HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

INTRODUCTION

Human-driven habitat degradation, climate change and biological invasions are major causes of current species mass extinction. In Europe where wetland surface area has declined by 90% since 1700s, the European pond turtle *Emys orbicularis* is considered as the reptile that suffered the most dramatic decline. Recently alien turtle species originated from America, Asia and Africa have been widely spread in Europe with high invasion potential threatening native biodiversity. In this study, we performed species distribution models and GIS modeling for the native European pond turtle and 7 of the most frequently recorded exotic freshwater turtles representative of invasive species throughout the range of the European pond turtle, in order to identify the most relevant priority areas for native biodiversity conservation in the context of global change.

MATERIALS & METHODS

Databases were created for the European pond turtle, and for 7 species originated from North America (the red-eared pond slider *Trachemys scripta*, the river cooter *Pseudemys concinna*, the Florida red-bellied cooter *Pseudemys nelsonii* and *Graptemys pseudogeographica*, from Asia (the Chinese soft-shell turtle *Pelodiscus sinensis*) and from middle East (the Caspian turtle *Mauremys caspica* and the Balkan terrapin *Mauremys rivulata*), using available points of registration of the target species using data published in literature, GBIF dataset and original field records.

Using Species Distribution Models based on CliMond climate dataset, and NGEI for freshwater ecosystems, we determined probabilistic models of distribution for the 8 species. We identified the major environmental drivers of species-specific distribution and potential overlaps for identifying priority areas for future conservation initiatives. GIS modeling was used to explore the potential distribution of each species, using Maxent v3.3.3 software with 25 replicates (Phillips 2005), 35 Bioclim variables and 5 bioclimatic covariates (CliMond; Kriticos et al. 2014; <https://www.climond.org/> accessed 27 December 2020).

