- > In-situ control of growth: a global approach
- > An example structure: the growth of VCSELs
- > Focus on some tools
 - Spectral Reflectivity
 - Atomic Absorption Spectroscopy for direct flux measurement
 - Curvature
- > Complementarity
 - For alloy concentration/growth rates
 - In time scales
- > The case of GaAsBi growth
- > Conclusion

Issues: growth of complex materials

Non-equilibrium growth dynamic processes

(atom mobility, growth rate,
involved energies, oblique
incidence, substrate
temperature....)

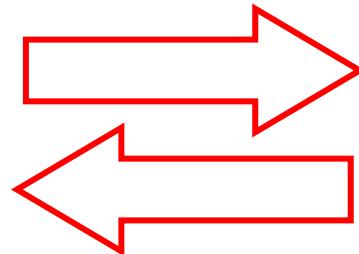

Ex-situ post-growth tools
(XRD, SEM, (HR)TEM, PL, ...)

Issues: growth of complex materials

Non-equilibrium growth dynamic processes

(atom mobility, growth rate,
involved energies, oblique
incidence, substrate
temperature....)

Probe, understand and tailor

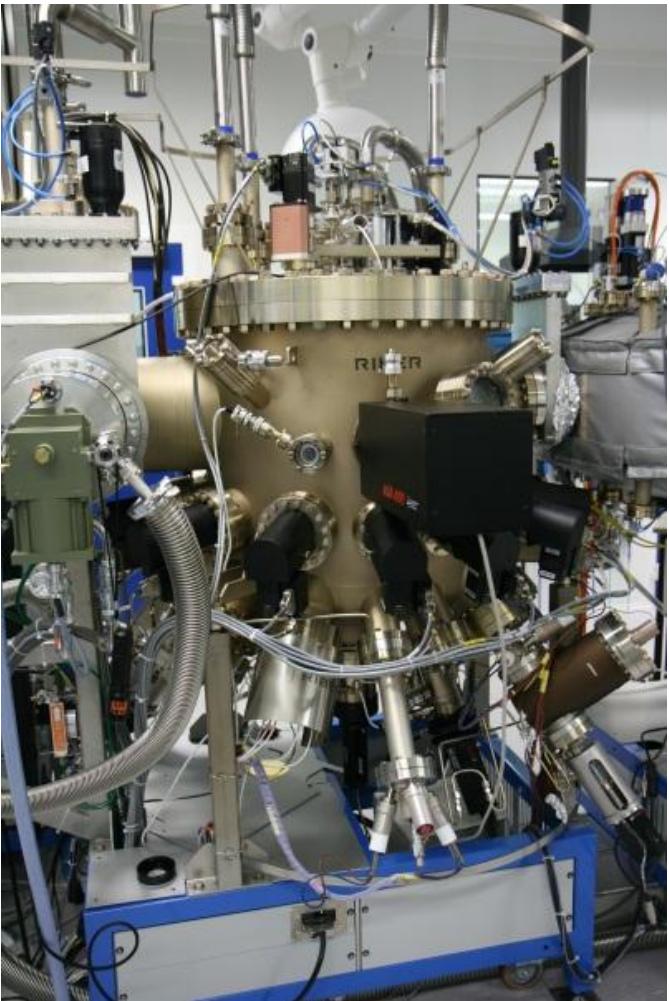

Coupled *In situ* and real-time diagnostics

(stress, reflectivity,
surface morphology,
flux monitoring...)

No diagnostic tool provide a complete picture of the growth process, but
coupling them in the same time base maximize their **complementarity**

In-situ measurements at LAAS

A global approach: complementary tools to get a clear picture of growth processes

MBE412 - 4" III-V chamber

> Spectral reflectivity

- White light source
- CCD sensors

RIBER EZ-REF

> Temperature

- Band-Edge Thermometry
- Pyrometry

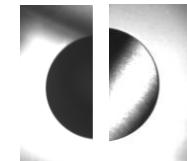

EZ-EDGE

> Fluxes (Atomic absorption Spectroscopy - OFM)

- Original tool (Patent FR1856743)

> RHEED: synchronised to rotation

- In-plane lattice parameter, streaks intensity

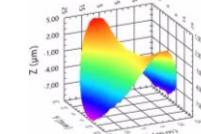

> Roughness (Diffuse Light Scattering)

> Curvature

- MIC : original tool (Patent FR175461)

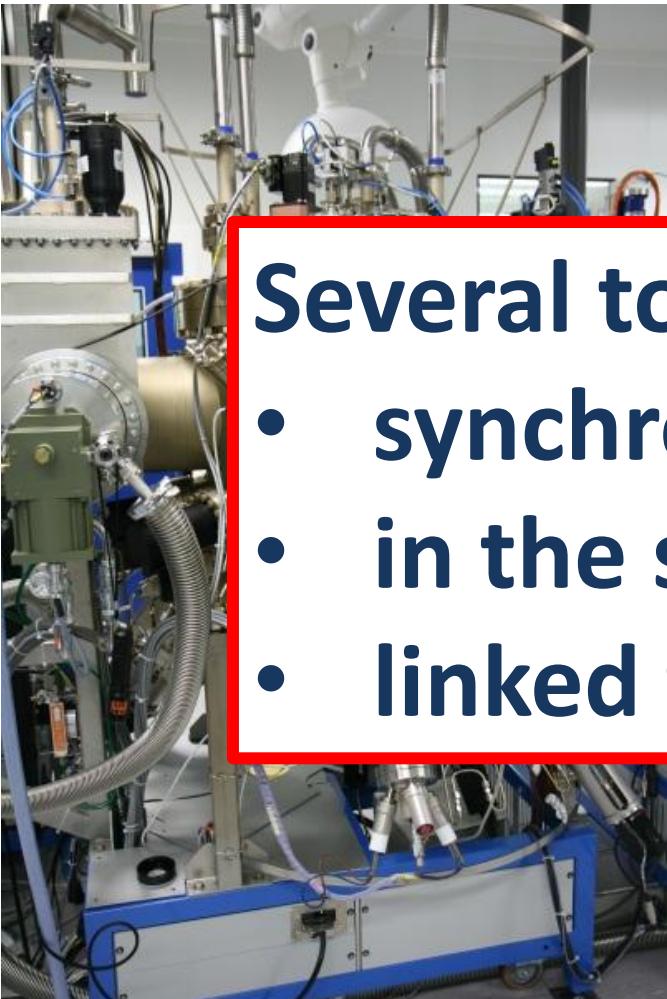

RIBER EZ-CURVE

In-situ measurements at LAAS

A global approach: complementary tools to get a clear picture of growth processes

MBE412 - 4" III-V chamber

> Spectral reflectivity

- White light source
- CCD sensors

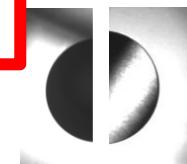

RIBER EZ-REF

Several tools

- synchronized to rotation
- in the same time base
- linked to MBE control software

> Roughness (Diffuse Light Scattering)

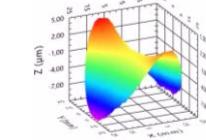

> Curvature

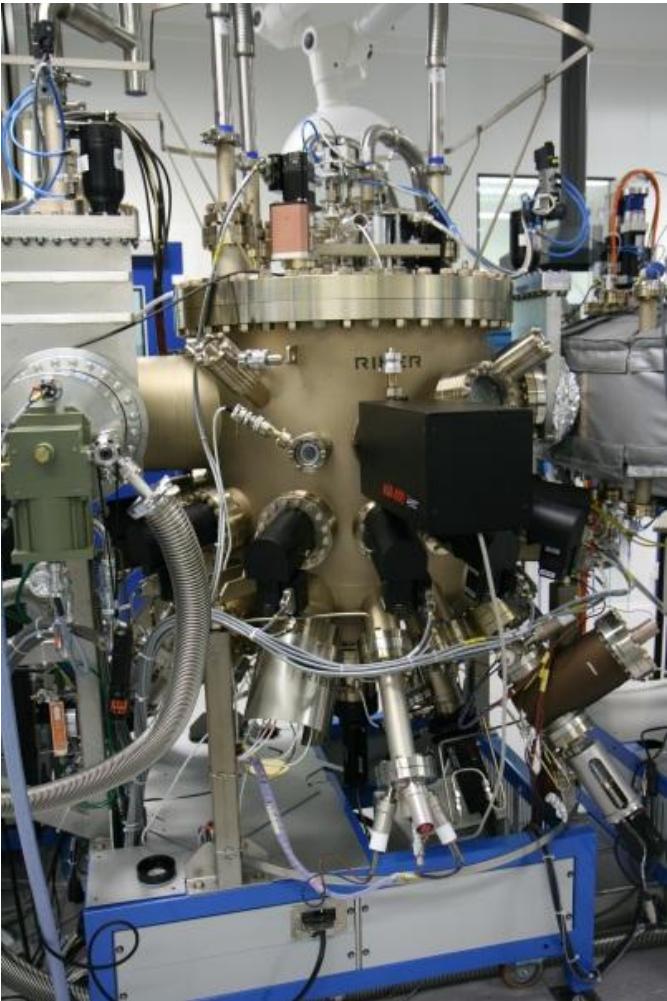

- MIC : original tool (Patent FR175461)

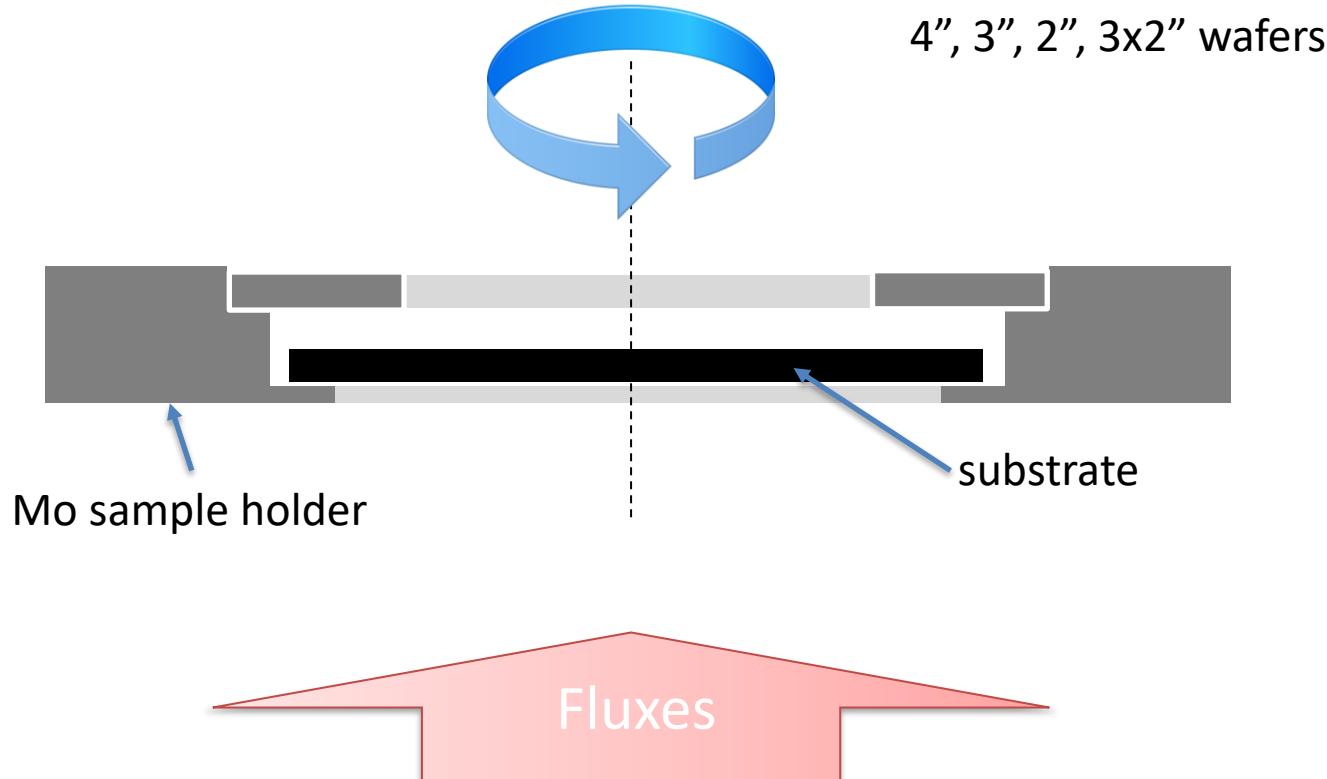

RIBER EZ-CURVE

Geometric configuration

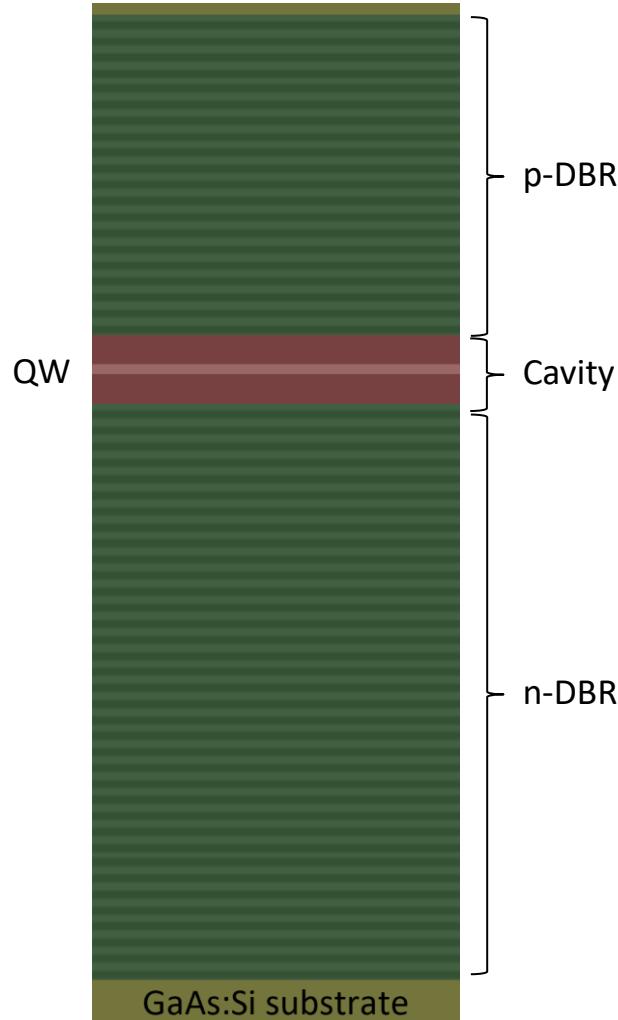

MBE412 - 4" III-V chamber

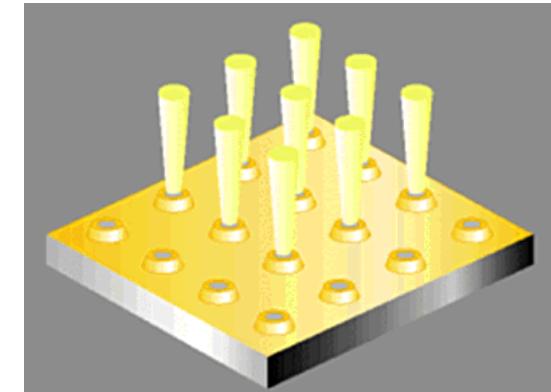

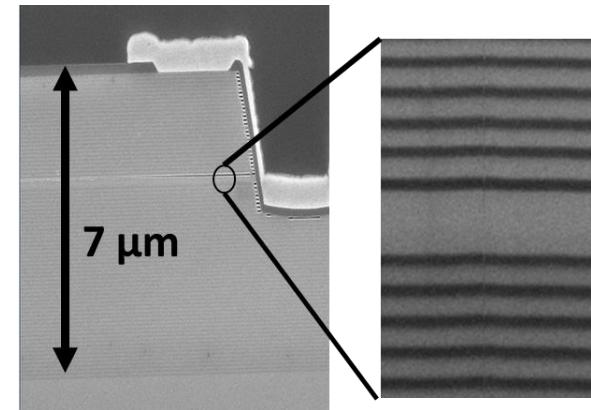

MBE growth of VCSELs

An example structure:
the growth of VCSELs

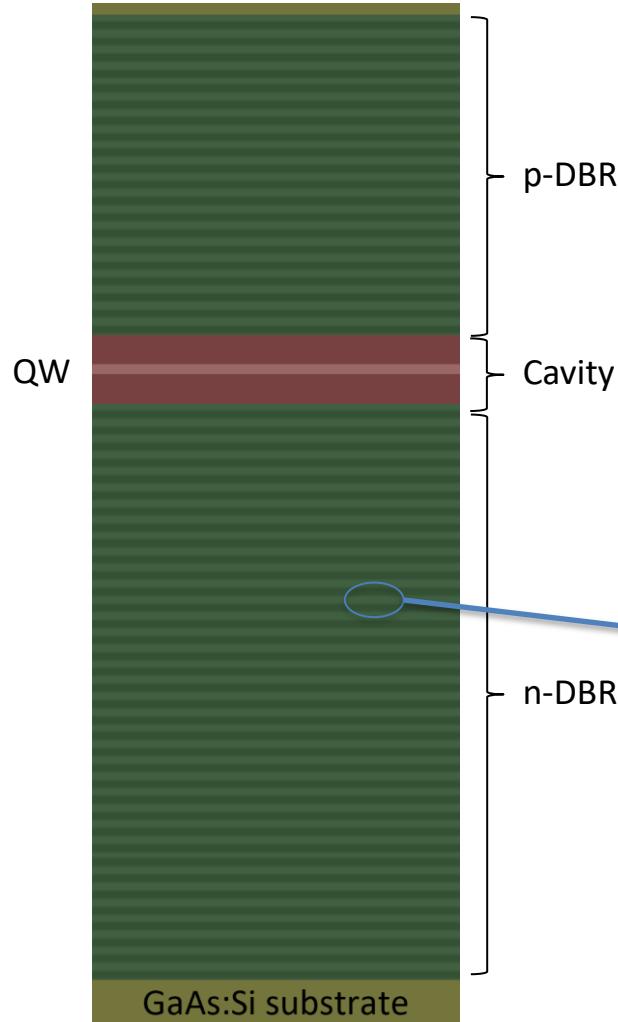

MBE growth of VCSELs

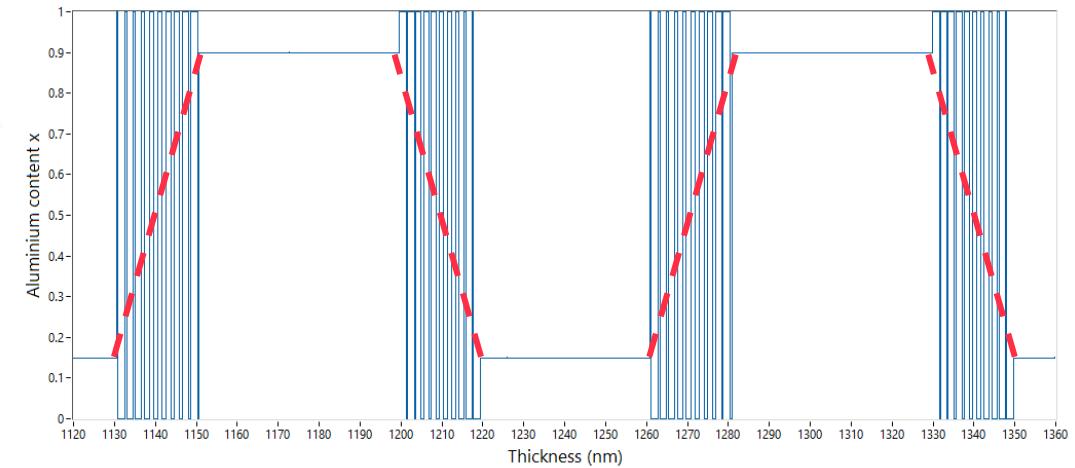

- Vertical Cavity Surface Emitting Lasers (VCSELs) are complex structures (>3000 layers, >17H growth)
- The vertical geometry permits the simultaneous processing of lasers, and the fabrication of laser matrices
- VCSELs are used in datacom, lidars, face recognition, etc...

