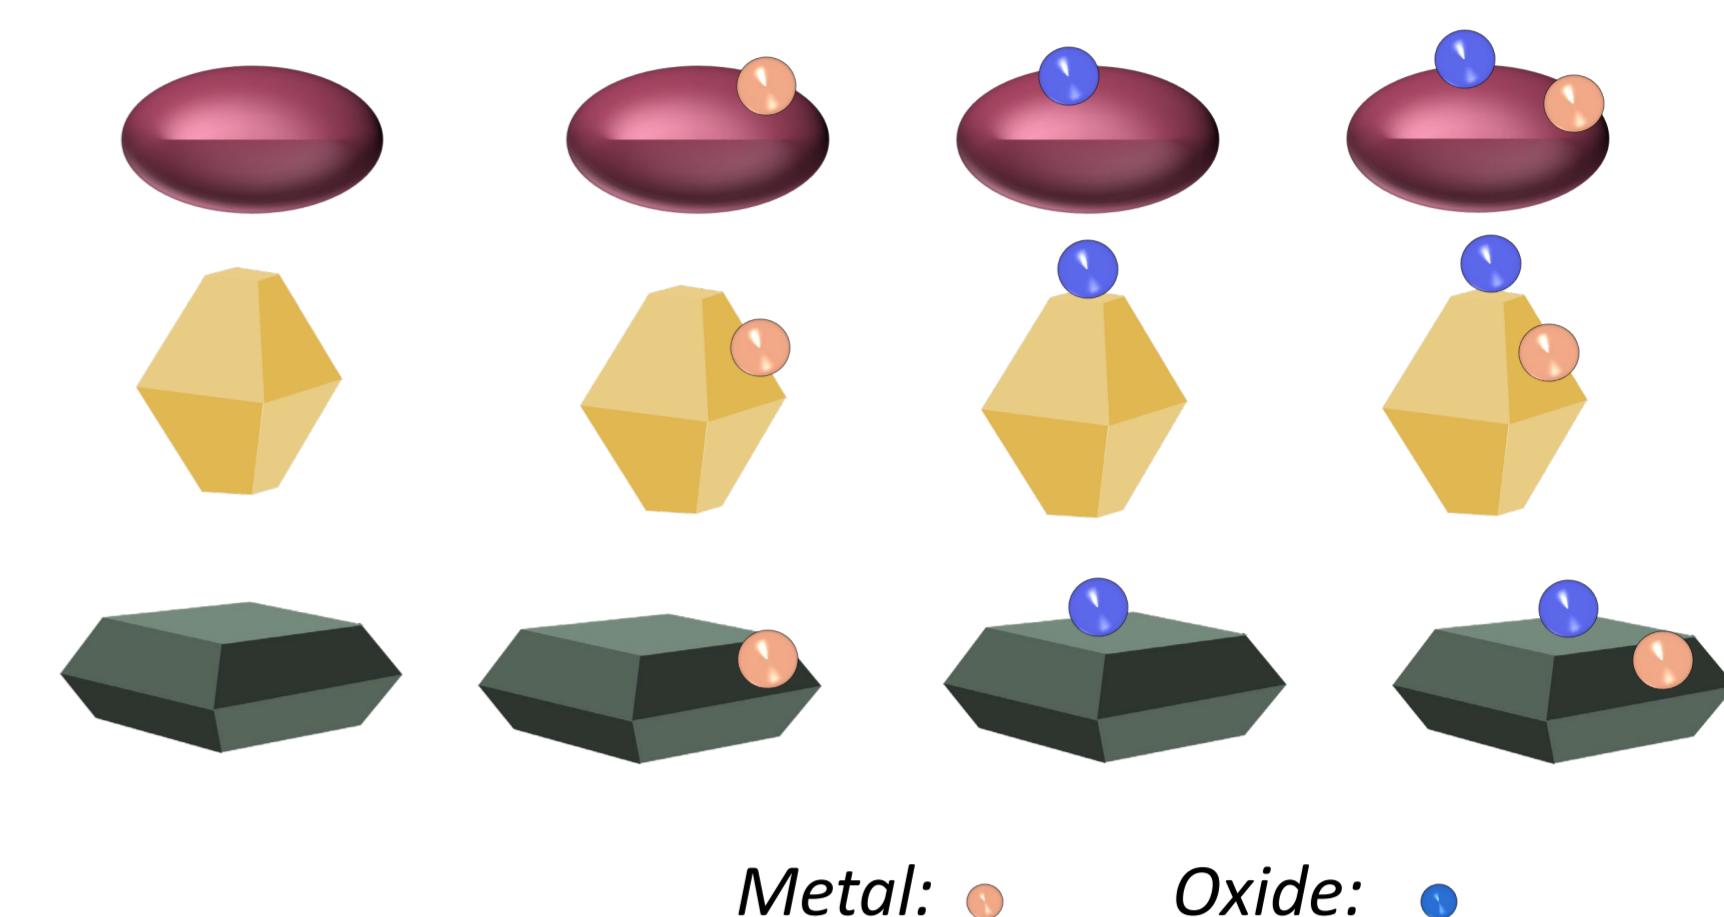

Develop a clean and renewable energy using **photocatalysis** based on solar energy