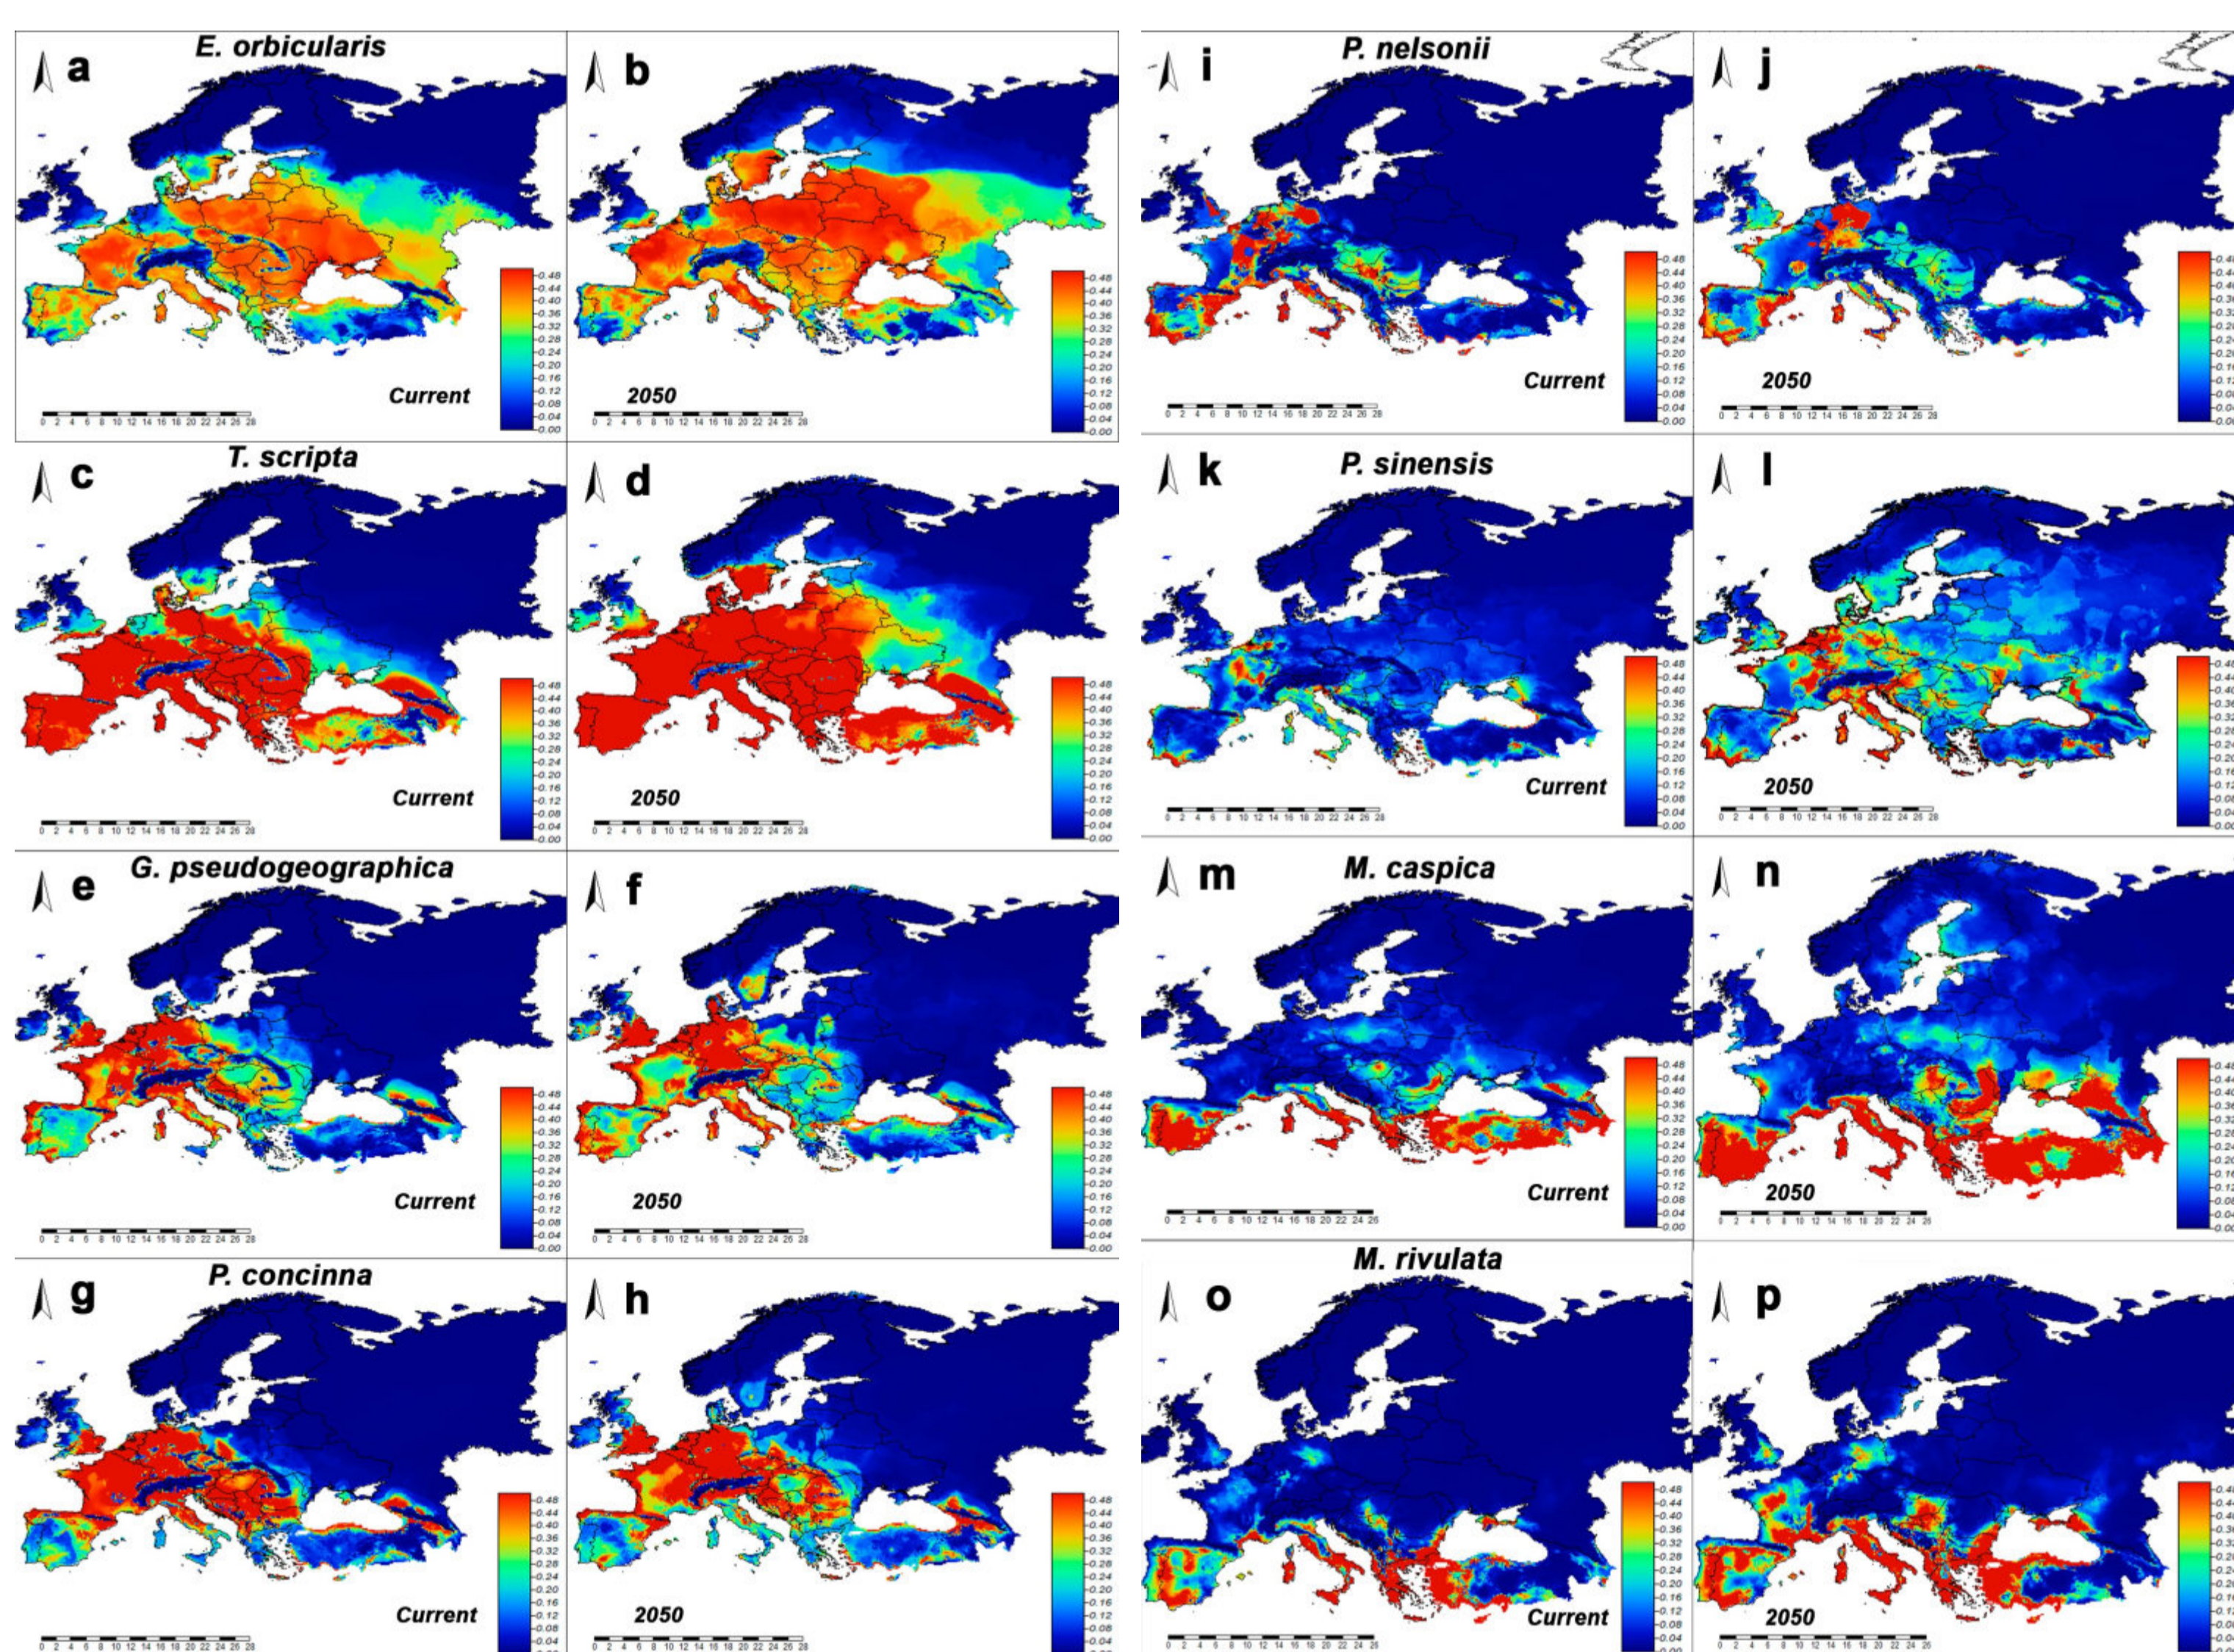

Fig 2. Potential (probabilistic) distribution model of: *E. orbicularis* (a - current; b - 2050); *T. scripta* (c - current; d - 2050); *G. pseudogeographica* (e - current; f - 2050); *P. concinna* (g - current; h - 2050); *P. nelsonii* (i - current; j - 2050); *P. sinensis* (k - current; l - 2050); *M. caspica* (m - current; n - 2050); *M. rivulata* (o - current; p - 2050).

RESULTS

Our models of present distributions of the 8 turtle species show that currently *T. scripta* and *G. pseudogeographica* share similar distributional drivers as the European pond turtle (Fig 1). These two exotic species exhibit highest ecological flexibility, occupying most habitats suitable for native *E. orbicularis* with ~45% overlap at the scale of (mainly Western) Europe (Fig 2). By 2050, this overlap will increase (Fig 2), except in Northern and Eastern Europe where *E. orbicularis* is predicted to expand its range by 700 km, while exotic turtles spread only up to Southwestern Ukraine (Fig 3).