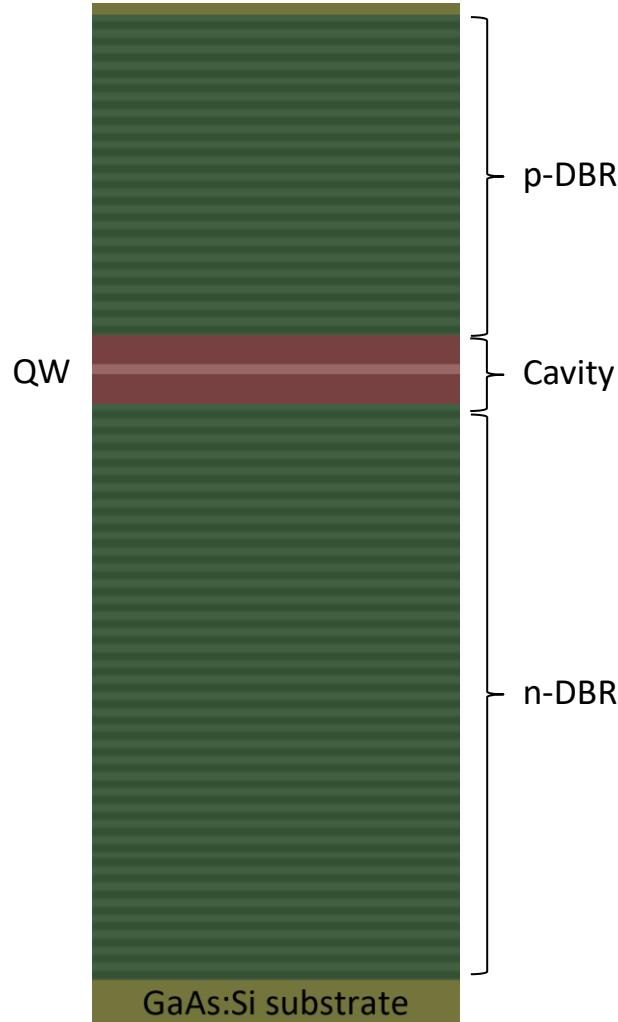

MBE growth of VCSELs

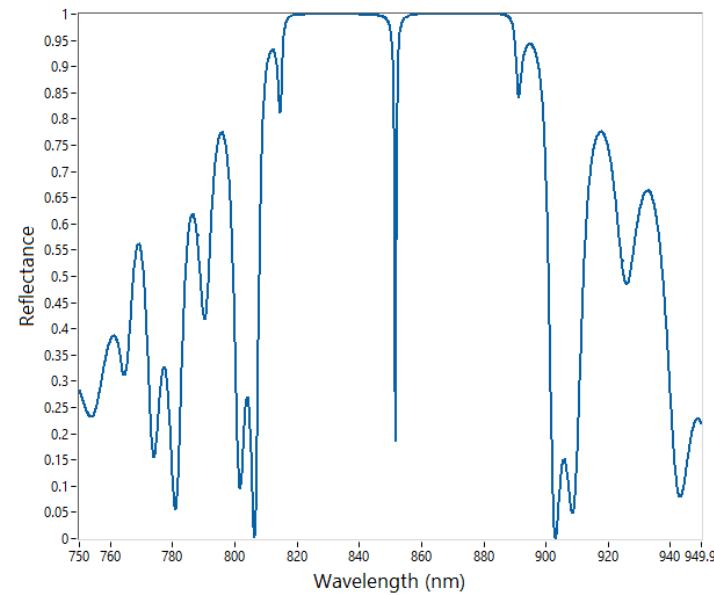

- Vertical Cavity Surface Emitting Lasers (VCSELs) are complex structures. (>3000 layers, >17H growth)
- The vertical geometry permits the simultaneous processing of lasers, and the fabrication of laser matrices.
- VCSELs are used in datacom, lidars, face recognition, etc...

