† Presented at the International Conference EcoBalt 2023 "Chemicals & Environment", Tallinn, Estonia, 09 – 11 October 2023.

**Keywords:** organometallic approach; nanoparticles; mild conditions; size control; colloidal stability; molybdenum oxide, molybdenum sulfide

In the early 1990s, the seminal work by B. Chaudret and J. S. Bradley led to the establishment of metal nanoparticles (NPs) synthesis from organometallic precursors. Since then, this methodology has attracted the attention of many research groups, ours included, and offered possibilities to selectively control the shape and size of these nano-objects under mild reaction conditions. Clever design of substrate and stabilizing ligand systems has allowed the synthesis of late transition metal and their oxide NPs (group 8-12) from precious metal (Ru, Rh, Pd, Pt, Ag, Au) and from first-row (Fe, Co, Ni, Cu, Zn) metal complexes [1,2]. However, to this day, the development of suitable early transition metal complexes (group 3-7) for the preparation of corresponding oxide, sulfide, etc. NPs has attracted only sporadic attention.

This presentation will focus on the use of highly reactive Mo(0) complex for the synthesis of molybdenum oxide and sulfide NPs at room temperature. These results will illustrate how the choice of the substrate, stabilizing ligand and solvent system can lead to stable colloidal NPs with a diameter of <10 nm in size (Scheme 1) [3].