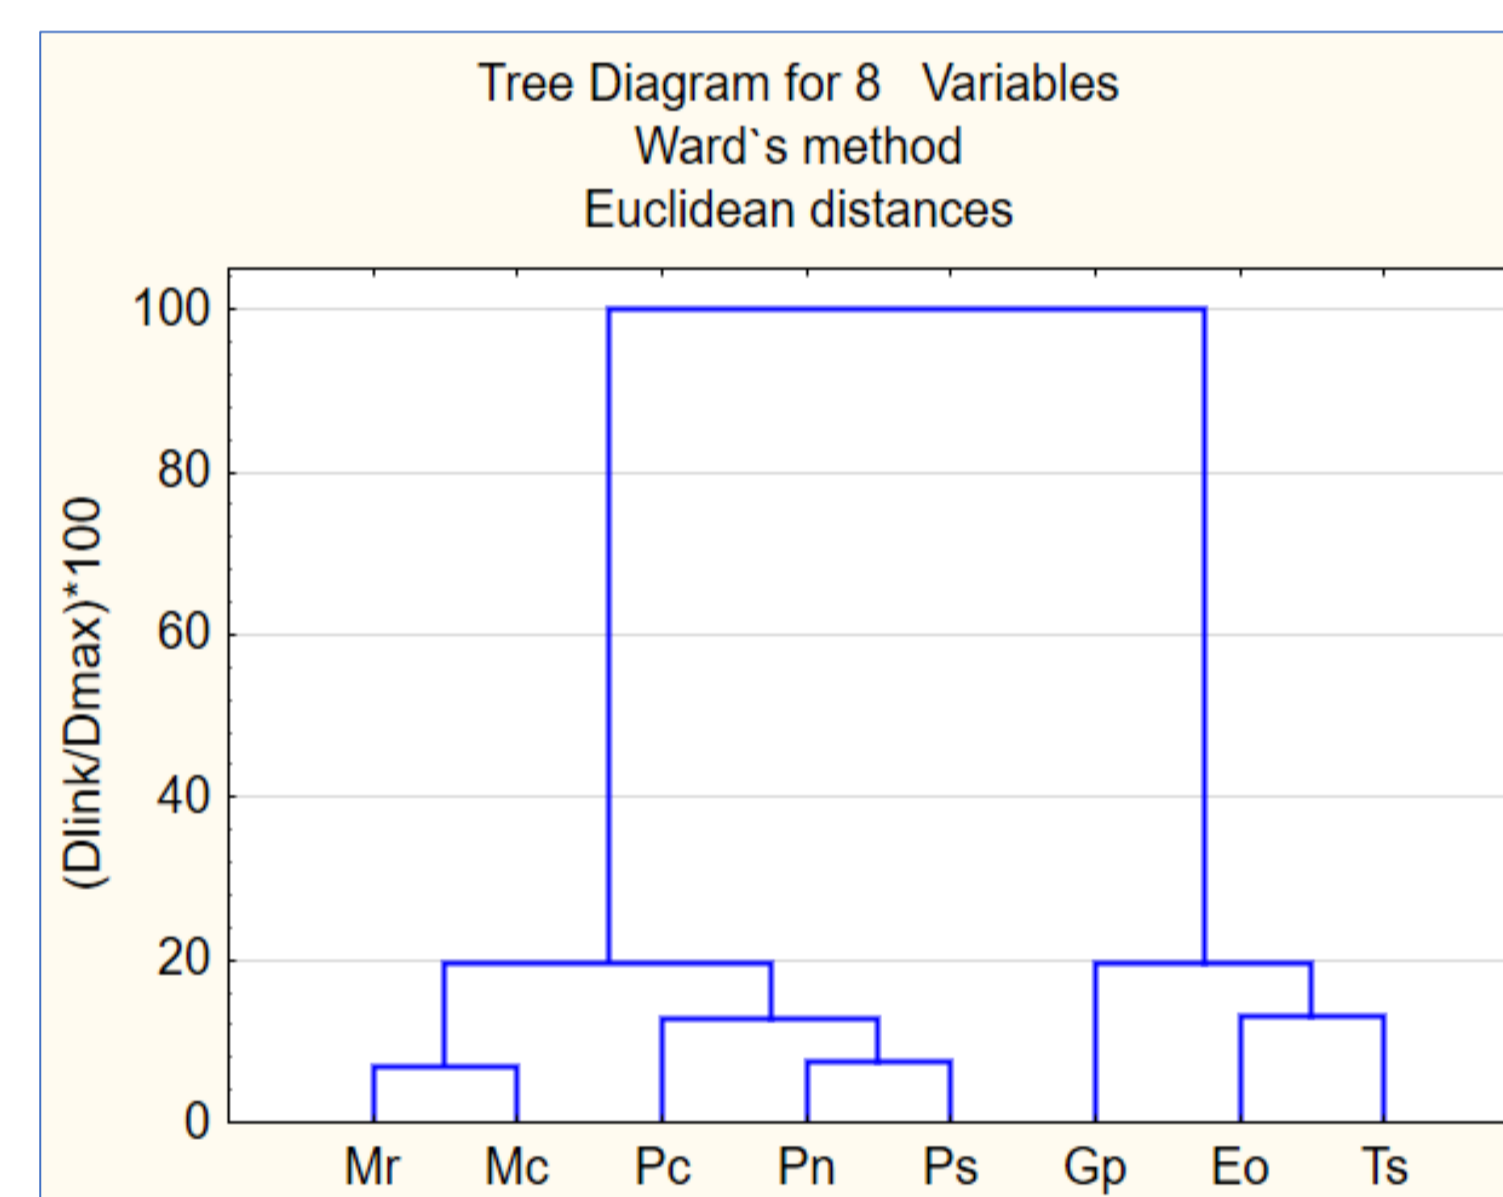

Fig 1. Results of cluster analysis with the use of distributional data: Mc – *M. caspica*, Mr – *M. rivulata*, Pc – *P. concinna*, Pn – *P. nelsonii*, Ps – *P. sinensis*, Gp – *G. pseudogeographica*, Eo – *E. orbicularis*, Ts – *T. scripta*.