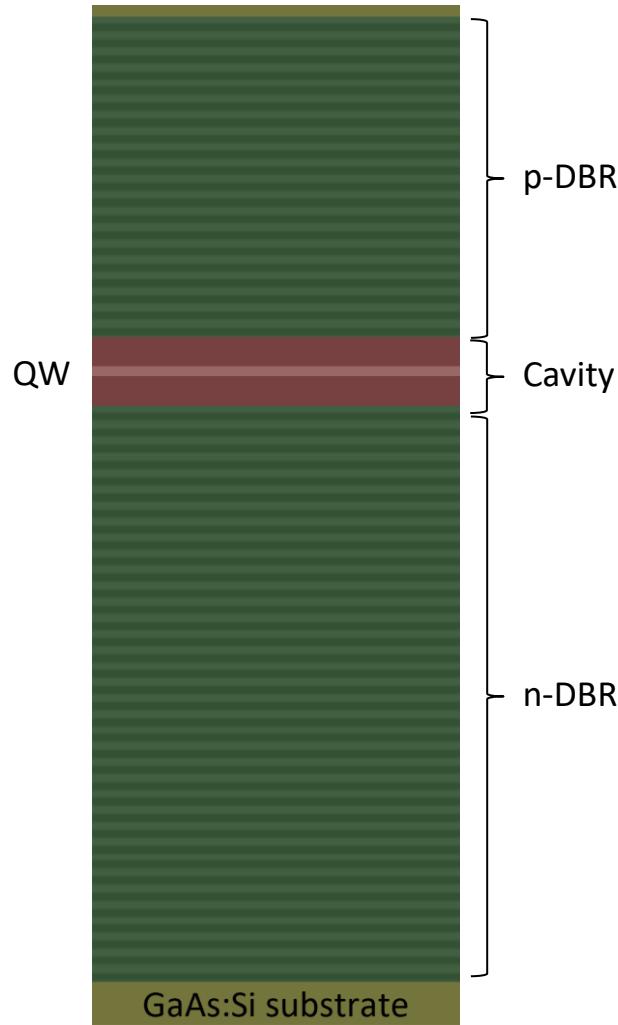

MBE growth of VCSELs

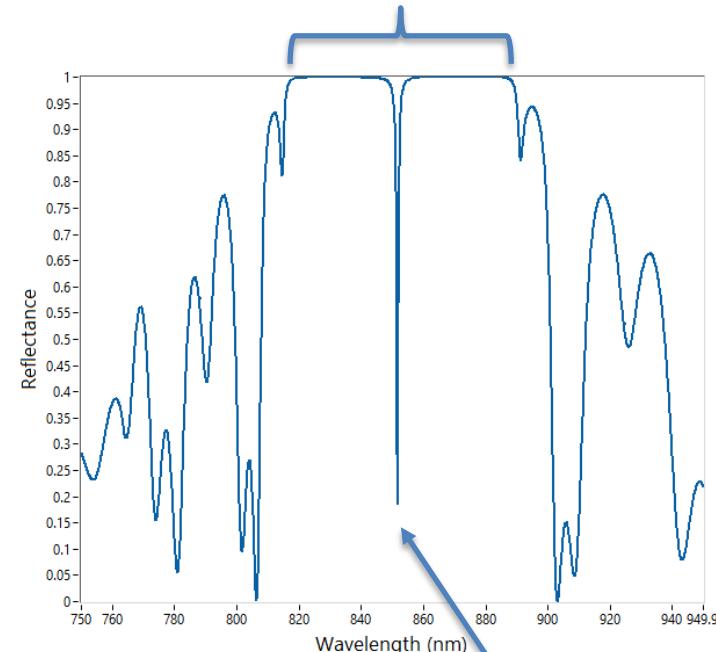

Reflectance spectrum of a VCSEL at RT

MBE growth of VCSELs

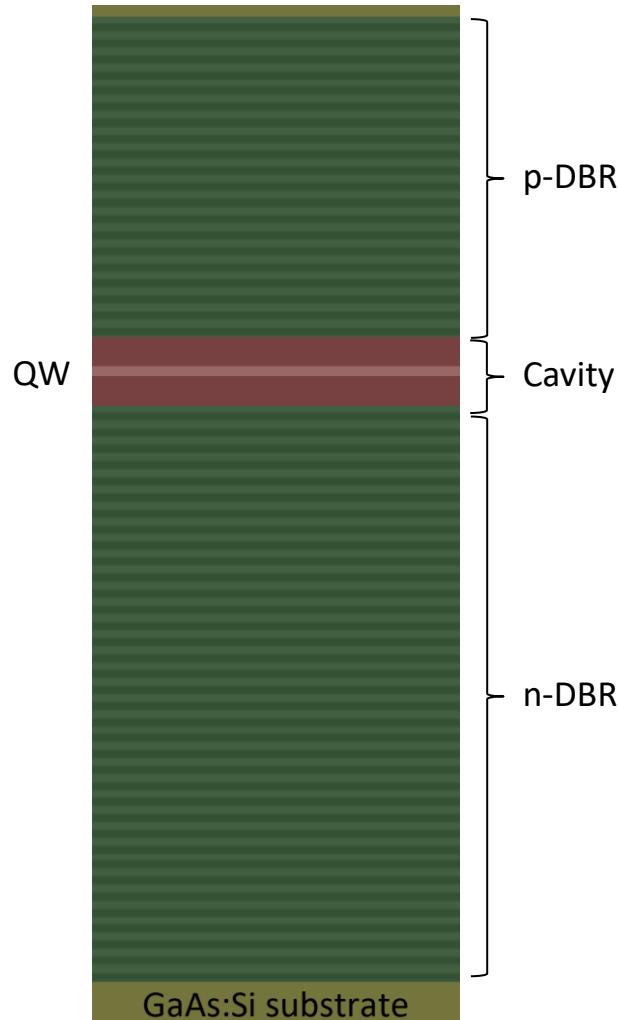

Reflectance spectrum of a VCSEL at RT
High reflectivity plateau

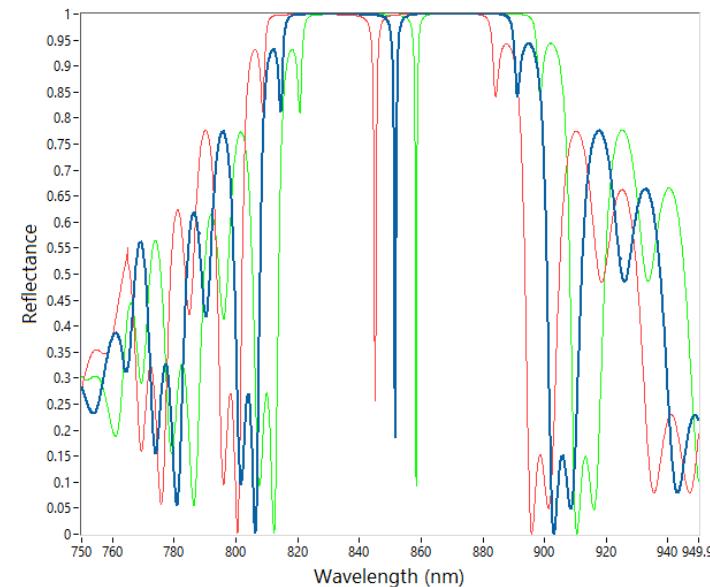

Fabry Perot dip

MBE growth of VCSELs

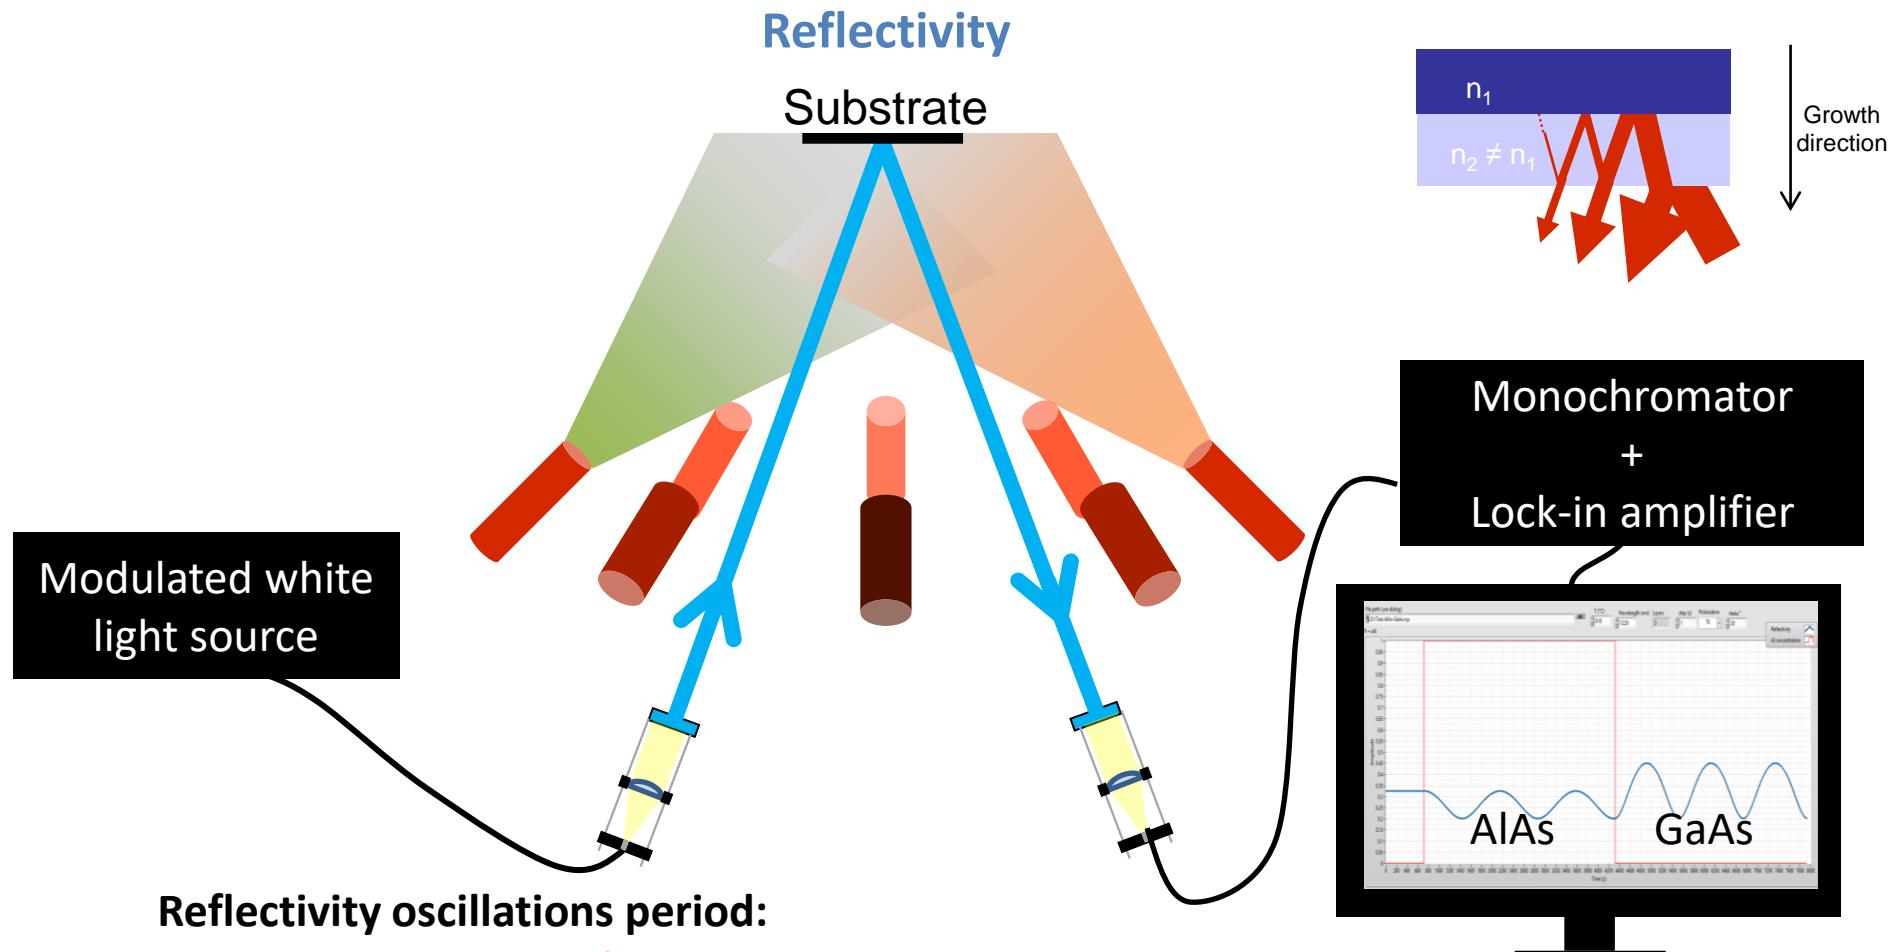

Reflectance spectrum of a VCSEL at RT

$\pm 1\%$ flux variation $\rightarrow \pm 6\text{nm}$ wavelength variation

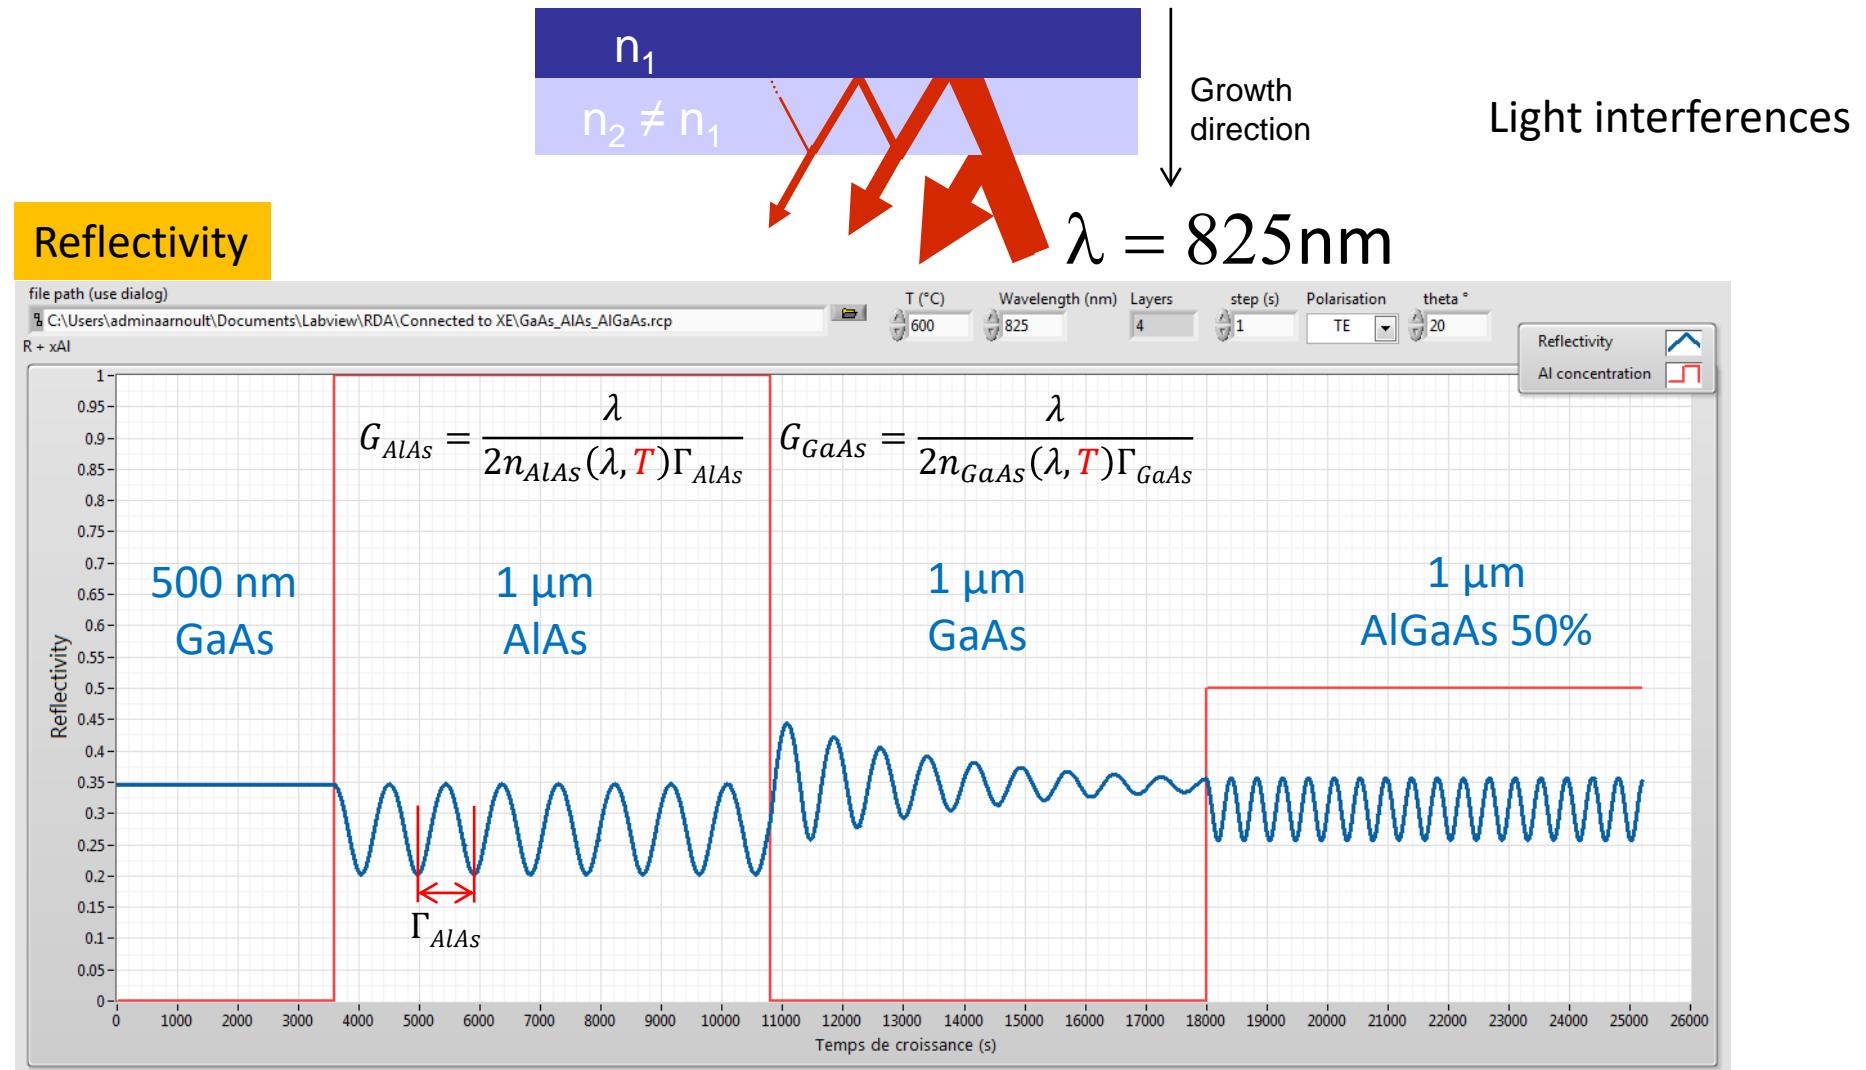

In-situ characterization tools: *Spectral reflectivity*

In situ characterization tools in MBE: Reflectivity

In-situ characterization tools: *Atomic Absorption*

In situ characterization tools in MBE: Atomic Absorption

Atomic absorption measurement of fluxes

Homemade simplified setup / P. Pinsukanjana, J. Cryst. Growth **251** (2003), 124

