The data in italic was previously published in Blommaert et al. (2022).

OC: organic carbon (%), CEC: cation exchange capacity, ex: exchangeable bases, ox: ammonium oxalate extractable Fe, Mn and Al.

Ca(NO₃)₂ – extraction: 0.05 M Ca(NO₃)₂ (5g soil: 50 mL Ca(NO₃)₂).

Letters a,b, and c denote different statistical groups with the posthoc Tukey HSD test ($p < 0.05$).

Table S2: Nutrient concentrations measured in the organs of the cacao trees for the different cultivars.

IF3 leaves	9.47 \pm 0.08 ^x	a	10.29 \pm 0.51 ^y	ab	9.09 \pm 0.06 ^x	bc

13 Letters x, y, z denote different statistical groups within the same row for the different cultivars, i.e. for one organ,
 14 cultivars falling in different groups x, y, z have significantly distinct X/Cd ratios. Letters a, b, c, d denote different
 15 statistical groups within the same column for the different organs, i.e. for one cultivar, organs falling in different
 16 group a, b, c, d have significantly different X/Cd ratios (posthoc Tukey HSD test, $p<0.05$). The bulk concentration
 17 ratios were log transformed to comply with the ANOVA assumptions (see Materials and Methods).

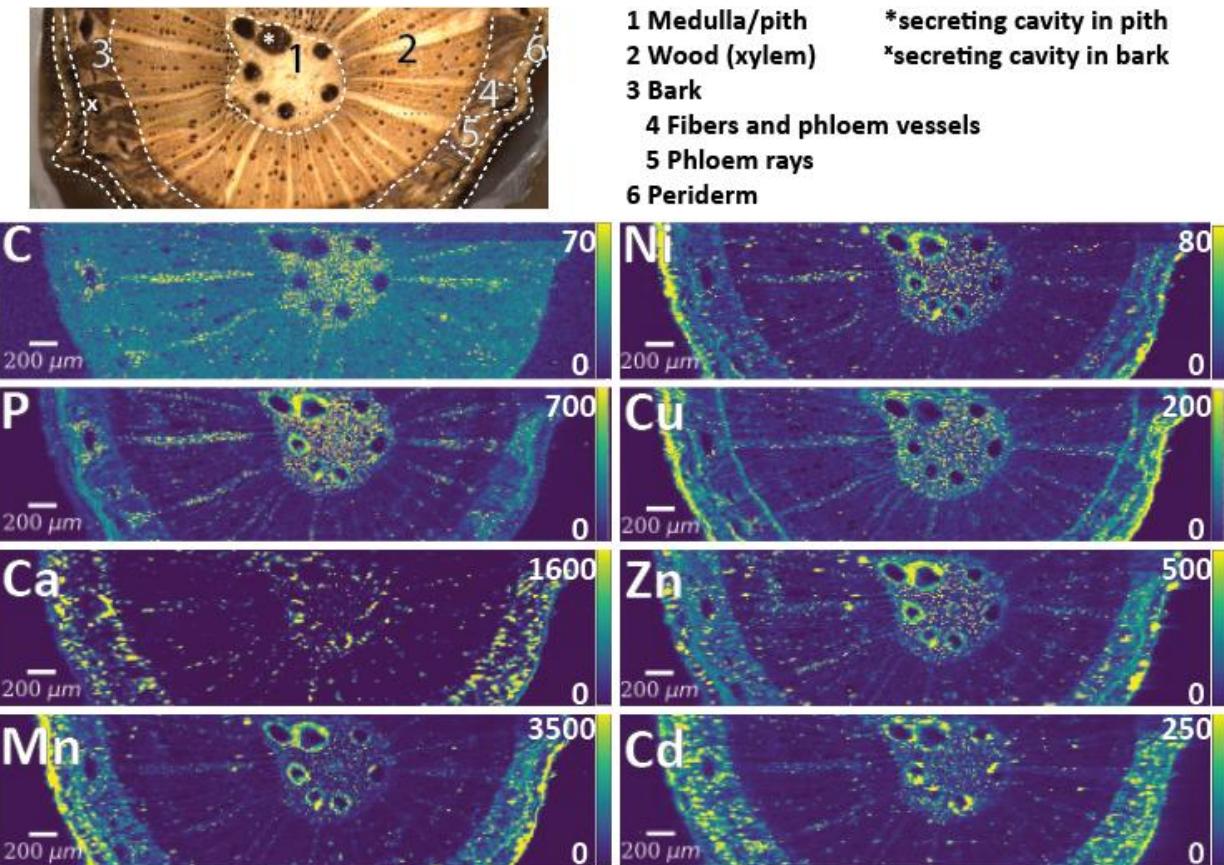

18 **Table S5:** Intensity of Cd signal detected by LA-ICP-MS in the different structures of the branch
 19 of the low Cd accumulating cultivar (replicates T15 and T3) and R^2 of regressions to intensities
 20 of other elements.

