HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Over the past ten years, new methodologies have emerged that have markedly accelerated the development of new alloys. In particular, the utilisation of rapid high-throughput techniques and novel numerical alloy design approaches now enables the development of alloys with multiple optimised characteristics for a specific application. These characteristics may concern thermomechanical properties (such as strength and creep resistance), or other properties (such as density or cost), and may

also relate to the ability of the alloy to achieve good behaviour in a corrosive environment at high temperature. In this context, the emergence of high-entropy alloys (HEAs) and concentrated complex alloys (CCAs), comprising four to six concentrated elements, has led to the emergence of new fields of research. However, in this new paradigm of ‘combinatorial metallurgy’, there is also an increased scope for innovation in the case of ‘conventional’ steels or nickel-based alloys or light alloys, since they may contain an even greater number of alloying elements.

This issue presents a few of studies in this area, including an article focusing on the development of a rapid methodology for characterising the high-temperature oxidation properties of alloys. Another article explores the effect of Si on the oxidation behaviour of new grades of titanium alloys, while an additional paper presents a review on studies on high-temperature oxidation of additively manufactured HEAs.

The following papers are contributions from the ‘Oxidation of Novel Metallic Materials (Intermetallics, MMCs, HEAs...)’ session of the 11th International Conference on High-Temperature Corrosion and Protection of Materials (HTCPM 2024), held at Les Embiez Island, France, on 9–14 June 2024.