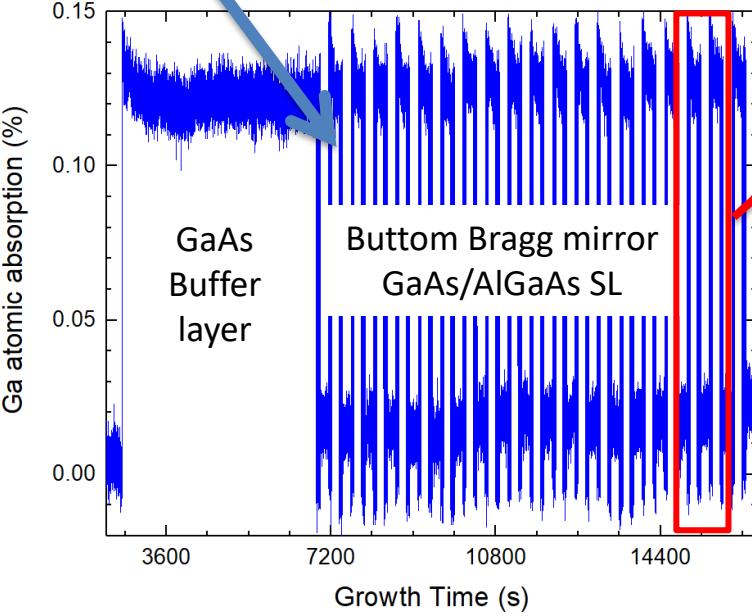

→ **Flux measurement (growth rates, alloys compositions)**

In situ characterization tools in MBE: Atomic Absorption

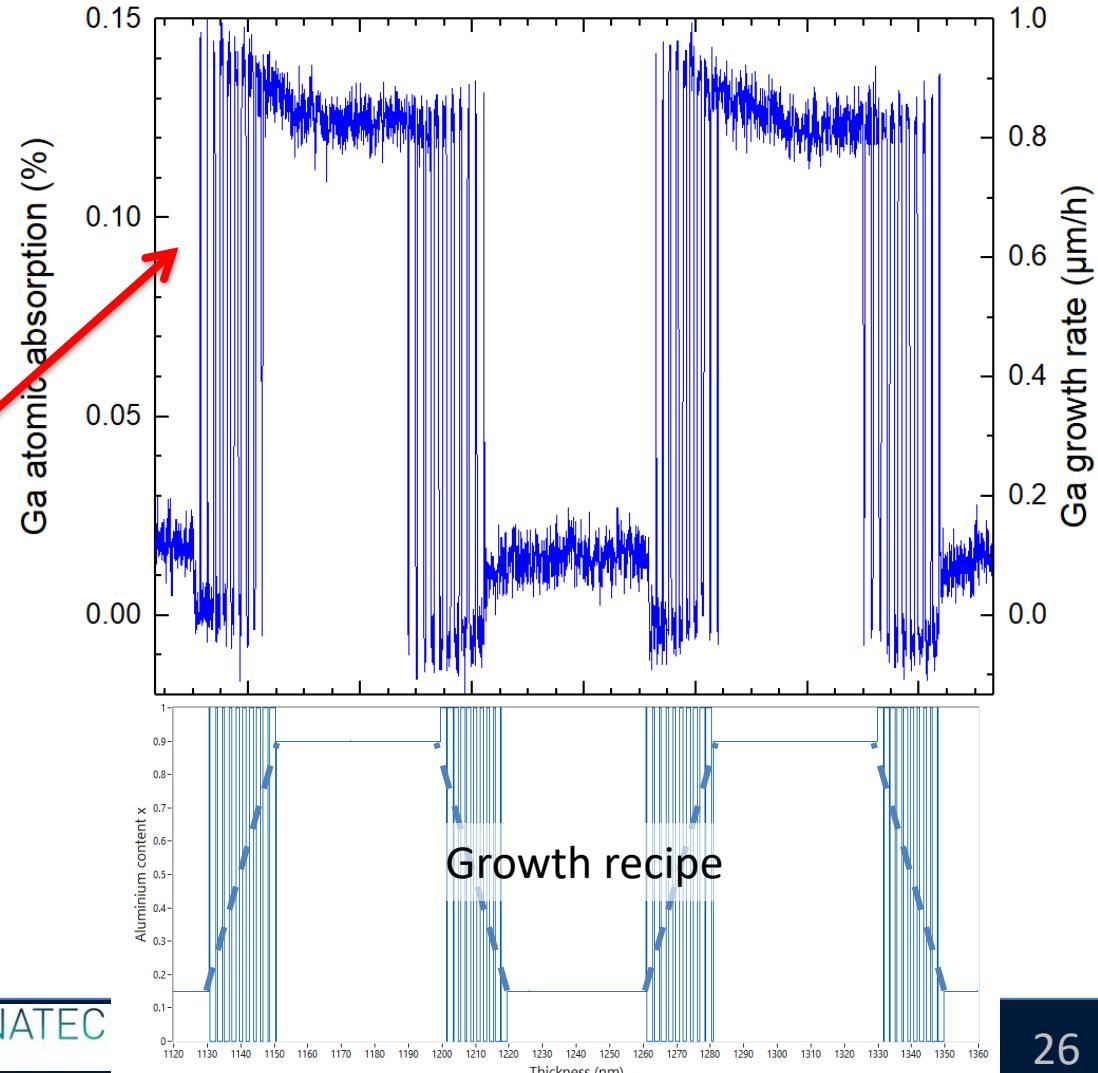

- SEM cross section

- In situ atomic absorption of Ga

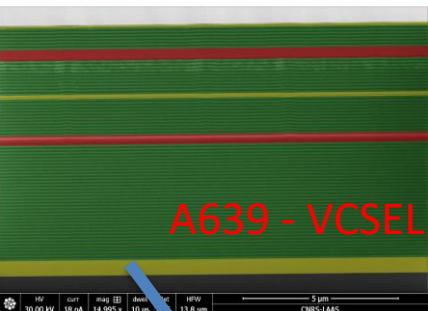

- In situ atomic absorption of Ga

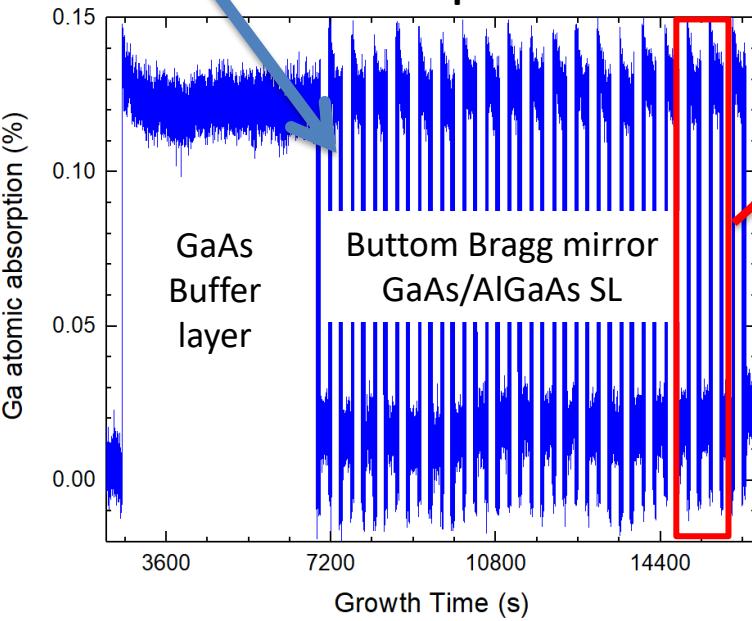

In situ characterization tools in MBE: Atomic Absorption

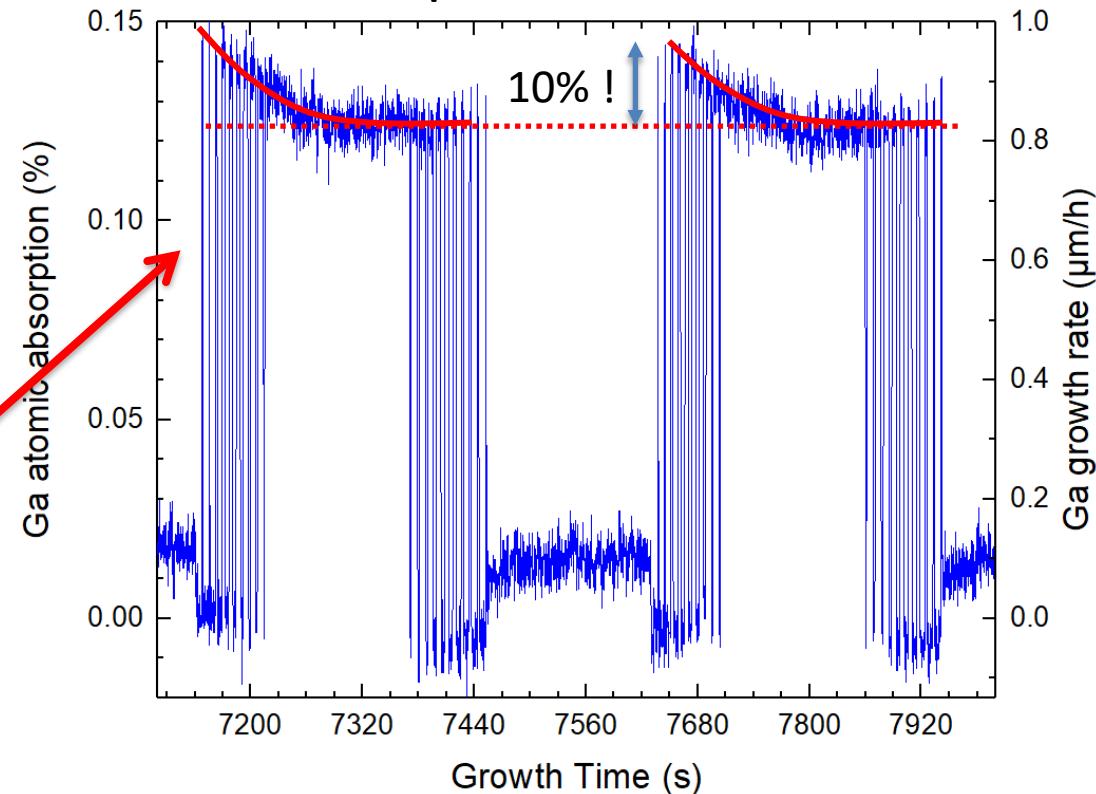

- SEM cross section

- In situ atomic absorption of Ga

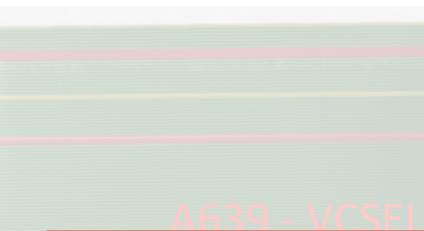

- In situ atomic absorption of Ga

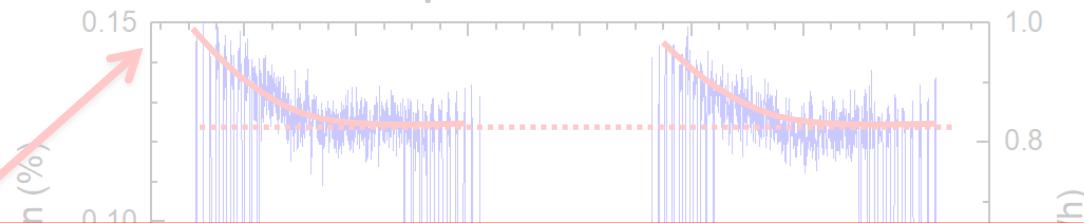

Evidence of a systematic error:
flux transients of the Ga cell

In situ characterization tools in MBE: Atomic Absorption

- SEM cross section

- In situ atomic absorption of Ga

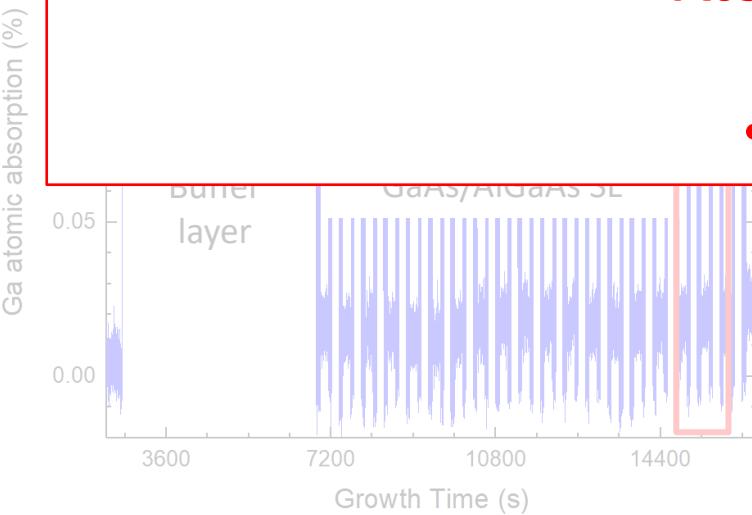

Result : 10% flux variations in some layers

Maximum tolerable error <1% on the whole wafer (100 mm diameter)

Atomic absorption allows for

- errors identification
- real-time corrections

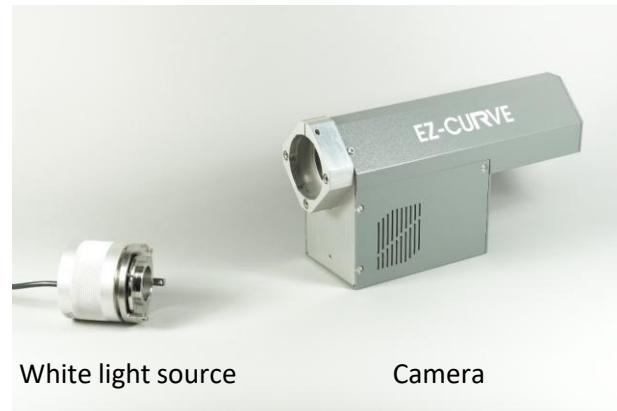

**Evidence of a systematic error:
flux transients of the Ga cell**

In-situ characterization tools: *Curvature*

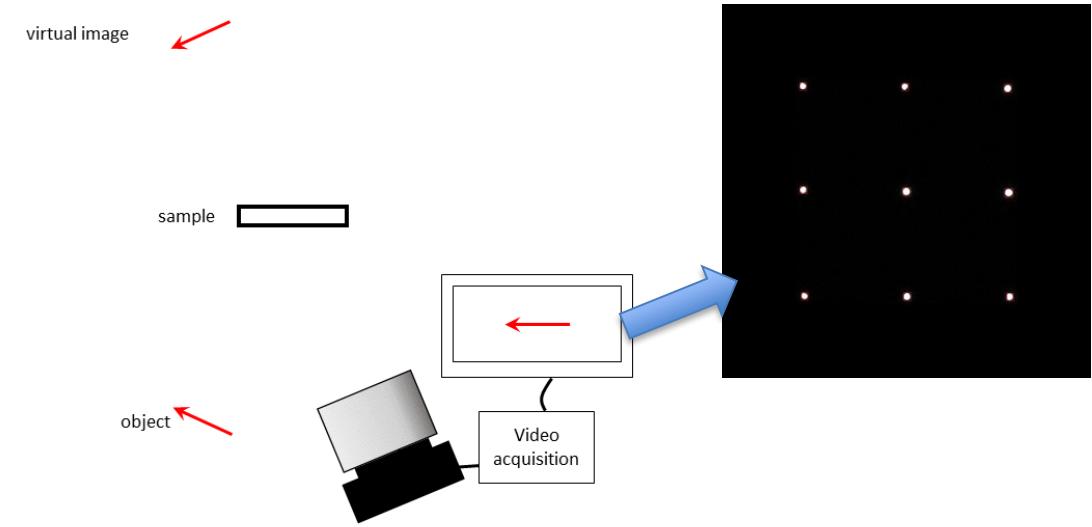

In situ characterization tools in MBE: Curvature

Virtual image magnification analysis: **MIC** (Magnification Inferred Curvature) measures the magnification factor of a virtual image created by a surface (i.e. a wafer)

Highly stable and alignment-free measurements

High rate capability (100FPS)

Arnoult, A., Colin, J. Magnification inferred curvature for real-time curvature monitoring. *Sci Rep* 11, 9393, 2021

Curvature and stress are linked

- > Usually, **three stress components** are distinguished:

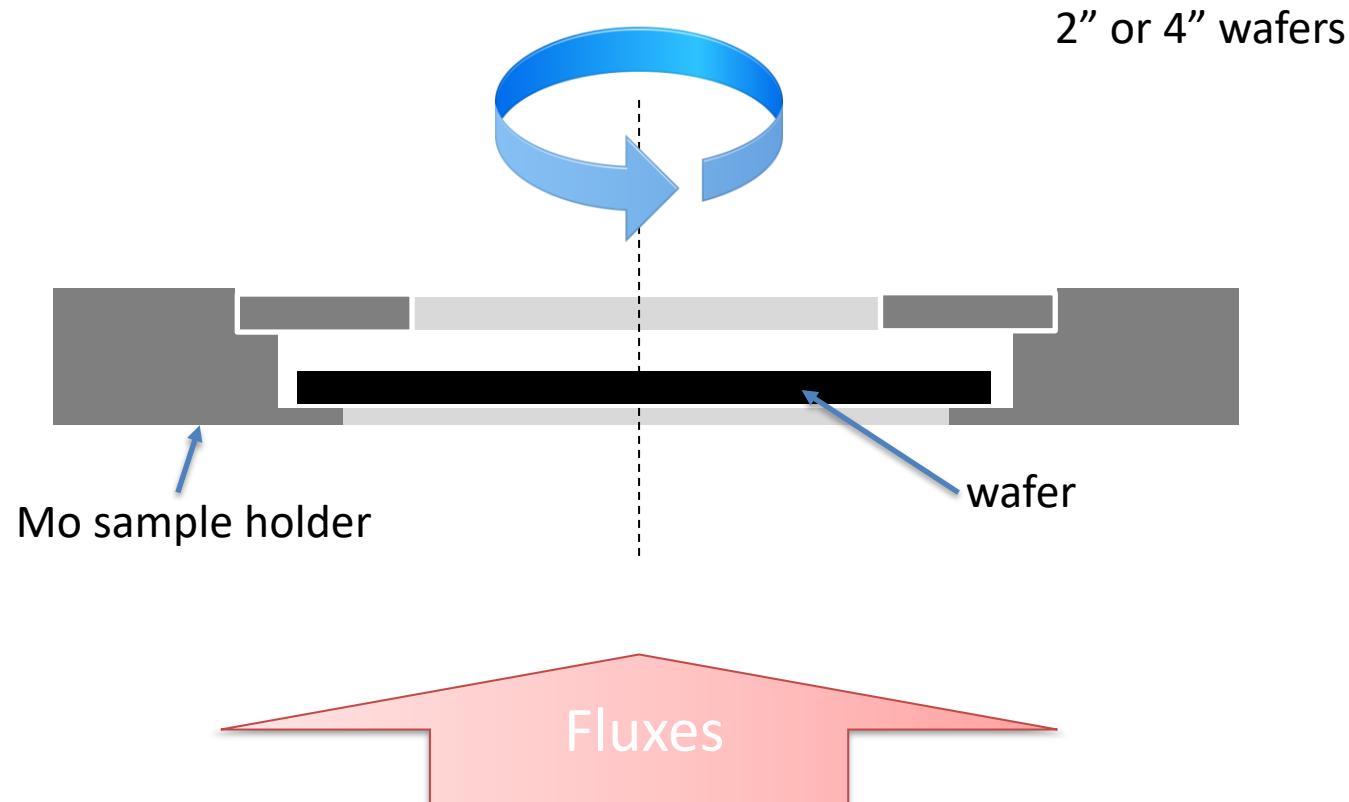

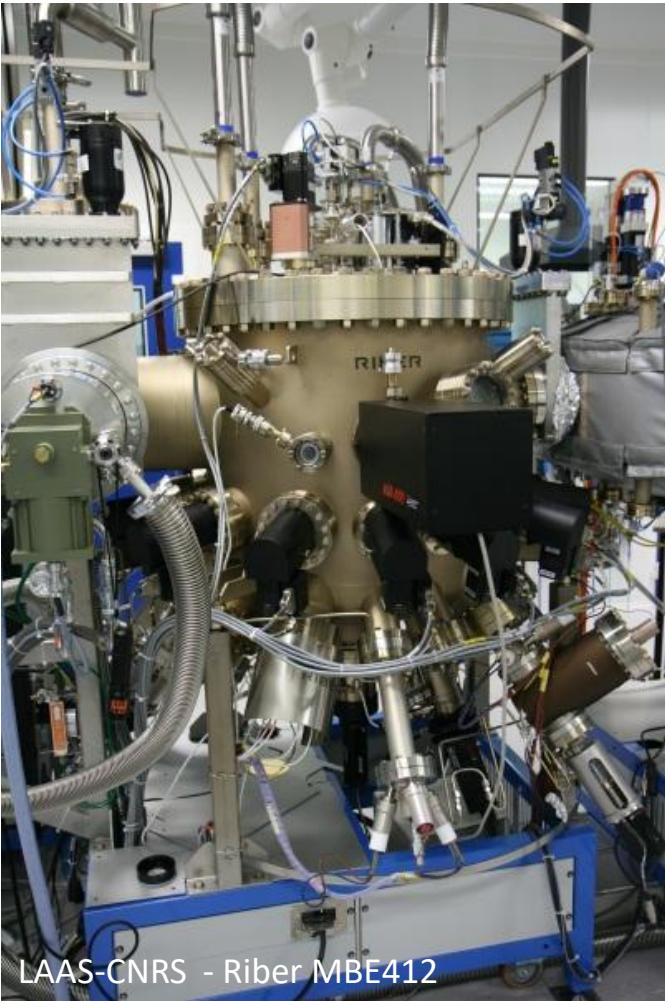

1. Extrinsic stress

- Induced by external factors: external loading, exposure to environment, ...

Stress/Curvature and crystal growth

Extrinsic stress

Wafer free to expand in holder \Rightarrow no extrinsic stress here

Curvature and stress are linked

- > Usually, **three stress components** are distinguished:
 1. Extrinsic stress
 - Induced by external factors: temperature, pressure, mechanical loading, exposure to environment, ...
 2. Intrinsic stress
 - Stress source introduced during the MBE process : lattice mismatch, growth mode, relaxation, surface and/or interface stress, incorporation or desorption of impurities, phase transformations...

Curvature and stress are linked

- > Usually, **three stress components** are distinguished:

1. Extrinsic stress

- Induced by external factors: temperature, pressure, mechanical loading, exposure to environment, ...

No extrinsic stress here

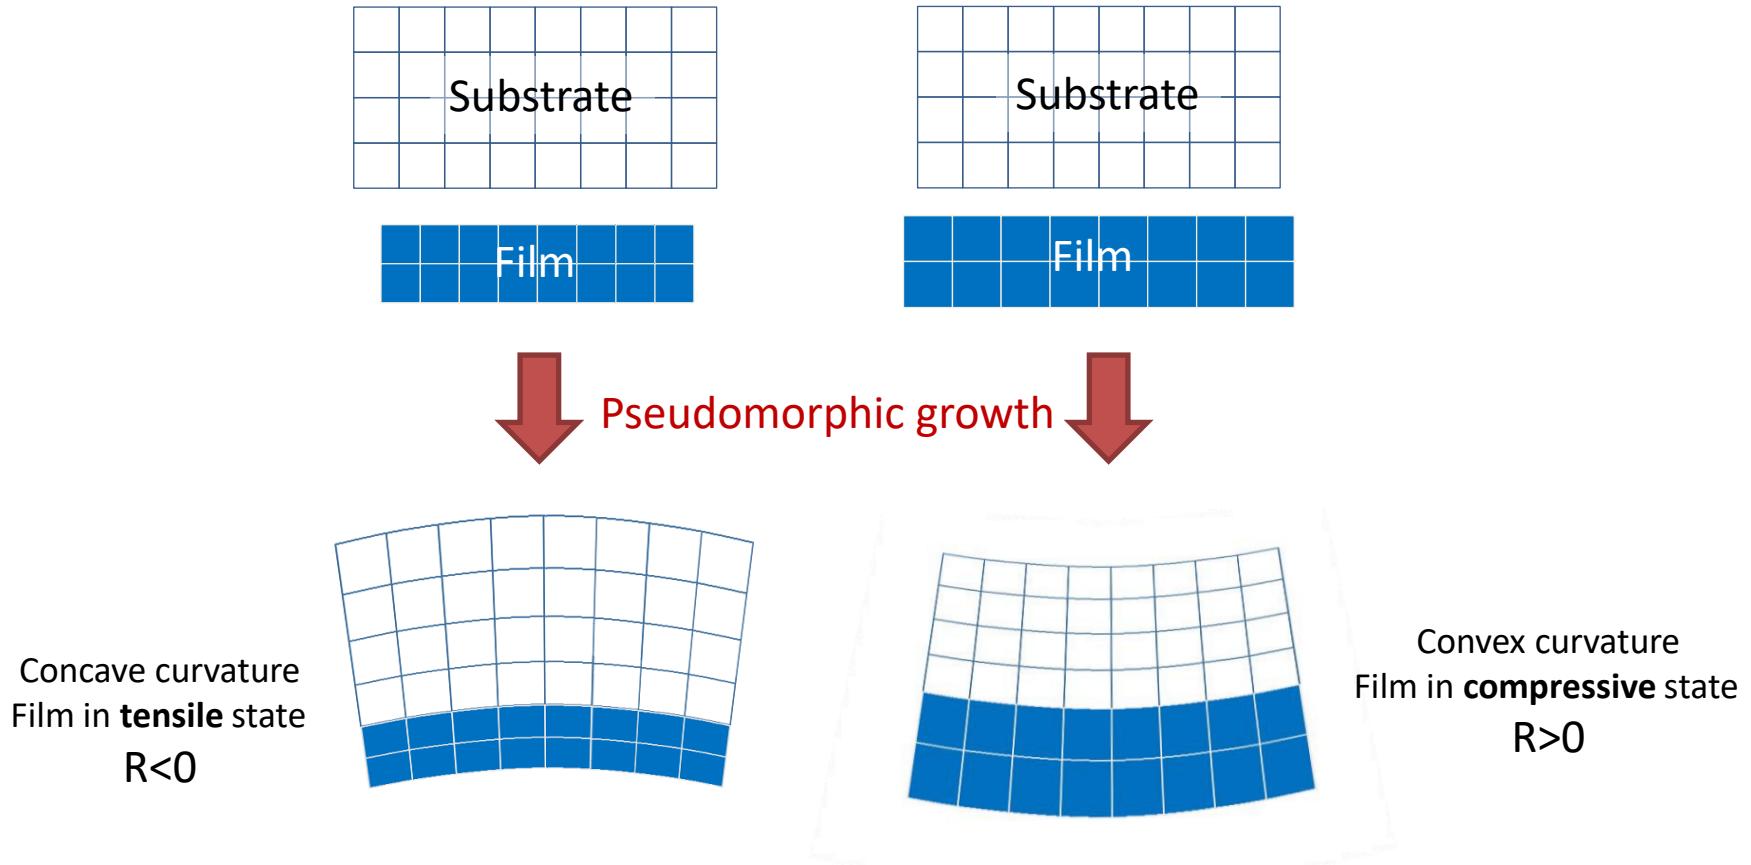

2. Intrinsic stress

- Stress source introduced during the MBE process : **lattice mismatch**, growth mode, relaxation, surface and/or interface stress, incorporation or desorption of impurities, phase transformations...