	Intensity\$								R^2							
	Cd		Ca		Mn		Zn		Cu		Ni		P			
	T15	T3	T15	T3	T15	T3	T15	T3	T15	T3	T15	T3	T15	T3	T15	T3
1 Pith	8.74	1.73	0.42	0.21	0.44	0.28	0.47	0.32	0.17	0.27	0.28	0.28	0.27	0.27	0.19	
2 Wood	1.00	1.00	0.28	0.29	0.36	0.27	0.37	0.16	0.25	0.16	0.16	0.12	0.29	0.18		
3 Bark phloem	9.43	3.74	0.48	0.45	0.55	0.54	0.32	0.38	0.2	0.25	0.22	0.22	0.36	0.42		
4 Phloem vessels	8.93	3.58	0.54	0.45	0.59	0.48	0.34	0.31	0.25	0.19	0.26	0.13	0.42	0.3		
5 Phloem rays	10.50	6.38	0.45	0.42	0.55	0.46	0.34	0.31	0.21	0.12	0.21	0.09	0.32	0.25		
6 Periderm	11.12	5.68	0.31	0.32	0.42	0.48	0.33	0.4	0.18	0.09	0.24	0.1	0.35	0.35		

21 Elemental counts (cts) of each element were normalized to ^{13}C to account for differences in tissue hardness and
 22 water content within the sample. \$The Cd counts were normalized to the mean Cd counts in wood to compare the
 23 accumulation of Cd in the different structures of the branch. In the materials and methods of Blommaert et al.
 24 (2022), more details can be found regarding the analysis.

25 **1.2. Supplementary figures**

26

27

28 **Figure S1:** Microscope image and LA-ICP-MS elemental maps of cross section of branch of the
 29 low Cd accumulator (replicate T15). The color scale bar indicates the intensity expressed in total
 30 counts (see Fig. 4 for explanation of the color scale) and is adjusted to the range of each element.
 31 Cadmium was particularly enriched in the phloem rays and the periderm. The Cd in the pith
 32 accumulated around the large secreting cavities in the pith, shown by white * .

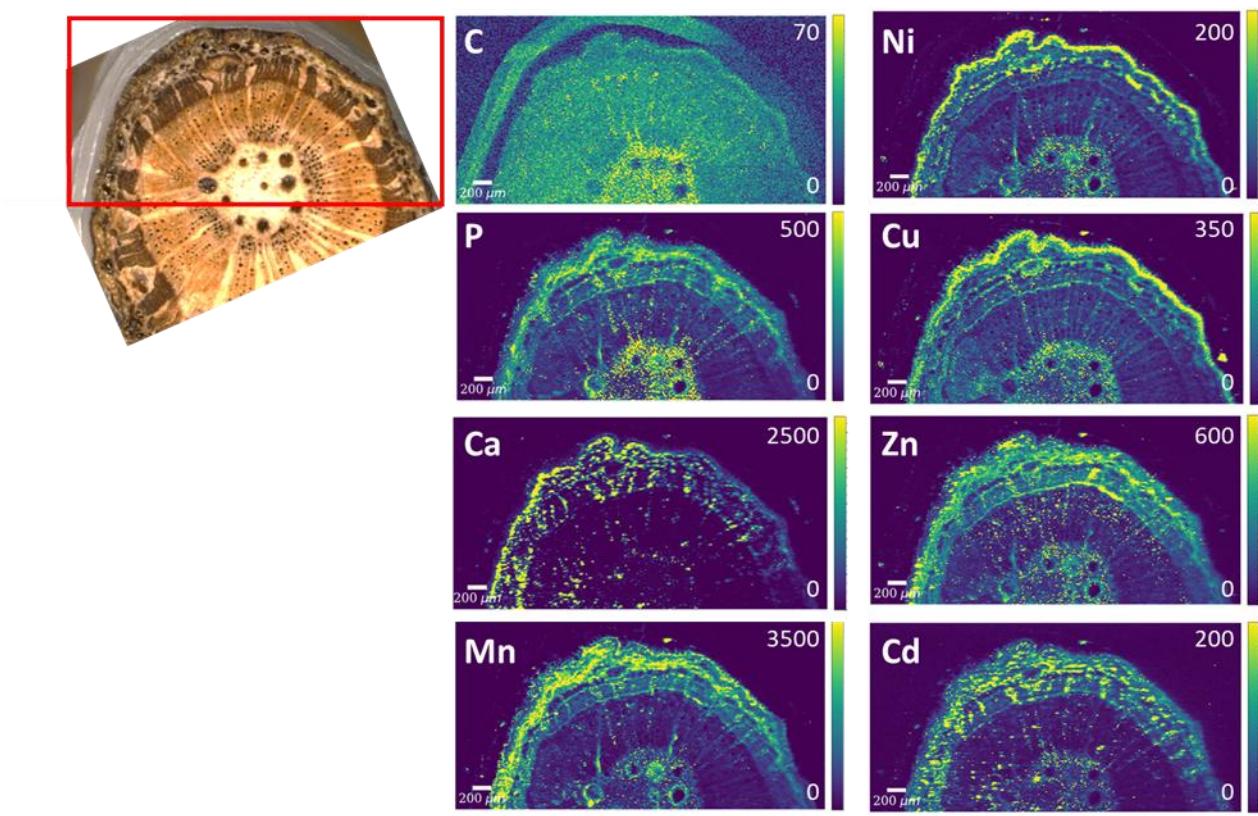

Figure S2: Microscope image and LA-ICP-MS elemental maps of a cross section of branch CL 10/3 (replicate T3). The intensity is expressed in total counts (cts). The color scale is adjusted to the range of each element.