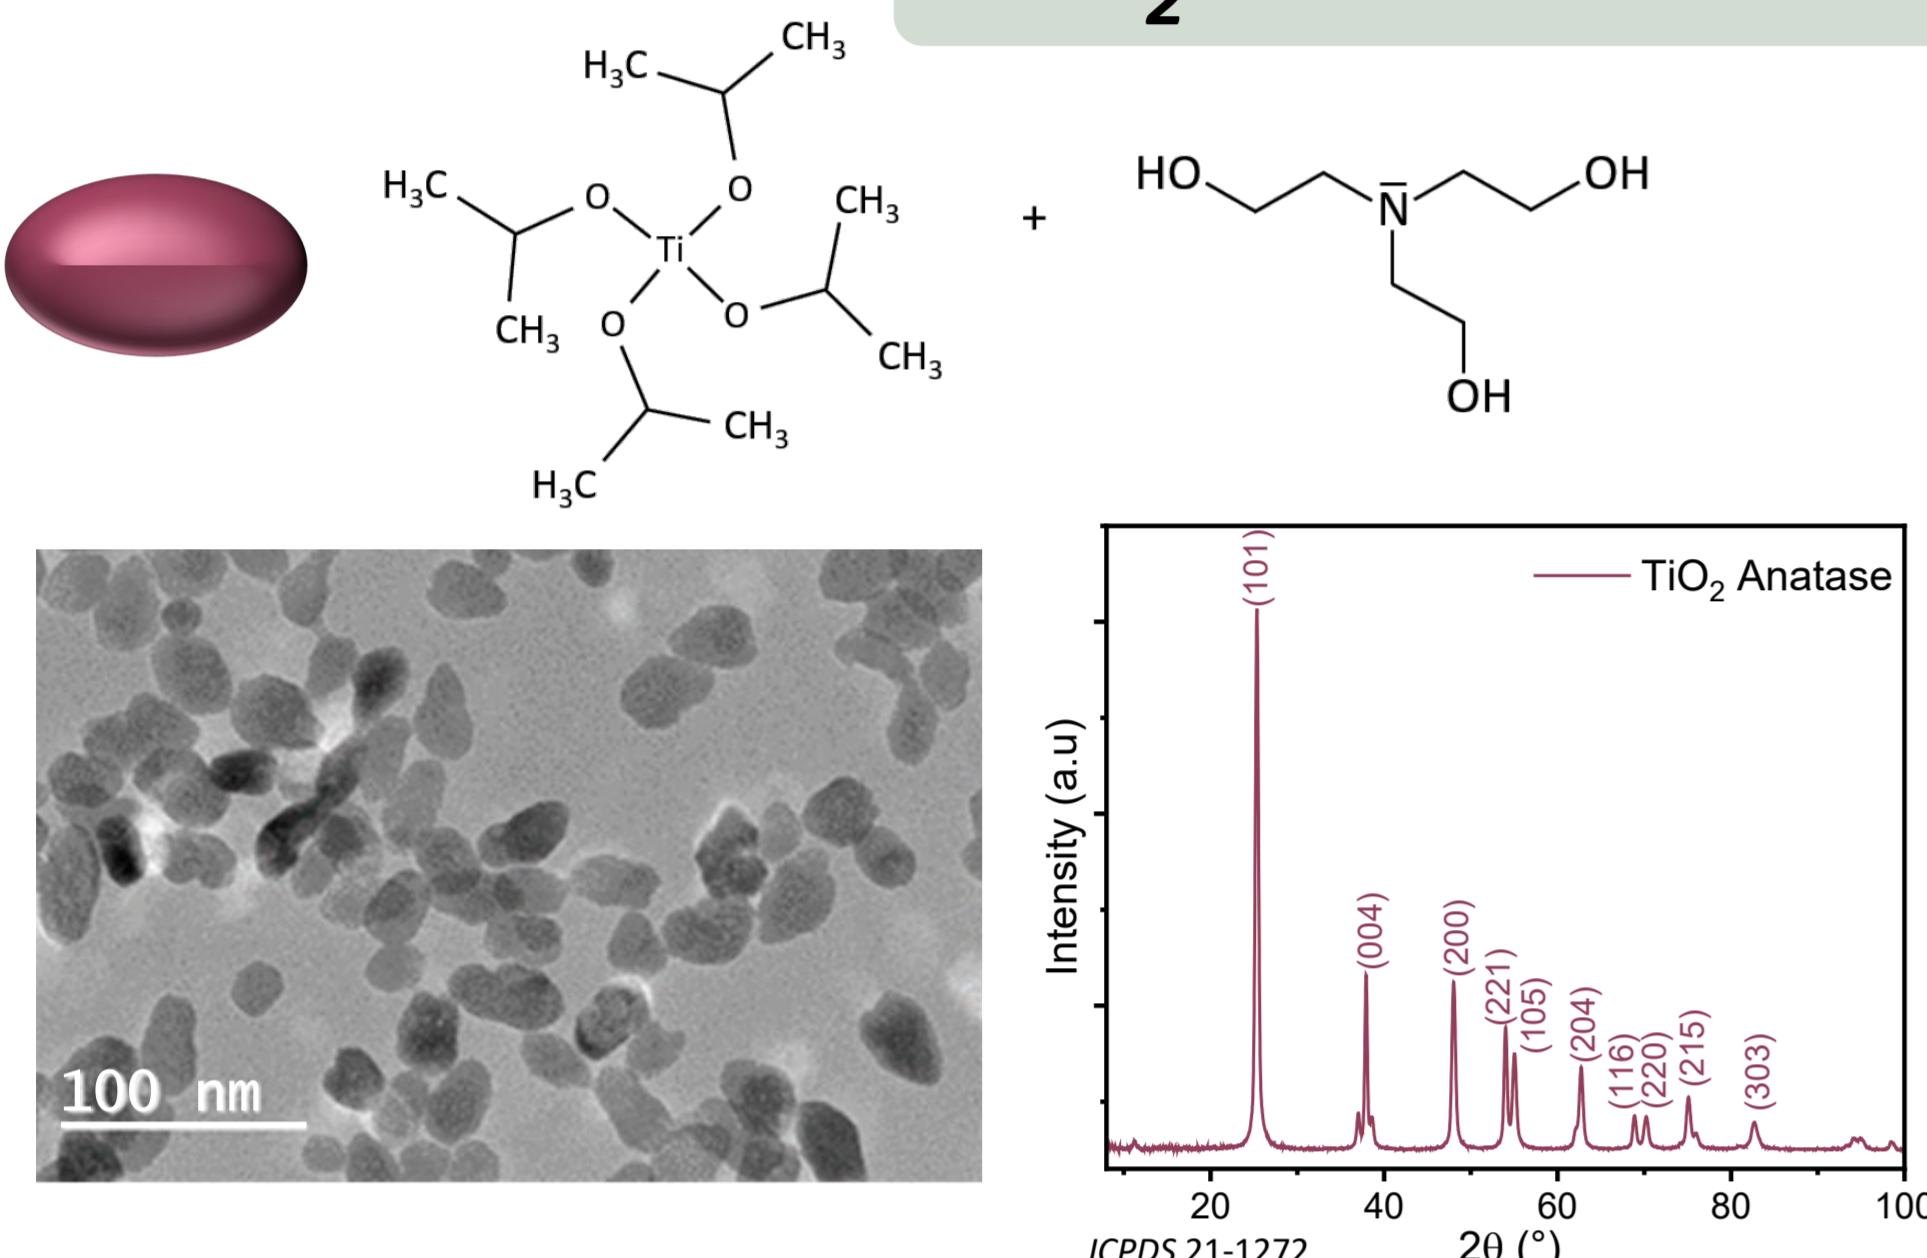

### Strategy

Coupling a co-catalyst to metal oxide semiconductor using **laser photodeposition**  
↓  
Nano-heterodimers (NHD)

Variety of semiconductor shapes to control the deposition of metals and/or oxides on specific facets <sup>1</sup>

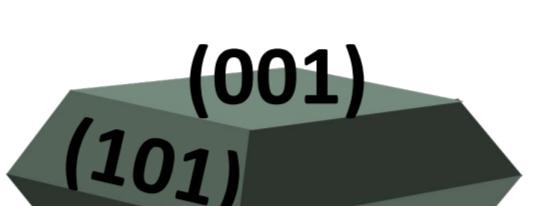

## TiO<sub>2</sub> NPs SYNTHESIS

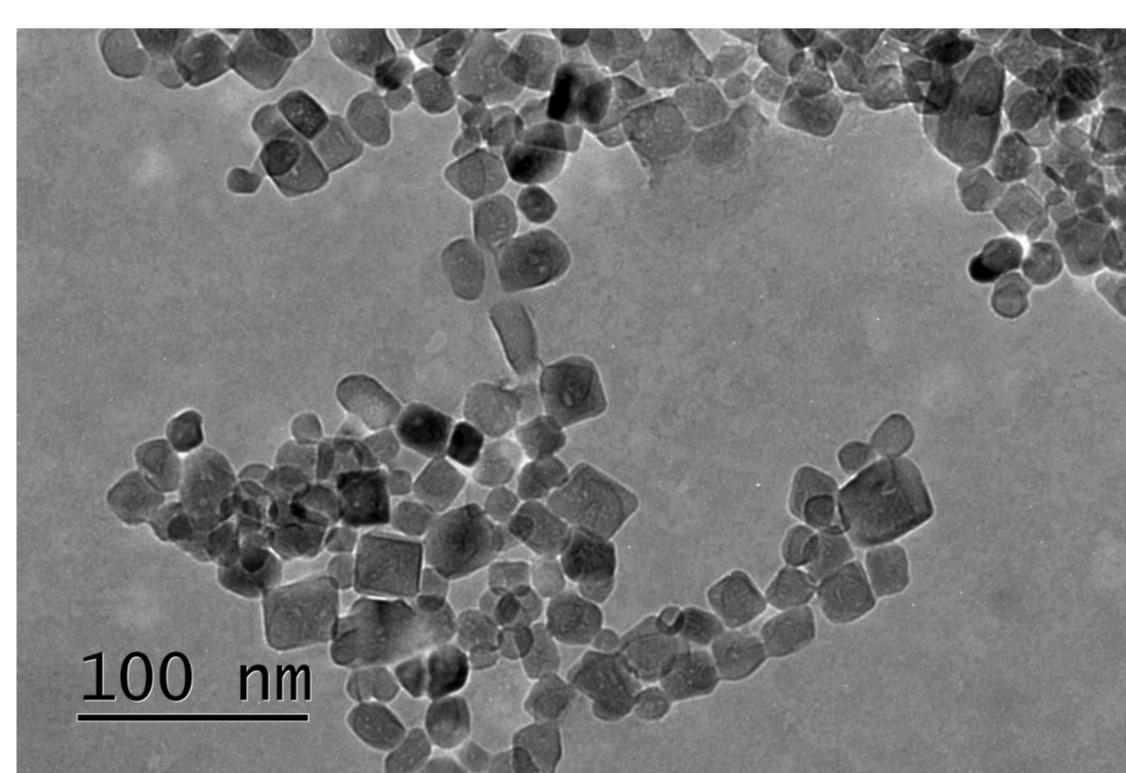

- Two-step hydrothermal synthesis <sup>2</sup>
- Low temperature requirement
- Cheap and easily up-scalable