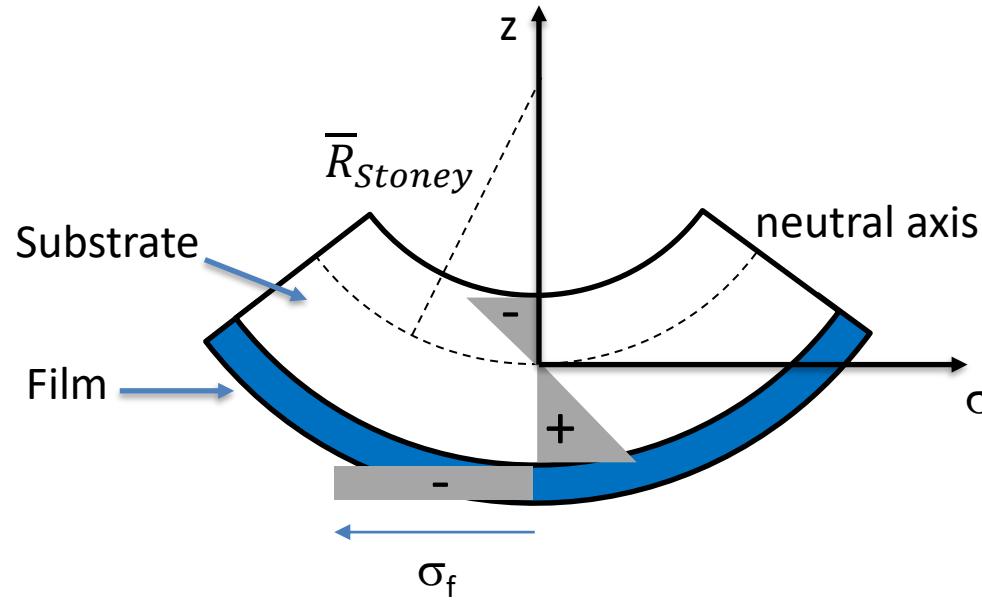

In situ characterization tools in MBE: Curvature

Why thin films are usually in a stressed state?

The stress in the film leads to a bending of the system “film+substrate”

In situ characterization tools in MBE: Curvature

h_f = film thickness
 M_s = substrate biaxial modulus
 h_s = substrate thickness
 σ_f = stress in the film

- Satisfying equilibrium conditions ($\Sigma F = 0$ and $\Sigma M = 0$) leads to the **Stoney equation**

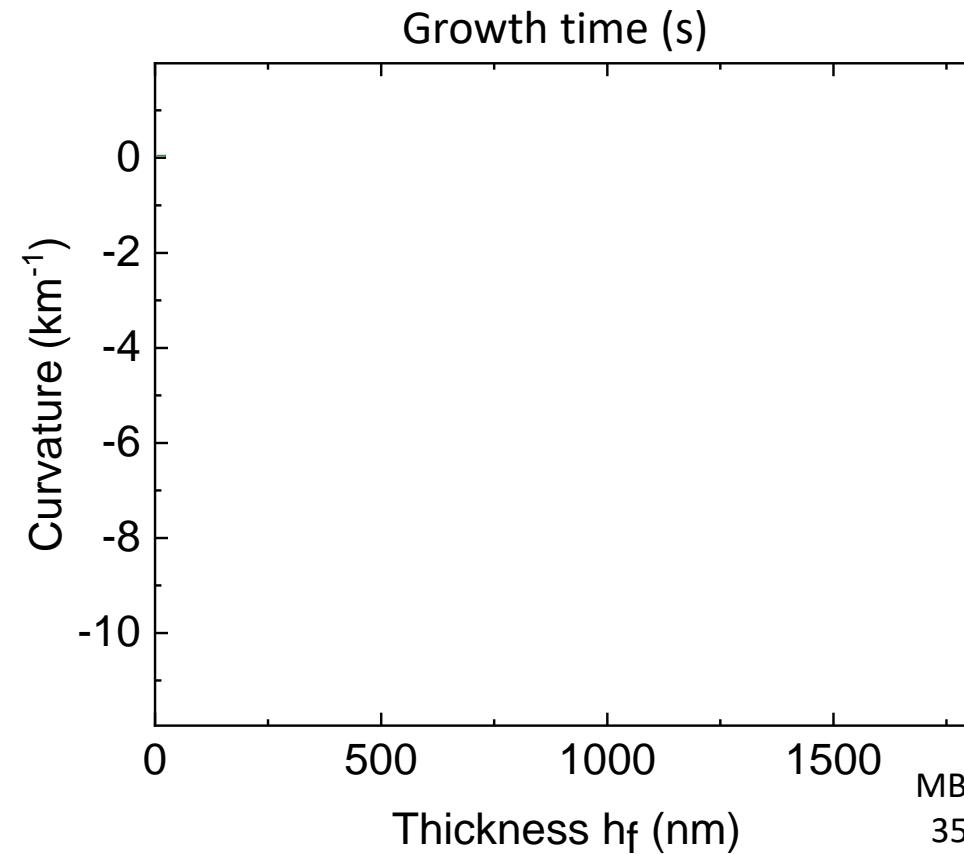

$$\kappa = \frac{1}{\bar{R}_{\text{Stoney}}} \approx \frac{6\sigma_f h_f}{M_s h_s^2}$$

with $M_s = \frac{E}{1 - \nu}$

G.G. Stoney, The tensions of metallic films deposited by electrolysis, Proc. R. Soc. Land. A82 (1909) 172-175

Curvature/Stress and MBE growth

Intrinsic stress

Curvature

(m⁻¹)

$$\kappa \approx \frac{6\bar{\sigma}_f}{M_s h_s^2} h_f$$

Constant for a given film on a given substrate

h_f = film thickness
 M_s = substrate biaxial modulus
 h_s = substrate thickness
 σ_f = stress in the film

M. Ettenberg, R. J. Paff, J. Appl. Phys., 41, no.10, pp.3926-3927 (1970)

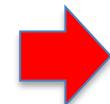

MBE growth of GaAs/AlGaAs on a rotating 350 µm-thick (001) GaAs wafer at 600°C

$$\bar{\sigma}_f h_f \approx \frac{M_s h_s^2}{6} \kappa$$

Stress/Curvature and crystal growth

Curvature and stress are linked

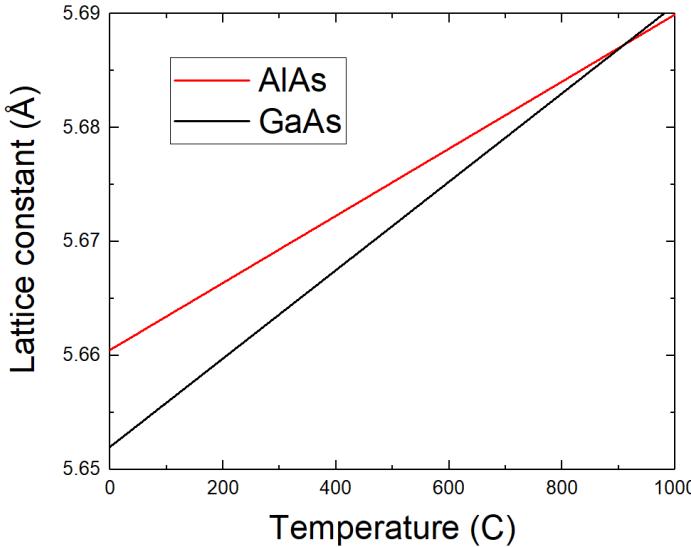

- > Usually, **three stress components** are distinguished:
 1. **Extrinsic stress**
 - Induced by external factors : temperature, pressure, mechanical loading, exposure to environment, ...
 2. **Intrinsic stress**
 - Stress source introduced during the MBE process : **lattice mismatch**, growth mode, relaxation, surface and/or interface stress, incorporation or desorption of impurities, phase transformations...
 3. **Thermal stress**
 - Difference in **thermal expansion coefficients** between film and substrate

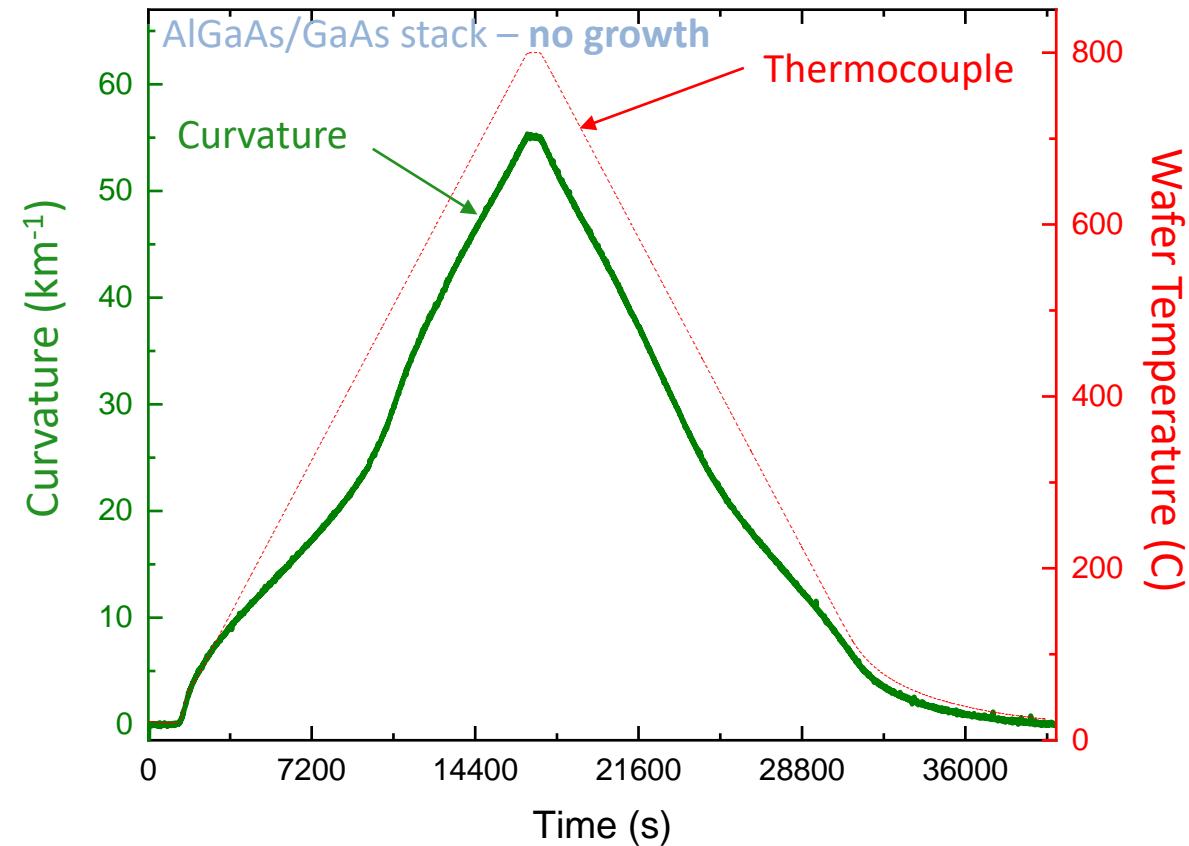

Stress/Curvature and crystal growth

Thermal stress

- > Because thermal expansion coefficient is material dependent, any change in temperature induces a change in stress/curvature of an heteroepitaxial stack.

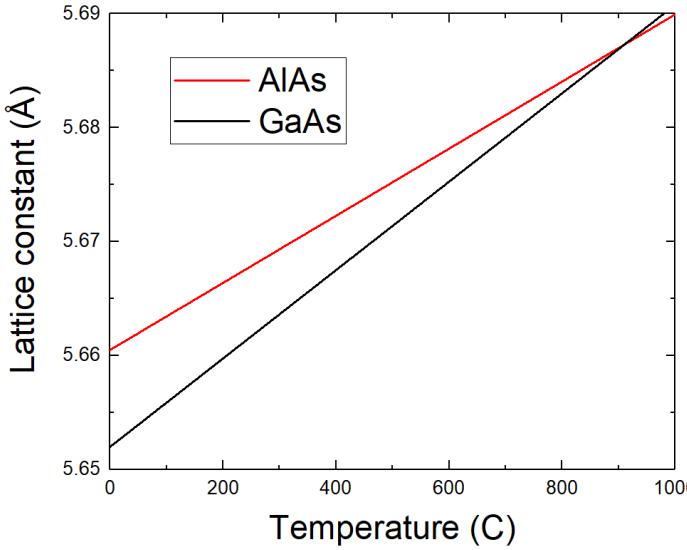

M. Ettenberg, R. J. Paff, *J. Appl. Phys.*, **41**, no.10,
pp.3926-3927 (1970)

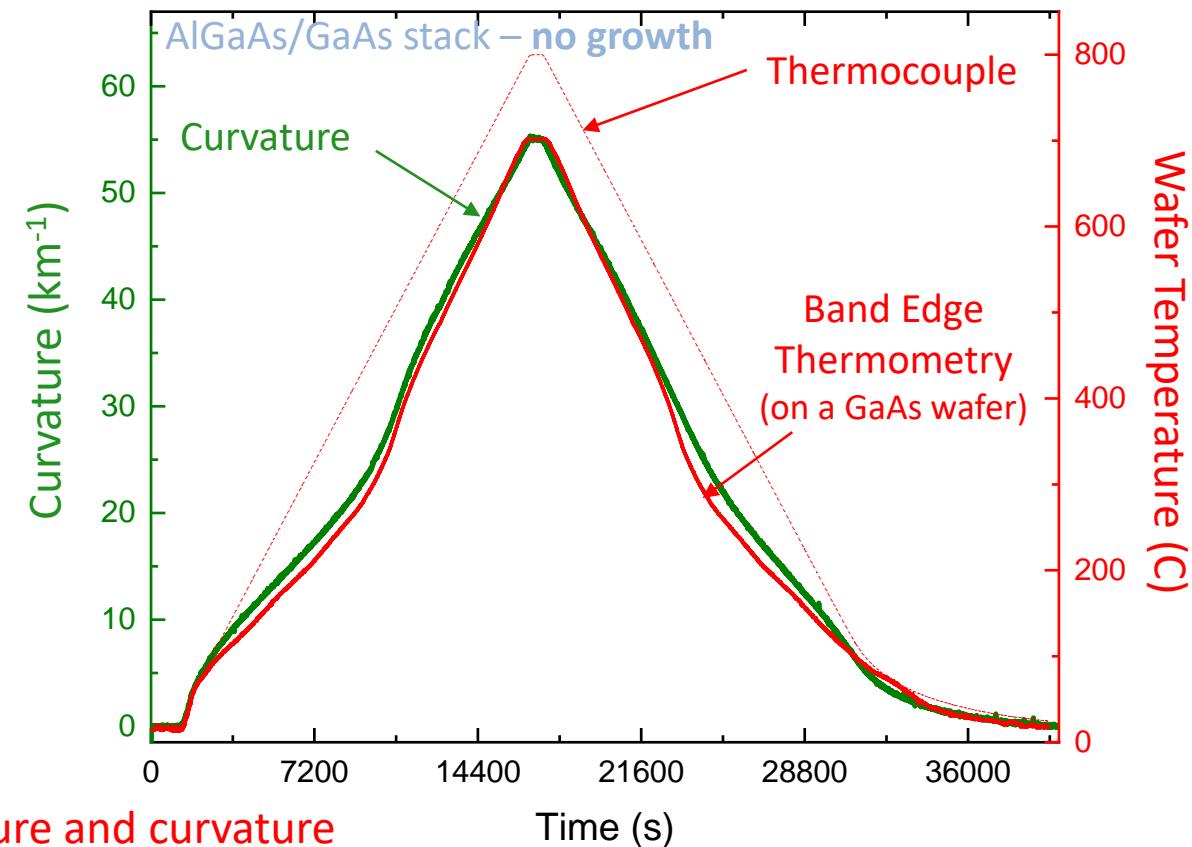

Stress/Curvature and crystal growth

Thermal stress

- > Because thermal expansion coefficient is material dependent, any change in temperature induces a change in stress/curvature of an heteroepitaxial stack.

