224 cycle using high-throughput smFISH (HT-smFISH, Figures 5A and S5). We selected 94 mRNAs
225 with or without known cyclic expr cycle using high-throughput smFISH (HT-smFISH, Figures 5A and S5). We selected 94 mRNAs

225 with or without known cyclic expression and carried out their analysis in non-synchronized

226 HEK293-GFP-LSM14A cells. Cells we with or without known cyclic expression and carried out their analysis in non-synchronized
226 HEK293-GFP-LSM14A cells. Cells were classified in G1 or G2 phase based on their DAPI
227 signal (see Methods, Figure 5A, Table 226 HEK293-GFP-LSM14A cells. Cells were classified in G1 or G2 phase based on their DAPI
227 signal (see Methods, Figure 5A, Table S7). While most transcripts displayed a similar fraction in
228 PBs in G1 and G2 cells, a s 227 signal (see Methods, Figure 5A, Table S7). While most transcripts displayed a similar fraction in

228 PBs in G1 and G2 cells, a subgroup of mRNAs showed higher accumulation in PBs in G1 than

229 in G2 (Figure 5B). T 228 PBs in G1 and G2 cells, a subgroup of mRNAs showed higher accumulation in PBs in G1 than

229 in G2 (Figure 5B). Their fraction in PBs was particularly heterogeneous in G1 cells, readily

230 reaching values above 50% 229 in G2 (Figure 5B). Their fraction in PBs was particularly heterogeneous in G1 cells, readily

230 reaching values above 50% of the molecules (Figure 5C). Interestingly, expression of many of

231 these transcripts was 230 reaching values above 50% of the molecules (Figure 5C). Interestingly, expression of many of

231 these transcripts was reported to peak in G2 and decrease in G1, while their encoded proteins

232 are implicated in G2 are implicated in G2-to-mitosis progression ($ECT2^{53}$, TTK^{54} , and $DLGAP5^{55}$).

231 these transcripts was reported to peak in G2 and decrease in G1, while their encoded proteins

232 are implicated in G2-to-mitosis progression (ECT2⁵³, TTK⁵⁴, and DLGAP5⁵⁵).

233 We hypothesized that mRNA accumu are implicated in G2-to-mitosis progression (ECT2⁵³, TTK⁵⁴, and DLGAP5⁵⁵).

233 We hypothesized that mRNA accumulation in PBs may be cond

elimination after mitosis. In agreement, most mRNAs showing higher accumu

2 233 We hypothesized that mRNA accumulation in PBs may be concomitant with their
234 elimination after mitosis. In agreement, most mRNAs showing higher accumulation in PBs in G1
235 than in G2 belonged to a group of mRNAs p elimination after mitosis. In agreement, most mRNAs showing higher accumulation in PBs in G1

235 than in G2 belonged to a group of mRNAs previously reported to undergo decay at the mitosis-

236 to-G1 (M-G1) transition²² 235 than in G2 belonged to a group of mRNAs previously reported to undergo decay at the mitosis-
236 to-G1 (M-G1) transition²² (Figure 5B-D and G). Conversely, mRNAs encoding G2 proteins but
237 not undergoing decay at to-G1 (M-G1) transition²² (Figure 5B-D and G). Conversely, mRNAs encoding G2 proteins but 236 to-G1 (M-G1) transition²² (Figure 5B-D and G). Conversely, mRNAs encoding G2 proteins but
237 not undergoing decay at the M-G1 transition accumulated similarly in PBs in G2 and G1 cells.
238 To extend these data, we not undergoing decay at the M-G1 transition accumulated similarly in PBs in G2 and G1 cells.