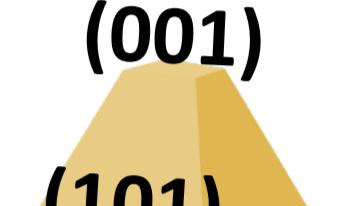

## SHAPE CONTROL

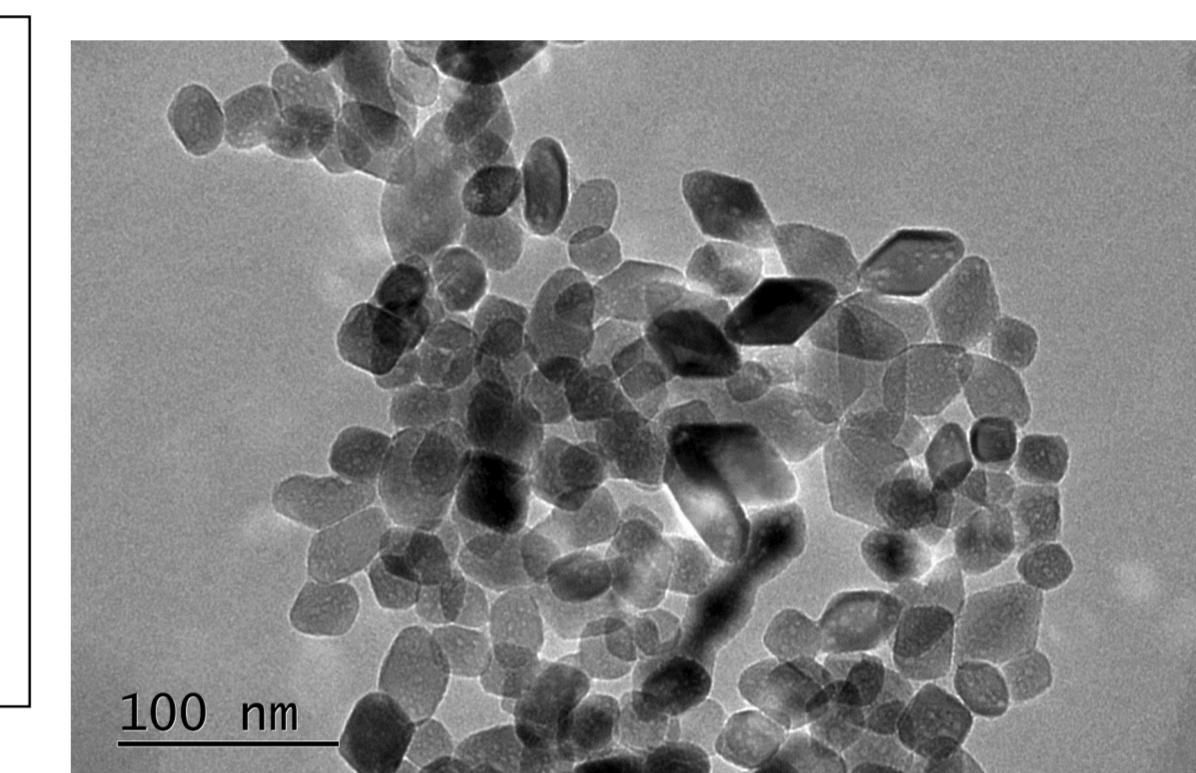

Addition of oleic acid as a capping agent <sup>3</sup>

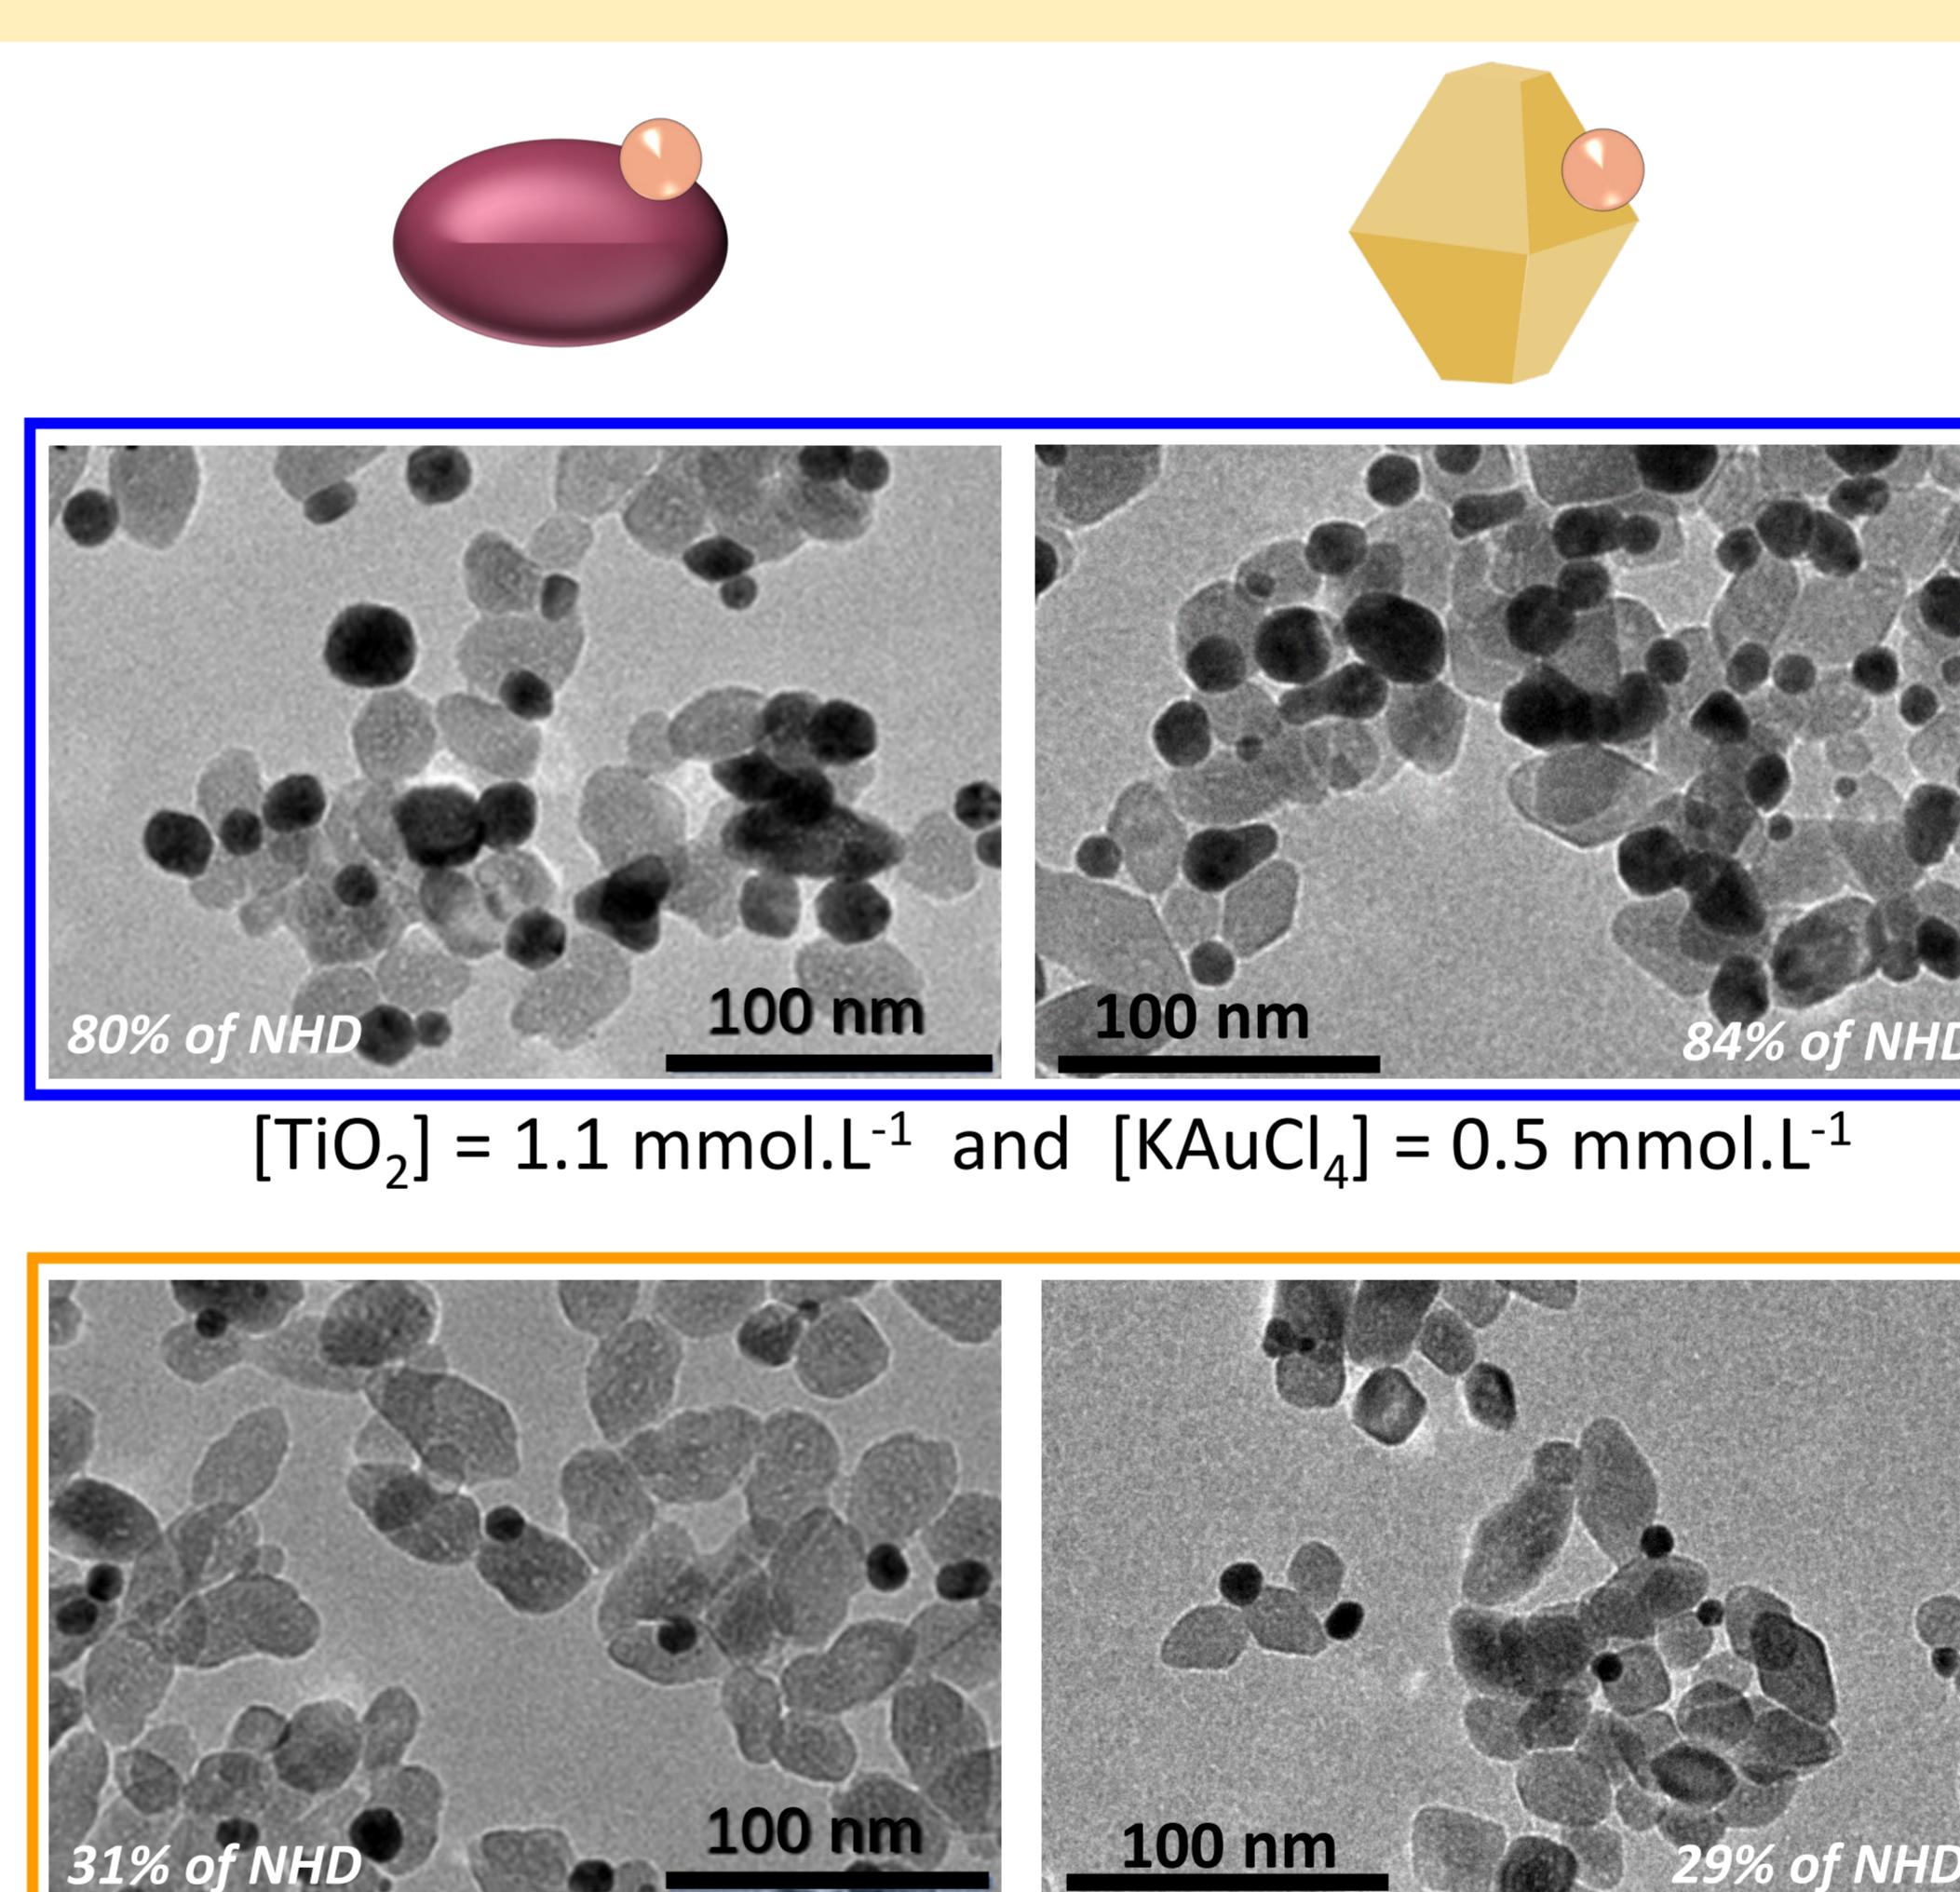

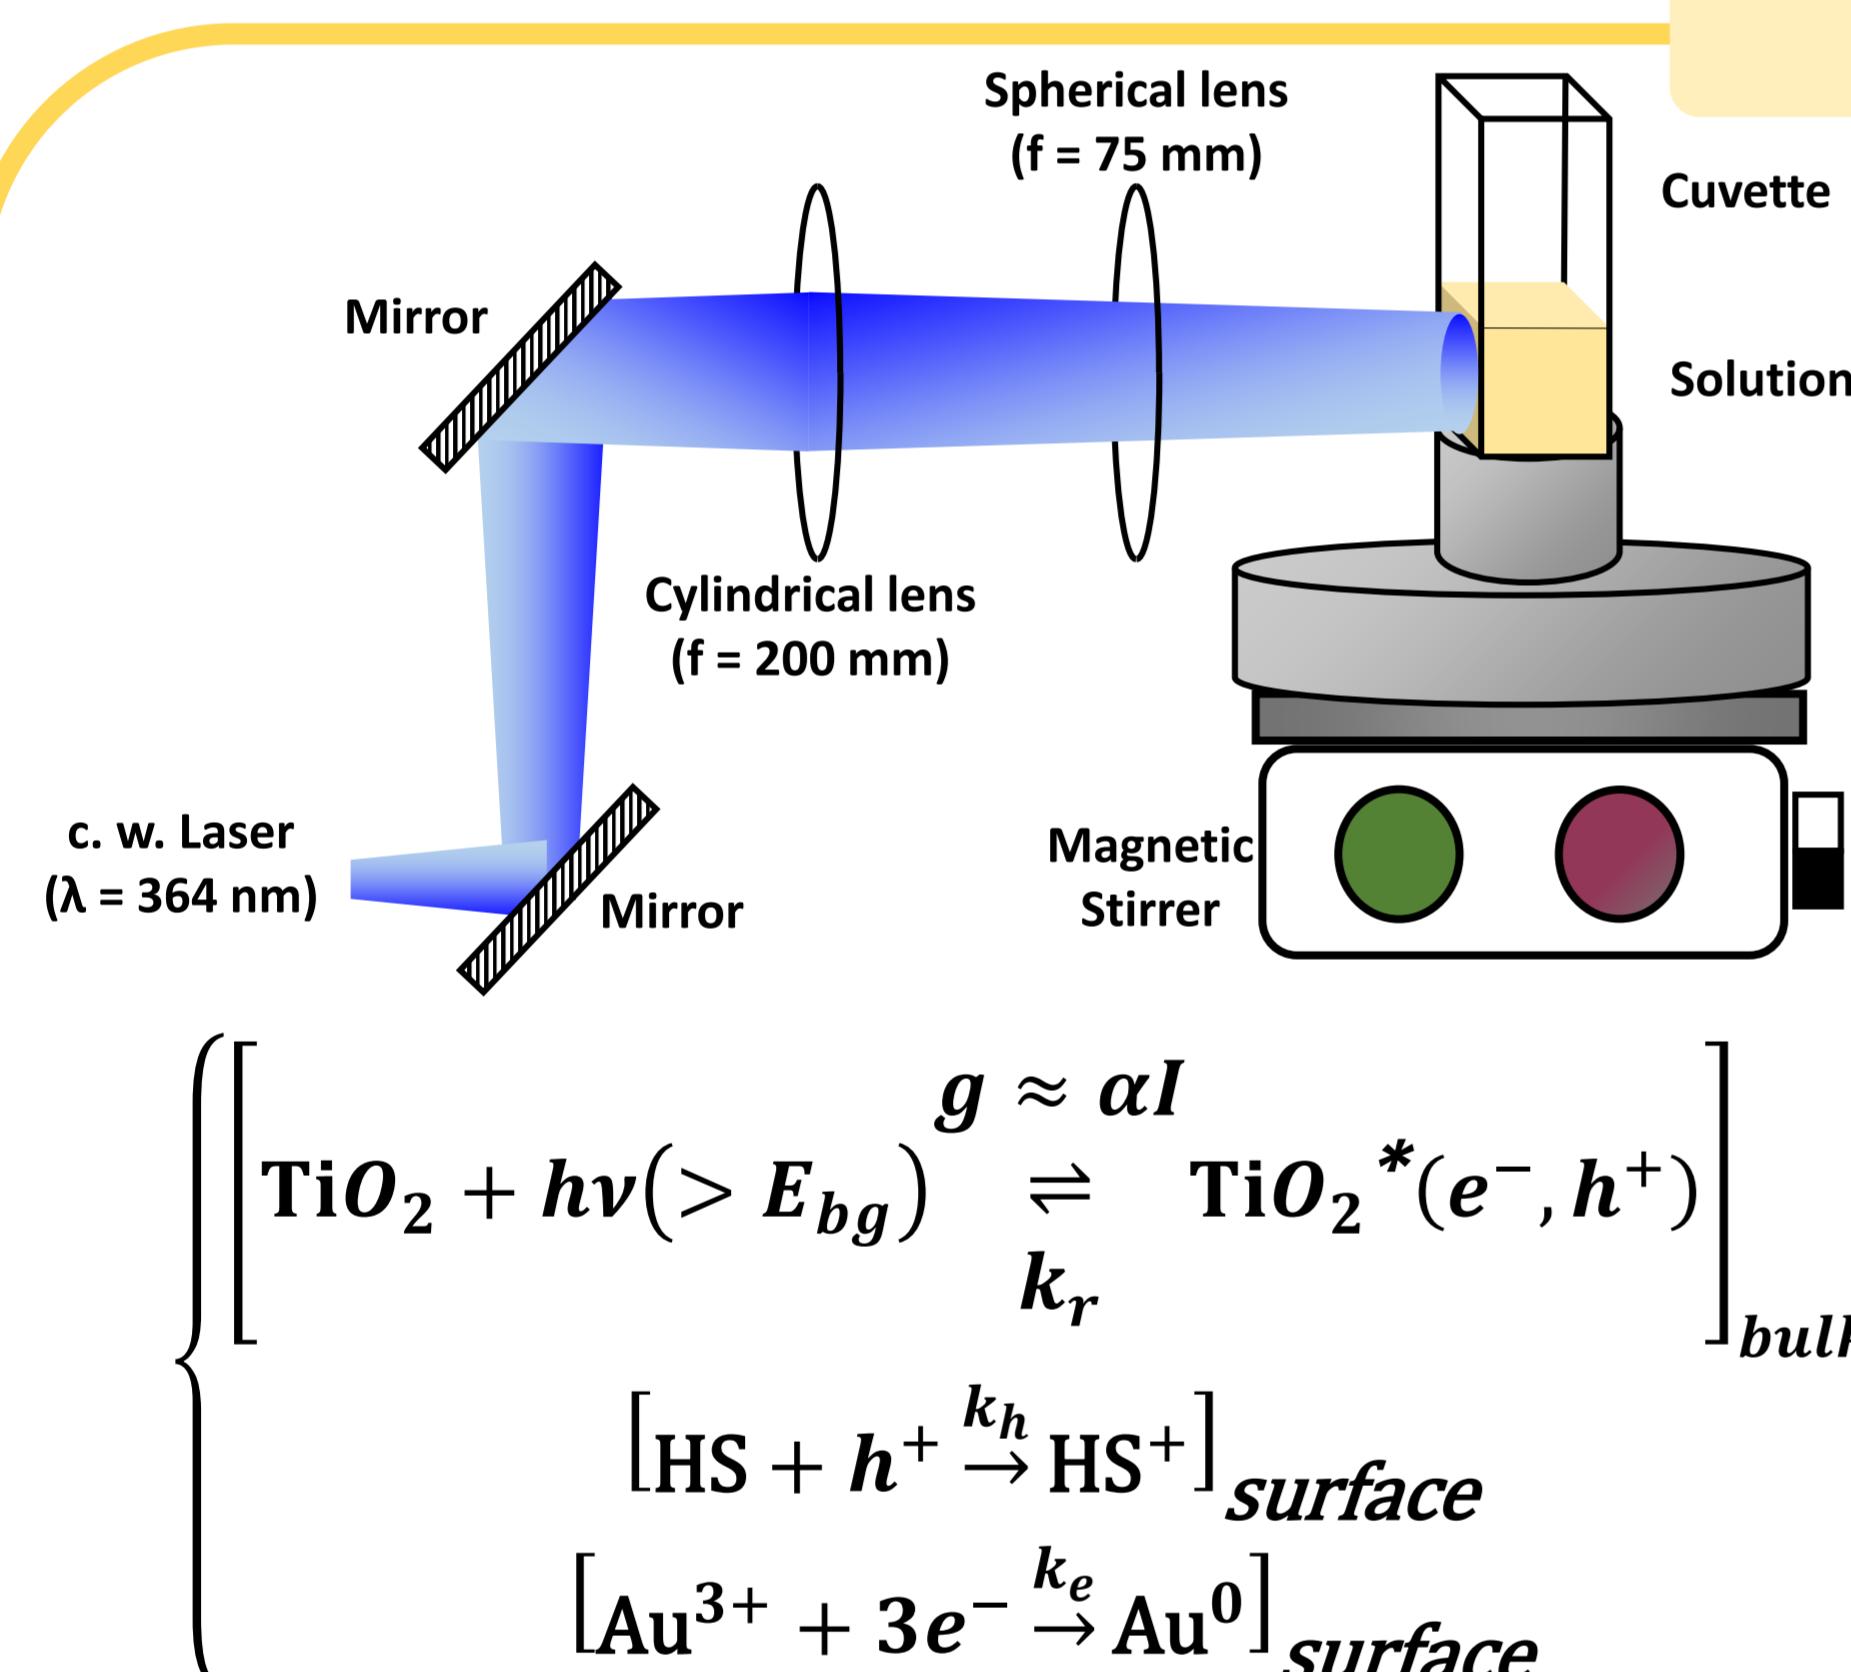