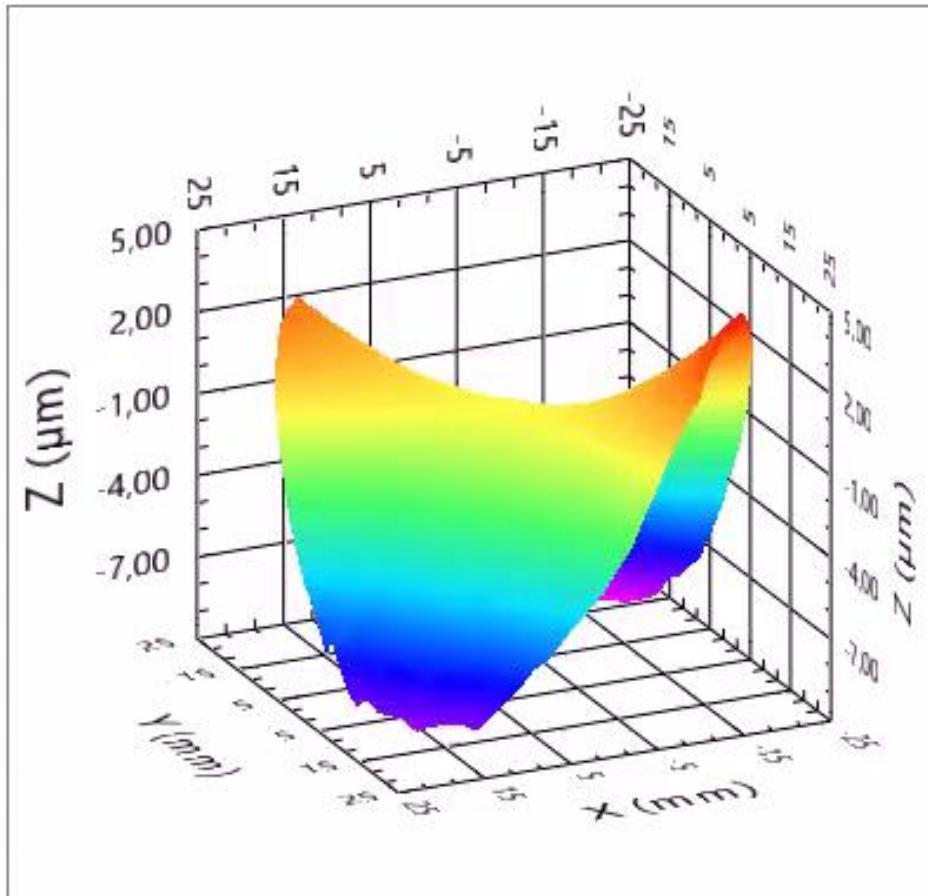

M. Ettenberg, R. J. Paff, *J. Appl. Phys.*, **41**, no.10,
pp.3926-3927 (1970)

→ Nice correlation between temperature and curvature

MIC Robustness to substrate rotation: anisotropy

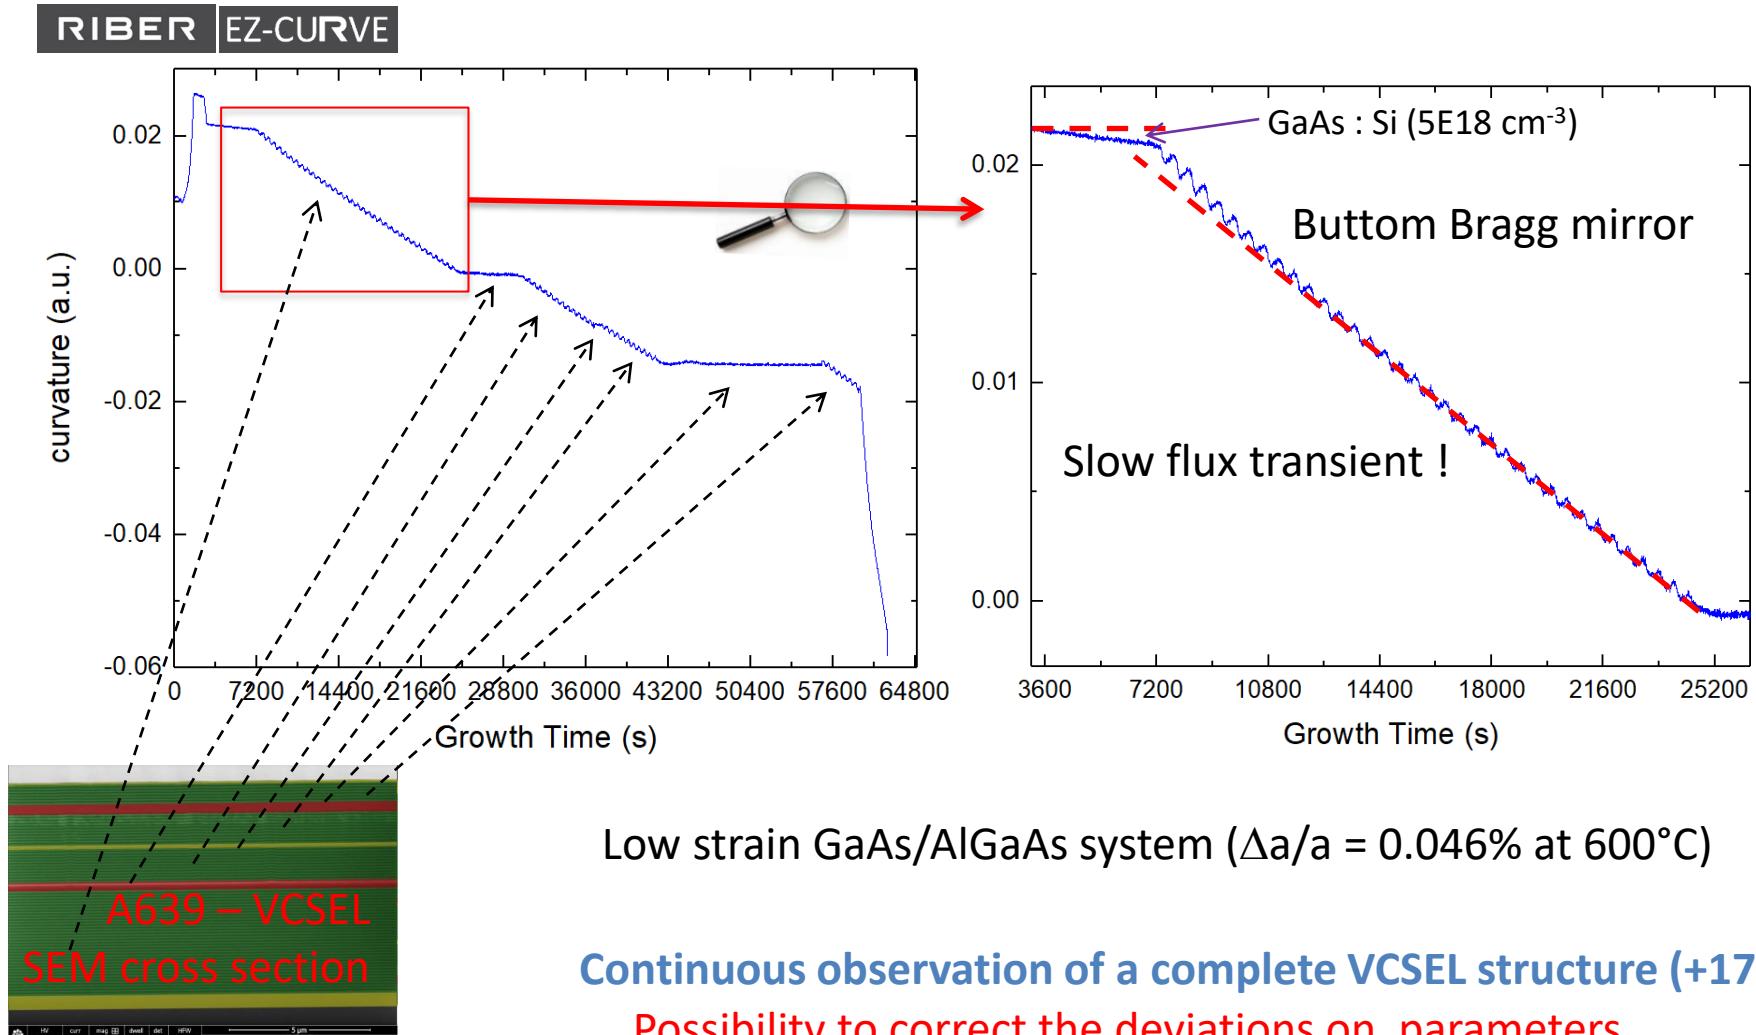

Wafer :
Single-side polished
GaAs NID AXT (001)
50mm diameter
350 μ m thick
Measured at 580C
Rotation : 12RPM

Because **substrate is rotating**, it is possible to measure the curvature in any direction, and to get a clear view of its shape in live

Note : It is also possible to measure this complete shape on non-rotating substrates at normal incidence

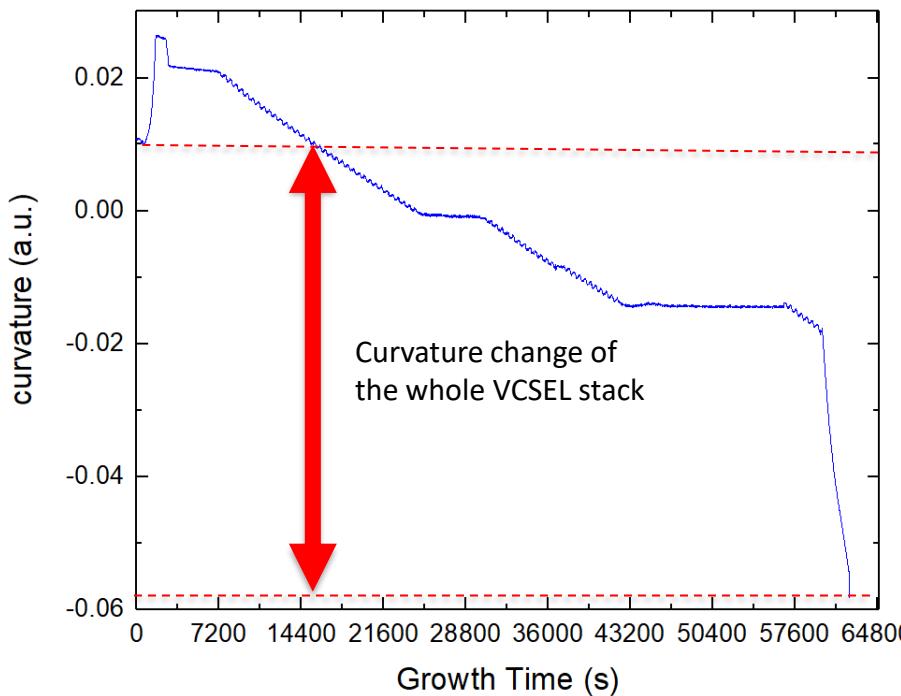

In situ characterization tools in MBE: Curvature

**Complementarity for
alloy concentration / growth rate
measurement**

Growth rate: Curvature

> Stoney equation:

$$\kappa \approx \frac{6\bar{\sigma}_f h_f}{M_s h_s^2} = 6 \frac{h_f M_f}{h_s^2 M_s} \varepsilon = -6 \frac{h_f M_f}{h_s^2 M_s} \frac{a_f - a_s}{a_s}$$

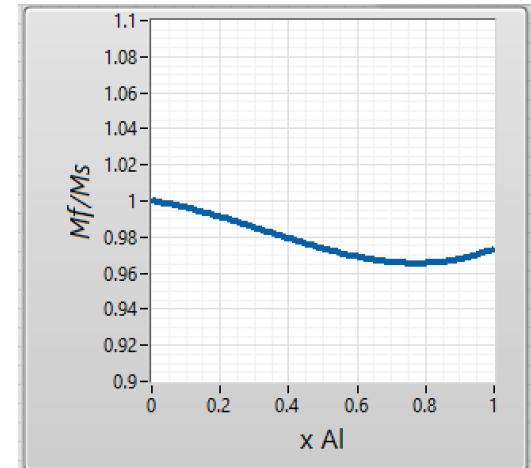

Young Modulus E
 Poisson coefficient ν

Avec $M = \frac{E}{1 - \nu}$

For $\text{Al}_x\text{Ga}_{(1-x)}\text{As}$:

$$a_f = a_{\text{AlGaAs}} = x a_{\text{AlAs}} + (1 - x) a_{\text{GaAs}}$$

$$\kappa \approx - \frac{6h_{\text{AlGaAs}}}{h_s^2} \times x \times \frac{a_{\text{AlAs}}(\textcolor{red}{T}) - a_{\text{GaAs}}(\textcolor{red}{T})}{a_{\text{GaAs}}(\textcolor{red}{T})}$$

Compositional dependence of the elastic constants and the lattice parameter of AlGaAs
 Gehristz et al.
 PRB 60 (16), 1999

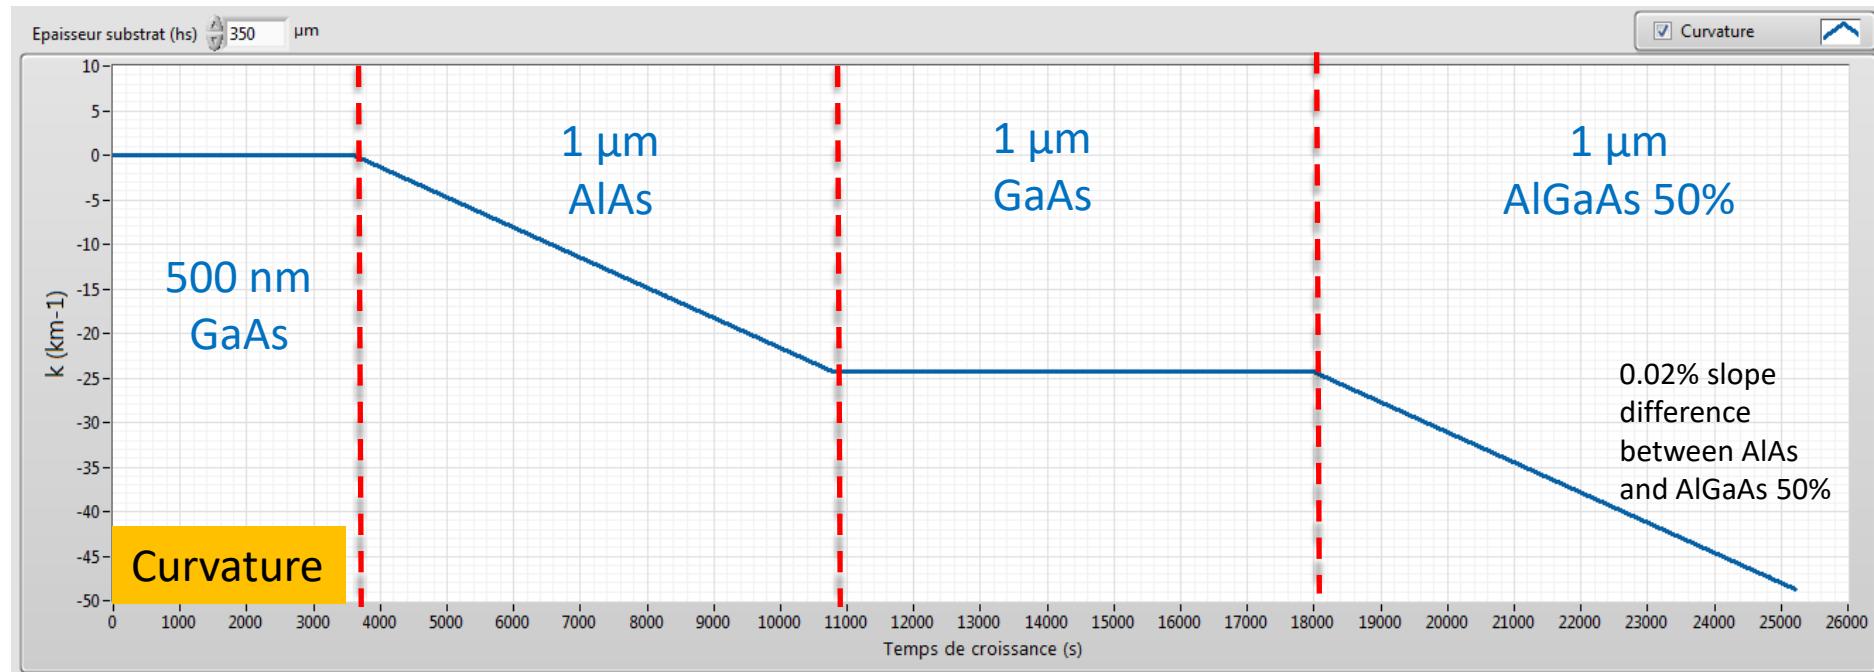

Growth rate: Curvature

$$k \approx -\frac{6h_{AlGaAs}}{h_s^2} \times x \times \frac{a_{AlAs}(T) - a_{GaAs}(T)}{a_{GaAs}(T)}$$