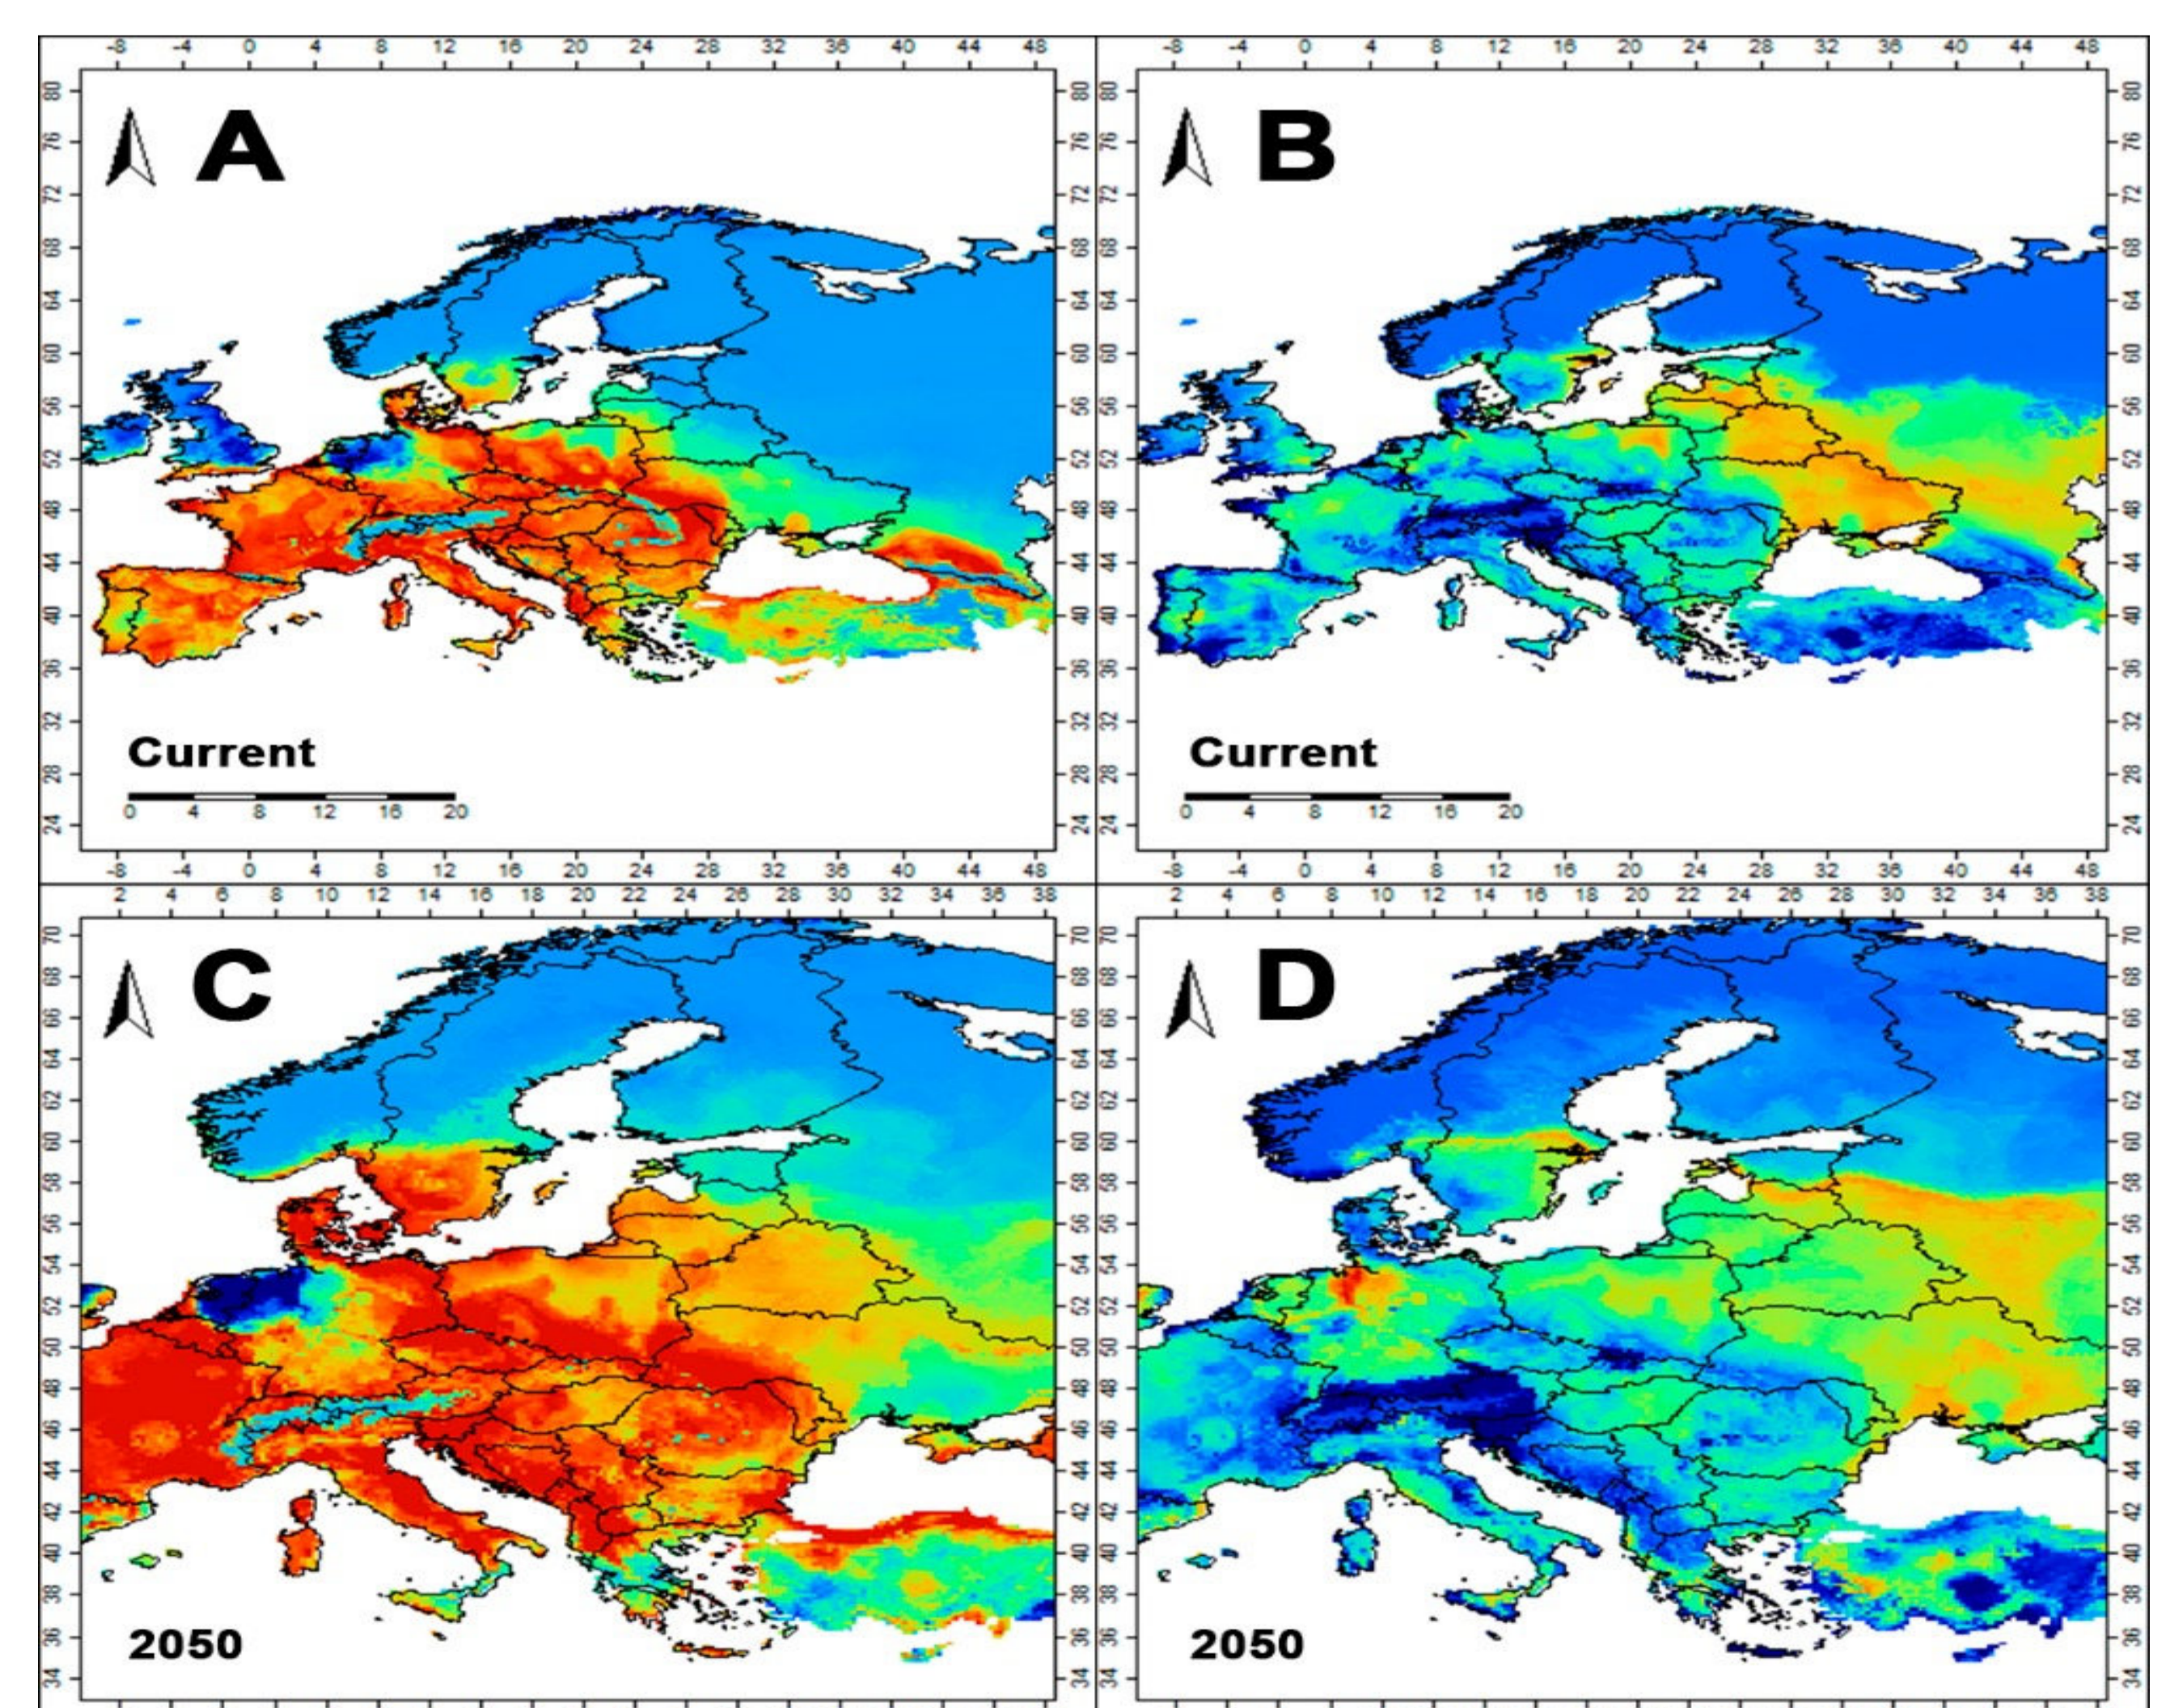

Fig 3. Based on Multiple Regression Analysis, models outcomes for: A - area of intersection of current promising habitats for the native European pond turtle *E. orbicularis* and 7 exotic turtle species; B - area of current promising habitat for *E. orbicularis*, without 7 species of invasive aquatic turtles; C - area of intersection of further promising habitats (to 2050) of all 8 species of turtles; D - area of further promising habitats (to 2050) for *E. orbicularis*, without 7 species of invasive aquatic turtles.

We conclude that priority conservation areas for the endangered European pond turtle are Eastern and Northern Europe, where future competition risks of invasive turtles are limited (Fig 3D).

Emys-R (<https://emysr.cnrs.fr/>) was funded through the 2020-2021 Biodiversa+ and Water JPI joint call for research projects, under the BiodivRestore ERA-NET Cofund (GA N°101003777), with the EU and the funding organisations Agence Nationale de la Recherche (ANR, France, grant ANR-21-BIRE-0005), Bundesministerium für Bildung und Forschung (BMBF, Germany, grant BMBF project number 16LW015), State Education Development Agency (VIAA, Latvia, grant ES RTD/2022/2), and National Science Center (NSC, Poland, grant 2021/03/Y/NZ8/00101).