Facets {001} and {101} present in different proportions

One-step hydrothermal reaction with reduced precursor concentration <sup>4</sup>

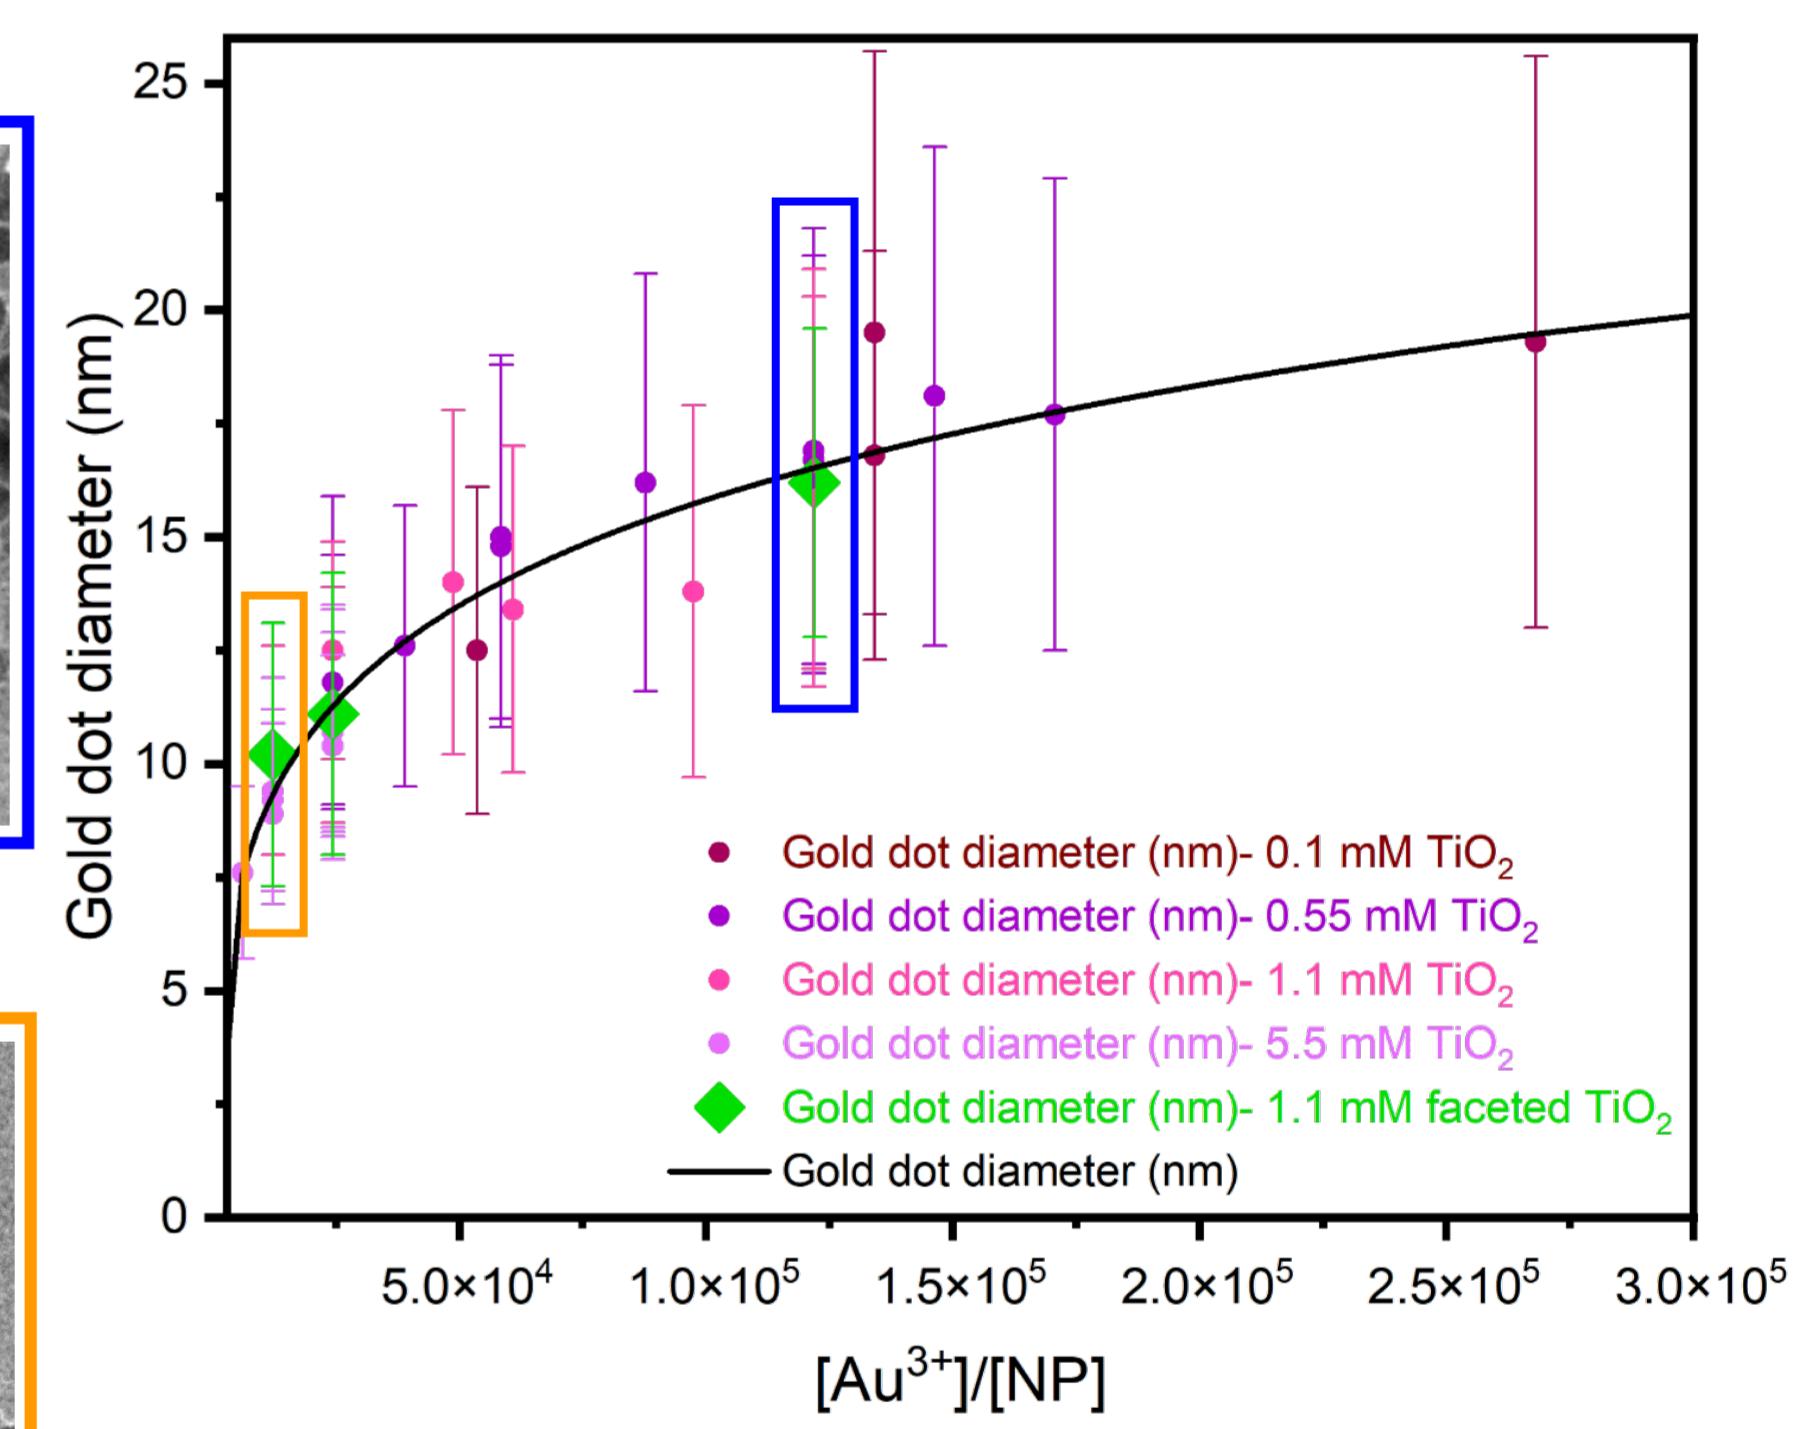

## LASER PHOTODEPOSITION AND GROWTH MODEL

### Fixed parameters <sup>5</sup>

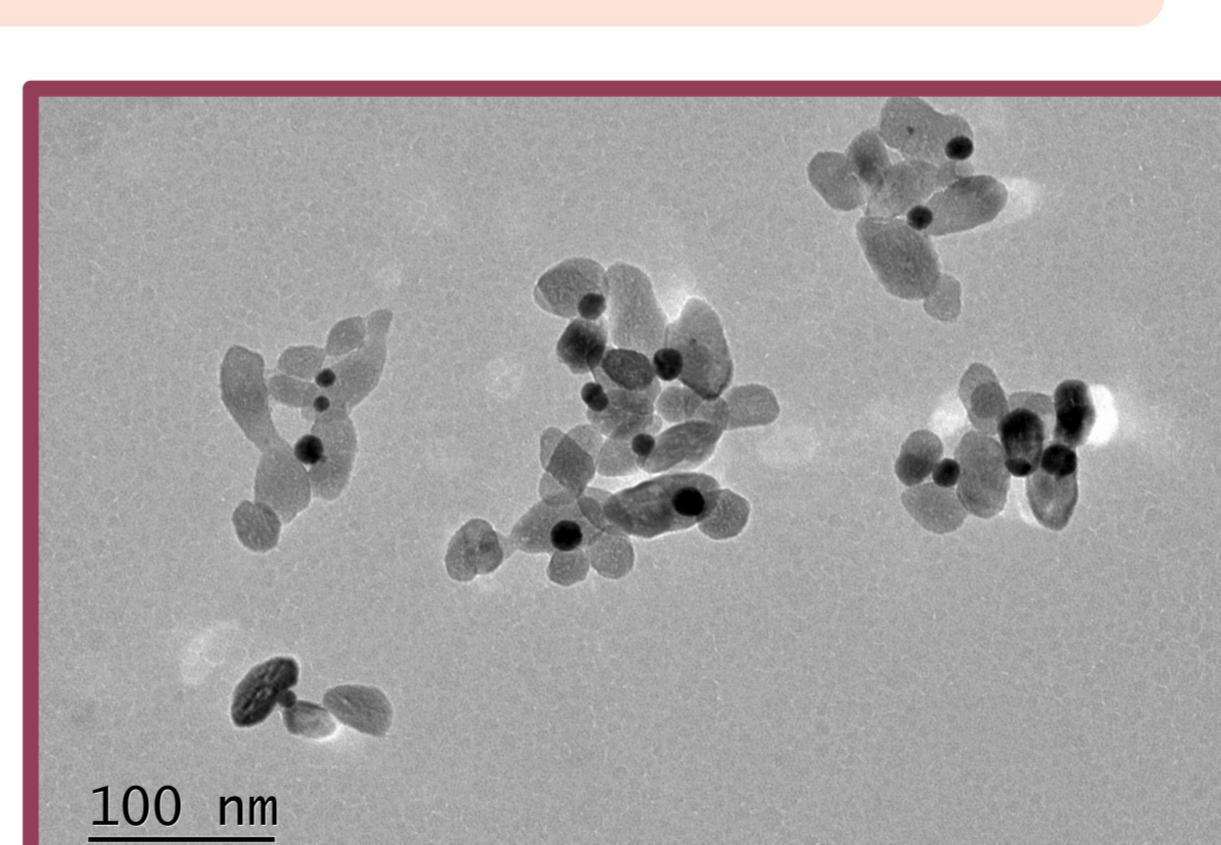