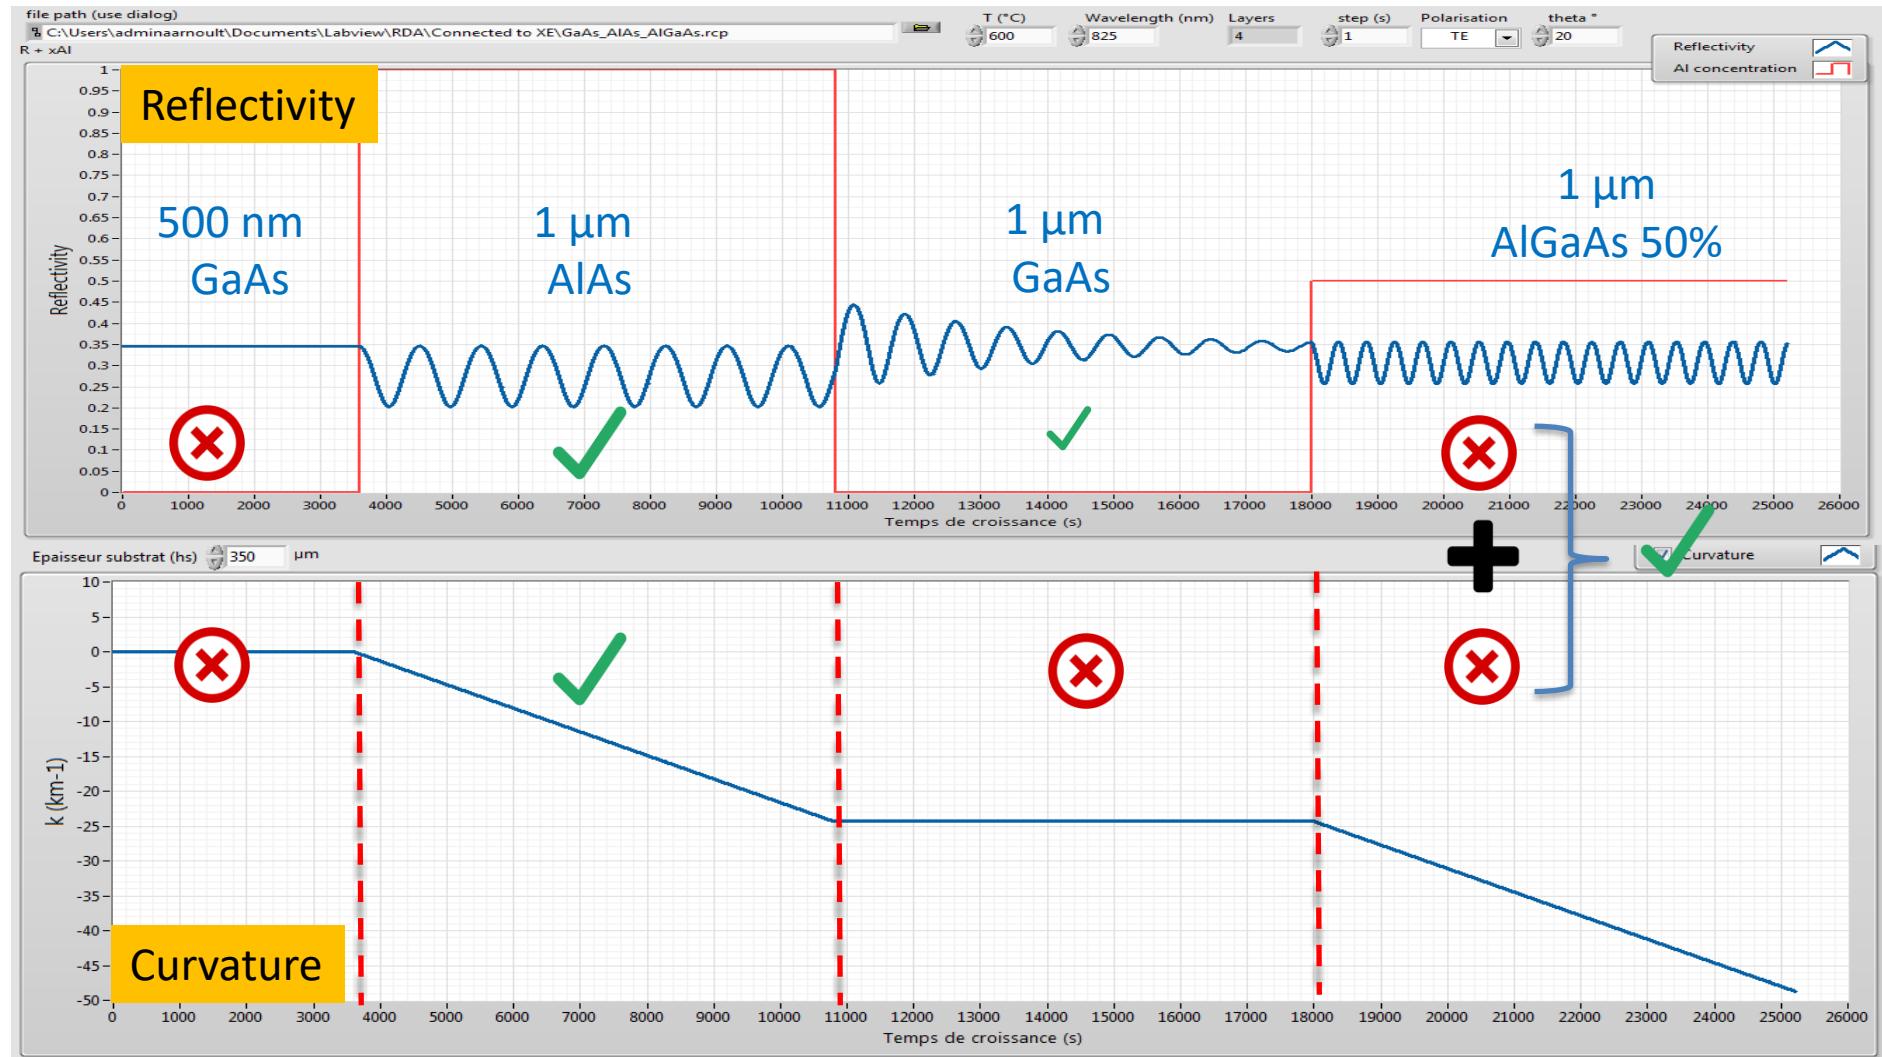

$$\frac{\Delta \kappa}{\Delta t} \approx -\frac{6 \times G_{AlAs}}{h_s^2} \times \frac{a_{AlAs}(T) - a_{GaAs}(T)}{a_{GaAs}(T)}$$

with $h_{AlGaAs} = G_{AlGaAs} \times t$
 $= (G_{GaAs} + G_{AlAs}) \times t$

$$x = \frac{G_{AlAs}}{G_{GaAs} + G_{AlAs}}$$

The case of GaAsBi growth

Case of $\text{GaAs}_{1-x}\text{Bi}_x$ MBE
growth studied with the
MIC curvature tool

GaAs_{1-x}Bi_x: a highly mismatched alloy

Wide range of applications for GaAs technology

- Solar cells
- Lasers
- Spintronics
- Photodiodes
- Thermoelectric materials
- Topological insulators

Alloy based on highly mismatched binary compounds: $\frac{\Delta a}{a} = 12\%$

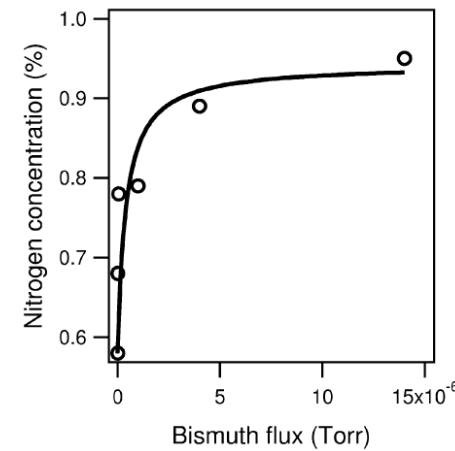

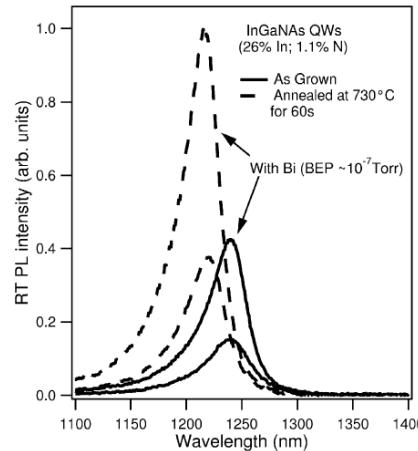

Bi incorporation in GaAs

→ Under 400°C : Bi incorporation with specific growth conditions

- V/III atomic ratio (~1!)
- Substrate temperature

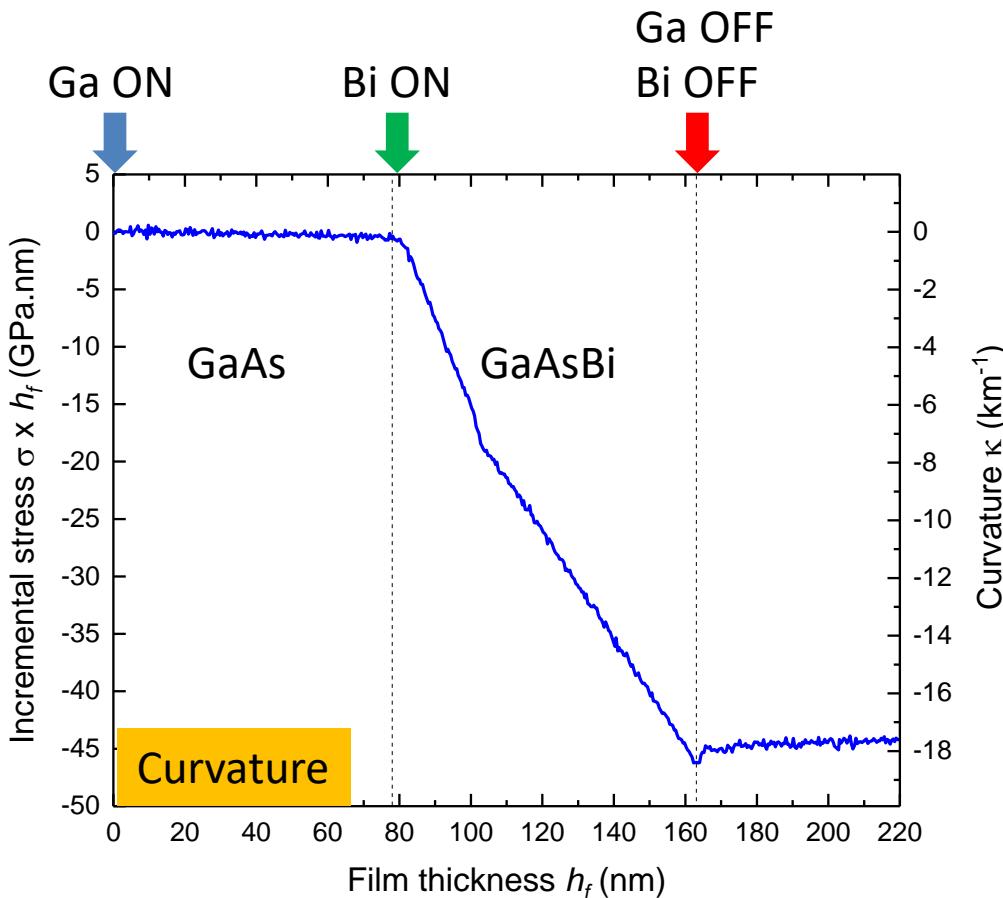

Any small changes in these conditions induce high difference in Bi composition, and different electrical, optical and mechanical properties of the alloy

→ Above 400°C : Bi acts as a surfactant

Surfactant enhanced growth of GaNAs and InGaNAs using bismuth, Tixier and al., 2003

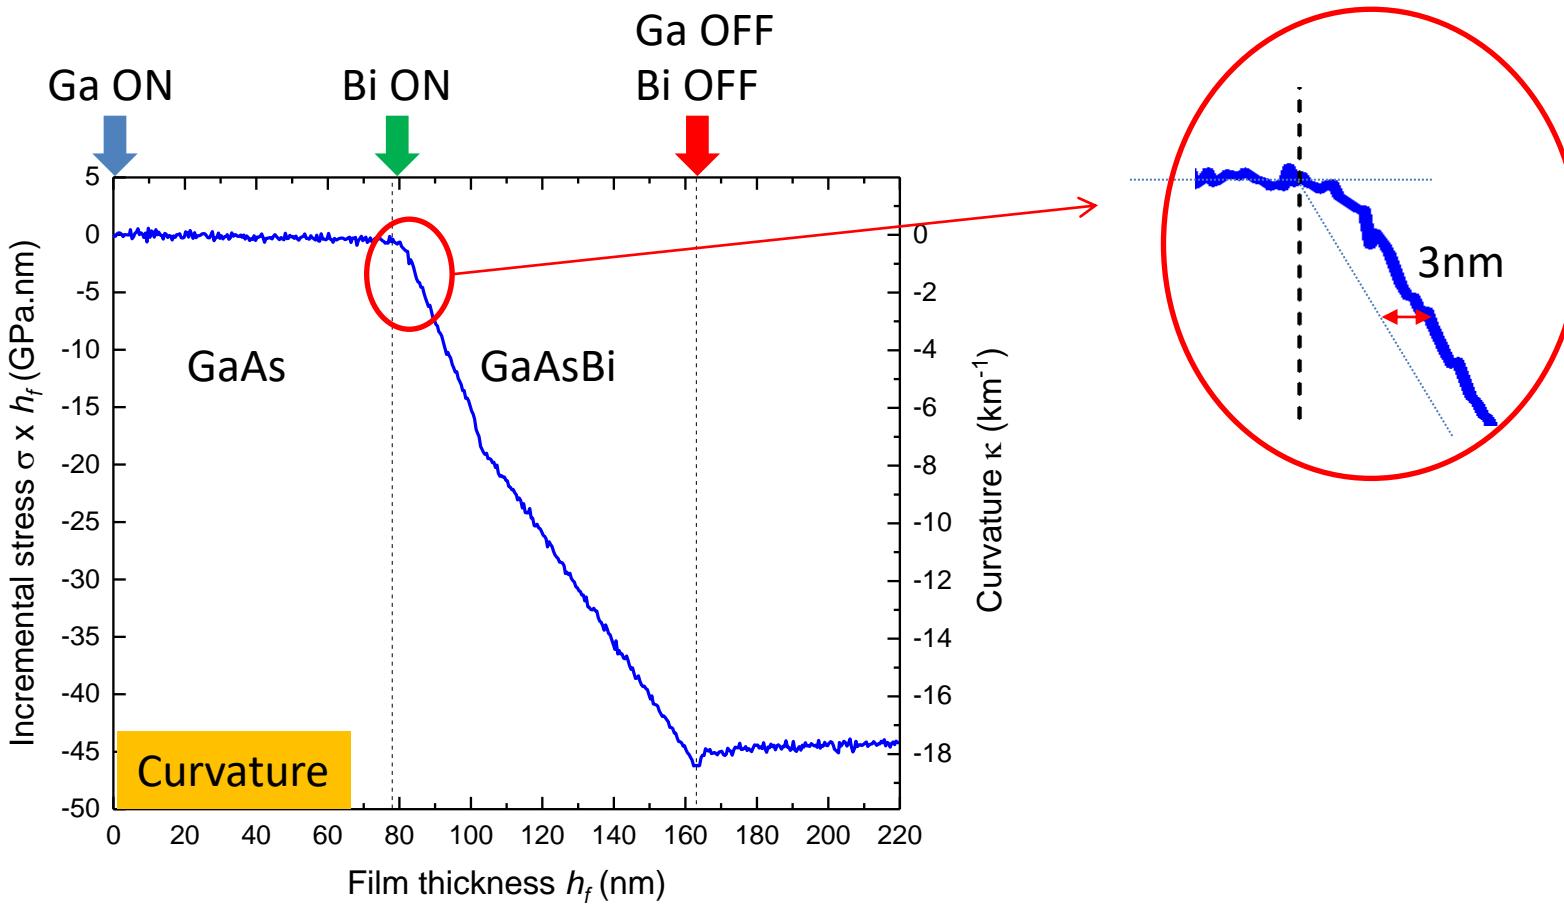

Curvature and GaAsBi Growth

- 350μm thick, 50mm diameter substrate
- V/III atomic ratio near 1
- $G_{\text{GaAs}} = 0.3\mu\text{m/h}$
- $T_{\text{sub}} = 265^\circ\text{C}$ BandiT
- 12 RPM rotation

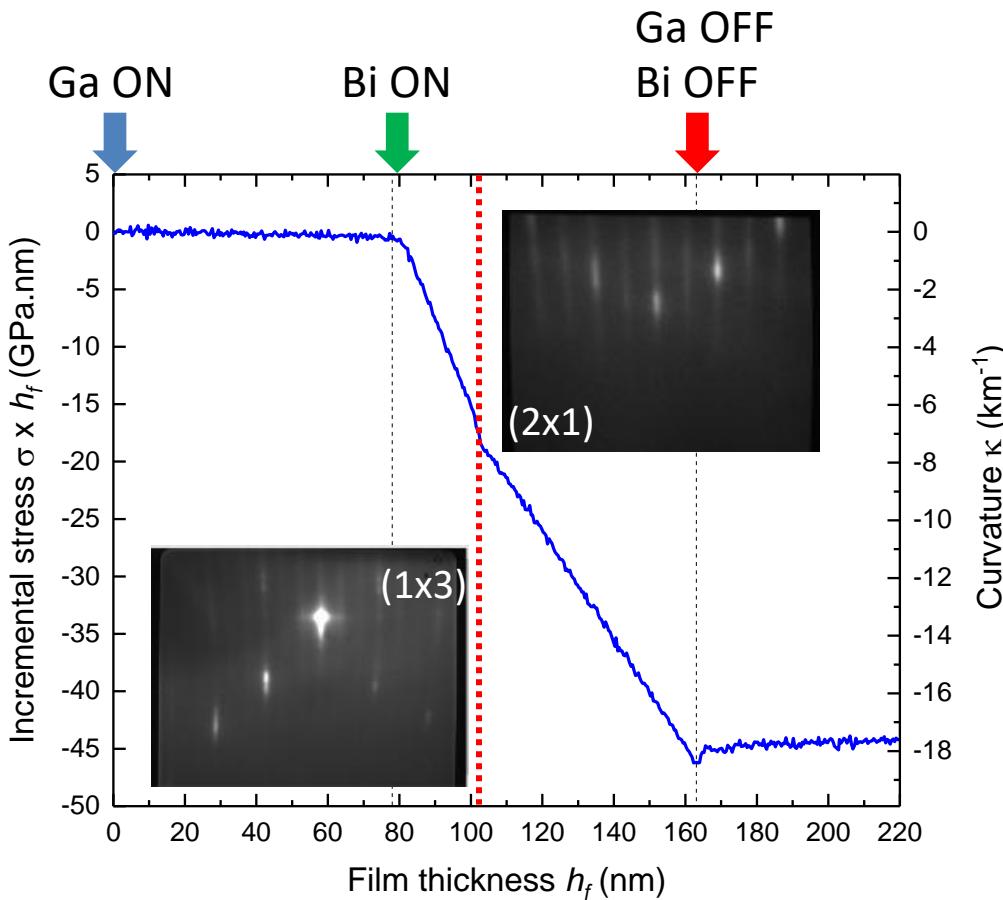

→ Some peculiar events during the growth

Curvature for GaAsBi Growth

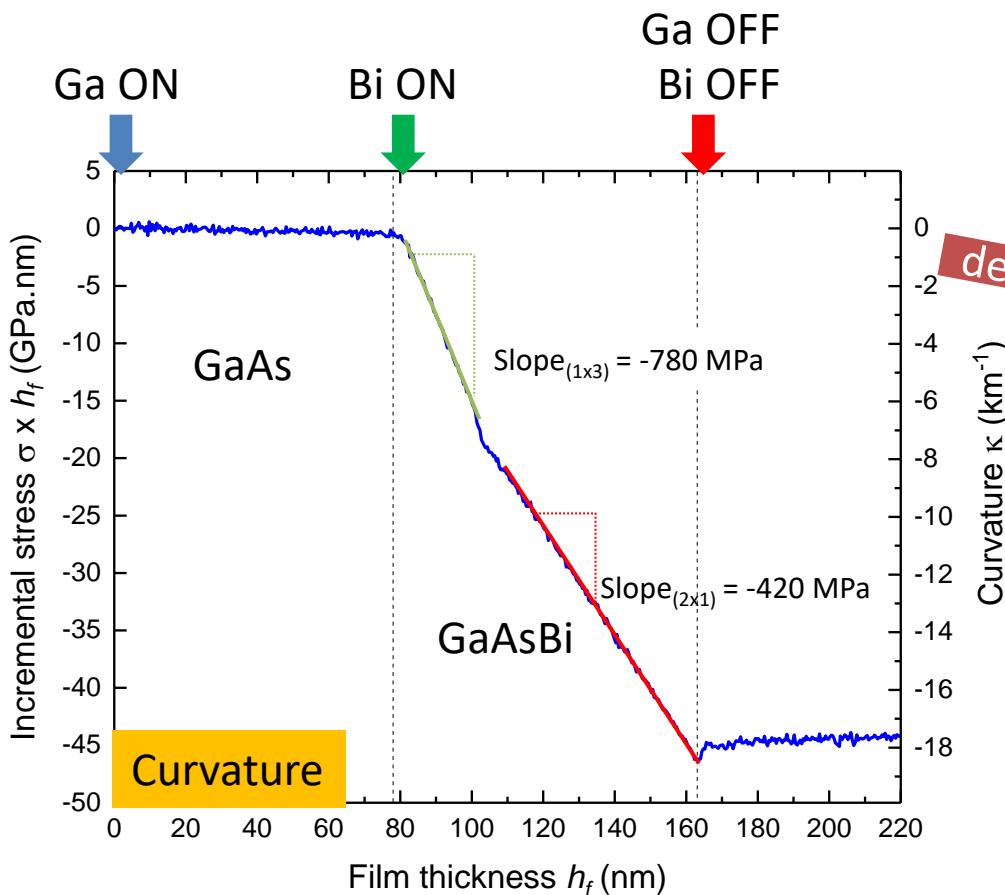

→ First nm: very low stress and incorporation (Bi segregation)