238 To extend these data, we considered the 161 mRNAs described as decaying at the M-G1

239 transition²² and well-detected in 238 To extend these data, we considered the 161 mRNAs described as decaying at the M-G1

239 transition²² and well-detected in our FAPS dataset. 62% of them were significantly enriched in

240 PBs purified from G1 cells, transition²² transition²² and well-detected in our FAPS dataset. 62% of them were significantly enriched in

240 PBs purified from G1 cells, which is higher than expected by chance (44%, Figure 5E). They

241 also tended to reach hig PBs purified from G1 cells, which is higher than expected by chance (44%, Figure 5E). They
241 also tended to reach higher levels of enrichment (Figure 5F). Thus, HT-smFISH independently

385 RBPs, we found that inhibiting HuR-ARE interaction causes the pre
386 target This prompted us to look for other determinants of cyclic mRNA localization in PBs. In terms of

RBPs, we found that inhibiting HuR-ARE interaction causes the premature localization of HuR

target mRNAs to PBs in S or G2. RBPs, we found that inhibiting HuR-ARE interaction causes the premature localization of HuR target mRNAs to PBs in S or G2. This highlights a role for HuR in preventing mRNA recruitment in PBs in later stages of the cell c 386 target mRNAs to PBs in S or G2. This highlights a role for HuR in preventing mRNA recruitment
387 in PBs in later stages of the cell cycle. In terms of mRNA features, we previously reported that
388 mRNA accumulation i in PBs in later stages of the cell cycle. In terms of mRNA features, we previously reported that
388 mRNA accumulation in PBs in asynchronous cells moderately correlates with their length⁸. To
389 our surprise, this feat mRNA accumulation in PBs in asynchronous cells moderately correlates with their length 8 . To 388 mRNA accumulation in PBs in asynchronous cells moderately correlates with their length⁸. To
389 our surprise, this feature was cell cycle-dependent, with PB mRNAs longer in G1 than in G2.
14 389 our surprise, this feature was cell cycle-dependent, with PB mRNAs longer in G1 than in G2.
14 390 Moreover, for the most AU-rich mRNAs of the transcriptome, PB enrichment correlated with
391 length in G1 but not G2. Such a phase specific impact of mRNA length was confirmed using
392 mRNA reporters. Overall, two mRN 391 length in G1 but not G2. Such a phase specific impact of mRNA length was confirmed using
392 mRNA reporters. Overall, two mRNA features appear associated with PB localization: the
393 strongest is their GC content, in

mRNA reporters. Overall, two mRNA features appear associated with PB localization: the
strongest is their GC content, in all phases; the second is their length, specifically in G1.
Interestingly, *in-silico* modeling showe 393 strongest is their GC content, in all phases; the second is their length, specifically in G1.

394 Interestingly, *in-silico* modeling showed that longer transcripts localize at the

395 RNA-protein condensates, where Interestingly, *in-silico* modeling showed that longer transcripts localize at the core of

395 RNA-protein condensates, where they augment the density of molecular interactions. This

396 promotes and stabilizes condensat RNA-protein condensates, where they augment the density of molecular interactions. This
promotes and stabilizes condensates, preventing them to collapse due to excessive RNA
recruitment^{65,66}. It is particularly tempting 396 promotes and stabilizes condensates, preventing them to collapse due to excessive RNA recruitment^{65,66}. It is particularly tempting to speculate that long RNAs favor the seeding and stabilize nascent PBs in early G1 recruitment^{65,66} 397 recruitment^{65,66}. It is particularly tempting to speculate that long RNAs favor the seeding and
398 stabilize nascent PBs in early G1. These PBs could then progressively grow into "mature" PBs
399 without collapsing 398 stabilize nascent PBs in early G1. These PBs could then progressively grow into "mature" PBs
399 without collapsing. Long RNAs may at a certain point lose their advantage, because the
300 interaction network becomes sa without collapsing. Long RNAs may at a certain point lose their advantage, because the

400 interaction network becomes saturated, or also because the short RNAs at the surface⁶⁵ provide

401 a barrier to long RNA recrui interaction network becomes saturated, or also because the short RNAs at the surface⁶⁵ provide a barrier to long RNA recruitment 67 .