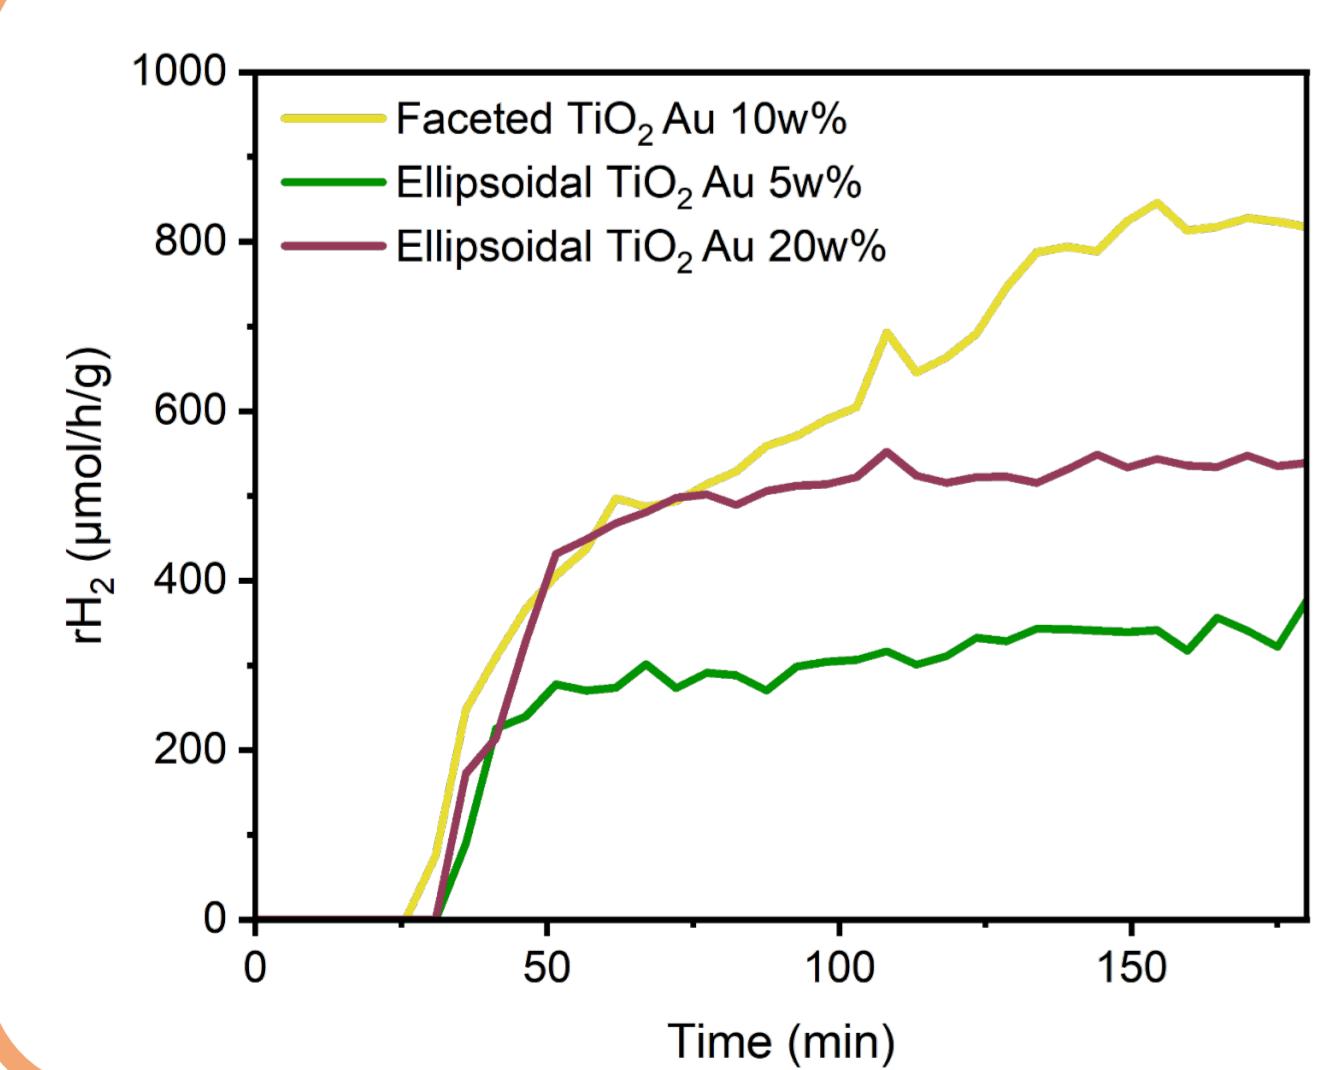

- Reaction under Argon
- Methanol (50%v) as a hole scavenger
- Power of the laser in the cuvette: 56 mW
- pH = 3 controlled with HNO<sub>3</sub>
- Exposure time: 8 min

### At completion:

$$D_{Au}^{t \rightarrow \infty} = \left( \frac{8}{\pi \kappa(\theta)} \frac{v_{Au}}{\bar{Y}} \right)^{1/3} \cdot \left[ \frac{[Au^{3+}]_0}{[NP]} \right]^{1/3}$$

## HYDROGEN PRODUCTION

Au deposition  
Hydrogen production

Next target: increase this production by synthesis modulations

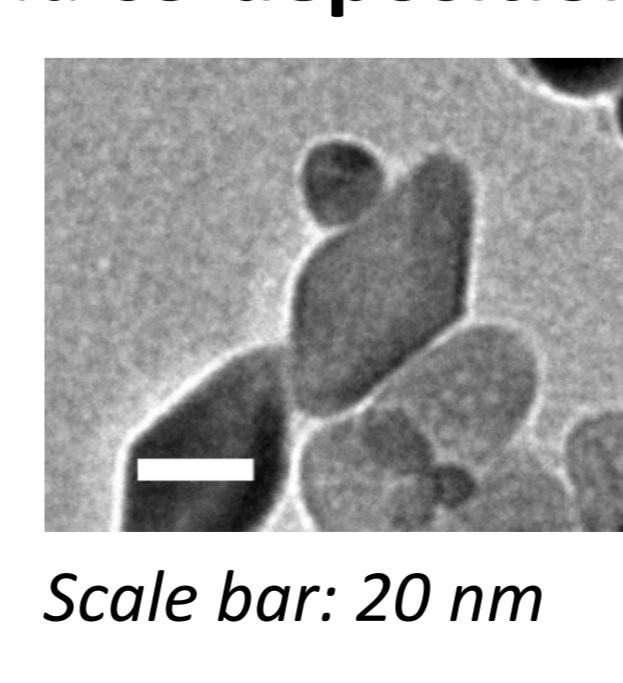

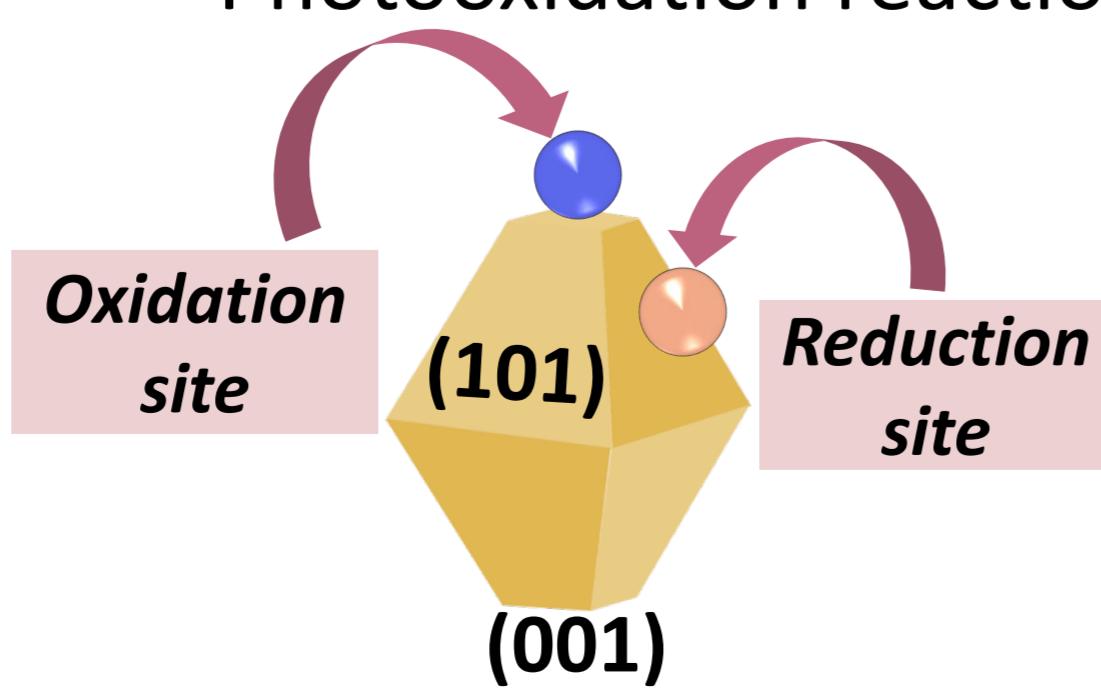

Collaboration: T. Cottineau University of Strasbourg/ ICEEPS

## CONCLUSIONS

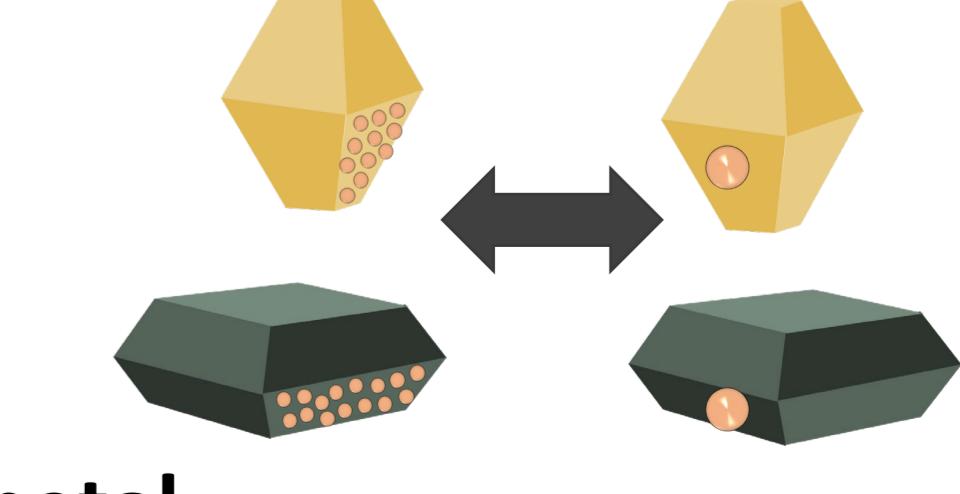

- Synthesis of the semiconductor ✓
- Shape control of TiO<sub>2</sub> ✓
- Laser photodeposition ✘
- Photoreduction reactions ✘

## PERSPECTIVES

- Photooxidation reactions and co-deposition

- Transition from a single dot to multidots
- Improve the ratio of hydrogen production
- Extension to other metals and metal oxides