Curvature for GaAsBi Growth

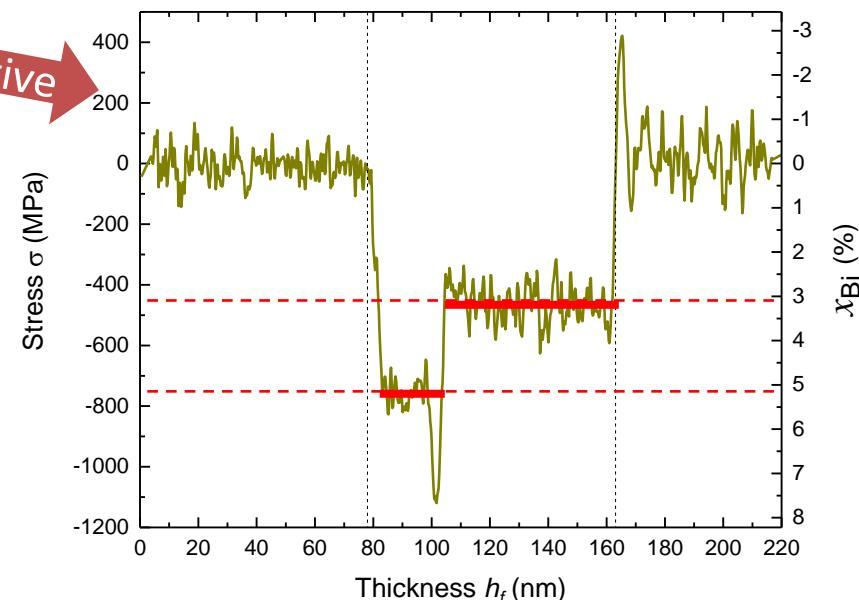

→ Change of surface reconstruction during GaAsBi layer

Curvature for GaAsBi Growth

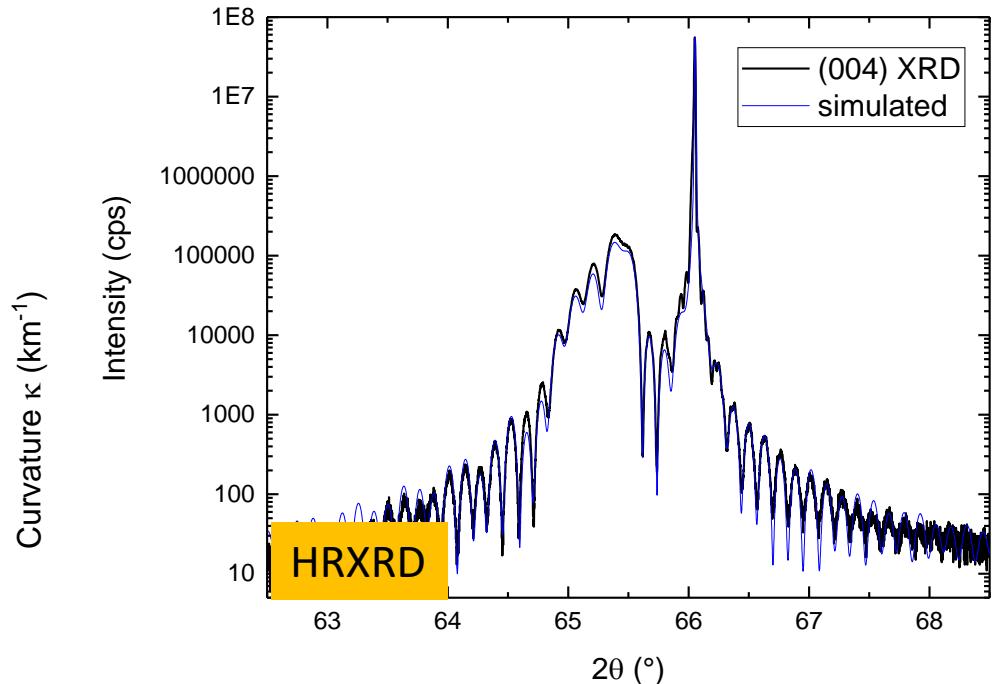

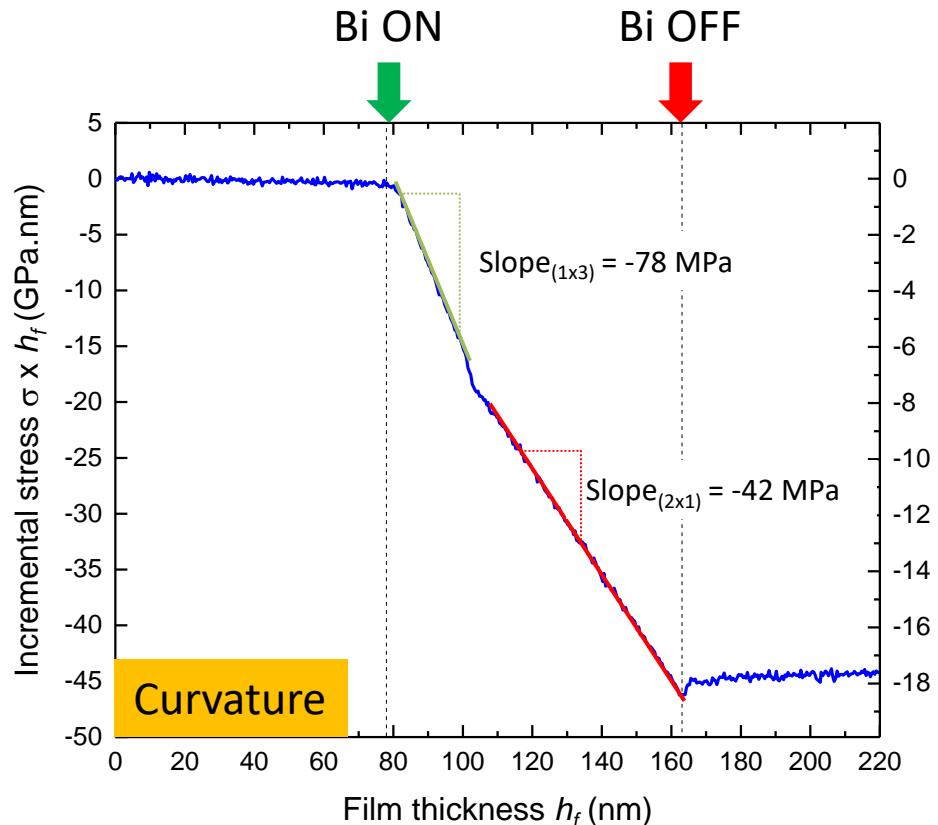

→ Observation of stress variation during growth

Constant growth parameters, two-step incorporation

Curvature for GaAsBi Growth

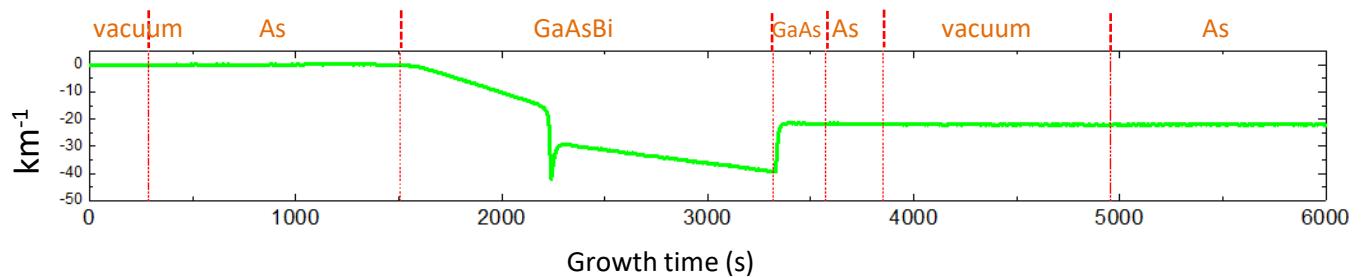

Material	Curvature		XRD	
	h_f (nm)	% Bi	h_f (nm)	% Bi
GaAsBi _(2x1)	60.5	2.9	57.3	3.6
GaAsBi _(1x3)	24.5	5.3	24.7	5.3
Substrate				

→ Specific growth conditions

- different stress during (1x3) and (2x1) reconstructions
- different Bi incorporation in the two layers

Better understanding : coupling of in-situ techniques

Curvature

Rotating substrate:

- (001) GaAs
- 50mm dia.
- **150 μm thick**

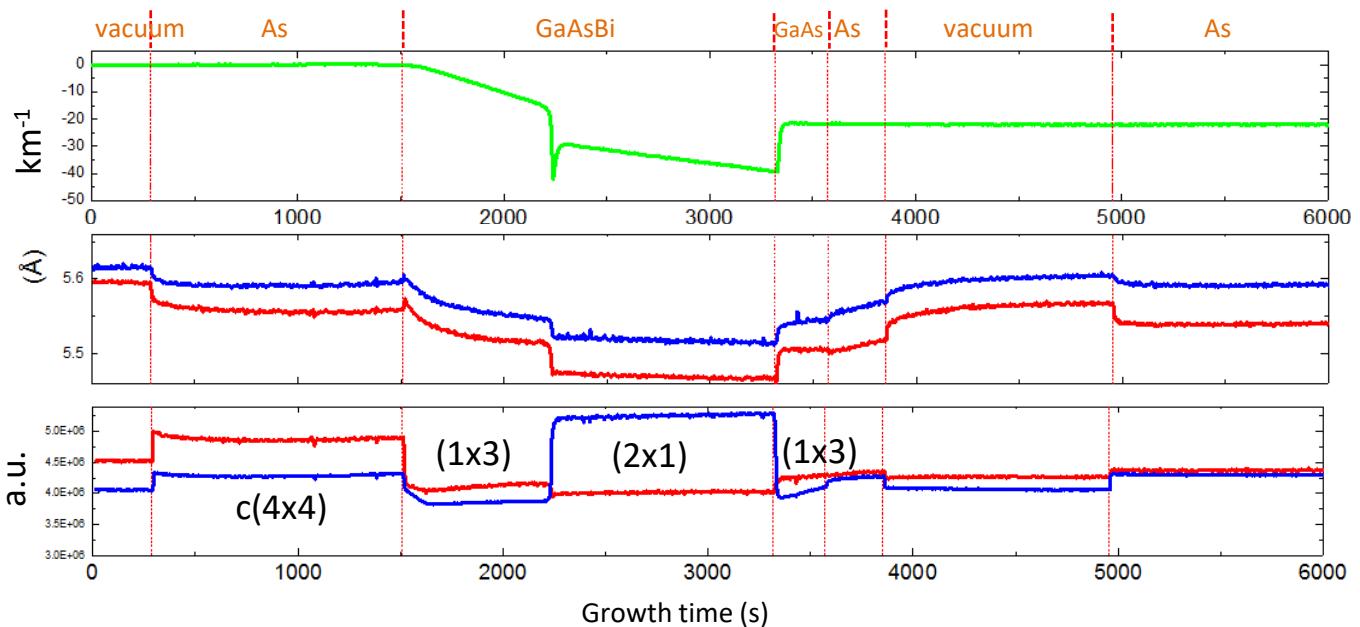

$$\kappa \approx 6 \frac{h_f}{h_s^2} \frac{\bar{\sigma}_f}{M_s}$$

resolution x5.4!

Better understanding : coupling of in-situ techniques

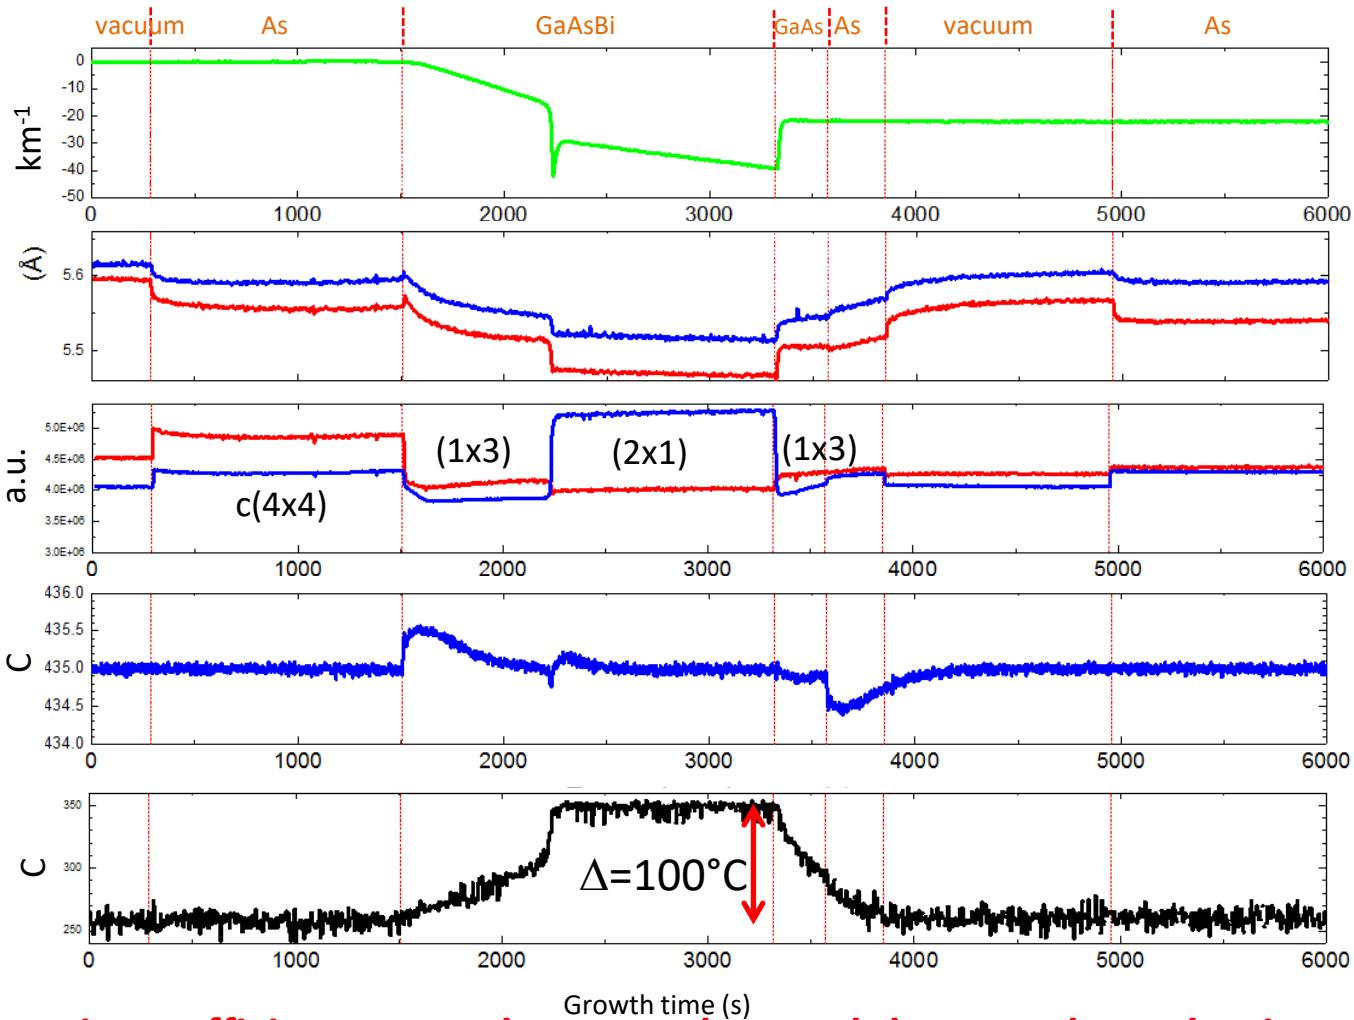

Curvature

RHEED : intensity

Better understanding : coupling of in-situ techniques

Curvature

Thermocouple temp.

BandiT temp.

→ Coupling techniques is an efficient way to better understand the growth mechanisms

Conclusions

- ✓ When facing peculiar dynamic conditions, in-situ analysis tools are mandatory
- ✓ Curvature measurements provide extremely rich information – MIC makes it accessible to MBE
- ✓ Coupling in-situ tools
 - Further understanding of the growth mechanisms
 - Control of growth and properties of epitaxial materials and device structures

Thank you!
